The clinical efficacy of methocarbamol p. 986 and meprobamate p. 324 as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

## NEUROPROTECTIVE DRUGS

## Riluzole

## ● INDICATIONS AND DOSE

To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease

▶ BY MOUTH

▶ Adult: 50 mg twice daily

- **CONTRA-INDICATIONS** Acute porphyria p. 930
- **CAUTIONS** History of abnormal hepatic function (consult product literature for details) · interstitial lung disease
- CAUTIONS, FURTHER INFORMATION**
- ▶ Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · tachycardia · vomiting
- ▶ **Uncommon** Anaemia · angioedema · interstitial lung disease · pancreatitis
- ▶ **Rare** Neutropenia
- ▶ **Very rare** Hepatitis
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Neutropenia White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid—no information available.
- **PATIENT AND CARER ADVICE**
- Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.
- Driving and skilled tasks  
Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).

## ● NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- ▶ Riluzole for motor neurone disease (January 2001) NICE TA20  
Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.  
[www.nice.org.uk/TA20](http://www.nice.org.uk/TA20)

## ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Riluzole (Non-proprietary)**

**Riluzole 50 mg** Riluzole 50mg tablets | 56 tablet [PoM] £320.00 DT price = £16.26

▶ **Rilutek (Sanofi)**

**Riluzole 50 mg** Rilutek 50mg tablets | 56 tablet [PoM] £320.33 DT price = £16.26

**Oral suspension**▶ **Teglutik** (Martindale Pharmaceuticals Ltd)

**Riluzole 5 mg per 1 ml** Teglutik 5mg/1ml oral suspension sugar-free | 300 ml [PoM] £100.00 DT price = £100.00

## 3.1 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

## ANTICHOLINESTERASES

## Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
- **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction
- **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdose · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) · diarrhoea · increased salivation · nausea · vomiting
- Overdose**  
Signs of overdose include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.

above

## Neostigmine

## (Neostigmine methylsulfate)

## ● INDICATIONS AND DOSE

**Treatment of myasthenia gravis**

▶ BY MOUTH

▶ Adult: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

**Reversal of non-depolarising (competitive) neuromuscular blockade**

▶ BY INTRAVENOUS INJECTION

▶ Adult: 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

- **CAUTIONS**
- ▶ With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **RENAL IMPAIRMENT** May need dose reduction.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**▶ **Neostigmine (Non-proprietary)**

**Neostigmine bromide 15 mg** Neostigmine 15mg tablets | 140 tablet [PoM] £99.60

**Solution for injection**▶ **Neostigmine (Non-proprietary)**

**Neostigmine metilsulfate 2.5 mg per 1 ml** Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £4.95-£5.45

P 983

**Pyridostigmine bromide**

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

**INDICATIONS AND DOSE****Myasthenia gravis**▶ **INITIALLY BY MOUTH**

- ▶ **Adult:** 30–120 mg, doses to be given at suitable intervals throughout day; usual dose 0.3–1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

- **RENAL IMPAIRMENT** Reduce dose; excreted by kidney.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Pyridostigmine bromide (Non-proprietary)**

**Pyridostigmine bromide 60 mg** Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.55 DT price = £45.53

▶ **Mestinon (Meda Pharmaceuticals Ltd)**

**Pyridostigmine bromide 60 mg** Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT price = £45.53

**CHOLINERGIC RECEPTOR STIMULATING DRUGS****Amifampridine****INDICATIONS AND DOSE****Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)**▶ **BY MOUTH**

- ▶ **Adult:** Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

- **CONTRA-INDICATIONS** Congenital QT syndromes · epilepsy · uncontrolled asthma

- **CAUTIONS** Non-paraneoplastic form of Lambert-Eaton myasthenic syndrome

- **INTERACTIONS** Caution if concomitant use of drugs that lower convulsive threshold. Avoid concomitant use of drugs that prolong QT interval. Avoid concomitant use of drugs with a narrow therapeutic index.

- **SIDE-EFFECTS** Anxiety · arrhythmias · blurred vision · bronchial hypersecretion · chorea · convulsions · cough · dizziness · drowsiness · exacerbation or precipitation of asthma · gastro-intestinal disorders · headache · myoclonia · palpitations · paraesthesia · Raynaud's syndrome · sleep disturbances · weakness

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days. Use with caution.

- **RENAL IMPAIRMENT** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days. Use with caution.

- **MONITORING REQUIREMENTS** Clinical and ECG monitoring required at treatment initiation and yearly thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2012) that amifampridine phosphate (*Firdapse*®) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 3, 21

▶ **Firdapse (BioMarin Europe Ltd)** ▼

**Amifampridine (as Amifampridine phosphate) 10 mg** Firdapse 10mg tablets | 100 tablet [PoM] £1,815.00

**3.2 Nocturnal leg cramps****Nocturnal leg cramps****Quinine salts**

Quinine salts p. 573, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdose and accidental fatalities have occurred.

**3.3 Spasticity**

**Other drugs used for Spasticity** Dantrolene sodium, p. 1191 · Diazepam, p. 321

## CANNIBINOIDS

## Cannabis extract

## ● INDICATIONS AND DOSE

**Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)**

- ▶ BY BUCCAL ADMINISTRATION
- ▶ Adult: (consult product literature)

● **CONTRA-INDICATIONS** Family history of psychosis · history of other severe psychiatric disorder · personal history of psychosis

● **CAUTIONS** History of epilepsy · significant cardiovascular disease

● **INTERACTIONS** → Appendix 1 (cannabis extract).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Amnesia · blurred vision · constipation · depression · diarrhoea · disorientation · dissociation · dizziness · drowsiness · dry mouth · dysarthria · impaired attention · increased or decreased appetite · malaise · mood disturbance · mouth ulcers · nausea · oral pain · taste disturbance · vertigo · vomiting
- ▶ **Uncommon** Abdominal pain · delusions · hallucinations · hypertension · oromucosal discolouration · palpitation · paranoia · pharyngitis · stomatitis · suicidal thoughts · syncope · tachycardia · tooth discolouration
- ▶ **Frequency not known** Anxiety · seizures

● **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.

● **BREAST FEEDING** Avoid—present in milk.

● **HEPATIC IMPAIRMENT** Manufacturer advises more frequent monitoring in significant hepatic impairment—possible risk of prolonged or enhanced effect.

● **RENAL IMPAIRMENT** Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.

● **MONITORING REQUIREMENTS** Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.

● **PATIENT AND CARER ADVICE****Driving and skilled tasks**

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Propylene glycol

- ▶ **Sativex** (Bayer Plc)

Cannabidiol 2.5 mg per 1 dose, Dronabinol 2.7 mg per

1 dose Sativex oromucosal spray | 270 dose [PoM] E375.00 [CD4-1]

## MUSCLE RELAXANTS &gt; CENTRALLY ACTING

## Baclofen

21-Nov-2016

● **INDICATIONS AND DOSE**

**Pain of muscle spasm in palliative care**

- ▶ BY MOUTH
- ▶ Adult: 5–10 mg 3 times a day

**Hiccup due to gastric distension (in palliative care)**

- ▶ BY MOUTH
- ▶ Adult: 5 mg twice daily

**Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord**

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

**Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)**

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then *dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

**IMPORTANT SAFETY INFORMATION**

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

● **CONTRA-INDICATIONS**

- ▶ With intrathecal use Local infection · systemic infection
- ▶ With oral use Avoid oral route in active peptic ulceration

● **CAUTIONS****GENERAL CAUTIONS**

Cerebrovascular disease · diabetes · elderly · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · Parkinson's disease · psychiatric illness · respiratory impairment

**SPECIFIC CAUTIONS**

- ▶ With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure
- **INTERACTIONS** → Appendix 1 (muscle relaxants).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastro-intestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disorders
- ▶ **Rare** Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances
- ▶ **Very rare** Hypothermia

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Present in milk—amount probably too small to be harmful.

● **HEPATIC IMPAIRMENT**

- ▶ With oral use Manufacturer advises use with caution.

### ● RENAL IMPAIRMENT

- ▶ With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m<sup>2</sup> manufacturer advises use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

#### Palliative care

For further information on the use of baclofen in palliative care, see [www.palliativedrugs.com/formulary/en/baclofen.html](http://www.palliativedrugs.com/formulary/en/baclofen.html)

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

### ● MEDICINAL FORMS

## Methocarbamol

### ● INDICATIONS AND DOSE

#### Short-term symptomatic relief of muscle spasm

##### ▶ BY MOUTH

▶ Adult: 1.5 g 4 times a day; reduced to 750 mg 3 times a day if required

▶ Elderly: Up to 750 mg 4 times a day, dose may be sufficient

- **CONTRA-INDICATIONS** Brain damage · coma · epilepsy · myasthenia gravis · pre-coma
- **INTERACTIONS** → Appendix 1 (muscle relaxants).
- **SIDE-EFFECTS** Amnesia · anaphylaxis · angioedema · anxiety · blurred vision · bradycardia · cholestatic jaundice · confusion · dizziness · drowsiness · dyspepsia · fever · headache · hypersensitivity reactions · hypotension · leucopenia · nasal congestion · nausea · pruritus · rash · restlessness · seizures · tremor · urticaria · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk in *animal studies*—manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; half-life may be prolonged.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

## Tizanidine

### ● INDICATIONS AND DOSE

#### Spasticity associated with multiple sclerosis or spinal cord injury or disease

##### ▶ BY MOUTH

▶ Adult: Initially 2 mg daily, then increased in steps of 2 mg daily in divided doses, increased at intervals of at least 3–4 days and adjust according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

- **CAUTIONS** Elderly
- **INTERACTIONS** → Appendix 1 (muscle relaxants). Caution with concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS**  
▶ **Common or very common** Altered liver enzymes (discontinue if persistently raised—consult product literature) · dizziness · drowsiness · dry mouth · fatigue · gastro-intestinal disturbance · hypotension · nausea  
▶ **Uncommon** Bradycardia

- ▶ **Frequency not known** Asthenia · blurred vision · confusion · convulsions · hallucinations · hepatitis · insomnia · liver failure · syncope
- **PREGNANCY** Avoid (toxicity in *animal studies*).
- **BREAST FEEDING** Avoid (present in milk in *animal studies*).
- **HEPATIC IMPAIRMENT** Avoid in severe impairment; use in moderate impairment only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
 Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

## 4 Pain and inflammation in musculoskeletal disorders

### Non-steroidal anti-inflammatory drugs

#### Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 414, but paracetamol is preferred, particularly in the elderly.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

#### Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 999 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Dexibuprofen p. 990 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen p. 1006 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).

Fenoprofen p. 997 is as effective as naproxen, and flurbiprofen p. 998 may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen p. 1002 has anti-inflammatory properties similar to ibuprofen and has more side-effects. Dexketoprofen p. 991, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid p. 1010 is as effective as naproxen; it has more side-effects than ibuprofen.

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac sodium p. 993 and aceclofenac p. 988 are similar in efficacy to naproxen.

Etodolac p. 995 is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin p. 1001 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances.

Mefenamic acid p. 1004 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam p. 1004 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone p. 1005 is comparable in effect to naproxen. Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 1007 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Sulindac p. 1009 is similar in tolerance to naproxen.

Tenoxicam p. 1009 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfenamic acid p. 440 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1186 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1187, are licensed for the short-term management of postoperative pain.

The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 996 and celecoxib p. 990, are as effective as non-selective

NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 114 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

#### Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 992.

#### Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

#### NSAIDs and cardiovascular events

All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of aceclofenac, treatment advice has been updated in line with diclofenac, based on aceclofenac's structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

#### NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam p. 1007, ketoprofen p. 1002, and ketorolac trometamol p. 1186 are associated with the highest risk; indometacin p. 1001, diclofenac, and naproxen p. 1006 are associated with intermediate risk, and ibuprofen p. 999 with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a *lower* risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are *generally preferred*, to start at the *lowest recommended dose* and not to use more than one oral NSAID at a time.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

### ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

## Aceclofenac

#### • INDICATIONS AND DOSE

**Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis**

▶ BY MOUTH

▶ Adult: 100 mg twice daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild heart failure · peripheral arterial disease · severe heart failure
- **CAUTIONS** Allergic disorders · avoid in acute porphyrias p. 930 · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Initially 100 mg daily. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution; avoid in moderate to severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

#### ▶ Acetofenac (Non-proprietary)

**Acetofenac 100 mg** Acetofenac 100mg tablets | 60 tablet **[PoM]**

#### ▶ Preservex (Almirall Ltd)

**Acetofenac 100 mg** Preservex 100mg tablets | 60 tablet **[PoM]**  
£9.63 DT price = £9.63

## Acemetacin

- **DRUG ACTION** Glycolic acid ester of indometacin.

#### ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease | Pain and inflammation in other musculoskeletal disorders | Postoperative analgesia**

#### ▶ BY MOUTH

- ▶ **Adult:** 120 mg daily in divided doses, then increased if necessary to 180 mg daily in divided doses, dose to be taken with food

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · parkinsonism · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · blood disorders · confusion · convulsions · hepatic damage · hyperglycaemia · interstitial fibrosis associated with NSAIDs can lead to renal failure · intestinal strictures · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · peripheral neuropathy · psychiatric disturbances · pulmonary eosinophilia · Stevens-Johnson syndrome · syncope · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hyperkalaemia · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Serious side-effects. For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** During prolonged therapy ophthalmic and blood examinations particularly advisable.
- **PATIENT AND CARER ADVICE**
  - Driving** Dizziness may affect performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 21

**Acemetacin 60 mg** Emflex 60mg capsules | 90 capsule **[PoM]**  
£28.20 DT price = £28.20

## Celecoxib

### ● INDICATIONS AND DOSE

#### Pain and inflammation in osteoarthritis

- ▶ BY MOUTH
- ▶ Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

#### Pain and inflammation in rheumatoid arthritis

- ▶ BY MOUTH
- ▶ Adult: 100 mg twice daily, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

#### Ankylosing spondylitis

- ▶ BY MOUTH
- ▶ Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 400 mg daily in 1–2 divided doses, discontinue if no improvement after 2 weeks on maximum dose

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dyspnoea · influenza-like symptoms
  - ▶ **Uncommon** Cerebral infarction · fatigue · muscle cramps · palpitation · paraesthesia · stomatitis
  - ▶ **Rare** Alopecia · alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · taste disturbance · toxic epidermal necrolysis · visual disturbances
  - ▶ **Very rare** Seizures
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · chest pain · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of

asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

Contra-indicated in patients with sulfonamide sensitivity.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies).
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Halve initial dose in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** Monitor blood pressure before and during treatment.

## Dexibuprofen

### ● INDICATIONS AND DOSE

#### Pain and inflammation associated with osteoarthritis and other musculoskeletal disorders | Mild to moderate pain and inflammation including dental pain

- ▶ BY MOUTH
- ▶ Adult: 600–900 mg daily in up to 3 divided doses; increased if necessary up to 1.2 g daily (max. per dose 400 mg)

#### Mild to moderate pain and inflammation in dysmenorrhoea

- ▶ BY MOUTH
- ▶ Adult: 600–900 mg daily in up to 3 divided doses (max. per dose 300 mg); maximum 900 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION**

- ▶ **High-dose dexibuprofen** A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose dexibuprofen ( $\geq 1.2$  g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.

● **INTERACTIONS** → Appendix 1 (NSAIDs).

**● SIDE-EFFECTS**

- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- ▶ BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

#### Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
- ▶ BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

#### Postoperative pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
- ▶ BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

#### DICLOMAX RETARD®

#### Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 capsule once daily

#### DICLOMAX SR®

#### Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 capsule 1–2 times a day, alternatively 2 capsules once daily

#### DYLOJECT®

#### Acute exacerbations of pain and postoperative pain

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg once daily for maximum 2 days, to be administered into the gluteal muscle

#### Acute exacerbations of pain and postoperative pain (severe cases)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg twice daily for maximum 2 days, to be administered into the gluteal muscle

#### Ureteric colic

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg, then 75 mg after 30 minutes if required

#### Acute postoperative pain (in supervised settings)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 75 mg every 4–6 hours if required for maximum 2 days; maximum 150 mg per day

#### Prevention of postoperative pain

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 25–50 mg, to be given after surgery; further doses given after 4–6 hours if necessary; maximum 150 mg in 24 hours for 2 days

#### MOTIFENE®

#### Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 capsule 1–2 times a day

#### VOLTAROL® 75MG SR TABLETS

#### Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 tablet 1–2 times a day

#### VOLTAROL® EMULGEL

#### Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

- ▶ TO THE SKIN
- ▶ Adult: Apply 3–4 times a day, therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

#### VOLTAROL® RETARD

#### Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

#### VOLTAROL® SOLUTION FOR INJECTION

#### Postoperative pain

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

#### Acute exacerbations of pain

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

#### Ureteric colic

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg, then 75 mg after 30 minutes if required

#### Acute postoperative pain (in hospital setting)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day

#### Prevention of postoperative pain (in hospital setting)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

### ● CONTRA-INDICATIONS

- ▶ With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage
- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

### ● CAUTIONS

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** → Appendix 1 (NSAIDs). Interactions do not generally apply to topical NSAIDs.
- ▶ With intravenous use Contra-indicated in concomitant NSAID use. Contra-indicated in concomitant anticoagulant use (including low-dose heparins).
- **SIDE-EFFECTS**
- **Rare**
- ▶ With systemic use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known**
- ▶ With intramuscular use or intravenous use Injection site reactions
- ▶ With rectal use Suppositories may cause rectal irritation
- ▶ With systemic use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- ▶ With topical use Paraesthesia · photosensitivity · rash (discontinue use if develops)
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- ▶ **With topical use** Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION**
- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY**
- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.
- **BREAST FEEDING**
- ▶ With systemic use Use with caution during breast-feeding. Amount in milk too small to be harmful.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- **HEPATIC IMPAIRMENT**
- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT**
- ▶ With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose

should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- ▶ With intravenous use Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Voltarol*<sup>®</sup>), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of 5 mg/hour.
- ▶ With topical use For topical preparations, apply with gentle massage only.
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ With oral use *Voltarol*<sup>®</sup> dispersible tablets are more suitable for **short-term** use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months).
- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity For topical preparations, patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- **EXCEPTIONS TO LEGAL CATEGORY** Various pack sizes of gel preparations may be available on sale to the public.
- **PROFESSION SPECIFIC INFORMATION**
- Dental practitioners' formulary**  
Diclofenac Sodium Tablets may be prescribed.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**DYLOJECT<sup>®</sup>**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (February 2008) that *Dyloject*<sup>®</sup> is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution
- Gastro-resistant tablet**

**Diclofenac sodium with misoprostol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, diclofenac sodium p. 993, misoprostol p. 73.

**● INDICATIONS AND DOSE****ARTHROTEC® 50/200**

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

- ▶ Adult: 1 tablet 2–3 times a day, take with food

**ARTHROTEC® 75/200**

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

▶ BY MOUTH

- ▶ Adult: 1 tablet twice daily, take with food

**MISOFEN® 50/200**

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

▶ BY MOUTH

- ▶ Adult: 1 tablet 2–3 times a day, take with food

**MISOFEN® 75/200**

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

▶ BY MOUTH

- ▶ Adult: 1 tablet twice daily, take with food

- **UNLICENSED USE** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the combination preparations of diclofenac and misoprostol.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant tablet**

**Etodolac****● INDICATIONS AND DOSE**

**Pain and inflammation in rheumatoid arthritis and osteoarthritis**

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 300–600 mg daily in 1–2 divided doses

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 600 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1 (NSAIDs).

**● SIDE-EFFECTS**

- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · confusion · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dyspnoea · dysuria · fatigue · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal

bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · palpitation · paraesthesia · photosensitivity · pruritus · pyrexia · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · stomatitis · tinnitus · tremor · urinary frequency · vasculitis · vertigo

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## Etoricoxib

23-Nov-2016

#### ● INDICATIONS AND DOSE

##### Pain and inflammation in osteoarthritis

###### ▶ BY MOUTH

- ▶ Child 16–17 years: 30 mg once daily, increased if necessary to 60 mg once daily
- ▶ Adult: 30 mg once daily, increased if necessary to 60 mg once daily

##### Pain and inflammation in rheumatoid arthritis |

##### Ankylosing spondylitis

###### ▶ BY MOUTH

- ▶ Child 16–17 years: 60 mg once daily, increased if necessary to 90 mg once daily

- ▶ Adult: 60 mg once daily, increased if necessary to 90 mg once daily

#### Acute gout

###### ▶ BY MOUTH

- ▶ Child 16–17 years: 120 mg once daily for maximum 8 days
- ▶ Adult: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Ecchymosis · fatigue · influenza-like symptoms · palpitation
  - ▶ **Uncommon** Anxiety · appetite change · arthralgia · atrial fibrillation · chest pain · cough · dry mouth · dyspnoea · electrolyte disturbance · epistaxis · flushing · mental acuity impaired · mouth ulcer · myalgia · paraesthesia · taste disturbance · transient ischaemic attack · weight change
  - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
  - ▶ **Very rare** Confusion · hallucinations
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in *animal* studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
  - ▶ In adults Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

## Felbinac

- **DRUG ACTION** Felbinac is an active metabolite of the NSAID fenbufen.

#### INDICATIONS AND DOSE

**Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

##### ▶ TO THE SKIN

- ▶ **Adult:** Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

- **CAUTIONS** Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported) ·

- **INTERACTIONS** → Appendix 1 (NSAIDs).

Interactions do not generally apply to topical NSAIDs.

- **SIDE-EFFECTS** Photosensitivity · rash (discontinue use if develops)

#### SIDE-EFFECTS, FURTHER INFORMATION

Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

- **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- **RENAL IMPAIRMENT** Deterioration in renal function has also been reported after topical use.
- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.
- **PATIENT AND CARER ADVICE** For topical preparations patients and carers should be advised to wash hands immediately after use. Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

- ▶ Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
- ▶ Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

##### Dysmenorrhoea

##### ▶ BY MOUTH

- ▶ Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
- ▶ Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of

recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Stomatitis
  - ▶ **Uncommon** Confusion · fatigue · hallucinations · paraesthesia
  - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.  
Deterioration in renal function has also been reported after topical use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

► **Flurbiprofen (Non-proprietary)**

**Flurbiprofen 50 mg** Flurbiprofen 50mg tablets | 100 tablet [PoM]

£21.30–£35.97 DT price = £35.80

**Flurbiprofen 100 mg** Flurbiprofen 100mg tablets | 100 tablet [PoM] £64.34 DT price = £64.03

**Ibuprofen****INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders** | Mild to moderate pain including dysmenorrhoea | Postoperative analgesia | Migraine | Dental pain

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Mild to moderate pain** | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

**Pain and inflammation**

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

**Pain and inflammation in systemic juvenile idiopathic arthritis**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

**Post-immunisation pyrexia in infants (on doctor's advice only)**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

**Pain relief in musculoskeletal conditions** | Treatment in knee or hand osteoarthritis (adjunct)

- TO THE SKIN
- Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

**FENBID® FORTE**

**Pain relief in musculoskeletal conditions** | Treatment in knee or hand osteoarthritis (adjunct)

- TO THE SKIN
- Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

**IBUGEL® FORTE**

**Pain relief in musculoskeletal conditions** | Treatment in knee or hand osteoarthritis (adjunct)

- TO THE SKIN
- Adult: Apply up to 3 times a day

- **UNLICENSED USE** Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

**CONTRA-INDICATIONS**

- With oral use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

**CAUTIONS**

- With oral use Allergic disorders (in adults) · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) (in adults) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**CAUTIONS, FURTHER INFORMATION**

- High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen ( $\geq 2.4$  g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

- **INTERACTIONS** → Appendix 1 (NSAIDs).

Interactions do not generally apply to topical NSAIDs.

**SIDE-EFFECTS**

- Rare
- With oral use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure ·

pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

► **Frequency not known**

- With oral use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- With topical use Photosensitivity · rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

**Overdose**

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 1211 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1204.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● **PREGNANCY**

- With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

● **BREAST FEEDING**

- With oral use Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● **HEPATIC IMPAIRMENT**

- With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● **RENAL IMPAIRMENT**

- With oral use If possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- With topical use Deterioration in renal function has also been reported after topical use.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: ibuprofen for pain and inflammation [www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation](http://www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation)

- With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

● **PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary**

Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public.

Oral preparations can be sold to the public in certain circumstances.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · avoid rectal administration in haemorrhoids · avoid rectal administration in proctitis · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · parkinsonism · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · blood disorders · confusion · convulsions · hepatic damage · hyperglycaemia · interstitial fibrosis associated with NSAIDs can lead to renal failure · intestinal strictures · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · peripheral neuropathy · psychiatric disturbances · pulmonary eosinophilia · Stevens-Johnson syndrome · syncope · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) ·

depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hyperkalaemia · hypersensitivity reactions · insomnia · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

- ▶ With oral use Nausea
- ▶ With rectal use Suppositories may cause occasional bleeding · suppositories may cause rectal irritation

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS**
  - ▶ During prolonged therapy ophthalmic and blood examinations particularly advisable.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Dizziness may affect performance of skilled tasks (e.g. driving).

## Ketoprofen

### ● INDICATIONS AND DOSE

#### Pain and mild inflammation in rheumatic disease

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 100–200 mg daily in 2–4 divided doses

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 100–200 mg once daily, dose to be taken with food

▶ BY RECTUM

▶ Adult: 100 mg once daily, to be administered at bedtime, combined oral and rectal treatment, maximum total daily dose 200 mg

#### Pain in musculoskeletal disorders | Pain after orthopaedic surgery | Dysmenorrhoea | Acute gout

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 50 mg up to 3 times a day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 100–200 mg once daily, dose to be taken with food

#### Relief of pain in musculoskeletal disorders | Treatment in knee or hand osteoarthritis (adjunct)

▶ TO THE SKIN

▶ Adult: Apply 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

#### POWERGEL®

#### Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

▶ TO THE SKIN

▶ Adult: Apply 2–3 times a day for up to max. 10 days

### ● CONTRA-INDICATIONS

▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · severe heart failure

### ● CAUTIONS

▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

● **INTERACTIONS** → Appendix 1 (NSAIDs).

▶ With topical use Interactions do not generally apply to topical NSAIDs.

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

Photosensitivity

#### SPECIFIC SIDE-EFFECTS

▶ Rare

▶ With systemic use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus

erythematous may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

▶ **Frequency not known**

- ▶ With rectal use Suppositories may cause rectal irritation
- ▶ With systemic use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- ▶ With topical use Rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- ▶ With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● **CONCEPTION AND CONTRACEPTION**

- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● **PREGNANCY**

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

● **BREAST FEEDING**

- ▶ With systemic use Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● **HEPATIC IMPAIRMENT**

- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

● **RENAL IMPAIRMENT**

- ▶ With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations apply with gentle massage only.

● **PRESCRIBING AND DISPENSING INFORMATION**

Caution—topical preparations not generally suitable for children.

Flavours of oral liquid formulations may include strawberry.

● **PATIENT AND CARER ADVICE**

- ▶ With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity

- ▶ With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

- **EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release capsule**

## Ketoprofen with omeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, ketoprofen p. 1002, omeprazole p. 76.

● **INDICATIONS AND DOSE**

**Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID associated duodenal or gastric ulcer or gastroduodenal erosions**

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- ▶ Adult: Initially 100/20 mg daily, increased if necessary to 200/20 mg daily, depending on severity of symptoms, dose expressed as x/y mg ketoprofen/omeprazole

- **PRESCRIBING AND DISPENSING INFORMATION** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

EXCIPIENTS: May contain Propylene glycol

- ▶ **Axorid** (Meda Pharmaceuticals Ltd)

**Omeprazole 20 mg, Ketoprofen 100 mg** Axorid 100mg/20mg modified-release capsules | 30 capsule [PoM] £13.80

**Omeprazole 20 mg, Ketoprofen 200 mg** Axorid 200mg/20mg modified-release capsules | 30 capsule [PoM] £13.80

## Mefenamic acid

### INDICATIONS AND DOSE

**Pain and inflammation in rheumatoid arthritis and osteoarthritis | Postoperative pain | Mild to moderate pain**

- ▶ BY MOUTH

▶ Adult: 500 mg 3 times a day

**Acute pain including dysmenorrhoea | Menorrhagia**

- ▶ BY MOUTH

▶ Child 12-17 years: 500 mg 3 times a day

▶ Adult: 500 mg 3 times a day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · inflammatory bowel disease · severe heart failure
- **CAUTIONS** Acute porphyrias p. 930 · allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea (withdraw treatment) · rashes (withdraw treatment) · stomatitis
  - ▶ **Uncommon** Fatigue · paraesthesia
  - ▶ **Rare** Alveolitis · aplastic anaemia · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · glucose intolerance · haemolytic anaemia (positive Coombs' test) · hepatic damage · hypotension · interstitial fibrosis associated with NSAIDs can lead to renal failure · palpitation · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
  - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · renal failure

(especially in patients with pre-existing renal impairment) · tinnitus · vertigo

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

#### Overdose

Mefenamic acid has important consequences in overdose because it can cause convulsions, which if prolonged or recurrent, require treatment.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1204, in particular, Convulsions.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## Meloxicam

### INDICATIONS AND DOSE

**Exacerbation of osteoarthritis (short-term)**

- ▶ BY MOUTH

▶ Child 16-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

▶ Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

**Pain and inflammation in rheumatic disease | Ankylosing spondylitis**

## ▶ BY MOUTH

- ▶ Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
- ▶ Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
- ▶ Elderly: 7.5 mg once daily

**Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs**

## ▶ BY MOUTH

- ▶ Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily
- ▶ Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

- **UNLICENSED USE** Not licensed for use in children under 16 years.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).

● **SIDE-EFFECTS**

- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

**Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg** Naproxen 500mg / Esomeprazole 20mg modified-release tablets | 60 tablet [PoM] no price available DT price = £14.95

##### ▶ Vimovo (AstraZeneca UK Ltd)

**Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg** Vimovo 500mg/20mg modified-release tablets | 60 tablet [PoM] £14.95 DT price = £14.95

## Naproxen with misoprostol

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1006, misoprostol p. 73.

#### ● INDICATIONS AND DOSE

**Patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration**

##### ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily, naproxen and 200 micrograms twice daily, misoprostol, taken together with food

- **PRESCRIBING AND DISPENSING INFORMATION** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the misoprostol with naproxen combination pack.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ Napratec (Pfizer Ltd)

Napratec OP tablets | 112 tablet [PoM] £23.76 DT price = £23.76

## Piroxicam

#### ● INDICATIONS AND DOSE

**Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)**

##### ▶ BY MOUTH

- ▶ Adult: Up to 20 mg once daily

**Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

##### ▶ TO THE SKIN

- ▶ Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

#### IMPORTANT SAFETY INFORMATION

##### CHMP ADVICE – PIROXICAM (JUNE 2007)

##### ▶ With systemic use

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily

- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
  - treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
  - concomitant administration of a gastro-protective agent should be considered.
- Topical preparations containing piroxicam are not affected by these restrictions.

#### ● CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

#### ● CAUTIONS

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

#### ● INTERACTIONS → Appendix 1 (NSAIDs).

- ▶ With topical use Interactions do not generally apply to topical NSAIDs.

#### ● SIDE-EFFECTS

##### ▶ Rare

- ▶ With systemic use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ Frequency not known

- ▶ With systemic use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- ▶ With topical use Photosensitivity · rash (discontinue use if develops)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- ▶ With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

#### ● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

#### ● PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

#### ● BREAST FEEDING

- ▶ With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

#### ● HEPATIC IMPAIRMENT

- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

#### ● RENAL IMPAIRMENT

- ▶ With systemic use Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.

#### ● DIRECTIONS FOR ADMINISTRATION

Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. For topical preparations apply with gentle massage only.

#### ● PATIENT AND CARER ADVICE

- ▶ With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity For topical preparations, patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

#### ● LESS SUITABLE FOR PRESCRIBING

- ▶ With oral use Piroxicam is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Sulindac

### ● INDICATIONS AND DOSE

#### Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Acute gout

##### ► BY MOUTH

- Adult: 200 mg twice daily for maximum duration 7–10 days in peri-articular disorders, dose may be reduced according to response; acute gout should respond within 7 days; maximum 400 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · ensure adequate hydration · heart failure · history of renal stones · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).

### ● SIDE-EFFECTS

- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Frequency not known** Angioedema · blood disorders · bronchospasm · cholestasis · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hepatic failure · hepatitis · hypersensitivity reactions · insomnia · jaundice with fever · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · urine discoloration · vertigo

### SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## Tiaprofenic acid

### ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders**

#### ▶ BY MOUTH

▶ Adult: 300 mg twice daily

### IMPORTANT SAFETY INFORMATION

#### CSM ADVICE

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they

● **RENAL IMPAIRMENT** Reduce dose in mild or moderate impairment. The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## 5 Soft tissue and joint disorders

### 5.1 Local inflammation of joints and soft tissue

**Other drugs used for local inflammation of joints and soft tissue** Betamethasone p. 618

#### CORTICOSTEROIDS

### Corticosteroids, inflammatory disorders

#### Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment.

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone p. 1012 up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone p. 1012 may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone p. 623 is also available for the treatment of moderate to severe rheumatoid arthritis.

*Polymyalgia rheumatica* and *giant cell (temporal) arteritis* are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be

necessary to continue long-term low-dose corticosteroid treatment.

*Polyarteritis nodosa* and *polymyositis* are usually treated with corticosteroids.

*Systemic lupus erythematosus* is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 569 or hydroxychloroquine sulfate p. 962, should be considered.

*Ankylosing spondylitis* should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

#### Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate p. 1012 or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

### Dexamethasone

616

06-Jun-2016

● **INDICATIONS AND DOSE**

**Local inflammation of joints**

▶ BY INTRA-ARTICULAR INJECTION

▶ Adult: 0.3–3.3 mg, where appropriate, dose may be repeated at intervals of 3–21 days according to response, dose given according to size—consult product literature

**Local inflammation of soft tissues**

▶ BY LOCAL INFILTRATION

▶ Adult: 1.7–5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3–21 days, use the 3.3 mg/mL injection preparation for this dose

● **PREGNANCY** Dexamethasone readily crosses the placenta.

● **PRESCRIBING AND DISPENSING INFORMATION**

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular,

intra-articular use or local infiltration are given in units of dexamethasone base.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

Depo-Medrone 120mg/3ml suspension for injection vials | 1 vial [PoM] £8.96 DT price = £8.96 | 10 vial [PoM] £88.81

## Methylprednisolone with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, methylprednisolone above, lidocaine hydrochloride p. 97.

### INDICATIONS AND DOSE

#### Local inflammation of joints

##### ▶ BY INTRA-ARTICULAR INJECTION

▶ Adult: 4–80 mg, dose adjusted according to size; where appropriate may be repeated at intervals of 7–35 days, for details consult product literature

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

##### ▶ Depo-Medrone with Lidocaine (Pfizer Ltd)

**Lidocaine hydrochloride 10 mg per 1 ml, Methylprednisolone acetate 40 mg per 1 ml** Depo-Medrone with Lidocaine suspension for injection 2ml vials | 1 vial [PoM] £7.06 DT price = £7.06 | 10 vial [PoM] £70.13

Depo-Medrone with Lidocaine suspension for injection 1ml vials | 1 vial [PoM] £3.94 DT price = £3.94 | 10 vial [PoM] £38.88

## Prednisolone

### INDICATIONS AND DOSE

#### DELTA STAB®

#### Local inflammation of joints

##### ▶ BY INTRA-ARTICULAR INJECTION

▶ Adult: 5–25 mg, dose according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs, for details consult product literature

### PREGNANCY

As it crosses the placenta 88% of prednisolone is inactivated.

### BREAST FEEDING

Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

##### ▶ Deltastab (AMCo)

**Prednisolone acetate 25 mg per 1 ml** Deltastab 25mg/1ml suspension for injection ampoules | 10 ampoule [PoM] £68.72

## Triamcinolone acetonide

### INDICATIONS AND DOSE

#### ADCORTYL® INTRA-ARTICULAR/INTRADERMAL

#### Local inflammation of joints and soft tissues

##### ▶ BY INTRA-ARTICULAR INJECTION

▶ Adult: 2.5–15 mg, adjusted according to size (for larger doses use *Kenalog*®). Where appropriate dose may be repeated when relapse occurs, for details consult product literature.

##### ▶ BY INTRADERMAL INJECTION

▶ Adult: 2–3 mg, max. 5 mg at any one site (total max. 30 mg). Where appropriate may be repeated at intervals of 1–2 weeks, for details consult product literature

#### KENALOG® VIALS

#### Local inflammation of joints and soft tissues

##### ▶ BY INTRA-ARTICULAR INJECTION

▶ Adult: 5–40 mg (max. per dose 80 mg), for further details consult product literature, select dose according

F 616

**Triamcinolone acetone 40 mg per 1 ml** Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial [PoM](#) £7.45 DT price = £7.45

⚡ 616

## Triamcinolone hexacetonide

#### ● INDICATIONS AND DOSE

**Local inflammation of joints and soft-tissues (for details, consult product literature)**

▶ BY INTRA-ARTICULAR INJECTION

- ▶ **Adult:** 2–20 mg, adjusted according to size of joint, no more than 2 joints should be treated on any one day, where appropriate, may be repeated at intervals of 3–4 weeks

▶ BY PERI-ARTICULAR INJECTION

- ▶ **Adult:** 10–20 mg, adjusted according to size of joint, no more than 2 joints should be treated on any one day

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **SIDE-EFFECTS** Consult product literature
- **PRESCRIBING AND DISPENSING INFORMATION** Various strengths available from 'special order' manufacturers or specialist importing companies.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Triamcinolone hexacetonide (Non-proprietary)**  
**Triamcinolone hexacetonide 20 mg per 1 ml** Triamcinolone hexacetonide 20mg/1ml suspension for injection ampoules | 10 ampoule [PoM](#) £120.00

## 5.2 Soft tissue disorders

### Soft-tissue disorders

#### Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition,

certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

#### Prevention of extravasation

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch p. 207 distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

#### Management of extravasation

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

**Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 1012 or dexamethasone p. 1011 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

**Antihistamines** and **analgesics** may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. 1014. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dexrazoxane p. 837 is licensed for the treatment of anthracycline-induced extravasation.

#### Enzymes

##### Collagenase

Collagenase p. 1014 are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren's contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

##### Hyaluronidase

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

## Rubefacients, topical NSAIDs, capsaicin, and poultices

**Rubefacients** act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotine and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

### Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac p. 997, ibuprofen p. 999, ketoprofen p. 1002, and piroxicam p. 1007) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

### Capsaicin

A preparation containing capsaicin 0.025% p. 446 can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

## ENZYMES

### Collagenase

#### ● INDICATIONS AND DOSE

##### Dupuytren's contracture in patients with a palpable cord

- ▶ BY INTRALESIONAL INJECTION
- ▶ Adult: 580 micrograms, then 580 micrograms every 4 weeks if required, inject into palpable cord, maximum 3 injections per cord, maximum 8 injections in total and only one cord may be treated at a time

- **CONTRA-INDICATIONS** Avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage
- **CAUTIONS** Coagulation disorders · use of anticoagulants
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arthralgia · burning sensation · ecchymosis · hyperhidrosis · hypoaesthesia · injection site reactions · joint swelling · lymphadenopathy · myalgia · paraesthesia
  - ▶ **Uncommon** Complex regional pain syndrome · crepitus · ligament injury · monoplegia · muscle spasm · muscle weakness · tendon rupture · tremor · wound dehiscence
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Systemic absorption by mother negligible.
- **DIRECTIONS FOR ADMINISTRATION** Reconstitution and injected volumes vary with site of injection—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2012) that collagenase *Clostridium histolyticum* (Xiapex<sup>®</sup>) is accepted for restricted use within NHS Scotland as an alternative to limited fasciotomy, for the treatment of Dupuytren's contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciotomy, but for whom percutaneous needle fasciotomy is not considered a suitable treatment option.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder and solvent for solution for injection**

- ▶ **Xiapex** (Swedish Orphan Biovitrum Ltd)  
**Collagenase clostridium histolyticum 900 microgram** Xiapex 0.9mg powder and solvent for solution for injection vials | 1 vial [PoM] £650.00

## Hyaluronidase

#### ● INDICATIONS AND DOSE

##### **Enhance permeation of subcutaneous or intramuscular injections**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

##### **Enhance permeation of local anaesthetics**

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 1500 units, to be mixed with the local anaesthetic solution

##### **Enhance permeation of ophthalmic local anaesthetic**

- ▶ TO THE EYE
- ▶ Adult: 15 units/mL, to be mixed with the local anaesthetic solution

##### **Hypodermoclysis**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid

##### **Extravasation**

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

##### **Haematoma**

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

- **CONTRA-INDICATIONS** Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be used to reduce swelling of bites · not to be used to reduce swelling of stings
- **CAUTIONS** Elderly (control speed and total volume and avoid overhydration especially in renal impairment)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Oedema
  - ▶ **Rare** Bleeding · bruising · infection · local irritation
  - ▶ **Frequency not known** Anaphylaxis · severe allergy

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for injection**

- ▶ **Hyaluronidase (Non-proprietary)**  
**Hyaluronidase 1500 unit** Hyaluronidase 1.500unit powder for solution for injection ampoules | 10 ampoule [PoM] £136.55

## Eye

### Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

### Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

### Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies

as a first-aid treatment. Sterile sodium chloride 0.9% p. 1026 solution is usually used. Clean water will suffice in an emergency.

### Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

### Ophthalmic Specials

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine mesilate, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website ([www.rcophth.ac.uk](http://www.rcophth.ac.uk)). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

### Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

### Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary* use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are

normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

### Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

### Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some

beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 254 and hydralazine hydrochloride p. 171). Other drugs that may affect contact lens wear are isotretinoin p. 1122 (can cause conjunctival inflammation), aspirin p. 114 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 535 and sulfasalazine p. 39 (can discolour lenses).

## 1 Allergic and inflammatory eye conditions

### Eye, allergy and inflammation

#### Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

*Topical corticosteroids* are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

*Systemic corticosteroids* may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

#### Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 1019 (*Ozurdex*<sup>®</sup>) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 1048 (*Iluvien*<sup>®</sup>) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

#### Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1018, and sodium cromoglicate p. 1018.

Eye drops containing antihistamines, such as **antazoline** (with xylometazoline hydrochloride p. 1057 as *Otrivine-Antistin*<sup>®</sup>), azelastine hydrochloride p. 1017, epinastine hydrochloride p. 1017, ketotifen p. 1017, and olopatadine p. 1018, can be used for allergic conjunctivitis.

Sodium cromoglicate (sodium cromoglycate) and nedocromil sodium p. 1018 eye drops can be useful for vernal

keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac sodium eye drops p. 1034 and emedastine eye drops below are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

Ciclosporin p. 1022 is licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

## 1.1 Allergic conjunctivitis

### ANTIHISTAMINES

#### Antazoline with xylometazoline

##### ● INDICATIONS AND DOSE

###### Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply 2-3 times a day for maximum 7 days
- ▶ Adult: Apply 2-3 times a day for maximum 7 days

● **CAUTIONS** Angle-closure glaucoma · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · phaeochromocytoma · urinary retention

● **INTERACTIONS** → Appendix 1 (antihistamines and sympathomimetics).  
Absorption of antazoline and xylometazoline may result in the possibility of interaction with other drugs.

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Transient stinging
- ▶ **Frequency not known** Blurred vision · eye irritation · mydriasis

##### SIDE-EFFECTS, FURTHER INFORMATION

Absorption of antazoline and xylometazoline may result in systemic side-effects.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- ▶ **Otrivine Antistin** (Thea Pharmaceuticals Ltd)  
Antazoline sulfate 5 mg per 1 ml, Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Antistin 0.5%/0.05% eye drops | 10 ml [P] £3.35 DT price = £3.35

#### Azelastine hydrochloride

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day

###### Perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- ▶ Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

##### ● SIDE-EFFECTS

- ▶ **Frequency not known** Bitter taste · mild transient irritation

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- ▶ **Optilast** (Meda Pharmaceuticals Ltd)  
Azelastine hydrochloride 500 microgram per 1 ml Optilast 0.05% eye drops | 8 ml [POM] £6.40 DT price = £6.40

#### Emedastine

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3-17 years: Apply twice daily
- ▶ Adult: Apply twice daily

● **SIDE-EFFECTS** Blurred vision · corneal infiltrates (discontinue) · corneal staining · dry eye · headache · irritation · keratitis · lacrimation · local oedema · photophobia · rhinitis · transient burning · transient stinging

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride
- ▶ **Emedastine** (Alcon Laboratories (UK) Ltd)  
Emedastine (as Emedastine difumarate) 500 microgram per 1 ml Emedastine 0.5mg/ml eye drops | 5 ml [POM] £7.31 DT price = £7.31

#### Epinephrine hydrochloride

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply twice daily for maximum 8 weeks
- ▶ Adult: Apply twice daily for maximum 8 weeks

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Burning
- ▶ **Uncommon** Conjunctival hyperaemia · dry eye · eye pain · eye pruritus · headache · increased lacrimation · nasal irritation · rhinitis · taste disturbance · visual disturbance

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- ▶ **Relestat** (Allergan Ltd)  
Epinephrine hydrochloride 500 microgram per 1 ml Relestat 500micrograms/ml eye drops | 5 ml [POM] £9.90 DT price = £9.90

#### Ketotifen

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3-17 years: Apply twice daily
- ▶ Adult: Apply twice daily

● **INTERACTIONS** Interactions do not generally apply to antihistamines used for topical action.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Punctate corneal epithelial erosion · transient burning · transient stinging
- ▶ **Uncommon** Dry eye · photophobia · subconjunctival haemorrhage
- ▶ **Frequency not known** Drowsiness · dry mouth · headache · skin reactions

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Zaditen** (Thea Pharmaceuticals Ltd)

**Ketotifen (as Ketotifen fumarate) 250 microgram per**

1 ml Zaditen 250micrograms/ml eye drops | 5 ml [PoM] £7.80 DT price = £7.80

## Olopatadine

### ● INDICATIONS AND DOSE

#### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3-17 years: Apply twice daily for maximum 4 months
- ▶ Adult: Apply twice daily for maximum 4 months

### ● SIDE-EFFECTS

- ▶ **Common or very common** Local irritation
- ▶ **Uncommon** Asthenia · dizziness · dry eye · headache · keratitis · local oedema · photophobia
- ▶ **Frequency not known** Dry nose

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Opatanol** (Alcon Laboratories (UK) Ltd)

**Olopatadine (as Olopatadine hydrochloride) 1 mg per**

1 ml Opatanol 1mg/ml eye drops | 5 ml [PoM] £4.68 DT price = £4.68

## MAST-CELL STABILISERS

## Lodoxamide

### ● INDICATIONS AND DOSE

#### Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4-17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
- ▶ Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

### ● SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · burning · itching · ocular discomfort · stinging · tear production disturbance
- ▶ **Uncommon** Blepharitis · dizziness · drowsiness · flushing · headache · keratitis · nasal dryness
- ▶ **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Alomide** (Alcon Laboratories (UK) Ltd)

**Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml** Alomide

0.1% eye drops | 10 ml [PoM] £5.21 DT price = £5.21

Alomide Allergy 0.1% eye drops | 5 ml [P] £3.12

## Nedocromil sodium

### ● INDICATIONS AND DOSE

#### Seasonal and perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 6-17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

#### Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child 6-17 years: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

- **SIDE-EFFECTS** Distinctive taste · transient burning · transient stinging

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rapitil** (Sanofi)

**Nedocromil sodium 20 mg per 1 ml** Rapitil 2% eye drops | 5 ml [PoM] £2.86 DT price = £2.86

## Sodium cromoglicate

### (Sodium cromoglycate)

### ● INDICATIONS AND DOSE

#### Allergic conjunctivitis | Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

- **SIDE-EFFECTS** Transient burning · transient stinging

- **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

- ▶ **Sodium cromoglicate (Non-proprietary)**

**Sodium cromoglicate 20 mg per 1 ml** Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £8.03 DT price = £1.72

- ▶ **Catacrom** (Moorfields Pharmaceuticals)

**Sodium cromoglicate 20 mg per 1 ml** Catacrom 2% eye drops 0.3ml unit dose | 30 unit dose [P] £8.99 DT price = £8.99

- ▶ **Cromolux** (Tubilux Pharma Ltd)

**Sodium cromoglicate 20 mg per 1 ml** Cromolux 2% eye drops | 13.5 ml [PoM] £3.20 DT price = £1.72

- ▶ **Opticrom** (Sanofi)

**Sodium cromoglicate 20 mg per 1 ml** Opticrom Allergy 2% eye drops | 5 ml [P] £2.74 | 10 ml [P] £3.35  
Opticrom Aqueous 2% eye drops | 13.5 ml [PoM] £8.03 DT price = £1.72

- ▶ **Optrex Allergy** (Reckitt Benckiser Healthcare (UK) Ltd)

**Sodium cromoglicate 20 mg per 1 ml** Optrex Allergy 2% eye drops | 10 ml [P] £3.88

- ▶ **Pollenase (sodium cromoglicate)** (E M Pharma)

**Sodium cromoglicate 20 mg per 1 ml** Pollenase Allergy 2% eye drops | 10 ml [P] £2.08

- ▶ **Vividrin** (Bausch & Lomb UK Ltd)

**Sodium cromoglicate 20 mg per 1 ml** Vividrin 2% eye drops | 13.5 ml [PoM] £10.95 DT price = £1.72

## 1.2 Inflammatory eye conditions

### ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

#### Nepafenac

##### ● INDICATIONS AND DOSE

- Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery | Reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients**
- ▶ TO THE EYE
  - ▶ Adult: (consult product literature)

- **CAUTIONS** Avoid sunlight · corneal epithelial breakdown (if evidence of, then discontinue immediately)

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Punctate keratitis
- ▶ **Uncommon** Allergic conjunctivitis · blurred vision · choroidal effusion · conjunctival hyperaemia · corneal deposits · corneal epithelium defect · dry eye · eye pruritus · headache · increased lacrimation · iritis · keratitis · nausea · ocular discomfort · photophobia
- ▶ **Frequency not known** Corneal opacity · dermatochalasis · dizziness · eye swelling · impaired corneal healing · reduced visual acuity

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Nevanac** (Alcon Laboratories (UK) Ltd)  
Nepafenac 1 mg per 1 ml Nevanac 1mg/ml eye drops | 5 ml [PoM]  
£14.92

### CORTICOSTEROIDS

#### Betamethasone

##### ● INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency
- ▶ Adult: Apply every 1–2 hours until controlled then reduce frequency
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops
- ▶ Adult: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **SIDE-EFFECTS** Corneal thinning · scleral thinning

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betamethasone (Non-proprietary)**  
Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] no price available
- ▶ **Betnesol** (Focus Pharmaceuticals Ltd)  
Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT price = £2.32
- ▶ **Vistamethasone** (Martindale Pharmaceuticals Ltd)  
Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £0.87 | 10 ml [PoM] £0.99 DT price = £2.32

#### Eye ointment

- ▶ **Betnesol** (Focus Pharmaceuticals Ltd)  
Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram [PoM] £1.41 DT price = £1.41

Combinations available: **Betamethasone with neomycin**, p. 1021

#### Dexamethasone

06-Jun-2016

##### ● INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply 4–6 times a day
- ▶ Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

##### Short term local treatment of inflammation (severe conditions)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

**Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only) | Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)**

##### ▶ BY INTRAVITREAL INJECTION

- ▶ Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pre-treatment, administration and repeat dosing, consult product literature

- **UNLICENSED USE** *Maxidex*® not licensed for use in children under 2 years. *Dropodex*® not licensed for use in children.
- **CONTRA-INDICATIONS**
  - ▶ With intravitreal use Active ocular herpes simplex · active or suspected ocular infection · active or suspected periorcular infection · rupture of the posterior lens capsule in patients with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens · uncontrolled advanced glaucoma
- **CAUTIONS**
  - ▶ With intravitreal use History of ocular viral infection (including herpes simplex) · posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) · retinal vein occlusion with significant retinal ischaemia
- **INTERACTIONS**
  - ▶ With intravitreal use Caution with concomitant administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.
- **SIDE-EFFECTS**
  - ▶ **Uncommon**
  - ▶ With intravitreal use Eyelid pruritus · glaucoma · migraine · necrotising retinitis
  - ▶ **Frequency not known**
  - ▶ When used by eye Corneal thinning · scleral thinning
  - ▶ With intravitreal use Blepharitis · cataract · headache · ocular hypertension · raised intra-ocular pressure · secondary ocular infection · visual disturbance
- **PREGNANCY** Dexamethasone readily crosses the placenta.
  - ▶ With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

### ● BREAST FEEDING

- With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

### ● MONITORING REQUIREMENTS

- With intravitreal use Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

### ● PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose Dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011)** NICE TA229

Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion. Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

- treatment with laser photocoagulation has not been beneficial, or
- treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage.

[www.nice.org.uk/TA229](http://www.nice.org.uk/TA229)

- ▶ **Dexamethasone intravitreal implant for treating diabetic macular oedema (July 2015)** NICE TA349

Dexamethasone intravitreal implant is recommended as an option for treating diabetic macular oedema only if:

- the implant is to be used in an eye with an intraocular (pseudophakic) lens **and**
- the diabetic macular oedema does not respond to non-corticosteroid treatment, or such treatment is unsuitable.

[www.nice.org.uk/TA349](http://www.nice.org.uk/TA349)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2012) that dexamethasone intravitreal implant (*Ozurdex*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

#### ▶ **Dexamethasone (Non-proprietary)**

**Dexamethasone sodium phosphate 1 mg per 1 ml** Dexamethasone 0.1% eye drops 0.4ml unit dose preservative free | 20 unit dose [PoM] £9.75 DT price = £9.75

#### ▶ **Dexafree** (Thea Pharmaceuticals Ltd)

**Dexamethasone sodium phosphate 1 mg per 1 ml** Dexafree 1mg/1ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.70

#### ▶ **Dropdex** (Moorfields Pharmaceuticals)

**Dexamethasone sodium phosphate 1 mg per 1 ml** Dropdex 0.1% eye drops 0.4ml unit dose | 20 unit dose [PoM] £9.75 DT price = £9.75

#### ▶ **Maxidex** (Alcon Laboratories (UK) Ltd)

**Dexamethasone 1 mg per 1 ml** Maxidex 0.1% eye drops | 5 ml [PoM] £1.42 DT price = £1.42 | 10 ml [PoM] £2.80 DT price = £2.80

### Implant

#### ▶ **Ozurdex** (Allergan Ltd)

**Dexamethasone 700 microgram** Ozurdex 700microgram intravitreal implant in applicator | 1 device [PoM] £870.00 (Hospital only)

Combinations available: **Dexamethasone with framycetin sulfate and gramicidin**, p. 1021 • **Dexamethasone with hypromellose, neomycin and polymyxin B sulfate**, p. 1021 • **Dexamethasone with tobramycin**, p. 1022

## Fluorometholone

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short term)

##### ▶ TO THE EYE

- ▶ Child 2-17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day
- ▶ Adult: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

- **SIDE-EFFECTS** Corneal thinning • scleral thinning

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

#### ▶ **FML Liquifilm** (Allergan Ltd)

**Fluorometholone 1 mg per 1 ml** FML Liquifilm 0.1% ophthalmic suspension | 5 ml [PoM] £1.71 DT price = £1.71 | 10 ml [PoM] £2.95 DT price = £2.95

## Prednisolone

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short-term)

##### ▶ TO THE EYE

- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency
- ▶ Adult: Apply every 1–2 hours until controlled then reduce frequency

- **UNLICENSED USE** *Pred Forte*<sup>®</sup> not licensed for use in children (age range not specified by manufacturer).

- **SIDE-EFFECTS** Corneal thinning • scleral thinning

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose prednisolone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

**Prednisolone sodium phosphate 300 microgram per 1 ml** Prednisolone sodium phosphate 0.03% eye drops preservative free | 10 ml [PoM] £33.17 DT price = £33.17

▶ **Pred Forte** (Allergan Ltd)

**Prednisolone acetate 10 mg per 1 ml** Pred Forte 1% eye drops | 5 ml [PoM] £1.82 DT price = £1.82 | 10 ml [PoM] £3.66 DT price = £3.66

## Rimexolone

### ● INDICATIONS AND DOSE

#### Local treatment of postoperative inflammation (short term use)

▶ TO THE EYE

- ▶ Adult: Apply 4 times a day for 2 weeks, treatment to begin 24 hours after surgery

#### Local treatment of steroid-responsive inflammation (short term use)

▶ TO THE EYE

- ▶ Adult: Apply in at least 4 times a day divided doses for up to 4 weeks

#### Uveitis (short term use)

▶ TO THE EYE

- ▶ Adult: Apply every 1 hour during the day time for week 1, then apply every 2 hours for week 2, then apply 4 times a day for week 3, then apply twice daily for the first 4 days of week 4, then apply once daily for the remaining 3 days of week 4

### ● SIDE-EFFECTS Corneal thinning · scleral thinning

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

## Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1019.

### ● INDICATIONS AND DOSE

#### Local treatment of eye inflammation and bacterial infection (short-term)

▶ TO THE EYE USING EYE DROP

- ▶ Adult: Apply up to 6 times a day

### ● LESS SUITABLE FOR PRESCRIBING

Betamethasone with neomycin eye-drops are less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ **Betnesol-N** (Focus Pharmaceuticals Ltd)

**Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml** Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT price = £2.39

## Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1019.

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short-term)

▶ TO THE EYE

- ▶ Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
- ▶ Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

### ● LESS SUITABLE FOR PRESCRIBING

*Sofradex*<sup>®</sup> is less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

▶ **Sofradex** (Sanofi)

**Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml, Gramicidin 50 microgram per 1 ml** Sofradex ear/eye drops | 10 ml [PoM] £7.50

## Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1019.

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short-term)

▶ TO THE EYE USING EYE DROP

- ▶ Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

#### Local treatment of inflammation (short-term)

▶ TO THE EYE USING EYE OINTMENT

- ▶ Adult: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

### ● LESS SUITABLE FOR PRESCRIBING

Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ **Maxitrol** (Alcon Laboratories (UK) Ltd)

**Dexamethasone 1 mg per 1 ml, Neomycin (as Neomycin sulfate) 3.5 mg per 1 ml, Hypromellose 5 mg per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml** Maxitrol eye drops | 5 ml [PoM] £1.68

#### Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin

▶ **Maxitrol** (Alcon Laboratories (UK) Ltd)

**Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram** Maxitrol eye ointment | 3.5 gram [PoM] £1.44

## Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1019

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short-term)

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with tobramycin eye-drops are less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Tobradex** (Alcon Laboratories (UK) Ltd)

**Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per 1 ml** Tobradex 3mg/ml / 1mg/ml eye drops | 5 ml [PoM] £5.37 DT price = £5.37

## IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

### Ciclosporin

01-Sep-2016

#### (Cyclosporin)

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

### ● INDICATIONS AND DOSE

#### Severe keratitis in dry eye disease that has not responded to treatment with tear substitutes (initiated by a specialist)

- ▶ TO THE EYE
- ▶ Adult: Apply 1 drop once daily, to be applied to the affected eye(s) at bedtime, review treatment at least every 6 months

- **CONTRA-INDICATIONS** Active or suspected ocular or peri-ocular infection
- **CAUTIONS** Glaucoma—limited information available - history of ocular herpes—no information available
- **SIDE-EFFECTS**
  - ▶ Common or very common Blurred vision · instillation site pain · local erythema · local irritation · local oedema · local pain · ocular hyperaemia
  - ▶ Uncommon Bacterial keratitis · blepharitis · chalazion · conjunctivitis · corneal decompensation · corneal infiltrates · corneal scar · eye discharge · herpes zoster (ophthalmic) · iridocyclitis · keratitis · local pruritus
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—limited information.
- **DIRECTIONS FOR ADMINISTRATION** Keep eyes closed for 2 minutes after using *Ikervis*<sup>®</sup> eye drops, to increase local drug action and reduce systemic absorption.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Ciclosporin for treating dry eye disease that has not improved despite treatment with artificial tears (December 2015)** NICE TA369  
Ciclosporin (*Ikervis*<sup>®</sup>) is recommended as an option for treating dry eye disease that has not improved despite treatment with tear substitutes.

## Homatropine hydrobromide

### ● INDICATIONS AND DOSE

#### Anterior uveitis

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

## 2 Dry eye conditions

### Dry eye

#### Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome) often responds to tear replacement therapy or pilocarpine p. 1062 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

Hypromellose p. 1024 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 1025 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 1026 are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 1026 are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride 5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

## OCULAR LUBRICANTS

### Acetylcysteine

#### ● INDICATIONS AND DOSE

##### Tear deficiency | Impaired or abnormal mucus production

- ▶ TO THE EYE
- ▶ Adult: Apply 3–4 times a day

### ● MEDICINAL FORMS

## 3 Eye infections

### Eye, infections of

#### Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

*Corneal ulcer* and *keratitis* require specialist treatment and may call for hospital admission for intensive therapy.

*Endophthalmitis* is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

#### Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 1030 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 1028, levofloxacin p. 1029, moxifloxacin p. 1029, and ofloxacin p. 1029; the aminoglycosides, gentamicin p. 1028 and tobramycin p. 1028 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 1028 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with

*Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

**Fusidic acid** is useful for staphylococcal infections.

Propamide isetionate p. 1030 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Cefuroxime p. 1028 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

#### With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

#### Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

#### Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or [www.moorfields.nhs.uk](http://www.moorfields.nhs.uk).

#### Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 1031 or ganciclovir p. 1031. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.

## 3.1 Bacterial eye infection

### ANTIBACTERIALS > AMINOGLYCOSIDES

#### Gentamicin

##### ● INDICATIONS AND DOSE

###### Bacterial eye infections

- ▶ TO THE EYE
- ▶ Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient
- ▶ Adult: Apply 1 drop at least every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

###### Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

###### ▶ Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] no price available DT price = £2.27  
Gentamicin 0.3% eye/ear drops | 10 ml [PoM] £2.13-£2.27 DT price = £2.27

#### Tobramycin

30-Nov-2016

##### ● INDICATIONS AND DOSE

###### Local treatment of infections

- ▶ TO THE EYE
- ▶ Child 1-17 years: Apply twice daily for 6–8 days
- ▶ Adult: Apply twice daily for 6–8 days

###### Local treatment of infections (severe infection)

- ▶ TO THE EYE
- ▶ Child 1-17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days
- ▶ Adult: Apply 4 times a day for first day, then apply twice daily for 5–7 days

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

EXCIPIENTS: May contain Benzodocinium bromide

###### ▶ Tobravisc (Alcon Laboratories (UK) Ltd)

Tobramycin 3 mg per 1 ml Tobravisc 3mg/ml eye drops | 5 ml [PoM] £4.74

### ANTIBACTERIALS > CEPHALOSPORINS, SECOND-GENERATION

#### Cefuroxime

##### ● INDICATIONS AND DOSE

###### APROKAM® INTRACAMERAL INJECTION

###### Prophylaxis of endophthalmitis after cataract surgery

- ▶ BY INTRACAMERAL INJECTION
- ▶ Adult: 1 mg, dose to be injected into the anterior chamber of the eye at the end of cataract surgery

- **CAUTIONS** Combined operations with cataract surgery · complicated cataracts · reduced corneal endothelial cells (less than 2000) · severe risk of infection · severe thyroid disease
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Powder for solution for injections

- ▶ Aproxam (Thea Pharmaceuticals Ltd)  
Cefuroxime sodium 50 mg Aproxam powder for solution for injection | 10 vial [PoM] £49.95

### ANTIBACTERIALS > MACROLIDES

#### Azithromycin

##### ● INDICATIONS AND DOSE

###### Trachomatous conjunctivitis caused by *Chlamydia trachomatis* | Purulent bacterial conjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment
- ▶ Adult: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · ocular burning · ocular discomfort · ocular pruritus
- ▶ **Uncommon** Conjunctival hyperaemia · eyelid eczema · eyelid erythema · eyelid oedema · keratitis

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

▶ Azyter (Thea Pharmaceuticals Ltd)

Azithromycin dihydrate 15 mg per 1 gram Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose [PoM] £6.99 DT price = £6.99

### ANTIBACTERIALS > QUINOLONES

#### Ciprofloxacin

##### ● INDICATIONS AND DOSE

###### Superficial bacterial eye infection

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply 4 times a day for maximum duration of treatment 21 days
- ▶ Adult: Apply 4 times a day for maximum duration of treatment 21 days
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child 1-17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
- ▶ Adult: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

**Superficial bacterial eye infection (severe infection)**

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
- ▶ Adult: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

**Corneal ulcer**

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- ▶ Adult: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child 1–17 years: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night
- ▶ Adult: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

**● SIDE-EFFECTS**

- ▶ **Common or very common** Corneal deposits (reversible after completion of treatment) · ocular discomfort · ocular hyperaemia · taste disturbance
- ▶ **Uncommon** Increased lacrimation · blurred vision · conjunctival hyperaemia · corneal infiltrates · corneal staining · eye dryness · eye irritation · eye pain · eye pruritus · eye swelling · eyelid disorders · eyelid erythema · eyelid exfoliation · eyelid oedema · headache · keratopathy · nausea · photophobia
- ▶ **Rare** Abdominal pain · asthenopia · corneal disorders · corneal epithelium defect · dermatitis · diarrhoea · diplopia · dizziness · ear pain · eye hypoaesthesia · keratitis · paranasal sinus hypersecretion · rhinitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Ciloxan** (Alcon Laboratories (UK) Ltd)  
Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Ciloxan 0.3% eye drops | 5 ml [PoM] £4.70 DT price = £4.70

**Eye ointment**

- ▶ **Ciloxan** (Alcon Laboratories (UK) Ltd)  
Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 gram Ciloxan 3mg/g eye ointment | 3.5 gram [PoM] £5.22

**Levofloxacin****● INDICATIONS AND DOSE****Local treatment of eye infections**

- ▶ TO THE EYE
- ▶ Child 1–17 years: Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days

- ▶ Adult: Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days

**● SIDE-EFFECTS**

- ▶ **Common or very common** Ocular burning · visual disturbances
- ▶ **Uncommon** Conjunctival follicles · headache · lid erythema · lid oedema · ocular discomfort · ocular dryness · ocular itching · ocular pain · photophobia · rhinitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Levofloxacin (Non-proprietary)**  
Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml Levofloxacin 5mg/ml eye drops | 5 ml [PoM] £6.25
- ▶ **Oftaquix** (Santen UK Ltd)  
Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml Oftaquix 5mg/ml eye drops | 5 ml [PoM] £6.95

**Moxifloxacin****● INDICATIONS AND DOSE****Local treatment of infections**

- ▶ TO THE EYE
- ▶ Child: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days
- ▶ Adult: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days

**● SIDE-EFFECTS**

- ▶ **Common or very common** Hyperaemia · ocular discomfort · ocular dryness · ocular irritation · ocular pain · taste disturbances
- ▶ **Uncommon** Conjunctival haemorrhage · corneal disorders · corneal erosion · corneal keratitis · corneal staining · eyelid erythema · headache · nasal discomfort · paraesthesia · pharyngolaryngeal pain · visual disturbances · vomiting
- ▶ **Frequency not known** Dizziness · dyspnoea · nausea · palpitation · photophobia · pruritus · raised intra-ocular pressure · rash

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- ▶ **Moxivig** (Alcon Laboratories (UK) Ltd)  
Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml Moxivig 0.5% eye drops | 5 ml [PoM] £9.80

**Ofloxacin****● INDICATIONS AND DOSE****Local treatment of infections**

- ▶ TO THE EYE
  - ▶ Child 1–17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment
- continued →

▶ Adult: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

● **CAUTIONS** Corneal ulcer (risk of corneal perforation) · epithelial defect (risk of corneal perforation)

● **SIDE-EFFECTS**

▶ **Common or very common** Eye irritation · ocular discomfort  
▶ **Frequency not known** Dry eyes · facial oedema · increased lacrimation · keratitis · ocular hyperaemia · ocular oedema · photophobia · visual disturbances

● **PREGNANCY** Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in *animal* studies).

● **BREAST FEEDING** Manufacturer advises avoid.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Exocin** (Allergan Ltd)

**Ofloxacin 3 mg per 1 ml** Exocin 0.3% eye drops | 5 ml [PoM] £2.17 DT price = £2.17

**ANTIBACTERIALS > OTHER**

**Chloramphenicol**

● **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● **INDICATIONS AND DOSE**

**Superficial eye infections**

▶ TO THE EYE USING EYE DROP

▶ Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

▶ Adult: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

▶ TO THE EYE USING EYE OINTMENT

▶ Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

▶ Adult: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

● **SIDE-EFFECTS** Transient stinging

● **PREGNANCY** Avoid unless essential—no information on *topical* use but risk of 'neonatal grey-baby syndrome' with *oral* use in third trimester.

● **BREAST FEEDING** Avoid unless essential—*theoretical* risk of bone-marrow toxicity.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Chloramphenicol for eye infections [www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0](http://www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0)

● **EXCEPTIONS TO LEGAL CATEGORY**

Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

EXCIPIENTS: May contain Phenylmercuric acetate

▶ **Chloramphenicol (Non-proprietary)**

**Chloramphenicol 5 mg per 1 ml** Minims chloramphenicol 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.99 DT price = £10.99  
Chloramphenicol 0.5% eye drops | 10 ml [PoM] £2.20 DT price = £1.82

▶ **Brochlor** (Sanofi)

**Chloramphenicol 5 mg per 1 ml** Brochlor 0.5% eye drops | 10 ml [P] £2.83 DT price = £1.82

▶ **Brolene Antibiotic** (Sanofi)

**Chloramphenicol 5 mg per 1 ml** Brolene Antibiotic 0.5% eye drops | 10 ml [P] £3.00 DT price = £1.82

▶ **Chloromycetin** (AMCO)

**Chloramphenicol 5 mg per 1 ml** Chloromycetin Redidrops 0.5% | 10 ml [PoM] £0.90 DT price = £1.82

▶ **Oprex Infected Eyes** (Reckitt Benckiser Healthcare (UK) Ltd)

**Chloramphenicol 5 mg per 1 ml** Oprex Infected Eyes 0.5% eye drops | 10 ml [P] £3.88 DT price = £1.82

**Eye ointment**

▶ **Chloramphenicol (Non-proprietary)**

**Chloramphenicol 10 mg per 1 gram** Chloramphenicol 1% eye ointment | 4 gram [PoM] £2.06 DT price = £1.93

▶ **Brochlor** (Sanofi)

**Chloramphenicol 10 mg per 1 gram** Brochlor 1% eye ointment | 4 gram [P] £2.95 DT price = £1.93

▶ **Chloromycetin** (AMCO)

**Chloramphenicol 10 mg per 1 gram** Chloromycetin 1% eye ointment | 4 gram [PoM] £1.08 DT price = £1.93

▶ **Klorafect** (Blumont Pharma Ltd)

**Chloramphenicol 10 mg per 1 gram** Klorafect 1% eye ointment | 4 gram [PoM] £1.81 DT price = £1.93

▶ **Oprex Infected Eyes** (Reckitt Benckiser Healthcare (UK) Ltd)

**Chloramphenicol 10 mg per 1 gram** Oprex Infected Eyes 1% eye ointment | 4 gram [P] £3.88 DT price = £1.93

**Fusidic acid**

● **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● **INDICATIONS AND DOSE**

**Staphylococcal eye infections**

▶ TO THE EYE

▶ Child: Apply twice daily

▶ Adult: Apply twice daily

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ **Fusidic acid (Non-proprietary)**

**Fusidic acid 10 mg per 1 gram** Fusidic acid 1% modified-release eye drops | 5 gram [PoM] £29.06 DT price = £29.06

**ANTIPROTOZOALS**

**Propamidine isetonate**

● **INDICATIONS AND DOSE**

***Acanthamoeba keratitis* infections (specialist use only) |**

**Local treatment of eye infections**

▶ TO THE EYE USING EYE OINTMENT

▶ Adult: Apply 1–2 times a day

▶ TO THE EYE USING EYE DROP

▶ Adult: Apply up to 4 times a day

● **UNLICENSED USE** Not licensed for *Acanthamoeba keratitis* infections.

● **SIDE-EFFECTS** Eye irritation · eye pain

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Brolene (Propamidine)** (Sanofi)  
Propamidine isetonate 1 mg per 1 ml Brolene 0.1% eye drops | 10 ml [P] £2.80
- ▶ **Golden eye** (Cambridge Healthcare Supplies Ltd)  
Propamidine isetonate 1 mg per 1 ml Golden Eye 0.1% drops | 10 ml [P] £3.26

##### Eye ointment

- ▶ **Brolene (Dibrompropamidine)** (Sanofi)  
Dibrompropamidine isetonate 1.5 mg per 1 gram Brolene 0.15% eye ointment | 5 gram [P] £2.92 DT price = £3.49
- ▶ **Golden eye** (Cambridge Healthcare Supplies Ltd)  
Dibrompropamidine isetonate 1.5 mg per 1 gram Golden Eye 0.15% ointment | 5 gram [P] £3.49 DT price = £3.49

## 3.2 Viral infection

### 3.2a Ophthalmic herpes simplex

#### ANTIVIRALS > NUCLEOSIDE ANALOGUES

### Aciclovir

#### (Acyclovir)

##### INDICATIONS AND DOSE

##### Herpes simplex infection (local treatment)

- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing
- ▶ Adult: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

##### SIDE-EFFECTS

- ▶ **Common or very common** Local inflammation · local irritation · superficial punctate keratopathy
- ▶ **Rare** Blepharitis
- ▶ **Very rare** Angioedema · hypersensitivity reactions

##### PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections [www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection](http://www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection)

##### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye ointment

- ▶ **Zovirax** (GlaxoSmithKline UK Ltd)  
Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram [PoM] £9.34 DT price = £9.34

### Ganciclovir

##### INDICATIONS AND DOSE

##### Local treatment of herpes simplex infections

- ▶ TO THE EYE
- ▶ Adult: Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days

- **SIDE-EFFECTS** Burning sensation · superficial punctate keratitis · tingling

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

##### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye gel

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Virgan** (Thea Pharmaceuticals Ltd)  
Ganciclovir 1.5 mg per 1 gram Virgan 0.15% eye gel | 5 gram [PoM] £19.99 DT price = £19.99

## 4 Eye procedures

### Mydriatics and cycloplegics

#### Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5%, below, (action lasts for 4–6 hours), alter the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride 1% p. 1023 (action up to 24 hours) or atropine sulfate p. 1022 (action up to 7 days).

Phenylephrine hydrochloride p. 1032 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 1023 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

#### Other drugs used for Eye procedures

- Apraclonidine p. 1043
- Lidocaine hydrochloride, p. 97

#### ANTIMUSCARINICS

F 1022

### Tropicamide

##### INDICATIONS AND DOSE

##### Funduscopy

- ▶ TO THE EYE
- ▶ Child: 0.5% eye drops to be applied 20 minutes before examination
- ▶ Adult: (consult product literature)

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

##### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

- ▶ **Mydriacyl** (Alcon Laboratories (UK) Ltd)  
Tropicamide 5 mg per 1 ml Mydriacyl 0.5% eye drops | 5 ml [PoM] £1.29
- ▶ **Tropicamide 10 mg per 1 ml** Mydriacyl 1% eye drops | 5 ml [PoM] £1.60
- ▶ **Tropicamide** (Bausch & Lomb UK Ltd)  
Tropicamide 5 mg per 1 ml Minims tropicamide 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.75
- ▶ **Tropicamide 10 mg per 1 ml** Minims tropicamide 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.77

Combinations available: **Phenylephrine with tropicamide**, p. 1033

## ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

### Povidone-iodine

#### ● INDICATIONS AND DOSE

##### Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

- ▶ TO THE EYE
- ▶ Adult: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

- **CONTRA-INDICATIONS** Concomitant use of ocular antimicrobial drugs - concomitant use of ocular formulations containing mercury-based preservatives

#### ● SIDE-EFFECTS

- ▶ Rare Conjunctival hyperaemia · superficial punctuate keratitis
- ▶ Frequency not known Cytotoxicity on deep tissue · cytotoxicity on mucous membranes · residual yellow coloration of the conjunctiva

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye lotion

##### Eye drops

- ▶ Povidone iodine (Bausch & Lomb UK Ltd)  
Povidone-iodine 50 mg per 1 ml Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose [PoM](#) £16.00

## DIAGNOSTIC AGENTS > DYES

### Fluorescein sodium

#### ● INDICATIONS AND DOSE

##### Detection of lesions and foreign bodies

- ▶ TO THE EYE USING EYE DROP
- ▶ Adult: Use sufficient amount to stain damaged areas

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ Fluorescein sodium (Bausch & Lomb UK Ltd)  
Fluorescein sodium 10 mg per 1 ml Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose [P](#) £8.89
- ▶ Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose [P](#) £8.89

### Fluorescein with lidocaine

#### ● INDICATIONS AND DOSE

##### Local anaesthesia

- ▶ TO THE EYE
- ▶ Adult: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ Lidocaine and Fluorescein (Bausch & Lomb UK Ltd)  
Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose [PoM](#) £11.24

## MIOTICS > PARASYMPATHOMIMETICS

### Acetylcholine chloride

#### ● INDICATIONS AND DOSE

##### Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **CAUTIONS** Asthma · gastro-intestinal spasm · heart failure · hyperthyroidism · parkinsonism · peptic ulcer · urinary-tract obstruction

#### ● SIDE-EFFECTS

- ▶ Rare Bradycardia · breathing difficulty · flushing · hypotension · sweating

- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid unless potential benefit outweighs risk—no information available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Irrigation

- ▶ Miochol-E (Bausch & Lomb UK Ltd)  
Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial [PoM](#) £7.28
- ▶ Miphtel (Alan Pharmaceuticals)  
Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule [PoM](#) £43.68 (Hospital only)

## SYMPATHOMIMETICS > VASOCONSTRICTOR

### Phenylephrine hydrochloride

#### ● INDICATIONS AND DOSE

##### Mydriasis

- ▶ TO THE EYE
- ▶ Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
- ▶ Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS** 10% strength eye drops in children and the elderly · aneurysms · cardiovascular disease · hypertension · thyrotoxicosis

- **CAUTIONS** Asthma · cerebral arteriosclerosis (in adults) · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdose · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber · ocular hyperaemia · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (sympathomimetics). Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.
- **SIDE-EFFECTS** Arrhythmias · blurred vision · conjunctivitis on prolonged administration · coronary artery spasm · extrasystoles · hyperaemia on prolonged administration · hypertension · local irritation on prolonged administration · myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) · oedema on prolonged administration · palpitation · photophobia · raised intraocular pressure · tachycardia · transient stinging
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

##### Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

▶ **Phenylephrine hydrochloride** (Bausch & Lomb UK Ltd)

**Phenylephrine hydrochloride 25 mg per 1 ml** Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose [P] £11.41

**Phenylephrine hydrochloride 100 mg per 1 ml** Minims phenylephrine hydrochloride 10% eye drops 0.5ml unit dose | 20 unit dose [P] £11.41

## Phenylephrine with tropicamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 1032, tropicamide p. 1031.

#### ● INDICATIONS AND DOSE

**Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient**

▶ TO THE EYE

▶ **Adult:** One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

- **DIRECTIONS FOR ADMINISTRATION** Patients with severe dry eyes may require a drop of saline to improve insert tolerance.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Ophthalmic insert

▶ **Mydriastert** (Thea Pharmaceuticals Ltd)

**Tropicamide 28 mg, Phenylephrine hydrochloride 5.4 mg** Mydriastert 5.4mg / 0.28mg ophthalmic inserts | 20 insert [PoM] £84.00

## 4.1 Post-operative pain and inflammation

### Eye, surgical and peri-operative drug use

#### Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Cefuroxime p. 1028, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 1034, flurbiprofen p. 1034, ketorolac trometamol p. 1035, and nepafenac p. 1019, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 1034 is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac sodium and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine p. 1043, an  $\alpha_2$ -adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 1032, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 1026 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine p. 1032 is used for peri-ocular and conjunctival antiseptics before ocular surgery to support postoperative infection control.

#### Local anaesthetics

Oxybuprocaine hydrochloride, below, and tetracaine p. 1034 are widely used topical local anaesthetics. Proxymetacaine hydrochloride, p. 1034 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 1032 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 211, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

### ANAESTHETICS, LOCAL

#### Oxybuprocaine hydrochloride (Benoxinate hydrochloride)

##### ● INDICATIONS AND DOSE

###### Local anaesthetic

▶ TO THE EYE

▶ **Adult:** Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose oxybuprocaine eye drops commonly contain

preservatives, preservative-free unit dose vials may be available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Oxybuprocaine hydrochloride** (Bausch & Lomb UK Ltd)  
**Oxybuprocaine hydrochloride 4 mg per 1 ml** Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.15

## Proxymetacaine hydrochloride

#### INDICATIONS AND DOSE

##### Local anaesthetic

- ▶ TO THE EYE
- ▶ Adult: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Proxymetacaine** (Bausch & Lomb UK Ltd)  
**Proxymetacaine hydrochloride 5 mg per 1 ml** Minims proxymetacaine 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.54

## Tetracaine

(Amethocaine)

#### INDICATIONS AND DOSE

##### Local anaesthetic

- ▶ TO THE EYE
- ▶ Adult: Apply as required

- **SIDE-EFFECTS** Local skin reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Tetracaine (Non-proprietary)**  
**Tetracaine hydrochloride 5 mg per 1 ml** Minims tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.16
- Tetracaine hydrochloride 10 mg per 1 ml** Minims tetracaine hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.16

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

## Bromfenac

#### INDICATIONS AND DOSE

##### Postoperative inflammation following cataract surgery

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sulfites

##### ▶ Bromfenac (Non-proprietary)

**Bromfenac (as Bromfenac sodium sesquihydrate)**  
**900 microgram per 1 ml** Bromfenac 900micrograms/ml eye drops | 5 ml [PoM] no price available

##### ▶ Yellox (Bausch & Lomb UK Ltd)

**Bromfenac (as Bromfenac sodium sesquihydrate)**  
**900 microgram per 1 ml** Yellox 900micrograms/ml eye drops | 5 ml [PoM] £8.50

## Diclofenac sodium

#### INDICATIONS AND DOSE

**Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties) | Postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty | Pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma | Seasonal allergic conjunctivitis**

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, propylene glycol

##### ▶ Voltarol Ophtha (Thea Pharmaceuticals Ltd)

**Diclofenac sodium 1 mg per 1 ml** Voltarol Ophtha 0.1% eye drops 0.3ml unit dose | 5 unit dose [PoM] £4.00 | 40 unit dose [PoM] £32.00

##### ▶ Voltarol Ophtha Multidose (Thea Pharmaceuticals Ltd)

**Diclofenac sodium 1 mg per 1 ml** Voltarol Ophtha Multidose 0.1% eye drops | 5 ml [PoM] £6.68

## Flurbiprofen

#### INDICATIONS AND DOSE

**Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated**

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- ▶ **Ocufen** (Allergan Ltd)

Flurbiprofen sodium 300 microgram per 1 ml Ocufen 0.03% eye drops 0.4ml unit dose | 40 unit dose [PoM] £37.15

**Ketorolac trometamol****INDICATIONS AND DOSE**

**Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery**

- ▶ TO THE EYE

- ▶ Adult: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Acular** (Allergan Ltd)

Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml [PoM] £3.00 DT price = £3.00

**CORTICOSTEROIDS****Loteprednol etabonate****INDICATIONS AND DOSE**

**Treatment of post-operative inflammation following ocular surgery**

- ▶ TO THE EYE

- ▶ Adult: Apply 4 times a day for maximum duration of treatment of 14 days, to be started 24 hours after surgery

- **SIDE-EFFECTS** Corneal thinning · scleral thinning

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Lotemax** (Bausch & Lomb UK Ltd)

Loteprednol etabonate 5 mg per 1 ml Lotemax 0.5% eye drops | 5 ml [PoM] £5.50 DT price = £5.50

## 5 Glaucoma and ocular hypertension

**Glaucoma****Overview**

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often

asymptomatic, but the patient may present with significant loss of visual-field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

**Acute angle-closure glaucoma**

Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

**Beta-blockers**

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in *primary open-angle glaucoma*, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol p. 1037, carteolol hydrochloride p. 1036, levobunolol hydrochloride p. 1036, and timolol maleate p. 1036.

**Prostaglandin analogues and prostamides**

The prostaglandin analogues latanoprost p. 1041, tafluprost and travoprost p. 1043, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

**Sympathomimetics**

Brimonidine tartrate, a selective  $\alpha_2$ -adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other anti-glaucoma therapy.

Apraclonidine p. 1043 is another  $\alpha_2$ -adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery. Apraclonidine may not provide additional benefit in patients already using two drugs that suppress the production of aqueous humour.

**Carbonic anhydrase inhibitors and systemic drugs**

The **carbonic anhydrase inhibitors**, acetazolamide p. 1037, brinzolamide p. 1038, and dorzolamide p. 1039, reduce intra-

ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue or the alpha<sub>2</sub>-adrenoceptor agonist, brimonidine tartrate p. 1044. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic mannitol p. 217 or glycerol by mouth are useful short-term ocular hypotensive drugs.

### Miotics

Miotics act by opening the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 1039, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

## BETA-ADRENOCEPTOR BLOCKERS > NON-SELECTIVE

### Carteolol hydrochloride

#### ● INDICATIONS AND DOSE

##### Primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

● **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block

● **CAUTIONS** Patients with corneal disease

#### CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

● **INTERACTIONS** → Appendix 1 (beta-blockers). Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

● **SIDE-EFFECTS** Anaphylaxis · blepharoconjunctivitis · burning · corneal disorders · dry eyes · erythema · itching · ocular stinging · pain

#### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Teoptil** (Thea Pharmaceuticals Ltd)

**Carteolol hydrochloride 10 mg per 1 ml** Teoptil 1% eye drops | 5 ml [PoM] £7.60 DT price = £7.60

**Carteolol hydrochloride 20 mg per 1 ml** Teoptil 2% eye drops | 5 ml [PoM] £8.40 DT price = £8.40

## Levobunolol hydrochloride

#### ● INDICATIONS AND DOSE

##### Primary open-angle glaucoma

- ▶ TO THE EYE
- ▶ Adult: Apply 1–2 times a day

● **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block

● **CAUTIONS** Patients with corneal disease

#### CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

● **INTERACTIONS** → Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

● **SIDE-EFFECTS** Anaphylaxis · anterior uveitis · blepharoconjunctivitis · burning · corneal disorders · dry eyes · erythema · itching · ocular stinging · pain

#### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

▶ **Betagan** (Allergan Ltd)

**Levobunolol hydrochloride 5 mg per 1 ml** Betagan 0.5% eye drops | 5 ml [PoM] £1.85 DT price = £1.85  
Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.98

## Timolol maleate

#### ● INDICATIONS AND DOSE

##### Reduction of intra-ocular pressure in primary open-angle glaucoma

## CARBONIC ANHYDRASE INHIBITORS

### Acetazolamide

#### ● INDICATIONS AND DOSE

**Reduction of intra-ocular pressure in open-angle glaucoma | Reduction of intra-ocular pressure in secondary glaucoma | Reduction of intra-ocular pressure perioperatively in angle-closure glaucoma**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

##### Glaucoma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 250–500 mg daily

##### Epilepsy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

- **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma

- **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

- **INTERACTIONS** → Appendix 1 (diuretics).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Ataxia · depression · diarrhoea · dizziness · excitement · fatigue · flushing · headache · irritability · loss of appetite · nausea · paraesthesia · polyuria · reduced libido · taste disturbance · thirst · vomiting
- ▶ **Uncommon** Blood disorders · bone marrow suppression · confusion · crystalluria · drowsiness · electrolyte disturbances on long-term therapy · fever · glycosuria · haematuria · hearing disturbances · melaena · metabolic acidosis · rash · renal calculi · renal colic · renal failure · renal lesions · Stevens-Johnson syndrome · toxic epidermal necrosis · ureteric colic
- ▶ **Rare** Cholestatic jaundice · convulsions · flaccid paralysis · fulminant hepatic necrosis · hepatitis · photosensitivity
- ▶ **Frequency not known** Transient myopia

### SIDE-EFFECTS, FURTHER INFORMATION

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in *animal* studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3

## Brinzolamide

### ● INDICATIONS AND DOSE

**Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated**

#### ▶ TO THE EYE

- ▶ Adult: Apply twice daily, then increased if necessary up to 3 times a day

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Renal tubular immaturity or abnormality · systemic absorption follows topical application

### ● INTERACTIONS → Appendix 1 (brinzolamide).

Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Corneal erosion · corneal oedema · dry mouth · headache · ocular disturbances · photophobia · reduced visual acuity · taste disturbances
- ▶ **Uncommon** Alopecia · amnesia · bradycardia · chest pain · cough · decreased libido · depression · diarrhoea · dizziness · drowsiness · dyspepsia · dyspnoea · epistaxis · erectile dysfunction · flatulence · malaise · nasal dryness · nausea · nervousness · oesophagitis · oral hypoesthesia and paraesthesia · palpitation · paraesthesia · pharyngitis · renal pain · sinusitis · sleep disturbances · throat irritation · tinnitus · upper respiratory tract congestion · vomiting
- ▶ **Frequency not known** Arrhythmia · asthma · dermatitis · erythema · hypertension · peripheral oedema · rhinitis · tachycardia · tremor · vertigo

### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

### ● MEDICINAL FORMS

## Brinzolamide with brimonidine

27-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide, above, brimonidine tartrate p. 1044.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma and in ocular hypertension when monotherapy is inadequate**

#### ▶ TO THE EYE

- ▶ Adult: Apply 1 drop twice daily

### ● SIDE-EFFECTS

- ▶ **Common or very common** Somnolence
- ▶ **Uncommon** Dermatitis · dry throat · hypotension · vertigo

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

CAUTIONARY AND ADVISORY LABELS 3

EXCIPIENTS: May contain Benzalkonium chloride, propylene glycol

#### ▶ Simbrinza (Alcon Laboratories (UK) Ltd)

**Brimonidine tartrate 2 mg per 1 ml, Brinzolamide 10 mg per 1 ml** Simbrinza 10mg/ml / 2mg/ml eye drops | 5 ml **[PoM]** £9.23 DT price = £9.23

## Brinzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1038, timolol maleate p. 1036.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ **Azarga** (Alcon Laboratories (UK) Ltd)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Brinzolamide 10 mg per 1 ml** Azarga 10mg/ml / 5mg/ml eye drops | 5 ml [PoM] £11.05 DT price = £11.05

## Dorzolamide

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in ocular hypertension used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Open-angle glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Pseudo-exfoliative glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated**

- ▶ TO THE EYE
- ▶ Adult: Apply 3 times a day

**Raised intra-ocular pressure in ocular hypertension as adjunct to beta-blocker | Open-angle glaucoma as adjunct to beta-blocker | Pseudo-exfoliative glaucoma as adjunct to beta-blocker**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

● **CONTRA-INDICATIONS** Hyperchloraemic acidosis

● **CAUTIONS** Chronic corneal defects · history of intra-ocular surgery · history of renal calculi · low endothelial cell count · systemic absorption follows topical application

● **INTERACTIONS** → Appendix 1 (dorzolamide). Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · bitter taste · blurred vision · conjunctivitis · eyelid inflammation · headache · lacrimation · nausea · ocular irritation · superficial punctate keratitis
- ▶ **Uncommon** Iridocyclitis
- ▶ **Rare** Contact dermatitis · corneal oedema · dizziness · dry mouth · epistaxis · eyelid crusting · paraesthesia · Stevens-Johnson syndrome · throat irritation · toxic epidermal necrolysis · transient myopia · urolithiasis

### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Dorzolamide (Non-proprietary)**

**Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Dorzolamide 2% eye drops | 5 ml [PoM] £6.33 DT price = £1.96

▶ **Trusopt** (Santen UK Ltd)

**Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Trusopt 2% eye drops | 5 ml [PoM] £6.33 DT price = £1.96

Trusopt 2% eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £24.18 DT price = £24.18

## Dorzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide, above, timolol maleate p. 1036.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in ocular hypertension when beta-blockers alone not adequate | Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate | Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Dorzolamide with timolol (Non-proprietary)**

**Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Dorzolamide 2% /

Timolol 0.5% eye drops | 5 ml [PoM] £27.16 DT price = £1.94

Dorzolamide 2% / Timolol 0.5% eye drops 0.2ml unit dose

preservative free | 60 unit dose [PoM] £27.16 DT price = £28.59

▶ **Cosopt** (Santen UK Ltd)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Cosopt eye drops

0.2ml unit dose preservative free | 60 unit dose [PoM] £28.59 DT price = £28.59

Cosopt eye drops | 5 ml [PoM] £10.05 DT price = £1.94

## PARASYMPATHOMIMETICS

### Pilocarpine

● **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

### ● INDICATIONS AND DOSE

**Primary angle-closure glaucoma | Some secondary glaucomas**

- ▶ TO THE EYE
- ▶ Adult: Apply up to 4 times a day

● **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions

where pupillary constriction is undesirable - some forms of secondary glaucoma (where pupillary constriction is undesirable)

- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · marked vasomotor instability · Parkinson's disease · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction
- **INTERACTIONS** → Appendix 1 (parasympathomimetics). Systemic effects rare following application to the eye.
- **SIDE-EFFECTS**
  - ▶ **Rare** Parasympathomimetics systemic side effects
  - ▶ **Frequency not known** Blurred vision · ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) · conjunctival vascular congestion · lens changes (with chronic use) · myopia · ocular burning · ocular itching · pupillary block · smarting · vitreous haemorrhage
- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**  
Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

#### ● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### **Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

#### ▶ **Pilocarpine (Non-proprietary)**

**Pilocarpine hydrochloride 10 mg per 1 ml** Pilocarpine hydrochloride 1% eye drops | 10 ml [PoM] £9.54 DT price = £8.77

**Pilocarpine hydrochloride 20 mg per 1 ml** Pilocarpine hydrochloride 2% eye drops | 10 ml [PoM] £11.72 DT price = £10.76

**Pilocarpine hydrochloride 40 mg per 1 ml** Pilocarpine hydrochloride 4% eye drops | 10 ml [PoM] £13.04 DT price = £11.97

▶ **Pilocarpine nitrate** (Bausch & Lomb UK Ltd)  
**Pilocarpine nitrate 20 mg per 1 ml** Minimis pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.99

## PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

### Bimatoprost

#### ● **INDICATIONS AND DOSE**

**Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension**

▶ TO THE EYE

▶ **Adult:** Apply once daily, to be administered preferably in the evening

- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · predisposition to bradycardia · predisposition to hypotension · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

#### ● **SIDE-EFFECTS**

- ▶ **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin · punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
- ▶ **Uncommon** Asthenopia · dizziness · skin rash
- ▶ **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
- ▶ **Very rare** Chest pain · exacerbation of angina · palpitation · periorbital changes resulting in deepening of the eyelid sulcus
- ▶ **Frequency not known** Asthma · blepharospasm · bradycardia · dyspnoea · exacerbation of asthma · exacerbation of COPD · eyelid retraction · malaise · nausea · ocular infection · reactivation of previous corneal infiltrates · retinal haemorrhage

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—no information available.

- **RENAL IMPAIRMENT** Use with caution—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● **PATIENT AND CARER ADVICE**

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

#### ● **NATIONAL FUNDING/ACCESS DECISIONS** **LUMIGAN®**

#### **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (*Lumigan*® single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Lumigan** (Allergan Ltd)

**Bimatoprost 100 microgram per 1 ml** Lumigan 100micrograms/ml eye drops | 3 ml [PoM] £11.71 DT price = £11.71 | 9 ml [PoM] £35.13  
**Bimatoprost 300 microgram per 1 ml** Lumigan 300micrograms/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £13.75 DT price = £13.75

**Bimatoprost with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost p. 1040, timolol maleate p. 1036.

**INDICATIONS AND DOSE**

**Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

▶ TO THE EYE

▶ Adult: Apply once daily

**NATIONAL FUNDING/ACCESS DECISIONS****GANFORT® SINGLE USE****Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2013) that *Ganfort*® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Ganfort** (Allergan Ltd)

**Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Ganfort 0.3mg/ml / 5mg/ml eye drops | 3 ml [PoM] £13.95 DT price = £13.95 | 9 ml [PoM] £37.59  
 Ganfort 0.3mg/ml / 5mg/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £17.50

**Latanoprost****INDICATIONS AND DOSE**

**Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension**

▶ TO THE EYE

▶ Adult: Apply once daily, to be administered preferably in the evening

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of *Xalatan*®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · do not use within 5 minutes of thiomersal-containing preparations · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · peri-operative period of cataract surgery · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

**SIDE-EFFECTS**

- ▶ **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin · punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
- ▶ **Uncommon** Asthenopia · dizziness · skin rash
- ▶ **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
- ▶ **Very rare** Chest pain · exacerbation of angina · palpitation · periobital changes resulting in deepening of the eyelid sulcus
- ▶ **Frequency not known** Asthma · dyspnoea · exacerbation of asthma · exacerbation of COPD · iris cyst · nasopharyngitis · pyrexia

• **PREGNANCY** Manufacturer advises avoid.

• **BREAST FEEDING** May be present in milk—manufacturer advises avoid.

• **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**NATIONAL FUNDING/ACCESS DECISIONS****MONOPOST®****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2013) that *Monopost*® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Latanoprost (Non-proprietary)**

**Latanoprost 50 microgram per 1 ml** Latanoprost 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT price = £1.48

▶ **Monopost** (Thea Pharmaceuticals Ltd)

**Latanoprost 50 microgram per 1 ml** Monopost 50micrograms/ml eye drops 0.2ml unit dose | 30 unit dose [PoM] £8.49 DT price = £8.49 | 90 unit dose [PoM] £25.47 DT price = £25.47

► **Xalatan** (Pfizer Ltd)

**Latanoprost 50 microgram per 1 ml** Xalatan 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT price = £1.48

## Latanoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, latanoprost p. 1041, timolol maleate p. 1036.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

► TO THE EYE

► Adult: Apply once daily

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

#### ► Latanoprost with timolol (Non-proprietary)

**Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Latanoprost 50micrograms/ml / Timolol 5mg/ml eye drops | 2.5 ml [PoM] £14.32 DT price = £2.73

#### ► Xalacom (Pfizer Ltd)

**Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Xalacom eye drops | 2.5 ml [PoM] £14.32 DT price = £2.73

## Tafuprost

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension**

► TO THE EYE

► Adult: Apply once daily, to be administered preferably in the evening

### ● CAUTIONS

Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

### ● SIDE-EFFECTS

- **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin · punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
- **Uncommon** Asthenopia · dizziness · skin rash
- **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
- **Very rare** Chest pain · exacerbation of angina · palpitation · periorbital changes resulting in deepening of the eyelid sulcus
- **Frequency not known** Asthma · dyspnoea · exacerbation of asthma · exacerbation of COPD
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—*toxicity in animal studies.*

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies.*

● **HEPATIC IMPAIRMENT** Use with caution—no information available.

● **RENAL IMPAIRMENT** Use with caution—no information available.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tafuprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### ● PATIENT AND CARER ADVICE

**Changes to eye colour** Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Disodium edetate

#### ► Tafuprost (Non-proprietary)

**Tafuprost 15 microgram per 1 ml** Tafloten 15micrograms/ml eye drops | 2.5 ml [PoM] no price available

#### ► Safutan (Santen UK Ltd)

**Tafuprost 15 microgram per 1 ml** Safutan 15micrograms/ml eye drops 0.3ml unit dose | 30 unit dose [PoM] £12.20 DT price = £12.20

## Tafuprost with timolol

30-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, tafuprost, above, timolol maleate p. 1036.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

► TO THE EYE

► Adult: Apply 1 drop once daily

### ● SIDE-EFFECTS

► **Common or very common** Blurred vision · ocular hyperaemia

► **Uncommon** Anterior chamber inflammation · conjunctivitis

### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks**

Blurred vision may affect performance of skilled tasks (e.g. driving or operating machinery).

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2015) that *Taptiqom*<sup>®</sup> (tafuprost with timolol) is accepted for restricted use within NHS Scotland, within the licensed indications, in patients who have proven sensitivity to preservatives.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Disodium edetate

#### ► Taptiqom (Santen UK Ltd)

**Tafuprost 15 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Taptiqom 15micrograms/ml / 5mg/ml eye drops | 30 unit dose [PoM] £14.50

## Travoprost

### ● INDICATIONS AND DOSE

#### Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

##### ► TO THE EYE

- Adult: Apply once daily, to be administered preferably in the evening

- **CAUTIONS** History of significant ocular viral infections · angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

### ● SIDE-EFFECTS

- **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin · punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
- **Uncommon** Asthenopia · dizziness · skin rash
- **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
- **Very rare** Chest pain · exacerbation of angina · palpitation · peri-orbital changes resulting in deepening of the eyelid sulcus
- **Frequency not known** Asthma · bradycardia · cataract · constipation · cough · dry mouth · dysgeusia · dysphonia · dyspnoea · exacerbation of asthma · exacerbation of COPD · gastro-intestinal disorders · herpes simplex · malaise · mydriasis · nasal congestion · oropharyngeal pain · peptic ulcer reactivation · photopsia · throat irritation · tinnitus · vertigo
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies; manufacturer advises avoid.
- **PATIENT AND CARER ADVICE**

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Propylene glycol

- **Travatan** (Alcon Laboratories (UK) Ltd)

**Travoprost 40 microgram per 1 ml** Travatan 40micrograms/ml eye drops | 2.5 ml [PoM] £10.95 DT price = £10.95

## Travoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, travoprost, above, timolol maleate p. 1036.

### ● INDICATIONS AND DOSE

#### Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

##### ► TO THE EYE

- Adult: Apply once daily

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Propylene glycol

- **DuoTrav** (Alcon Laboratories (UK) Ltd)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Travoprost 40 microgram per 1 ml** DuoTrav 40micrograms/ml / 5mg/ml eye drops | 2.5 ml [PoM] £13.95 DT price = £13.95 | 7.5 ml [PoM] £39.68

## SYMPATHOMIMETICS > ALPHA<sub>2</sub>-ADRENOCEPTOR AGONISTS

## Apraclonidine

- **DRUG ACTION** Apraclonidine is an alpha<sub>2</sub>-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

### ● INDICATIONS AND DOSE

#### Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

##### ► TO THE EYE

- Adult: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

#### Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

##### ► TO THE EYE

- Adult: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

- **CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease
- **CAUTIONS** Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Parkinson's syndrome · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack
- **INTERACTIONS** → Appendix 1 (apraclonidine).
- **SIDE-EFFECTS**
  - **Common or very common** Conjunctivitis · dry eye · ocular intolerance · rhinitis · taste disturbance
  - **Uncommon** Asthma · blepharitis · blepharospasm · chest pain · conjunctival vascular disorders · corneal erosion and infiltrates · dyspnoea · eyelid ptosis or retraction · impaired co-ordination · irritability · keratitis · keratopathy · myalgia · mydriasis · nervousness · parosmia · photophobia · rhinorrhoea · throat irritation · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION**
  - Ocular intolerance Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
  - Systemic effects Since absorption may follow topical application, see clonidine hydrochloride p. 136.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor intra-ocular pressure and visual fields.
  - ▶ Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ Iopidine (Alcon Laboratories (UK) Ltd)

**Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml** Iopidine 5mg/ml eye drops | 5 ml [PoM] £10.88 DT price = £10.88

**Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml** Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose [PoM] £77.85 DT price = £77.85

## Brimonidine tartrate

- **DRUG ACTION** Brimonidine, an alpha<sub>2</sub>-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate | Ocular hypertension in patients for whom beta-blockers are inappropriate | Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy**

▶ TO THE EYE

▶ Adult: Apply twice daily

- **CAUTIONS** Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangitis obliterans
- **INTERACTIONS** → Appendix 1 (brimonidine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Burning sensation at application site · conjunctival blanching · conjunctival disturbances · conjunctival follicles · conjunctival infection · corneal erosion · corneal staining · dizziness · drowsiness · dry mouth · eyelid inflammation · gastro-intestinal disturbances · headache · malaise · ocular disturbances · ocular dryness · ocular hyperaemia · ocular pain · ocular pruritus · photophobia · stinging at application site · taste disturbances · upper respiratory symptoms · visual disturbances
  - ▶ **Uncommon** Arrhythmia · bradycardia · depression · nasal dryness · palpitation · tachycardia
  - ▶ **Rare** Dyspnoea
  - ▶ **Very rare** Hypertension · hypotension · insomnia · iritis · miosis · syncope
- **PREGNANCY** Limited information available; manufacturer advises use only if benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ Brimonidine tartrate (Non-proprietary)

**Brimonidine tartrate 2 mg per 1 ml** Brimonidine 0.2% eye drops | 5 ml [PoM] £6.85 DT price = £1.68

##### ▶ Alphagan (Allergan Ltd)

**Brimonidine tartrate 2 mg per 1 ml** Alphagan 0.2% eye drops | 5 ml [PoM] £6.85 DT price = £1.68

##### ▶ Brymont (Blumont Pharma Ltd)

**Brimonidine tartrate 2 mg per 1 ml** Brymont 2mg/ml eye drops | 5 ml [PoM] £2.27 DT price = £1.68

**Combinations available: Brinzolamide with brimonidine,** p. 1038

## Brimonidine with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brimonidine tartrate, above, timolol maleate p. 1036.

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate**

▶ TO THE EYE

▶ Adult: Apply twice daily

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ Combigan (Allergan Ltd)

**Brimonidine tartrate 2 mg per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Combigan eye drops | 5 ml [PoM] £10.00 DT price = £10.00 | 15 ml [PoM] £27.00

## 6 Retinal disorders

### 6.1 Macular degeneration

#### Subfoveal choroidal neovascularisation

##### Treatment

Aflibercept p. 1045, pegaptanib sodium p. 1046 and ranibizumab p. 1046 are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion, and diabetic macular oedema; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered

concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion.

## ANTINEOVASCULARISATION DRUGS > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

### Aflibercept

● **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

#### ● INDICATIONS AND DOSE

##### Neovascular (wet) age-related macular degeneration (specialist use only)

###### ▶ BY INTRAVITREAL INJECTION

- Adult: Initially 2 mg once a month for 3 months, to be injected into the affected eye, then 2 mg every 2 months, review treatment frequency after 12 months

##### Macular oedema secondary to central retinal vein occlusion (specialist use only)

###### ▶ BY INTRAVITREAL INJECTION

- Adult: Initially 2 mg once a month, to be injected into the affected eye, monitor visual and anatomic outcomes monthly; continue treatment until visual and anatomic outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomic outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart

##### Diabetic macular oedema (specialist use only)

###### ▶ BY INTRAVITREAL INJECTION

- Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, to be injected into the affected eye, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

- **CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss · ocular or periocular infection · severe intra-ocular inflammation
- **CAUTIONS** Active systemic infection · diabetic patients with uncontrolled hypertension · discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details · discontinue treatment in the event of a retinal break—consult product literature for full details · discontinue treatment in the event of rhegmatogenous retinal detachment—consult product literature for full details · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma · recent history of myocardial infarction · recent history of stroke · recent history of transient ischaemic attack

#### CAUTIONS, FURTHER INFORMATION

Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · cataract formation · conjunctival haemorrhage · conjunctival hyperaemia · corneal abrasion or oedema · corneal erosion

- eye pain · eyelid oedema · foreign body sensation in eye · increased lacrimation · injection-site haemorrhage · injection-site pain · ocular hyperaemia · punctate keratitis · raised intra-ocular pressure · reduced visual acuity · retinal degeneration · retinal pigment epithelium detachment · retinal pigment epithelium tear · vitreous detachment · vitreous floaters · vitreous haemorrhage

- ▶ **Uncommon** Anterior chamber flare · blindness · corneal epithelium defect · eyelid irritation · iridocyclitis · iritis · lenticular opacities · retinal detachment · retinal tear · uveitis
- ▶ **Rare** Hypopyon · vitritis
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor intra-ocular pressure following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ **Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294**  
Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:
  - it is used in accordance with the recommendations for ranibizumab in NICE TA 155 and
  - the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme[www.nice.org.uk/TA294](http://www.nice.org.uk/TA294)
- ▶ **Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305**  
Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA305](http://www.nice.org.uk/TA305)
- ▶ **Aflibercept for treating diabetic macular oedema (July 2015) NICE TA346**  
Aflibercept solution for injection is recommended as an option for treating visual impairment caused by diabetic macular oedema only if:
  - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment and
  - the company provides aflibercept with the discount agreed in the patient access scheme.[www.nice.org.uk/TA346](http://www.nice.org.uk/TA346)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Eylea (Bayer Plc) ▼

**Aflibercept 40 mg per 1 ml** Eylea 2mg/50 microlitres solution for injection vials | 1 vial (POM) £816.00

## Pegaptanib sodium

### ● INDICATIONS AND DOSE

#### Treatment of neovascular (wet) age-related macular degeneration (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: 300 micrograms every 6 weeks, to be administered into the affected eye, review treatment if no benefit after 2 consecutive injections

- **CONTRA-INDICATIONS** Ocular or periocular infection
- **CAUTIONS** Pegaptanib is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anterior chamber inflammation · cataract · conjunctival haemorrhage · conjunctivitis · corneal dystrophy · dry eye · eye discharge · eye irritation · eye pain · flashing lights · headache · local oedema · macular degeneration · mydriasis · periorbital haematoma · photophobia · punctate keratitis · raised intra-ocular pressure · retinal haemorrhage · rhinorrhoea · vitreous disorders · vitreous floaters
  - ▶ **Uncommon** Aortic aneurysm · asthenopia · back pain · blepharitis · chalazion · changes in hair colour · chest pain · corneal deposits · deafness · decreased intra-ocular pressure · depression · dyspepsia · ectropion · eczema · eye movement disorder · eyelid ptosis · hypertension · influenza-like symptoms · injection-site reactions · iritis · nasopharyngitis · night sweats · nightmares · occlusion of retinal blood vessels · optic nerve cupping · palpitation · pruritus · pupillary disorder · rash · retinal detachment · retinal exudates · vertigo · vitreous haemorrhage · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor intra-ocular pressure (transient increase may occur following injection, and small, sustained increases reported after repeated dosing).
  - ▶ Monitor for vitreous haemorrhage and for signs of ocular infection for 2 weeks following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012) NICE TA155  
Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.  
[www.nice.org.uk/TA155](http://www.nice.org.uk/TA155)
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Ranibizumab

### ● INDICATIONS AND DOSE

#### Neovascular (wet) age-related macular degeneration (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months, thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

#### Diabetic macular oedema | Macular oedema secondary to retinal vein occlusion (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: Initially 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections), thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

#### Choroidal neovascularisation secondary to pathologic myopia (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: Initially 500 micrograms, to be administered as a single injection into the affected eye, monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required, if necessary subsequent doses may be given at least 1 month apart

#### Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: 500 micrograms, to be administered at least 30 minutes after laser photocoagulation

- **CONTRA-INDICATIONS** Ocular or periocular infection · severe intra-ocular inflammation · signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion
- **CAUTIONS** Active systemic infection · diabetic macular oedema due to type 1 diabetes (limited information available) · diabetic patients with HbA<sub>1c</sub> over 12% · history of stroke · history of transient ischaemic attack · patients at risk of retinal pigment epithelial tear · previous intravitreal injections · proliferative diabetic retinopathy · retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) · uncontrolled hypertension
- **CAUTIONS, FURTHER INFORMATION**  
Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Allergic skin reactions · anaemia · anterior chamber flare · anxiety · arthralgia · blepharitis · cataract · conjunctival disorders · conjunctivitis · cough · eye haemorrhage · eyelid oedema · headache · iridocyclitis · iritis · nasopharyngitis · nausea · ocular discomfort · photophobia · photopsia · posterior capsule opacification · punctate keratitis · raised intra-ocular pressure · retinal disorders · urinary tract infection · uveitis · visual disturbance · vitreous disorders

- ▶ **Uncommon** Blindness · corneal disorders · hyphaema · hypopyon · iris adhesion · keratopathy
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection.
  - ▶ Monitor visual acuity, see individual indications and dose for frequency.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ **Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013)** NICE TA298  
Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA298](http://www.nice.org.uk/TA298)
  - ▶ **Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013)** NICE TA283  
Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:
    - following central retinal vein occlusion **or**
    - following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage **and**
    - only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274.  
[www.nice.org.uk/TA283](http://www.nice.org.uk/TA283)
  - ▶ **Ranibizumab for the treatment of diabetic macular oedema (February 2013)** NICE TA274  
Ranibizumab is recommended as an option for the treatment of visual impairment due to diabetic macular oedema only if:
    - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
    - the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).
 Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA274](http://www.nice.org.uk/TA274)
  - ▶ **Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012)** NICE TA155  
Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:
    - the best corrected visual acuity is between 6/12 and 6/96;
    - there is no permanent structural damage to the central fovea;
    - the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
    - there is evidence of recent disease progression;

- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy.

[www.nice.org.uk/TA155](http://www.nice.org.uk/TA155)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2007) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration.

The *Scottish Medicines Consortium* has advised (October 2011 and April 2013) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Lucentis** (Novartis Pharmaceuticals UK Ltd)

**Ranibizumab 10 mg per 1 ml** Lucentis 2.3mg/0.23ml solution for injection vials | 1 vial [POM] £551.00 (Hospital only)

Lucentis 1.65mg/0.165ml solution for injection pre-filled syringes | 1

pre-filled disposable injection [POM] £551.00

## PHOTOSENSITISERS

### Verteporfin

- **DRUG ACTION** Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

#### ● INDICATIONS AND DOSE

**Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 6 mg/m<sup>2</sup>, dose to be given over 10 minutes

- **CONTRA-INDICATIONS** Acute porphyria p. 930

- **CAUTIONS** Avoid extravasation · biliary obstruction · photosensitivity

- **INTERACTIONS** Caution on concomitant use with other photosensitising drugs.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Back pain · flashing lights · hypercholesterolaemia · malaise · nausea · photosensitivity · reduced visual acuity · visual disturbances · visual-field defects
- ▶ **Uncommon** Hyperaesthesia · hypertension · pyrexia · retinal detachment · subretinal, retinal or vitreous haemorrhage
- ▶ **Rare** Retinal or choroidal vessel non-perfusion
- ▶ **Frequency not known** Chest pain · macular oedema · myocardial infarction · retinal oedema · vasovagal reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal* studies).

- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.
- **HEPATIC IMPAIRMENT** Use with caution in moderate hepatic impairment. Avoid in severe hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** For information on administration and light activation, consult product literature.

For intravenous infusion (*Visudyne*®), give intermittently in Glucose 5%; reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.

- **PATIENT AND CARER ADVICE** Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**  
▶ Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003) NICE TA68  
Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

Photodynamic therapy is **not** recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation *except* in clinical studies.

[www.nice.org.uk/TA68](http://www.nice.org.uk/TA68)

- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

EXCIPIENTS: May contain Butylated hydroxytoluene

▶ *Visudyne* (Novartis Pharmaceuticals UK Ltd)

▶ **Verteporfin 15 mg** *Visudyne* 15mg powder for solution for infusion vials | 1 vial **[PoM]** £850.00 (Hospital only)

## 6.2 Macular oedema

**Other drugs used for Macular oedema** Afibercept p. 1045 · Dexamethasone p. 1019 · Ranibizumab p. 1046

F 1097

### Fluocinolone acetonide

#### ● INDICATIONS AND DOSE

**Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)**

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: 190 micrograms, to be administered into the affected eye

- **CONTRA-INDICATIONS** Active or suspected ocular infection · active or suspected peri-ocular infection · pre-existing glaucoma
- **CAUTIONS** Raised baseline intra-ocular pressure
- **INTERACTIONS** Caution with concomitant administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).
- **SIDE-EFFECTS**  
▶ **Common or very common** Blurred vision · cataract · conjunctival haemorrhage · glaucoma · ocular discomfort ·

raised intra-ocular pressure · reduced visual acuity · vitreous floaters · vitreous haemorrhage

▶ **Uncommon** Conjunctival ulcer · endophthalmitis · eye discharge · eye pruritus · headache · iris adhesions · iris neovascularisation · maculopathy · ocular hyperaemia · optic atrophy · optic nerve disorder · posterior capsule opacification · retinal exudates · retinal vascular occlusion · sclera thinning · vitreous degeneration · vitreous detachment

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **MONITORING REQUIREMENTS**  
▶ Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.
- ▶ Monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months).

- **DIRECTIONS FOR ADMINISTRATION** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013) NICE TA301  
Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:

- the implant is to be used in an eye with an intra-ocular (pseudophakic lens) **and**
- the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA301](http://www.nice.org.uk/TA301)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that fluocinolone acetonide intravitreal implant (*Iluvien*®) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), **and** retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Implant

▶ *Iluvien* (Alimera Sciences Ltd)

**Fluocinolone acetonide 190 microgram** *ILUVIEN* 190microgram intravitreal implant in applicator | 1 device **[PoM]** £5,500.00

## 6.3 Vitreomacular traction

### RECOMBINANT PROTEOLYTIC ENZYMES

#### Ocriplasmin

##### ● INDICATIONS AND DOSE

**Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)**

##### ▶ BY INTRAVITREAL INJECTION

- ▶ Adult: 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

- **CONTRA-INDICATIONS** Active or suspected ocular or periocular infection · aphakia · exudative age-related macular degeneration · high myopia · history of rhegmatogenous retinal detachment · ischaemic retinopathies · large diameter macular hole (> 400 microns) · lens zonule instability · proliferative diabetic retinopathy · recent intra-ocular injection (including laser therapy) · recent ocular surgery · retinal vein occlusions · vitreous haemorrhage
- **CAUTIONS** History of uveitis (including severe active inflammation) · non-proliferative diabetic retinopathy · significant eye trauma
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abnormal retinograph · anterior chamber cell or flare · chromatopsia · conjunctival disorders · eyelid oedema · iritis · macular degeneration · macular hole · macular oedema · metamorphopsia · ocular discomfort · ocular hyperaemia · photophobia · photopsia · raised intra-ocular pressure · reduced visual acuity · retinal disorders · retinal pigment epitheliopathy · vitreous disorders
  - ▶ **Uncommon** Anterior chamber inflammation · corneal abrasion · diplopia · eye inflammation · hyphaema · lens subluxation · miosis · scotoma · transient blindness · unequal pupils · visual field defect
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ **Ocriplasmin for treating vitreomacular traction (October 2013) NICE TA297**  
Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:
    - an epiretinal membrane is not present **and**
    - they have a stage II full-thickness macular hole with a diameter of 400 microns or less **and/or**
    - they have severe symptoms.[www.nice.org.uk/TA297](http://www.nice.org.uk/TA297)

**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (July 2014) that ocriplasmin (*Jetrea*®) is accepted for restricted use within NHS Scotland for the treatment of patients with vitreomacular traction plus macular hole, regardless of whether they have epiretinal membrane formation, and in patients with vitreomacular traction alone (no epiretinal membrane and no macular hole).

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Solution for injection**

- ▶ **Jetrea** (Alcon Laboratories (UK) Ltd) ▼

**Ocriplasmin 2.5 mg per 1 ml** Jetrea 0.5mg/0.2ml concentrate for solution for injection vials | 1 vial (PoM) £2,500.00

## Ear

### Ear

#### Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 1054. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 1052 or **clioquinol**) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 1052 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;

- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*<sup>®</sup> spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 414 or ibuprofen p. 999, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 511 is the drug of choice; ciprofloxacin p. 514 (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid cream or ointment is then required, but prolonged use should be avoided.

#### Otitis media

##### Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

**Otitis media with effusion**

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

**Chronic otitis media**

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 506 (or erythromycin p. 497 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only **by specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

**Removal of ear wax**

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate ear drops p. 1054 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 1054 or urea hydrogen peroxide p. 1055

are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to cooperate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

Urea hydrogen peroxide 50 mg per 1 gram Otex 5% ear drops | 8 ml [P] £2.89 DT price = £2.89

## Nose

### Nose

**Rhinitis and bacterial sinusitis**

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution p. 914 may be used as a douche or 'sniff' following endonasal surgery.

**Drugs used in nasal allergy**

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 259) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal **corticosteroids**; sodium cromoglicate p. 1061 is an alternative, but may be less effective. The topical antihistamine azelastine hydrochloride p. 1017 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more

effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 251 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhoea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

**Corticosteroids**

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Nasal polyps**

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

**Pregnancy**

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 1059, budesonide p. 1059, fluticasone p. 1060, or sodium cromoglicate may be considered.

**Topical nasal decongestants**

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 277).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the

nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride nasal drops, below, are the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 1057 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide p. 1058.

### Sinusitis and oral pain

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 475).

### Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci.

### Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 1058 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant and does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

## 1 Nasal congestion

### SYMPATHOMIMETICS > VASOCONSTRICTOR

## Ephedrine hydrochloride

#### ● INDICATIONS AND DOSE

#### Nasal congestion | Sinusitis affecting the maxillary antrum

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
- ▶ Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

#### IMPORTANT SAFETY INFORMATION

##### CHM/MHRA ADVICE

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be

considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute urinary retention) (in adults)
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Headache · nausea
  - ▶ **Frequency not known** After excessive use tolerance with diminished effect · cardiovascular effect · local irritation · rebound congestion
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- **PROFESSION SPECIFIC INFORMATION**
  - ▶ **Dental practitioners' formulary** Ephedrine nasal drops may be prescribed.
  - ▶ **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
- **MEDICINAL FORMS**
  - ▶ There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops
  - ▶ **Nasal drops**
    - ▶ **Ephedrine hydrochloride (Non-proprietary)**
      - ▶ **Ephedrine hydrochloride 5 mg per 1 ml** Ephedrine 0.5% nasal drops | 10 ml [P] £1.75 DT price = £1.75
      - ▶ **Ephedrine hydrochloride 10 mg per 1 ml** Ephedrine 1% nasal drops | 10 ml [P] £1.81 DT price = £1.81

## Pseudoephedrine hydrochloride

#### ● INDICATIONS AND DOSE

#### Congestion of mucous membranes of upper respiratory tract

- ▶ BY MOUTH
- ▶ Child 6-11 years: 30 mg 3–4 times a day
- ▶ Child 12-17 years: 60 mg 3–4 times a day
- ▶ Adult: 60 mg 3–4 times a day

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): **OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN** Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (in adults) · raised intra-ocular pressure (in children) · susceptibility to angle-closure glaucoma (in adults)
- **INTERACTIONS** → Appendix 1 (sympathomimetics). Contra-indicated in patients taking monoamine oxidase inhibitors within the previous 2 weeks.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · headache · hypertension · insomnia · nausea · restlessness · tachycardia · vomiting
- ▶ **Rare** Hallucinations · rash
- ▶ **Very rare** Angle-closure glaucoma
- ▶ **Frequency not known** Urinary retention
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*<sup>®</sup> and *Sudafed*<sup>®</sup> can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Pseudoephedrine hydrochloride (Non-proprietary)**  
Pseudoephedrine hydrochloride 60 mg 60mg tablets | 12 tablet [P] no price available
- ▶ **Galpseud** (Thornton & Ross Ltd)  
Pseudoephedrine hydrochloride 60 mg Galpseud 60mg tablets | 24 tablet [PoM] £2.25 | 100 tablet [PoM] £5.42 DT price = £5.42
- ▶ **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)  
Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet [P] £2.04

#### Oral solution

EXCIPIENTS: May contain Alcohol

- ▶ **Pseudoephedrine hydrochloride (Non-proprietary)**  
Pseudoephedrine hydrochloride 6 mg per 1 ml 30mg/5ml oral liquid sugar-free | 100 ml [P] £1.57 DT price = £1.57
- ▶ **Galpseud** (Thornton & Ross Ltd)  
Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30mg/5ml linctus sugar-free | 2000 ml [PoM] £14.00
- ▶ **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)  
Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30mg/5ml liquid | 100 ml [P] £1.92

## Xylometazoline hydrochloride

- **DRUG ACTION** Xylometazoline is a sympathomimetic.

### ● INDICATIONS AND DOSE

#### Nasal congestion

- ▶ **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
- ▶ **Child 6–11 years:** 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- ▶ **Child 12–17 years:** 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- ▶ **Adult:** 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

### ▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- ▶ **Child 12–17 years:** 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
- ▶ **Adult:** 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

### IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute retention)(in adults) · rebound congestion

### CAUTIONS, FURTHER INFORMATION

- ▶ **Rebound congestion** Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- **SIDE-EFFECTS** Cardiovascular effects · hallucinations in small children · headache · local irritation · nausea · rebound congestion · restlessness in small children · sleep disturbances in small children · tolerance with diminished effect (after excessive use) · transient visual disturbances
- ▶ **SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ **Hallucinations (in small children)** Discontinue treatment if the hallucinations occur.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Spray

- ▶ **Otrivine** (Novartis Consumer Health UK Ltd)  
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.05 DT price = £2.18  
Otrivine Adult Measured Dose Sinusitis spray | 10 ml [GSL] £2.62 DT price = £2.18  
Otrivine Allergy Relief 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18  
Otrivine Adult nasal spray | 10 ml [GSL] £2.18 DT price = £2.18  
Otrivine Adult Metered Dose 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18
- ▶ **Sudafed Congestion Relief** (McNeil Products Ltd)  
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.25 DT price = £2.18
- ▶ **Sudafed Mucus Relief** (McNeil Products Ltd)  
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Mucus Relief 0.1% nasal spray | 15 ml [GSL] £2.37
- ▶ **Sudafed Non-Drowsy Decongestant (xylometazoline)** (McNeil Products Ltd)  
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 15 ml [GSL] £2.38

#### Nasal drops

- ▶ **Otrivine** (Novartis Consumer Health UK Ltd)  
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.18 DT price = £2.18  
Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml [P] £1.91 DT price = £1.91

## 2 Nasal infection

### ANTIBACTERIALS > AMINOGLYCOSIDES

#### Chlorhexidine with neomycin

##### ● INDICATIONS AND DOSE

##### Eradication of nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 4 times a day for 10 days
- ▶ Adult: Apply 4 times a day for 10 days

##### Preventing nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Naseptin** (Alliance Pharmaceuticals Ltd)  
Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram [PoM] £2.24 DT price = £2.24

### ANTIBACTERIALS > OTHER

#### Mupirocin

##### ● INDICATIONS AND DOSE

##### BACTROBAN NASAL<sup>®</sup>

For eradication of nasal carriage of staphylococci, including meticillin-resistant *Staphylococcus aureus* (MRSA)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril
- ▶ Adult: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** No information available.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Nasal ointment

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)  
Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram [PoM] £4.24 DT price = £4.24

### CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

#### Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1052, neomycin sulfate p. 480.

##### ● INDICATIONS AND DOSE

##### Nasal infection

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril
- ▶ Adult: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (Focus Pharmaceuticals Ltd)  
Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT price = £2.39

## 3 Nasal inflammation, nasal polyps and rhinitis

**Other drugs used for Nasal inflammation, nasal polyps and rhinitis** Desloratadine, p. 262 · Fexofenadine hydrochloride, p. 263 · Ketotifen, p. 269

### ANTIMUSCARINICS

#### Ipratropium bromide

24-Feb-2016

##### ● INDICATIONS AND DOSE

##### Rhinorrhoea associated with allergic and non-allergic rhinitis

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
- ▶ Adult: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS** Avoid spraying near eyes · bladder outflow obstruction · cystic fibrosis · prostatic hyperplasia (in adults) · susceptibility to angle-closure glaucoma

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Epistaxis · nasal dryness · nasal irritation
- ▶ **Uncommon** Headache · nausea
- ▶ **Very rare** Gastro-intestinal motility disturbances · palpitations · urinary retention
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rinatec** (Boehringer Ingelheim Ltd)  
Ipratropium bromide 21 microgram per 1 dose Rinatec  
21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT price =  
£6.54

**CORTICOSTEROIDS****Corticosteroids (intranasal)**

- **CAUTIONS** Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

**CAUTIONS, FURTHER INFORMATION**

- ▶ Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

**● SIDE-EFFECTS**

- ▶ **Rare** Glaucoma · raised intra-ocular pressure
- ▶ **Very rare** Nasal septal perforation (usually following nasal surgery)
- ▶ **Frequency not known** Aggression (particularly in children) · anxiety (particularly in children) · bronchospasm · depression (particularly in children) · dryness · epistaxis · headache · hyperactivity (particularly in children) · hypersensitivity reactions · nasal irritation · nasal ulceration · sleep disturbances (particularly in children) · smell disturbances · taste disturbances · throat irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

**● MONITORING REQUIREMENTS**

- ▶ The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Beclometasone dipropionate**  
(Beclomethasone dipropionate)**● INDICATIONS AND DOSE****Prophylaxis and treatment of allergic and vasomotor rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 6–17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- ▶ Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of beclometasone dipropionate can be sold to the public for

nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

## Fluticasone

04-Jan-2016

#### INDICATIONS AND DOSE

##### Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

- ▶ **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
- ▶ **Child 4–11 years:** 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- ▶ **Child 12–17 years:** 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
- ▶ **Adult:** 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to

50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

#### Nasal polyps

##### ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- ▶ **Child 16–17 years:** 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)
- ▶ **Adult:** 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)

#### AVAMYS® SPRAY

##### Prophylaxis and treatment of allergic rhinitis

##### ▶ BY INTRANASAL ADMINISTRATION

- ▶ **Child 6–11 years:** 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- ▶ **Child 12–17 years:** 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- ▶ **Adult:** 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Avamys*® spray: 1 spray equivalent to 27.5 micrograms.

- **SIDE-EFFECTS** Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.
- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

##### Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

##### ▶ Nasofan (Teva UK Ltd)

**Fluticasone propionate 50 microgram per 1 dose** Nasofan Allergy 50micrograms/dose nasal spray | 60 dose [P] £4.68  
Nasofan 50micrograms/dose aqueous nasal spray | 150 dose [PoM] £8.04 DT price = £11.01

##### ▶ Pirinase Hayfever (GlaxoSmithKline Consumer Healthcare)

**Fluticasone propionate 50 microgram per 1 dose** Pirinase Hayfever 0.05% nasal spray | 60 dose [P] £4.59

Pirinase Hayfever Relief for Adults 0.05% nasal spray | 60 dose [GSL] £4.59

### Nasal drops

EXCIPIENTS: May contain Polysorbates

- ▶ **Flixonase** (GlaxoSmithKline UK Ltd)

**Fluticasone propionate 400 microgram** Flixonase Nasale 400microgram/unit dose nasal drops | 28 unit dose [PoM] £12.99 DT price = £12.99

## Fluticasone with azelastine

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 1060, azelastine hydrochloride p. 1017.

### ● INDICATIONS AND DOSE

**Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate**

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 12-17 years: 1 spray twice daily, dose to be administered into each nostril
- ▶ Adult: 1 spray twice daily, dose to be administered into each nostril

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- ▶ **Fluticasone with azelastine (Non-proprietary)**

**Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram** per 1 actuation Fluticasone propionate 50micrograms/dose / Azelastine 137micrograms/dose nasal spray | 120 dose [PoM] no price available DT price = £14.80

- ▶ **Dymista** (Meda Pharmaceuticals Ltd)

**Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram** per 1 actuation Dymista 137micrograms/dose / 50micrograms/dose nasal spray | 120 dose [PoM] £14.80 DT price = £14.80

F 1059

## Mometasone furoate

### ● INDICATIONS AND DOSE

**Prophylaxis and treatment of allergic rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 6-11 years: 50 micrograms daily, dose to be sprayed into each nostril
- ▶ Child 12-17 years: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril
- ▶ Adult: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

#### Nasal polyps

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: Initially 100 micrograms daily for 5-6 weeks, dose to be sprayed into each nostril, then increased if necessary to 100 micrograms twice daily, dose to be sprayed into each nostril, consider alternative treatment if no improvement after further 5-6 weeks, reduce to the lowest effective dose when control achieved

- **SIDE-EFFECTS** Nasal ulceration occurs commonly with preparations containing mometasone furoate.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- ▶ **Mometasone furoate (Non-proprietary)**

**Mometasone furoate 50 microgram per 1 dose** Mometasone 50micrograms/dose nasal spray | 140 dose [PoM] £7.30 DT price = £2.31

- ▶ **Nasonex** (Merck Sharp & Dohme Ltd)

**Mometasone furoate 50 microgram per 1 dose** Nasonex 50micrograms/dose nasal spray | 140 dose [PoM] £7.68 DT price = £2.31

F 1059

## Triamcinolone acetonide

### ● INDICATIONS AND DOSE

**Prophylaxis and treatment of allergic rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 6-11 years: 55 micrograms once daily, dose to be sprayed into each nostril, increased if necessary to 110 micrograms once daily, dose to be sprayed into each nostril; reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved; maximum duration of treatment 3 months
- ▶ Child 12-17 years: 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved
- ▶ Adult: 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to maximum daily dose of 110 micrograms per nostril for maximum 3 months, and a pack size of 3.575 mg.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- ▶ **Nasacort** (Sanofi)

**Triamcinolone acetonide 55 microgram per 1 dose** Nasacort Allergy 55micrograms/dose nasal spray | 30 dose [P] £3.01  
Nasacort 55micrograms/dose nasal spray | 120 dose [PoM] £7.39 DT price = £7.39

## MAST-CELL STABILISERS

### Sodium cromoglicate

(Sodium cromoglycate)

### ● INDICATIONS AND DOSE

**Prophylaxis of allergic rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child: 1 spray 2-4 times a day, to be administered into each nostril
- ▶ Adult: 1 spray 2-4 times a day, to be administered into each nostril

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturers).

### ● SIDE-EFFECTS

- ▶ **Rare** Transient bronchospasm
- ▶ **Frequency not known** Local irritation

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified

## Oropharynx

### 1 Dry mouth

#### Treatment of dry mouth

##### Overview

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Aqualor*<sup>®</sup>, *Biotène Oralbalance*<sup>®</sup> gel or *Xerotin*<sup>®</sup> can be used for any condition giving rise to a dry mouth. *BioXtra*<sup>®</sup>, *Glandosane*<sup>®</sup>, *Saliva Orthana*<sup>®</sup>, and *Saliveze*<sup>®</sup> have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix*<sup>®</sup> pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine tablets, below, are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

### PARASYMPATHOMIMETICS

#### Pilocarpine

##### INDICATIONS AND DOSE

##### Xerostomia following irradiation for head and neck cancer

###### BY MOUTH

- ▶ Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

##### Dry mouth and dry eyes in Sjögren's syndrome

###### BY MOUTH

- ▶ Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

- **CONTRA-INDICATIONS** Acute iritis · chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) · uncontrolled asthma (increased bronchial secretions and increased airways resistance) · uncontrolled cardiorenal disease

- **CAUTIONS** Asthma (avoid if uncontrolled) · biliary-tract disease · cardiovascular disease (avoid if uncontrolled) · cholelithiasis · chronic obstructive pulmonary disease (avoid if uncontrolled) · cognitive disturbances · maintain adequate fluid intake to avoid dehydration associated with excessive sweating · peptic ulceration · psychiatric disturbances · risk of increased renal colic · risk of increased urethral smooth muscle tone · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (parasympathomimetics).

##### SIDE-EFFECTS

- ▶ **Common or very common** Influenza-like symptoms · abdominal pain · asthenia · conjunctivitis · constipation · diarrhoea · dizziness · dyspepsia · flushing · headache · hypertension · increased urinary frequency · lacrimation · nausea · ocular pain · palpitation · pruritus · rash · rhinitis · sweating · visual disturbances · vomiting
- ▶ **Uncommon** Flatulence · urinary urgency

- **PREGNANCY** Avoid—smooth muscle stimulant; toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Reduce initial oral dose in moderate or severe cirrhosis.

- **RENAL IMPAIRMENT** Manufacturer advises caution with tablets.

##### PATIENT AND CARER ADVICE

###### Driving and skilled tasks

Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

##### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

###### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

- ▶ **Salagen** (Merus Labs Luxco S.a R.L.)

**Pilocarpine hydrochloride 5 mg** Salagen 5mg tablets | 84 tablet [POM] £41.14 DT price = £41.14

### LUBRICANTS

#### Artificial saliva products

##### ARTIFICIAL SALIVA PRODUCTS

###### AS SALIVA ORTHANA<sup>®</sup> LOZENGES

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

##### INDICATIONS AND DOSE

##### Dry mouth as a result of having (or having undergone) radiotherapy | Sicca syndrome

###### BY MOUTH

- ▶ Adult: 1 lozenge as required, allow to dissolve slowly in the mouth

- **PRESCRIBING AND DISPENSING INFORMATION** *AS Saliva Orthana*<sup>®</sup> lozenges do not contain fluoride.

**AS Saliva Orthana lozenges** (A S Pharma Ltd)

30 lozenge(ACBS) · NHS indicative price = £3.50

###### AS SALIVA ORTHANA<sup>®</sup> SPRAY

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of dry mouth

- ▶ BY MOUTH
- ▶ Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
*AS Saliva Orthana*® Oral Spray may be prescribed.  
*AS Saliva Orthanaspray* (CCMed Ltd)  
 50 ml • NHS indicative price = £4.924

#### BIOXTRA® GEL

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

### ● INDICATIONS AND DOSE

#### Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- ▶ BY MOUTH
- ▶ Adult: Apply as required, apply to oral mucosa

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
*BioXtra*® Gel may be prescribed.  
*BioXtra Dry Mouth oral gel* (R.I.S. Products Ltd)  
 40 ml • NHS indicative price = £3.94 • Drug Tariff (Part IXa)

#### BIOTENE ORALBALANCE®

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of dry mouth

- ▶ BY MOUTH
- ▶ Adult: Apply as required, apply to gums and tongue

### ● PATIENT AND CARER ADVICE

Avoid use with toothpastes containing detergents (including foaming agents).

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
*Biotene Oralbalance*® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.  
*Biotene Oralbalance dry mouth saliva replacement gel* (GlaxoSmithKline Consumer Healthcare)  
 Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg 50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

#### GLANDOSANE®

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

### ● INDICATIONS AND DOSE

#### Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- ▶ BY MOUTH
- ▶ Adult: Apply as required, spray onto oral and pharyngeal mucosa

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
*Glandosane*® Aerosol Spray may be prescribed.  
*Glandosane synthetic saliva spray lemon* (Fresenius Kabi Ltd)  
 50 ml(ACBS) • NHS indicative price = £5.58  
*Glandosane synthetic saliva spray natural* (Fresenius Kabi Ltd)  
 50 ml(ACBS) • NHS indicative price = £5.58

*Glandosane synthetic saliva spray peppermint* (Fresenius Kabi Ltd)  
 50 ml(ACBS) • NHS indicative price = £5.58

### ORALIEVE GEL

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of dry mouth

- ▶ BY MOUTH
- ▶ Adult: Apply as required, particularly at night, to oral mucosa

### ● PRESCRIBING AND DISPENSING INFORMATION

Contains traces of milk protein and egg white protein.

*Oralieve moisturising mouth gel* (Inspiration Pharma Ltd)  
 50 ml • NHS indicative price = £2.96 • Drug Tariff (Part IXa)

#### SST®

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

- ▶ BY MOUTH
- ▶ Adult: 1 tablet as required, allow tablet to dissolve slowly in the mouth

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
 May be prescribed as Saliva Stimulating Tablets.

*SST saliva stimulating tablets* (Sinclair IS Pharma Plc)  
 100 tablet • NHS indicative price = £4.86 • Drug Tariff (Part IXa)

#### SALIVEZE®

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

### ● INDICATIONS AND DOSE

#### Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- ▶ BY MOUTH
- ▶ Adult: Apply 1 spray as required, spray onto oral mucosa

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
*Saliveze*® Oral Spray may be prescribed.

*Saliveze mouth spray* (Wyvern Medical Ltd)  
 50 ml(ACBS) • NHS indicative price = £3.50

#### SALIVIX®

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of dry mouth

- ▶ BY MOUTH USING PASTILLES
- ▶ Adult: 1 unit as required, suck pastille

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary  
*Salivix*® Pastilles may be prescribed as Artificial Saliva Pastilles.

*Salivix pastilles* (Galen Ltd)  
 50 pastille • NHS indicative price = £3.55 • Drug Tariff (Part IXa)

#### XEROTIN®

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium

chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

#### ● INDICATIONS AND DOSE

##### Symptomatic treatment of dry mouth

- ▶ BY MOUTH
- ▶ Adult: 1 spray as required

#### ● PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

*Xerotin*<sup>®</sup> Oral Spray may be prescribed as Artificial Saliva Oral Spray.

*Xerotin spray* (SpePharm UK Ltd)  
100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)

## 2 Oral hygiene

### Mouthwashes and other preparations for oropharyngeal use

#### Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

#### Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1066 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1065, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine, below, is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing

an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

## ANTISEPTICS AND DISINFECTANTS > OTHER

### Chlorhexidine

#### ● INDICATIONS AND DOSE

##### Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
- ▶ Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

##### Denture stomatitis

- ▶ MOUTHWASH
- ▶ Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

##### Oral hygiene and plaque inhibition and gingivitis

- ▶ BY MOUTH USING DENTAL GEL
- ▶ Child: Apply 1–2 times a day, to be brushed on the teeth
- ▶ Adult: Apply 1–2 times a day, to be brushed on the teeth

##### Oral candidiasis | Management of aphthous ulcers

- ▶ BY MOUTH USING DENTAL GEL
- ▶ Child: Apply 1–2 times a day, to affected areas
- ▶ Adult: Apply 1–2 times a day, to affected areas

##### Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

- ▶ BY MOUTH USING OROMUCOSAL SPRAY
- ▶ Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
- ▶ Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

##### Bladder irrigation and catheter patency solutions

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** *Corsodyl*<sup>®</sup> not licensed for use in children under 12 years (unless on the advice of a healthcare professional).
- **SIDE-EFFECTS** Anaphylaxis • hypersensitivity • mucosal irritation • parotid gland swelling • reversible brown staining of composite restorations • reversible brown staining of silicate compositions • reversible brown staining of teeth • taste disturbance • tongue discolouration

#### SIDE-EFFECTS, FURTHER INFORMATION

If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

- **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.
- **PROFESSION SPECIFIC INFORMATION**

##### Dental practitioners' formulary

*Corsodyl*<sup>®</sup> dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl*<sup>®</sup> mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl*<sup>®</sup> oral spray may be prescribed as Chlorhexidine Oral Spray.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Dental gel

- ▶ **Corsodyl** (GlaxoSmithKline Consumer Healthcare)  
**Chlorhexidine gluconate 10 mg per 1 gram** Corsodyl 1% dental gel sugar-free | 50 gram [P] £1.26 DT price = £1.26

### Mouthwash

- ▶ **Chlorhexidine (Non-proprietary)**  
**Chlorhexidine gluconate 2 mg per 1 ml** Chlorhexidine gluconate 0.2% mouthwash natural | 300 ml [GSL] £3.65 DT price = £3.60  
Chlorhexidine gluconate 0.2% mouthwash | 300 ml [GSL] £1.99–£2.09 DT price = £3.60  
Chlorhexidine gluconate 0.2% mouthwash plain | 300 ml [GSL] £3.59 DT price = £3.60  
Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 ml [GSL] £3.65 DT price = £3.60  
Chlorhexidine gluconate 0.2% mouthwash original | 300 ml [GSL] £3.65 DT price = £3.60  
Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 ml [GSL] no price available DT price = £3.60 | 500 ml [GSL] no price available
- ▶ **Corsodyl** (GlaxoSmithKline Consumer Healthcare)  
**Chlorhexidine gluconate 2 mg per 1 ml** Corsodyl 0.2% mouthwash antiseed | 300 ml [GSL] £2.44 DT price = £3.60  
Corsodyl Mint 0.2% mouthwash | 300 ml [GSL] £2.44 DT price = £3.60 | 600 ml [GSL] £4.76  
Corsodyl 0.2% mouthwash alcohol free | 300 ml [GSL] £3.06 DT price = £3.60
- ▶ **Curasept** (Curaprox (UK) Ltd)  
**Chlorhexidine gluconate 2 mg per 1 ml** Curasept 0.2% oral rinse | 200 ml no price available

### Irrigation solution

- ▶ **Chlorhexidine (Non-proprietary)**  
**Chlorhexidine acetate 200 microgram per 1 ml** Chlorhexidine acetate 0.02% catheter maintenance solution | 100 ml [P] no price available
- ▶ **Uro-Tainer (chlorhexidine)** (B.Braun Medical Ltd)  
**Chlorhexidine acetate 200 microgram per 1 ml** Uro-Tainer chlorhexidine 1:5000 catheter maintenance solution | 100 ml [P] £2.70

## Chlorhexidine with chlorobutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1064.

### INDICATIONS AND DOSE

#### Oral hygiene and plaque inhibition

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6–17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided
- ▶ Adult: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided

#### Denture disinfection

- ▶ Adult: Soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include mint.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Hexetidine

### INDICATIONS AND DOSE

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
- ▶ Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

### SIDE-EFFECTS

- ▶ **Very rare** Taste disturbance - transient anaesthesia
- ▶ **Frequency not known** Local irritation

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Mouthwash

- ▶ **Oraldene** (McNeil Products Ltd)  
**Hexetidine 1 mg per 1 ml** Oraldene Icemint 0.1% mouthwash sugar-free | 200 ml [GSL] £2.21 DT price = £2.21  
Oraldene 0.1% mouthwash peppermint sugar-free | 100 ml [GSL] £1.43 sugar-free | 200 ml [GSL] £2.21 DT price = £2.21

## Hydrogen peroxide

- **DRUG ACTION** Hydrogen peroxide is an oxidising agent.

### INDICATIONS AND DOSE

#### Oral hygiene (with hydrogen peroxide 6%)

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water
- ▶ Adult: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

#### PEROXYL®

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
- ▶ Adult: Rinse or gargle 10 mL up to 4 times a day for about 1 minute, to be used after meals and at bedtime

- **SIDE-EFFECTS** Hypertrophy of papillae of tongue on prolonged use

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

### PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Hydrogen Peroxide Mouthwash may be prescribed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Mouthwash

- ▶ **Peroxyol** (Colgate-Palmolive (UK) Ltd)  
**Hydrogen peroxide 15 mg per 1 ml** Peroxyol 1.5% mouthwash sugar-free | 300 ml [GSL] £2.94

## Sodium bicarbonate with sodium chloride

### ● INDICATIONS AND DOSE

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Compound sodium chloride mouthwash may be prescribed.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash

## Sodium chloride

### ● INDICATIONS AND DOSE

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle as required
- ▶ Adult: Rinse or gargle as required

- **DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

- **PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Compound Sodium Chloride Mouthwash may be prescribed.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No Licensed medicines identified

supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

## VITAMINS AND TRACE ELEMENTS

### Sodium fluoride

#### ● INDICATIONS AND DOSE

##### Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride ion

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Adult: 1 mg daily, doses expressed as fluoride ion (F<sup>-</sup>)

##### Prophylaxis of dental caries for water content between 300 and 700micrograms/litre (0.3-0.7 parts per million) of fluoride ion

- ▶ BY MOUTH USING TABLETS
- ▶ Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Adult: 500 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)

##### Prophylaxis of dental caries for water content above 700micrograms/litre (0.7 parts per million) of fluoride ion

- ▶ Child 6 months-17 years: Supplements not advised
- ▶ Adult: Supplements not advised

##### Prophylaxis of dental caries for individuals who are caries prone or medically compromised

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: Rinse or gargle 10 mL daily

#### COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

##### Prophylaxis of dental caries

- ▶ BY MOUTH USING PASTE
- ▶ Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
- ▶ Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

#### COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

##### Prophylaxis of dental caries

- ▶ BY MOUTH USING PASTE
- ▶ Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
- ▶ Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

## 2.1 Dental caries

### Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable

**EN-DE-KAY® FLUORINSE****Prophylaxis of dental caries for individuals who are caries prone or medically compromised**

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
- ▶ These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182**: 6–7).

- **CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Occasional white flecks on teeth with recommended doses
  - ▶ **Rare** Yellowish-brown discoloration if recommended doses are exceeded
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
  - ▶ With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.
- **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Brush teeth for 1 minute before spitting out.
- **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Brush teeth for 3 minutes before spitting out.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.
- **PATIENT AND CARER ADVICE**
  - ▶ Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.
- **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.
- **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.
- **PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary**

Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops. Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** May be prescribed as Sodium Fluoride Toothpaste 0.619%.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** May be prescribed as Sodium Fluoride Toothpaste 1.1%.

**Dental information**

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Endekay** (Manx Healthcare Ltd)
  - Sodium fluoride 1.1 mg** Endekay Fluotabs 3-6 Years 1.1mg tablets | 200 tablet [P] £2.38 DT price = £2.38

## 3 Oral ulceration and inflammation

### Oral ulceration and inflammation

**Ulceration and inflammation**

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also *Chemotherapy induced mucositis and myelosuppression* under Cytotoxic drugs p. 797). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes**

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes**

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 1064 is often beneficial and may accelerate healing of recurrent aphthae.

**Corticosteroids**

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone **oromucosal tablets** p. 1070 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 1059 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 1052 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 1011), is reserved for severe conditions such as pemphigus vulgaris.

**Local analgesics**

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% ointment, below, or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% solution as spray can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Preparations on sale to the public:** many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzylamine hydrochloride p. 1069 and flurbiprofen p. 1069 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzylamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 1070 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

**Other preparations**

Doxycycline p. 1071 rinsed in the mouth may be of value for recurrent aphthous ulceration.

**Periodontitis**

Low-dose doxycycline (*Periostat*<sup>®</sup>) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal bacterial infections p. 1071. See also

Mouthwashes and other preparations for oropharyngeal use p. 1064 for mouthwashes used for oral hygiene and plaque inhibition.

**ANAESTHETICS, LOCAL****Lidocaine hydrochloride**

(Lignocaine hydrochloride)

**• INDICATIONS AND DOSE****Dental practice**

► BY BUCCAL ADMINISTRATION USING OINTMENT

► Adult: Rub gently into dry gum

**Relief of pain in oral lesions**

► TO THE LESION USING OINTMENT

► Adult: Apply as required, rub sparingly and gently on affected areas

**LARYNGOJET<sup>®</sup>****Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract**

► TO MUCOUS MEMBRANES

► Adult: 40–200 mg, to be given as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient); usual dose 160 mg

**XYLOCAINE<sup>®</sup>****Bronchoscopy | Laryngoscopy | Oesophagoscopy |****Endotracheal intubation**

► TO MUCOUS MEMBRANES

► Adult: Up to 20 doses

**Dental practice**

► TO MUCOUS MEMBRANES

► Adult: 1–5 doses

**Maxillary sinus puncture**

► TO MUCOUS MEMBRANES

► Adult: 3 doses

**Relief of pain in oral lesions**

► TO THE LESION

► Adult: Apply thinly to the ulcer using a cotton bud

- **UNLICENSED USE** Spray not licensed for the relief of pain in oral lesions.
- **CAUTIONS** Avoid anaesthesia of the pharynx before meals—risk of choking · can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.
- **SIDE-EFFECTS** A single application of a topical lidocaine preparation does not generally cause systemic side-effects.
- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%  
**XYLOCAINE®** May be prescribed as lidocaine spray 10%.

For preparations, see inhaled beclometasone, p. 244

## Betamethasone

### ● INDICATIONS AND DOSE

#### Oral ulceration

- ▶ TO THE LESION USING SOLUBLE TABLETS
- ▶ Child 12–17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
- ▶ Adult: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

### ● UNLICENSED USE

- ▶ In children Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

### ● CONTRA-INDICATIONS

- Untreated local infection

### ● SIDE-EFFECTS

- Candidal infection · exacerbation of local infection

### ● PATIENT AND CARER ADVICE

- Patient counselling is advised for betamethasone soluble tablets (administration).

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

#### ▶ Betamethasone (Non-proprietary)

**Betamethasone (as Betamethasone sodium phosphate)**

**500 microgram** Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [PbM] £42.60 DT price = £42.57

## Hydrocortisone

### ● INDICATIONS AND DOSE

#### Oral and perioral lesions

- ▶ TO THE LESION USING BUCCAL TABLET
- ▶ Child 1 month–11 years: Only on medical advice
- ▶ Child 12–17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- ▶ Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

### ● UNLICENSED USE

*Hydrocortisone mucoadhesive buccal tablets* licensed for use in children (under 12 years—on medical advice only).

### ● CONTRA-INDICATIONS

- Untreated local infection

### ● SIDE-EFFECTS

- Candidal infection · exacerbation of local infection

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Muco-adhesive buccal tablet

#### ▶ Hydrocortisone (Non-proprietary)

**Hydrocortisone (as Hydrocortisone sodium succinate)**

**2.5 mg** Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet [P] £6.83 DT price = £6.29

## SALICYLIC ACID AND DERIVATIVES

### Choline salicylate

### ● INDICATIONS AND DOSE

#### Mild oral and perioral lesions

- ▶ TO THE LESION
- ▶ Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- ▶ Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

### ● CONTRA-INDICATIONS

- Children under 16 years

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

### ● CAUTIONS

Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures

### ● SIDE-EFFECTS

- Transient local burning sensation

### ● PRESCRIBING AND DISPENSING INFORMATION

When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Choline Salicylate Dental Gel may be prescribed.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Salicylic acid with rhubarb extract

### ● INDICATIONS AND DOSE

#### Mild oral and perioral lesions

- ▶ TO THE LESION
- ▶ Child 16–17 years: Apply 3–4 times a day maximum duration 7 days
- ▶ Adult: Apply 3–4 times a day maximum duration 7 days

### ● CONTRA-INDICATIONS

- Children under 16 years

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

### ● CAUTIONS

Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures

### ● SIDE-EFFECTS

Temporary discolouration of oral mucosa · temporary discolouration of teeth · transient local burning sensation

### ● PATIENT AND CARER ADVICE

May cause temporary discolouration of teeth and oral mucosa.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Paint

EXCIPIENTS: May contain Ethanol

▶ **Pyralvex** (Meda Pharmaceuticals Ltd)

Salicylic acid 10 mg per 1 ml, Rhubarb extract 50 mg per 1 ml Pyralvex solution | 10 ml **P** £3.25

## 4 Oropharyngeal bacterial infections

### Oropharyngeal bacterial infections

#### Antibacterial therapy for pericoronitis

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 499, or *alternatively*, amoxicillin p. 506
- ▶ *Suggested duration of treatment* 3 days or until symptoms resolve.

#### Antibacterial therapy for gingivitis: acute necrotising ulcerative

Antibacterial required only if systemic features of infection.

- Metronidazole, or *alternatively*, amoxicillin
- ▶ *Suggested duration of treatment* 3 days or until symptoms resolve.

#### Antibacterial therapy for periapical or periodontal abscess

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or *alternatively*, metronidazole
- ▶ *Suggested duration of treatment* 5 days.

#### Antibacterial therapy for periodontitis

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or *alternatively* in adults and children over 12 years, doxycycline below

#### Antibacterial therapy for throat infections

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 504
- ▶ In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 504, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 507). **Avoid** amoxicillin if possibility of glandular fever.
- ▶ *Suggested duration of treatment* 10 days.
- If penicillin-allergic, clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- ▶ *Suggested duration of treatment* 10 days

### ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

F 520

## Doxycycline

#### INDICATIONS AND DOSE

##### Treatment of recurrent aphthous ulceration

- ▶ BY MOUTH USING SOLUBLE TABLETS
- ▶ Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2-3 minutes, it should preferably not be swallowed
- ▶ Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2-3 minutes, it should preferably not be swallowed

- **UNLICENSED USE** Not licensed for use in children under 12 years. Not licensed for severe recurrent aphthous ulceration.

- **CAUTIONS** Alcohol dependence

- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.

- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · tinnitus

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

#### PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

## 5 Oropharyngeal fungal infections

### Oropharyngeal fungal infections

#### Overview

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

#### Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 1073 or

miconazole below may be needed. Fluconazole p. 548 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

#### Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

#### Denture stomatitis

Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only).

Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

#### Chronic hyperplastic candidiasis

Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole to eliminate candidal overlay. Patients should avoid the use of tobacco.

#### Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 527; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 1107 can be used.

#### Immunocompromised patients

See advice on prevention of fungal infections in *Immunocompromised patients* under Antifungals, systemic use p. 544.

#### Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 550 can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by

appropriate anticandidal therapy; the patient's partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.

## ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

### Miconazole

#### • INDICATIONS AND DOSE

##### Prevention and treatment of oral candidiasis

###### ► BY MOUTH USING ORAL GEL

- Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

##### Prevention and treatment of intestinal candidiasis

###### ► BY MOUTH USING ORAL GEL

- Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
- Adult: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

- **UNLICENSED USE** Not licensed for use in children under 4 months of age or during first 5-6 months of life of an infant born pre-term.

- **CONTRA-INDICATIONS** Infants with impaired swallowing reflex

- **CAUTIONS** Avoid in acute porphyrias p. 930

- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).

#### ● SIDE-EFFECTS

- **Common or very common** Nausea · rash · vomiting
- **Very rare** Diarrhoea (usually on long term treatment) · hepatitis · rash (in children) · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in *animal* studies.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **HEPATIC IMPAIRMENT** Avoid.

- **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.

#### ● PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Miconazole Oromucosal Gel may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Oromucosal gel

CAUTIONARY AND ADVISORY LABELS 9

▶ **Daktarin** (McNeil Products Ltd, Janssen-Cilag Ltd)

**Miconazole 20 mg per 1 gram** Daktarin 20mg/g oromucosal gel  
sugar-free | 15 gram [P] £3.23 DT price = £3.23 sugar-free | 80  
gram [PoM] £4.38 DT price = £4.38

## ANTIFUNGALS > POLYENE ANTIFUNGALS

### Nystatin

06-Jun-2016

#### ● INDICATIONS AND DOSE

##### Oral candidiasis

▶ BY MOUTH

- ▶ Child: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved
- ▶ Adult: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved

● **SIDE-EFFECTS** Local irritation · local sensitisation · nausea

● **PATIENT AND CARER ADVICE** Counselling advised with oral suspension (use of pipette, hold in mouth, after food).

EXCIPIENTS: May contain Ethanol

▶ **Nystatin (Non-proprietary)**

**Nystatin 100000 unit per 1 ml** Nystatin 100,000units/ml oral suspension | 30 ml [PoM] £2.73 DT price = £2.09

▶ **Nystan** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Nystatin 100000 unit per 1 ml** Nystan 100,000units/ml oral suspension (ready mixed) | 30 ml [PoM] £1.80 DT price = £2.09

## 6 Oropharyngeal viral infections

### Oropharyngeal viral infections

#### Management

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzydamine hydrochloride p. 1069. The use of chlorhexidine mouthwash p. 1064 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 585 is required. Valaciclovir p. 587 and famciclovir p. 587 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.

## Skin conditions, management

### Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at [www.bad.org.uk/specials](http://www.bad.org.uk/specials).

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

**Applications** are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

**Collodions** are painted on the skin and allowed to dry to leave a flexible film over the site of application.

**Creams** are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

**Gels** consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

**Lotions** have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

**Ointments** are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic* and *lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they

have a limited but useful role where ready removal is desirable.

**Pastes** are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

**Dusting powders** are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

### Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### Suitable quantities for prescribing

#### Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments	Lotions
Face	15–30 g	100 ml
Both hands	25–50 g	200 ml
Scalp	50–100 g	200 ml
Both arms or both legs	100–200 g	200 ml
Trunk	400 g	500 ml
Groins and genitalia	15–25 g	100 ml

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations **do not** apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.

## Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

# 1 Dry and scaling skin disorders

## Emollient and barrier preparations

### Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

### Emollients

**Emollients** soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

### Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less

should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

### MHRA/CHM update (April 2016): Fire risk with paraffin-based skin emollients on dressings and clothing

When patients are being treated with a paraffin-based emollient product that is covered by a dressing or clothing, there is a danger that smoking or using a naked flame could cause dressings or clothing to catch fire.

Patients should be advised not to smoke, use naked flames (or be near people who are smoking or using naked flames), or go near anything that may cause a fire while emollients are in contact with their medical dressings or clothing. Patients' clothing and bedding should be changed regularly—preferably daily—because emollients soak into fabric and can become a fire hazard.

### Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 1091 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

### Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 620 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 758 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

## DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

### Barrier creams and ointments

#### ● INDICATIONS AND DOSE

##### For use as a barrier preparation

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

**EXCIPIENTS:** May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, wool fat and related substances including lanolin

##### ▶ Conotrane (LEO Pharma)

**Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram** Conotrane cream | 100 gram **GSL** £0.88 DT price = £0.88 | 500 gram **GSL** £3.51

- ▶ **Drapolene** (Omega Pharma Ltd)  
Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram | Drapolene cream | 100 gram [GSL] £1.76 | 200 gram [GSL] £2.86 | 350 gram [GSL] £4.28
- ▶ **Siopel** (Derma UK Ltd)  
Cetrimide 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram | Siopel cream | 50 gram [GSL] £4.65
- ▶ **Sudocrem** (Forest Laboratories UK Ltd)  
Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrous 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram | Sudocrem antiseptic healing cream | 60 gram [GSL] £1.45 | 125 gram [GSL] £2.15 | 250 gram [GSL] £3.67 | 400 gram [GSL] £5.25

**Ointment**

EXCIPIENTS: May contain Wool fat and related substances including lanolin

- ▶ **Barrier creams and ointments (Non-proprietary)**  
Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram | Zinc and Castor oil ointment | 100 gram [GSL] £1.41 | 500 gram [GSL] £4.99–£5.34 DT price = £5.34
- ▶ Zinc and Castor oil cream | 100 gram [GSL] £1.41
- ▶ Brands may include Metanium

**Spray**

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), wool fat and related substances including lanolin

- ▶ **Sprilon** (J M Loveridge Ltd)  
Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram | Sprilon aerosol spray | 115 gram [GSL] £8.90 DT price = £8.90

**DERMATOLOGICAL DRUGS > EMOLLIENTS****Emollient bath and shower products, antimicrobial-containing**

31-Aug-2016

**● INDICATIONS AND DOSE****DERMOL® 200 SHOWER EMOLLIENT****Dry and pruritic skin conditions including eczema and dermatitis****▶ TO THE SKIN**

- ▶ Child: To be applied to the skin or used as a soap substitute
- ▶ Adult: To be applied to the skin or used as a soap substitute

**DERMOL® 600® BATH EMOLLIENT****Dry and pruritic skin conditions including eczema and dermatitis****▶ TO THE SKIN**

- ▶ Child 1-23 months: 5–15 mL/bath, not to be used undiluted
- ▶ Child 2-17 years: 15–30 mL/bath, not to be used undiluted
- ▶ Adult: Up to 30 mL/bath, not to be used undiluted

**DERMOL® WASH EMULSION****Dry and pruritic skin conditions including eczema and dermatitis****▶ TO THE SKIN**

- ▶ Child: To be applied to the skin or used as a soap substitute
- ▶ Adult: To be applied to the skin or used as a soap substitute

**EMULSIDERM®****Dry skin conditions including eczema and ichthyosis****▶ TO THE SKIN**

- ▶ Child 1-23 months: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- ▶ Child 2-17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- ▶ Adult: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

**OILATUM® PLUS****Topical treatment of eczema, including eczema at risk from infection****▶ TO THE SKIN**

- ▶ Child 6-11 months: 1 mL/bath, not to be used undiluted
- ▶ Child 1-17 years: 1–2 capfuls/bath, not to be used undiluted
- ▶ Adult: 1–2 capfuls/bath, not to be used undiluted

**IMPORTANT SAFETY INFORMATION**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING  
See Emollient and barrier preparations p. 1075.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION**  
Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- ▶ Child 12-17 years: 15–20 mL/bath
- ▶ Adult: 15–20 mL/bath

**Pruritus of the elderly**

## ▶ TO THE SKIN

- ▶ Elderly: 15–20 mL/bath

**IMPORTANT SAFETY INFORMATION**

These preparations make the skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING  
See Emollient and barrier preparations p. 1075.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

QV Gentle wash | 250 ml £3.17 | 500 ml £5.29

## Emollient bath and shower products, soya-bean oil-containing

### ● INDICATIONS AND DOSE

#### BALNEUM® BATH OIL

Dry skin conditions including those associated with dermatitis and eczema

- ▶ TO THE SKIN
- ▶ Child 1-23 months: 5-15 mL/bath, not to be used undiluted
- ▶ Child 2-17 years: 20-60 mL/bath, not to be used undiluted
- ▶ Adult: 20-60 mL/bath, not to be used undiluted

#### BALNEUM® PLUS BATH OIL

Dry skin conditions including those associated with dermatitis and eczema where pruritus also experienced

- ▶ TO THE SKIN
- ▶ Child 1-23 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 2-17 years: 10-20 mL/bath, alternatively, to be applied to wet skin and rinse
- ▶ Adult: 20 mL/bath, alternatively, to be applied to wet skin and rinse

#### ZERONEUM®

Dry skin conditions including eczema

- ▶ TO THE SKIN
- ▶ Child 1 month-11 years: 5 mL/bath
- ▶ Child 12-17 years: 20 mL/bath
- ▶ Adult: 20 mL/bath

### IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10-20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Bath additive

EXCIPIENTS: May contain Butylated hydroxytoluene, fragrances, propylene glycol

- ▶ **Balneum** (Almirall Ltd)  
Lauroamogrols 150 mg per 1 gram, Soya oil 829.5 mg per 1 gram | Balneum Plus bath oil | 500 ml [GSL] £6.66  
Soya oil 847.5 mg per 1 gram | Balneum 84.75% bath oil | 200 ml [GSL] £2.48 | 500 ml [GSL] £5.38 | 1000 ml [GSL] £10.39
- ▶ **Zeroneum** (Thornton & Ross Ltd)  
Soya oil 833.5 mg per 1 gram | Zeroneum 83.35% bath additive | 500 ml £4.48

## Emollient bath and shower products, tar-containing

17-Aug-2016

### ● INDICATIONS AND DOSE

#### POLYTAR EMOLLIENT®

Psoriasis, eczema, atopic and pruritic dermatoses

- ▶ TO THE SKIN
- ▶ Adult: 2-4 capfuls/bath, add 15-30 mL to an adult-size bath; soak for 20 minutes

### PSORIDERM® EMULSION

#### Psoriasis

- ▶ TO THE SKIN
- ▶ Adult: Up to 30 mL/bath, use 30mL in adult-size bath, soak for 5 minutes

### IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10-20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Bath additive

EXCIPIENTS: May contain Isopropyl palmitate, polysorbates

- ▶ **Psoriderm** (Dermal Laboratories Ltd)

Coal tar distilled 400 mg per 1 ml | Psoriderm Emulsion 40% bath additive | 200 ml [P] £2.74

## Emollient creams and ointments, antimicrobial-containing

17-Aug-2016

### ● INDICATIONS AND DOSE

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child: To be applied to the skin or used as a soap substitute
- ▶ Adult: To be applied to the skin or used as a soap substitute

### IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

See Emollient and barrier preparations p. 1075.

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION**  
Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Dry, scaling, and itching skin

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs
- ▶ Adult: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

#### DERMATONICS ONCE HEEL BALM®

##### Dry skin on soles of feet

- ▶ TO THE SKIN
- ▶ Child 12–17 years: Apply once daily
- ▶ Adult: Apply once daily

#### E45® ITCH RELIEF CREAM

##### Dry, scaling, and itching skin

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

#### EUCERIN® INTENSIVE CREAM

##### Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied thinly and rubbed into area
- ▶ Adult: Apply twice daily, to be applied thinly and rubbed into area

#### EUCERIN® INTENSIVE LOTION

##### Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied sparingly and rubbed into area
- ▶ Adult: Apply twice daily, to be applied sparingly and rubbed into area

#### FLEXITOL®

##### Dry skin on soles of feet and heels

- ▶ TO THE SKIN
- ▶ Child 12–17 years: Apply 1–2 times a day
- ▶ Adult: Apply 1–2 times a day

continued →

**HYDROMOL® INTENSIVE****Dry, scaling, and itching skin**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied thinly
- ▶ Adult: Apply twice daily, to be applied thinly

**IMUDERM® EMOLLIENT****Dry skin conditions including eczema, psoriasis or dermatitis**

- ▶ TO THE SKIN
- ▶ Adult: Apply to skin or use as a soap substitute

**NUTRAPLUS®****Dry, scaling, and itching skin**

- ▶ TO THE SKIN
- ▶ Child: Apply 2–3 times a day
- ▶ Adult: Apply 2–3 times a day

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

EXCIPIENTS: May contain Benzyl alcohol, isopropyl palmitate

- ▶ **Eucerin** (Beiersdorf UK Ltd)

**Urea 100 mg per 1 gram** Eucerin Intensive 10% lotion | 250 ml [GSL] £7.93

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), isopropyl palmitate, polysorbates, propylene glycol, wool fat and related substances including lanolin

- ▶ **Aquadrate** (Alliance Pharmaceuticals Ltd)

**Urea 100 mg per 1 gram** Aquadrate 10% cream | 100 gram [P] £4.37

- ▶ **Balneum** (Almirall Ltd)

## 2 Infections of the skin

### Skin infections

#### Antibacterial preparations

*Cellulitis*, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis.

*Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid p. 1089; mupirocin p. 1086 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as flucloxacillin p. 511 (or clarithromycin p. 496 in penicillin allergy) should be used. Mild antiseptics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be **avoided** on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1084, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 479. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins p. 1085), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine p. 1032, chlorhexidine p. 1064, or alcohol can be used; their use should be discussed with the local microbiologist.

Retapamulin p. 1086 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Tedizolid p. 528 is licensed for the treatment of acute bacterial skin and skin structure infections.

Silver sulfadiazine p. 1085 is used in the treatment of infected burns.

#### Antibacterial preparations also used systemically

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1071 for further information on angular cheilitis.

Metronidazole p. 1084 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

### Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

#### Dermatophytoses

Ringworm infection can affect the scalp (*tinea capitis*), body (*tinea corporis*), groin (*tinea cruris*), hand (*tinea manuum*), foot (*tinea pedis*, athlete's foot), or nail (*tinea unguium*). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1087, econazole nitrate p. 1087, ketoconazole p. 1087, and miconazole p. 1088 are all effective. Terbinafine cream p. 1089 is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1089 and the **undecenoates**. **Compound benzoid acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1088 or tioconazole p. 1088 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

#### Pityriasis versicolor

Pityriasis (*tinea*) versicolor can be treated with ketoconazole shampoo. Alternatively, **selenium sulfide** shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

#### Candidiasis

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin p. 1073 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 548; systemic treatment with terbinafine is **not appropriate** for refractory candidiasis.

#### Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

#### Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 620) may be of value in the treatment of eczematous intertrigo and, in the first few days of, a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin p. 1073 may be of use in the treatment of intertrigo associated with candida.

#### Antiviral preparations

Aciclovir cream p. 1092 is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster* (*shingles*).

#### Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

#### Parasitocidal preparations

##### Suitable quantities of parasitocidal preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	
Body (crab lice)	30–60 g	100 mL	
These amounts are usually suitable for an adult for single application.			

#### Scabies

Permethrin p. 1092 is used for the treatment of *scabies* (*Sarcoptes scabiei*); malathion p. 1092 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1091 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 557 (available on a named patient basis from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses may be required.

#### Application

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

#### Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1117 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

#### Head lice

Dimeticone p. 1091 is effective against head lice (*Pediculus humanus capitis*). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

#### Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)

- Scottish Drug Tariff: [www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)

#### Crab lice

Permethrin and malathion are used to eliminate *crab lice* (*Phthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular

attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

## 2.1 Bacterial skin infections

### ANTIBACTERIALS > AMINOGLYCOSIDES

#### Neomycin sulfate

##### • INDICATIONS AND DOSE

##### Bacterial skin infections

##### ▶ TO THE SKIN

- ▶ Child: Apply up to 3 times a day, for short-term use only
- ▶ Adult: Apply up to 3 times a day, for short-term use only

##### • UNLICENSED USE

- ▶ In children *Neomycin Cream BPC*—no information available.

##### • CONTRA-INDICATIONS Neonates

- **CAUTIONS** If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, the elderly, and in those with renal impairment.

##### • INTERACTIONS → Appendix 1 (aminoglycosides).

- **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)

- **RENAL IMPAIRMENT** Ototoxicity may be a hazard if large areas of skin are treated.

- **LESS SUITABLE FOR PRESCRIBING** Neomycin sulfate cream is less suitable for prescribing.

##### • MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

### ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

#### Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

##### • INDICATIONS AND DOSE

##### ACEA®

##### Acute inflammatory exacerbation of rosacea

##### ▶ TO THE SKIN

- ▶ Adult: Apply twice daily for 8 weeks, to be applied thinly

##### ANABACT®

##### Malodorous fungating tumours and malodorous gravitational and decubitus ulcers

##### ▶ TO THE SKIN

- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

##### METROGEL®

##### Acute inflammatory exacerbation of rosacea

##### ▶ TO THE SKIN

- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

##### Malodorous fungating tumours

##### ▶ TO THE SKIN

- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

**METROSA®****Acute exacerbation of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for up to 8 weeks, to be applied thinly

**ROSICED®****Inflammatory papules and pustules of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 6 weeks (longer if necessary)

**ROZEX® CREAM****Inflammatory papules, pustules and erythema of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 3–4 months

**ROZEX® GEL****Inflammatory papules, pustules and erythema of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 3–4 months

**ZYOMET®****Acute inflammatory exacerbation of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

- **CAUTIONS** Avoid exposure to strong sunlight or UV light
- **SIDE-EFFECTS** Skin irritation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, gel

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, isopropyl palmitate, propylene glycol

- ▶ **Rosiced** (Pierre Fabre Dermo-Cosmetique)  
**Metronidazole 7.5 mg per 1 gram** Rosiced 0.75% cream | 30 gram **[PoM]** £7.50 DT price = £6.60
- ▶ **Rozex** (Galderma (UK) Ltd)  
**Metronidazole 7.5 mg per 1 gram** Rozex 0.75% cream | 30 gram **[PoM]** £6.60 DT price = £6.60 | 40 gram **[PoM]** £9.88 DT price = £9.88

**Gel**

EXCIPIENTS: May contain Benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol

- ▶ **Acea** (Ferndale Pharmaceuticals Ltd)  
**Metronidazole 7.5 mg per 1 gram** Acea 0.75% gel | 40 gram **[PoM]** £9.95 DT price = £22.63
- ▶ **Anabact** (Cambridge Healthcare Supplies Ltd)  
**Metronidazole 7.5 mg per 1 gram** Anabact 0.75% gel | 15 gram **[PoM]** £4.47 DT price = £4.47 | 30 gram **[PoM]** £7.89
- ▶ **Metrogel** (Galderma (UK) Ltd)  
**Metronidazole 7.5 mg per 1 gram** Metrogel 0.75% gel | 40 gram **[PoM]** £22.63 DT price = £22.63
- ▶ **Metrosa** (M & A Pharmachem Ltd)  
**Metronidazole 7.5 mg per 1 gram** Metrosa 0.75% gel | 30 gram **[PoM]** £12.00 | 40 gram **[PoM]** £19.90 DT price = £22.63
- ▶ **Rozex** (Galderma (UK) Ltd)  
**Metronidazole 7.5 mg per 1 gram** Rozex 0.75% gel | 30 gram **[PoM]** £6.60 | 40 gram **[PoM]** £9.88 DT price = £22.63
- ▶ **Zyomet** (AMCo)  
**Metronidazole 7.5 mg per 1 gram** Zyomet 0.75% gel | 30 gram **[PoM]** £12.00

**ANTIBACTERIALS > POLYMYXINS****Polymyxins****INDICATIONS AND DOSE****Bacterial skin infections**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily, may be applied more frequently if required

- **CAUTIONS** If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment.

- **SIDE-EFFECTS** Sensitisation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

**ANTIBACTERIALS > SULFONAMIDES****Silver sulfadiazine****INDICATIONS AND DOSE****Prophylaxis and treatment of infection in burn wounds**

- ▶ TO THE SKIN
- ▶ Child: Apply daily, may be applied more frequently if very exudative
- ▶ Adult: Apply daily, may be applied more frequently if very exudative

**For conservative management of finger-tip injuries**

- ▶ TO THE SKIN
- ▶ Child: Apply every 2–3 days, consult product literature for details
- ▶ Adult: Apply every 2–3 days, consult product literature for details

**Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**Adjunct to short-term treatment of infection in pressure sores**

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily or on alternate days

**As an adjunct to short-term treatment of infection in leg ulcers**

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

**UNLICENSED USE**

- ▶ In children No age range specified by manufacturer.

- **CONTRA-INDICATIONS** Not recommended for neonates

- **CAUTIONS** G6PD deficiency

**CAUTIONS, FURTHER INFORMATION**

- ▶ Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides if large areas of skin are treated.

- **INTERACTIONS** → Appendix 1 (sulfonamides)—if large amounts given.

May inactivate enzymatic debriding agents—concomitant use may be inappropriate.

- **SIDE-EFFECTS** Allergic reactions · argyria (following treatment of large areas of skin or prolonged use) · burning · itching · leucopenia · rashes

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Severe blood and skin disorders Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sensitivity to sulfonamides.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **MONITORING REQUIREMENTS** Monitor for leucopenia.
- **DIRECTIONS FOR ADMINISTRATION** Apply with sterile applicator.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Flamazine** (Smith & Nephew Healthcare Ltd)

**Sulfadiazine silver 10 mg per 1 gram** Flamazine 1% cream | 20 gram [PoM] £2.91 | 50 gram [PoM] £3.85 DT price = £3.85 | 250 gram [PoM] £10.32 DT price = £10.32 | 500 gram [PoM] £18.27 DT price = £18.27

## ANTIBACTERIALS > OTHER

### Bacitracin with polymyxin B

#### INDICATIONS AND DOSE

##### Bacterial skin infections

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, can be applied more frequently if required
- ▶ Adult: Apply twice daily, can be applied more frequently if required

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Nephrotoxicity · neurotoxicity  
**CAUTIONS, FURTHER INFORMATION**  
If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment.
- **SIDE-EFFECTS** Contact sensitisation
- **RENAL IMPAIRMENT** Renal impairment increases the risk of nephrotoxicity and neurotoxicity.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Ointment

- ▶ **Polyfax** (Teva UK Ltd)

**Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate 10000 unit per 1 gram** Polyfax ointment | 4 gram [PoM] £3.26 | 20 gram [PoM] £4.62 DT price = £4.62

### Mupirocin

#### INDICATIONS AND DOSE

##### Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)

- ▶ TO THE SKIN
- ▶ Child: Apply up to 3 times a day for up to 10 days
- ▶ Adult: Apply up to 3 times a day for up to 10 days

- **UNLICENSED USE** Mupirocin ointment is licensed for use in children (age range not specified by manufacturer). **Bactroban**<sup>®</sup> cream not recommended for use in children under 1 year.

- **SIDE-EFFECTS** Burning sensation · local reactions · pruritus · rash · urticaria
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

**Mupirocin (as Mupirocin calcium) 20 mg per 1 gram** Bactroban 2% cream | 15 gram [PoM] £5.26 DT price = £5.26

##### Ointment

- ▶ **Mupirocin (Non-proprietary)**

**Mupirocin 20 mg per 1 gram** Mupirocin 2% ointment | 15 gram [PoM] £14.25 DT price = £5.26

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

**Mupirocin 20 mg per 1 gram** Bactroban 2% ointment | 15 gram [PoM] £5.26 DT price = £5.26

### Retapamulin

#### INDICATIONS AND DOSE

##### Superficial bacterial skin infection caused by *Staphylococcus aureus* and *Streptococcus pyogenes* (if resistant to first line topical antibacterials)

- ▶ TO THE SKIN
- ▶ Child 9 months–17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days
- ▶ Adult: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 100 cm<sup>2</sup> or lesion length 10 cm, review treatment if no response within 2–3 days

- **CONTRA-INDICATIONS** Contact with eyes · contact with mucous membranes
- **SIDE-EFFECTS** Contact dermatitis · localised erythema · localised irritation · localised pain · pruritus

#### NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that retapamulin (*Altargo*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the treatment of superficial skin infections.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

- ▶ **Altargo** (GlaxoSmithKline UK Ltd)

**Retapamulin 10 mg per 1 gram** Altargo 10mg/g ointment | 5 gram [PoM] £7.89

## 2.2 Fungal skin infections

### ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

#### Clotrimazole

##### ● INDICATIONS AND DOSE

##### Fungal skin infections

- ▶ TO THE SKIN
- ▶ Child: Apply 2–3 times a day
- ▶ Adult: Apply 2–3 times a day

- **CAUTIONS** Contact with eyes and mucous membranes should be avoided
- **SIDE-EFFECTS** Local irritation · erythema · hypersensitivity reactions · itching · mild burning sensation
- SIDE-EFFECTS, FURTHER INFORMATION**  
Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.
- **PRESCRIBING AND DISPENSING INFORMATION** Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

- ▶ **Canesten (clotrimazole)** (Bayer Plc)  
Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml [P]  
£2.30 DT price = £2.30

##### Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Clotrimazole (Non-proprietary)**  
Clotrimazole 10 mg per 1 gram Clotrimazole 1% cream | 20 gram [P] £2.06 DT price = £1.07 | 50 gram [P] £5.45 DT price = £2.68
- ▶ **Canesten (clotrimazole)** (Bayer Plc)  
Clotrimazole 10 mg per 1 gram Canesten 1% cream | 20 gram [P] £2.14 DT price = £1.07 | 50 gram [P] £3.50 DT price = £2.68  
Canesten Antifungal 1% cream | 20 gram [P] £1.85 DT price = £1.07

Combinations available: **Hydrocortisone with clotrimazole**, p. 1107

#### Econazole nitrate

##### ● INDICATIONS AND DOSE

##### Fungal skin infections

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

##### Fungal nail infections

- ▶ BY TRANSUNGUAL APPLICATION
- ▶ Child: Apply once daily, applied under occlusive dressing
- ▶ Adult: Apply once daily, applied under occlusive dressing

- **CAUTIONS** Avoid contact with eyes and mucous membranes
- **SIDE-EFFECTS** Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**  
Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances

- ▶ **Pevaryl** (Janssen-Cilag Ltd)  
Econazole nitrate 10 mg per 1 gram Pevaryl 1% cream | 30 gram [P] £3.71

#### Ketoconazole

##### ● INDICATIONS AND DOSE

##### Tinea pedis

▶ TO THE SKIN USING CREAM

- ▶ Adult: Apply twice daily

##### Fungal skin infection (not Tinea pedis)

▶ TO THE SKIN USING CREAM

- ▶ Adult: Apply 1–2 times a day

##### Treatment of seborrhoeic dermatitis and dandruff

▶ TO THE SKIN USING SHAMPOO

- ▶ Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing

##### Prophylaxis of seborrhoeic dermatitis and dandruff

▶ TO THE SKIN USING SHAMPOO

- ▶ Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing

##### Treatment of pityriasis versicolor

▶ TO THE SKIN USING SHAMPOO

- ▶ Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

##### Prophylaxis of pityriasis versicolor

▶ TO THE SKIN USING SHAMPOO

- ▶ Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CAUTIONS** Avoid contact with eyes · avoid contact with mucous membranes
- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS** Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**  
Treatment should be discontinued if side-effects are severe.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** Ketoconazole cream is not prescribable on the NHS except for seborrhoeic dermatitis and pityriasis versicolor and endorsed 'SLS'.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ With topical use for Fungal skin infections in adults A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo.
  - ▶ With topical use for Seborrhoeic dermatitis and dandruff Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

▶ **Daktarin Gold** (McNeil Products Ltd)

**Ketoconazole 20 mg per 1 gram** Daktarin Gold 2% cream | 15 gram [P] £3.16

## Griseofulvin

#### ● INDICATIONS AND DOSE

##### Tinea pedis

▶ TO THE SKIN

- ▶ Adult: Apply 400 micrograms once daily, apply to an area approximately 13 cm<sup>2</sup>; increased if necessary to 1.2 mg once daily for maximum treatment duration of 4 weeks, allow each spray to dry between application

- **CAUTIONS** Avoid contact with eyes and mucous membranes
- **INTERACTIONS** → Appendix 1 (griseofulvin).
- **SIDE-EFFECTS** Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**  
Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Spray

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Benzyl alcohol

##### ▶ Grisof AF (Transdermal Ltd)

**Griseofulvin 10 mg per 1 gram** Grisof AF 1% spray | 20 ml [P] £3.35

## Terbinafine

#### ● INDICATIONS AND DOSE

##### Tinea pedis

▶ TO THE SKIN USING CREAM

- ▶ Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly

▶ BY MOUTH USING TABLETS

- ▶ Adult: 250 mg once daily for 2–6 weeks

##### Tinea corporis

▶ TO THE SKIN USING CREAM

- ▶ Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

▶ BY MOUTH USING TABLETS

- ▶ Adult: 250 mg once daily for 4 weeks

##### Tinea cruris

▶ TO THE SKIN USING CREAM

- ▶ Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

▶ BY MOUTH USING TABLETS

- ▶ Adult: 250 mg once daily for 2–4 weeks

##### Dermatophyte infections of the nails

▶ BY MOUTH USING TABLETS

- ▶ Adult: 250 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)

##### Cutaneous candidiasis | Pityriasis versicolor

▶ TO THE SKIN USING CREAM

- ▶ Adult: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

#### ● CAUTIONS

- ▶ With oral use Autoimmune disease (risk of lupus-erythematosus-like effect) · psoriasis (risk of exacerbation)
- ▶ With topical use Contact with eyes and mucous membranes should be avoided

#### ● INTERACTIONS

- ▶ With oral use → Appendix 1 (terbinafine).

#### ● SIDE-EFFECTS

##### ▶ Common or very common

- ▶ With oral use Abdominal discomfort · anorexia · arthralgia · diarrhoea · dyspepsia · headache · myalgia · nausea · rash · urticaria

##### ▶ Uncommon

- ▶ With oral use Taste disturbance

##### ▶ Rare

- ▶ With oral use Cholestasis · dizziness · hepatitis · hypoaesthesia · jaundice · liver toxicity · malaise · paraesthesia

##### ▶ Very rare

- ▶ With oral use Alopecia · blood disorders · lupus erythematosus-like effect · neutropenia · photosensitivity · serious skin reactions · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis

##### ▶ Frequency not known

- ▶ With oral use Disturbances in smell · exacerbation of psoriasis · hearing disturbances · influenza-like symptoms · pancreatitis · rhabdomyolysis · vasculitis
- ▶ With topical use Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation

#### SIDE-EFFECTS, FURTHER INFORMATION

▶ Liver toxicity

- ▶ With oral use Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

▶ Serious skin reactions

- ▶ With oral use Discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

- ▶ Topical application Treatment should be discontinued if side effects are severe.

### ● PREGNANCY

- ▶ With topical use Manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects.
- ▶ With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.

### ● BREAST FEEDING

- ▶ With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest.
- ▶ With oral use Avoid—present in milk.

### ● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises avoid—elimination reduced.

### ● RENAL IMPAIRMENT

- ▶ With oral use Use half normal dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> and no suitable alternative available.

### ● MONITORING REQUIREMENTS

- ▶ With oral use Monitor hepatic function before treatment and then every 4–6 weeks during treatment—discontinue if abnormalities in liver function tests.

### ● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With topical use Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## BENZOATES

## Benzoic acid with salicylic acid

## ● INDICATIONS AND DOSE

**Ringworm (tinea)**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Avoid broken or inflamed skin · avoid contact with eyes · avoid contact with mucous membranes
- CAUTIONS, FURTHER INFORMATION**
- ▶ Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin.
- **SIDE-EFFECTS** Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**
- Treatment should be discontinued if side effects are severe.
- **PRESCRIBING AND DISPENSING INFORMATION** Benzoic Acid Ointment, Compound, BP has also been referred to as Whitfield's ointment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

## SALICYLIC ACID AND DERIVATIVES

## Boric acid with salicylic acid and tannic acid

## ● INDICATIONS AND DOSE

**Fungal nail infection, particularly tinea**

- ▶ BY TRANSUNGUAL APPLICATION
- ▶ Child 5-17 years: Apply twice daily, and after washing
- ▶ Adult: Apply twice daily, and after washing

- **CAUTIONS** Avoid broken or inflamed skin · contact with eyes and mucous membranes should be avoided · use with caution in children likely to suck affected digits
- CAUTIONS, FURTHER INFORMATION**
- ▶ Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin.
- **SIDE-EFFECTS** Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**
- Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Avoid.
- **MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- No licensed medicines identified.

## 2.3 Parasitic skin infections

## PARASITICIDES

## Benzyl benzoate

## ● INDICATIONS AND DOSE

**Scabies**

- ▶ TO THE SKIN
- ▶ Adult: Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

- **CAUTIONS** Avoid contact with eyes and mucous membranes · children (not recommended) · do not use on broken or secondarily infected skin
- **SIDE-EFFECTS** Burning sensation (especially on genitalia and excoriations) · rashes · skin irritation
- **BREAST FEEDING** Suspend feeding until product has been washed off.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Benzyl Benzoate Application, BP consists of benzyl benzoate 25% in an emulsion basis.
- Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears. Note—dilution to reduce irritant effect also reduces efficacy.
- **LESS SUITABLE FOR PRESCRIBING** Benzyl benzoate is less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

## Dimeticone

## ● INDICATIONS AND DOSE

**Head lice**

- ▶ TO THE SKIN
- ▶ Child: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)
- ▶ Adult: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.
- **CAUTIONS** Avoid contact with eyes · children under 6 months, medical supervision required
- **SIDE-EFFECTS** Skin irritation
- **PATIENT AND CARER ADVICE** Patients should be told to keep hair away from fire and flames during treatment.
- **MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

- Dimeticone 40 mg per 1 gram** Hedrin 4% lotion | 50 ml [P] £2.98 DT price = £2.98 | 150 ml [P] £6.92 DT price = £6.92

**Cutaneous spray solution**

- ▶ Hedrin (Thornton & Ross Ltd)
- Dimeticone 40 mg per 1 gram** Hedrin 4% spray | 120 ml [GS] £7.13

## Malathion

### ● INDICATIONS AND DOSE

#### Head lice

- ▶ TO THE SKIN
- ▶ Child: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours
- ▶ Adult: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours

#### Crab lice

- ▶ TO THE SKIN
- ▶ Child: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight
- ▶ Adult: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight

#### Scabies

- ▶ TO THE SKIN
- ▶ Child: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated
- ▶ Adult: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.
- **CAUTIONS** Alcoholic lotions **not** recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice · avoid contact with eyes · children under 6 months, medical supervision required · do not use lotion more than once a week for 3 consecutive weeks · do not use on broken or secondarily infected skin
- **SIDE-EFFECTS** Chemical burns · hypersensitivity reactions · skin irritation
- **PRESCRIBING AND DISPENSING INFORMATION** For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Liquid

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)

- ▶ **Derbac-M** (G.R. Lane Health Products Ltd)

**Malathion 5 mg per 1 gram** Derbac-M 0.5% liquid | 50 ml [P] £3.57  
DT price = £3.57 | 200 ml [P] £8.44 DT price = £8.44

## Permethrin

### ● INDICATIONS AND DOSE

#### Scabies

- ▶ TO THE SKIN
- ▶ Child: Apply once weekly for 2 doses, apply 5% preparation over whole body including face, neck, scalp and ears then wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream
- ▶ Adult: Apply once weekly for 2 doses, apply 5% preparation over whole body including face, neck, scalp and ears then wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream

#### Crab lice

- ▶ TO THE SKIN
- ▶ Adult: Apply once weekly for 2 doses, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight

#### Head lice

- ▶ TO THE SKIN
- ▶ Adult: **Not recommended**; no information given

- **UNLICENSED USE** *Dermal Cream* (scabies), not licensed for use in children under 2 months; not licensed for treatment of crab lice in children under 18 years. *Creme Rinse* (head lice) not licensed for use in children under 6 months except under medical supervision.
- **CAUTIONS** Avoid contact with eyes · children aged 2 months–2 years, medical supervision required for dermal cream (scabies) · children under 6 months, medical supervision required for cream rinse (head lice) · do not use on broken or secondarily infected skin
- **SIDE-EFFECTS**
  - ▶ **Rare** Oedema · rashes
  - ▶ **Frequency not known** Erythema · pruritus · stinging
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears.
  - ▶ Larger patients may require up to two 30-g packs for adequate treatment.
- **LESS SUITABLE FOR PRESCRIBING** *Lyclear*<sup>®</sup> *Creme Rinse* is less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Liquid

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Lyclear** (Omega Pharma Ltd)

**Permethrin 10 mg per 1 gram** *Lyclear* 1% creme rinse | 59 ml [P]  
£3.55 DT price = £3.55 | 118 ml [P] £6.46 DT price = £6.46

#### Cream

CAUTIONARY AND ADVISORY LABELS 10 (Dermal cream only)

EXCIPIENTS: May contain Butylated hydroxytoluene, wool fat and related substances including lanolin

- ▶ **Permethrin (Non-proprietary)**

**Permethrin 50 mg per 1 gram** Permethrin 5% cream | 30 gram [P] £7.46 DT price = £7.46

- ▶ **Lyclear** (Omega Pharma Ltd)

**Permethrin 50 mg per 1 gram** *Lyclear* 5% dermal cream | 30 gram [P] £5.71 DT price = £7.46

## 2.4 Viral skin infections

### ANTIVIRALS > NUCLEOSIDE ANALOGUES

## Aciclovir

### (Acyclovir)

### ● INDICATIONS AND DOSE

#### Herpes simplex infection (local treatment)

- ▶ TO THE SKIN
- ▶ Child: Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack
- ▶ Adult: Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack

- **UNLICENSED USE** Cream licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid cream coming in to contact with eyes and mucous membranes
- **SIDE-EFFECTS** Drying of the skin · erythema · itching of the skin · transient burning · transient stinging
- **PREGNANCY** Limited absorption from topical aciclovir preparations.
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Aciclovir cream for herpes [www.medicinesforchildren.org.uk/aciclovir-cream-for-herpes](http://www.medicinesforchildren.org.uk/aciclovir-cream-for-herpes)
- **PROFESSION SPECIFIC INFORMATION**  
**Dental practitioners' formulary**  
Aciclovir Cream may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores.
- **MEDICINAL FORMS**

Zovirax Cold Sore 5% cream | 2 gram [GSL] £3.96-£4.28 DT price = £1.09

## 3 Inflammatory skin conditions

### 3.1 Eczema and psoriasis

#### Eczema

##### Types and management

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent

corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1108) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See *Wound management products and elasticated garments* for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 1094 for the role of topical pimecrolimus p. 1111 and tacrolimus p. 1112 in atopic eczema.

#### Infection

Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic **antibacterial drugs**. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

#### Management of other features of eczema

*Lichenification*, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol **paste** p. 1410 (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** and ichthammol can be useful in some cases of *chronic eczema*.

A *non-sedating antihistamine* may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating antihistamine* can be used if itching causes sleep disturbance.

*Exudative ('weeping') eczema* requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 1128 can be used in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

#### Severe refractory eczema

*Severe refractory eczema* is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1113 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

#### Seborrhoeic dermatitis

*Seborrhoeic dermatitis (seborrhoeic eczema)* is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 624 and coal tar) and combinations of mild corticosteroids with suitable antimicrobials are used.

## Eczema and psoriasis, drugs affecting the immune response

### Overview

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1111 by topical application is licensed for *mild to moderate atopic eczema*. Tacrolimus p. 1112 is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 766 by mouth can be used for *severe psoriasis* and for *severe eczema*. Azathioprine p. 765 or mycophenolate mofetil p. 773 are used for severe refractory eczema [unlicensed indication].

Methotrexate p. 817 can be used for *severe psoriasis*, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 898 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 973, adalimumab p. 969, and infliximab p. 976 inhibit the activity of tumour necrosis factor (TNF $\alpha$ ). They are used for *severe plaque psoriasis* either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Secukinumab p. 966 inhibits the activity of interleukin-17A. It is used for *moderate to severe plaque psoriasis* in patients who are candidates for systemic therapy. Secukinumab is also licensed for psoriatic arthritis and ankylosing spondylitis. Ustekinumab p. 967 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for *severe plaque psoriasis* that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications. Adalimumab is also licensed for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in patients who have had inadequate response to conventional systemic therapy. Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis.

## Psoriasis

### Management

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

**Emollients**, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in *inflammatory psoriasis* and in *plaque psoriasis of palms and soles*, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs involves the use of **vitamin D analogues**, coal tar p. 1109, dithranol p. 1108, and the retinoid tazarotene p. 1114. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

*Scalp psoriasis* is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

*Facial, flexural and genital psoriasis* can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcitriol p. 1115 or tacalcitol p. 1115 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1115 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1111 or tacrolimus p. 1112 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, calcitriol and calcitriol are less likely to irritate.

**Coal tar** has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however,

irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes ('short contact'). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical **corticosteroid** is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

#### Phototherapy

**Phototherapy** is available in specialist centres under the supervision of a dermatologist. **Ultraviolet B (UVB)** radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

**Photochemotherapy** combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

#### Systemic treatment

**Systemic treatment** is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (such as ciclosporin p. 766 and methotrexate p. 817).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin p. 1112, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is *psoriasis*, but it is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

#### Topical treatment

The vitamin D and analogues, calcipotriol p. 1115, calcitriol p. 1115, and tacalcitol p. 1115 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

**Other drugs used for Eczema and psoriasis** Apremilast, p. 978

## CORTICOSTEROIDS

### Topical corticosteroids

#### Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are **not** recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in *psoriasis* because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). See the role of topical corticosteroids in the treatment of psoriasis.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars*, *hypertrophic lichen planus*, or *localised alopecia areata*.

#### Perioral lesions

Hydrocortisone cream 1% p. 1102 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 1107 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

#### Choice of formulation

Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene or hydrocolloid dressings* increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

#### Absorption through the skin

*Mild* and *moderately potent* topical corticosteroids are associated with few side-effects but care is required in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

#### Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments
Face and neck	15 to 30 g
Both hands	15 to 30 g
Scalp	15 to 30 g
Both arms	30 to 60g
Both legs	100 g
Trunk	100 g
Groins and genitalia	15 to 30 g
These amounts are usually suitable for an adult for a single daily application for 2 weeks	

#### Compound preparations

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for

1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1137 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

#### Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

##### Mild

- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

##### Mild with antimicrobials

- Canesten HC
- Daktacort
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

##### Moderate

- Betnovate-RD
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

##### Moderate with antimicrobials

- Trimovate

##### Moderate with urea:

- Alphaderm

##### Potent

- Beclometasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacap
- Betesil
- Bettamousse
- Betnovate
- Cutivate
- Diprosone
- Elocon
- Hydrocortisone butyrate
- Locoid
- Locoid Crelo
- Metosyn
- Mometasone furoate 0.1%
- Nerisone
- Synalar

##### Potent with antimicrobials

- Aureocort
- Betamethasone and clioquinol
- Betamethasone and neomycin
- Fucibet
- Lotriderm
- Synalar C
- Synalar N

##### Potent with salicylic acid

- Diprosalic

##### Very potent

- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte

##### Very potent with antimicrobials

- Clobetazol with neomycin and nystatin

## Use in children

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient's condition.

## Corticosteroids (topical)

- **CONTRA-INDICATIONS** Acne · perioral dermatitis · potent corticosteroids in widespread plaque psoriasis · rosacea (in adults) · untreated bacterial, fungal or viral skin lesions
- **CAUTIONS** Avoid prolonged use (particularly on the face) · cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) · infection · keep away from eyes · use potent or very potent topical corticosteroids under specialist supervision (in children) · use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity) (in adults)
- **SIDE-EFFECTS**
  - ▶ **Rare** Adrenal suppression · Cushing's syndrome
  - ▶ **Frequency not known** Acne · contact dermatitis · hypertrichosis · irreversible striae atrophicae · irreversible telangiectasia · mild depigmentation (may be reversible) · perioral dermatitis · side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · spread and worsening of untreated infection · thinning of the skin (may be restored over a period after stopping treatment but the original structure may never return) · worsening of acne · worsening of rosacea

### SIDE-EFFECTS, FURTHER INFORMATION

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it **thinly** to affected areas **only**, no more frequently than **twice daily**, and to use the least potent formulation which is fully effective.

- **DIRECTIONS FOR ADMINISTRATION** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a *finger tip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several

minutes should elapse between application of different preparations.

- ▶ In children 'Wet-wrap bandaging' increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.
- **PRESCRIBING AND DISPENSING INFORMATION** The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

## Alclometasone dipropionate

### INDICATIONS AND DOSE

**Inflammatory skin disorders such as eczemas**

#### TO THE SKIN

- ▶ Child: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

#### POTENCY

Alclometasone dipropionate cream 0.05%: moderate

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of alclometasone dipropionate cream.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

#### Alclometasone dipropionate (Non-proprietary)

Alclometasone dipropionate 500 microgram per 1 gram Boots  
Derma Care Eczema & Dermatitis Flare-Up 0.05% cream | 15 gram  no price available

## Beclometasone dipropionate

(Beclomethasone dipropionate)

### INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

#### TO THE SKIN

- ▶ Child: Apply 1–2 times a day, thin layer to be applied
- ▶ Adult: Apply 1–2 times a day, thin layer to be applied

#### POTENCY

Beclometasone dipropionate cream and ointment 0.025%: potent.

- **UNLICENSED USE** Not licensed for use in children under 1 year.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

▶ **Beclomethasone dipropionate (Non-proprietary)**

EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin

- ▶ **Metosyn** (Derma UK Ltd)

**Fluocinonide 500 microgram per 1 gram** Metosyn 0.05% ointment | 25 gram [PoM] £3.50 DT price = £3.50 | 100 gram [PoM] £13.15 DT price = £13.15

F 1097

## Fluocortolone

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

### POTENCY

Fluocortolone hexanoate 0.25% cream and ointment; fluocortolone pivalate 0.25% cream and fluocortolone 0.25% ointment: moderate.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients or carers should be counselled on the application of fluocortolone preparations.
- **MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- No licensed medicines identified.

F 1097

## Fluticasone

04-Jan-2016

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child 3 months-17 years: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

### POTENCY

Fluticasone cream 0.05%: potent.

Fluticasone ointment 0.005%: potent.

- **UNLICENSED USE** Not licensed for use in children under 3 months.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on application of fluticasone creams and ointments.

Skin

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), imidurea, propylene glycol

► **Cutivate** (GlaxoSmithKline UK Ltd)

**Fluticasone propionate 500 microgram per 1 gram** Cutivate 0.05% cream | 15 gram [PoM] £2.27 DT price = £2.27 | 30 gram [PoM] £4.24 DT price = £4.24

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol

► **Cutivate** (GlaxoSmithKline UK Ltd)

**Fluticasone propionate 50 microgram per 1 gram** Cutivate 0.005% ointment | 15 gram [PoM] £2.27 DT price = £2.27 | 30 gram [PoM] £4.24 DT price = £4.24

**Hydrocortisone acetate 10 mg per 1 gram** Hydrocortisone 1% cream | 10 gram [GSC] no price available

**Hydrocortisone 25 mg per 1 gram** Hydrocortisone 2.5% cream | 15 gram [PoM] £25.00 DT price = £5.68 | 30 gram [PoM] £44.00

► **Derma Care Hydrocortisone** (The Boots Company Plc)

**Hydrocortisone 10 mg per 1 gram** Derma Care Hydrocortisone 1% cream | 15 gram [P] no price available DT price = £0.94

► **Dermacol** (Marlbrough Pharmaceuticals Ltd)

**Hydrocortisone 1 mg per 1 gram** Dermacol hydrocortisone 0.1% cream | 15 gram [P] £2.83 DT price = £2.83

► **Dioderm** (Dermal Laboratories Ltd)

**Hydrocortisone 1 mg per 1 gram** Dioderm 0.1% cream | 30 gram [PoM] £2.03 DT price = £2.03

► **Hc45** (Reckitt Benckiser Healthcare (UK) Ltd)

**Hydrocortisone acetate 10 mg per 1 gram** Hc45 Hydrocortisone 1% cream | 15 gram [P] £2.58

► **Mildison Lipocream** (LEO Pharma)

**Hydrocortisone 10 mg per 1 gram** Mildison Lipocream 1% cream | 30 gram [PoM] £1.71 DT price = £1.88

► **Zenoxone** (Teva UK Ltd)

**Hydrocortisone 10 mg per 1 gram** Zenoxone 1% cream | 15 gram [P] £1.25 DT price = £0.94

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

► **Hydrocortisone (Non-proprietary)**

**Hydrocortisone 5 mg per 1 gram** Hydrocortisone 0.5% ointment | 15 gram [PoM] £5.55 DT price = £5.55 | 30 gram [PoM] £11.10-£12.00

**Hydrocortisone 10 mg per 1 gram** Hydrocortisone 1% ointment | 15 gram [PoM] £10.50 DT price = £1.13 | 30 gram [PoM] £23.83 DT price = £2.26 | 30 gram [P] £3.31 DT price = £2.26 | 50 gram [PoM] £36.12 DT price = £3.77

**Hydrocortisone 25 mg per 1 gram** Hydrocortisone 2.5% ointment | 15 gram [PoM] £24.45 DT price = £24.43 | 30 gram [PoM] £48.86

Combinations available: **Hydrocortisone with benzalkonium chloride, dimeticane and nystatin**, p. 1106 · **Hydrocortisone with chlorhexidine hydrochloride and nystatin**, p. 1106 · **Hydrocortisone with clotrimazole**, p. 1107 · **Hydrocortisone with fusidic acid**, p. 1107 · **Hydrocortisone with miconazole**, p. 1107 · **Hydrocortisone with oxytetracycline**, p. 1108

## Hydrocortisone

### ● INDICATIONS AND DOSE

#### Mild inflammatory skin disorders such as eczema

► TO THE SKIN

► Child: Apply 1–2 times a day, to be applied thinly

► Adult: Apply 1–2 times a day, to be applied thinly

#### Nappy rash

► TO THE SKIN

► Child: Apply 1–2 times a day for no longer than 1 week, discontinue as soon as the inflammation subsides

#### POTENCY

Hydrocortisone cream and ointment 0.5 to 2.5%: mild

● **PRESCRIBING AND DISPENSING INFORMATION** When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied. Although *Dioderm*® contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone cream and ointment (application).

### ● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Hydrocortisone Cream 1% 15 g may be prescribed.

### ● EXCEPTIONS TO LEGAL CATEGORY

Over-the-counter hydrocortisone preparations Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should **not** be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete's foot).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol

► **Hydrocortisone (Non-proprietary)**

**Hydrocortisone 5 mg per 1 gram** Hydrocortisone 0.5% cream | 15 gram [PoM] £3.00 DT price = £1.17 | 30 gram [PoM] £2.69-£4.90

**Hydrocortisone 10 mg per 1 gram** Hydrocortisone 1% cream | 15 gram [P] £1.64 DT price = £0.94 | 15 gram [PoM] £10.50 DT price = £0.94 | 30 gram [PoM] £23.83 DT price = £1.88 | 50 gram [PoM] £36.12 DT price = £3.13

## Hydrocortisone butyrate

### ● INDICATIONS AND DOSE

#### Severe inflammatory skin disorders such as eczema unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN

► Child 1-17 years: Apply 1–2 times a day, to be applied thinly

► Adult: Apply 1–2 times a day, to be applied thinly

#### POTENCY

Hydrocortisone butyrate 0.1% cream, liquid, and ointment: potent

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydrocortisone butyrate lotion, cream, ointment and scalp lotion.

Medicines for Children leaflet: Hydrocortisone (topical) for eczema [www.medicinesforchildren.org.uk/hydrocortisone-topical-for-eczema](http://www.medicinesforchildren.org.uk/hydrocortisone-topical-for-eczema)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

#### Liquid

CAUTIONARY AND ADVISORY LABELS 15(excluding Locoid Crelo topical emulsion), 28

EXCIPIENTS: May contain Butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol

► **Locoid** (LEO Pharma)

**Hydrocortisone butyrate 1 mg per 1 ml** Locoid 0.1% scalp lotion | 100 ml [PoM] £6.83 DT price = £6.83

- **Locoid Crelo** (LEO Pharma)

**Hydrocortisone butyrate 1 mg per 1 gram** Locoid Crelo 0.1% topical emulsion | 100 gram [PoM] £5.91

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- **Locoid** (LEO Pharma)

**Hydrocortisone butyrate 1 mg per 1 gram** Locoid 0.1% cream | 30 gram [PoM] £1.60 DT price = £1.60 | 100 gram [PoM] £4.93 DT price = £4.93

- **Locoid Lipocream** (LEO Pharma)

**Hydrocortisone butyrate 1 mg per 1 gram** Locoid 0.1% Lipocream | 30 gram [PoM] £1.69 DT price = £1.60 | 100 gram [PoM] £5.17 DT price = £4.93

### Ointment

CAUTIONARY AND ADVISORY LABELS 28

- **Locoid** (LEO Pharma)

**Hydrocortisone butyrate 1 mg per 1 gram** Locoid 0.1% ointment | 30 gram [PoM] £1.60 DT price = £1.60 | 100 gram [PoM] £4.93 DT price = £4.93

## Hydrocortisone with urea

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102.

- **INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas**

- ▶ TO THE SKIN

- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

### POTENCY

Hydrocortisone 1% with urea cream: moderate

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with urea cream.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Cream

CAUTIONARY AND ADVISORY LABELS 28

- **Alphaderm** (Alliance Pharmaceuticals Ltd)

**Hydrocortisone 10 mg per 1 gram, Urea 100 mg per 1 gram** Alphaderm 1%/10% cream | 30 gram [PoM] £2.38 DT price = £2.38 | 100 gram [PoM] £7.03 DT price = £7.03

1097

## Mometasone furoate

- **INDICATIONS AND DOSE**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN

- ▶ Child 2-17 years: Apply once daily, to be applied thinly (to scalp in case of lotion)
- ▶ Adult: Apply once daily, to be applied thinly (to scalp in case of lotion)

### POTENCY

Mometasone furoate 0.1% cream, ointment, and scalp lotion: potent.

- **PATIENT AND CARER ADVICE** Patients and carers should be advised on the application of topical mometasone.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

### Liquid

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol

- **Elocon** (Merck Sharp & Dohme Ltd)

**Mometasone furoate 1 mg per 1 gram** Elocon 0.1% scalp lotion | 30 ml [PoM] £4.36 DT price = £4.36

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Beeswax

- **Mometasone furoate (Non-proprietary)**

**Mometasone furoate 1 mg per 1 gram** Mometasone 0.1% cream | 30 gram [PoM] £4.36 DT price = £1.87 | 100 gram [PoM] £12.58 DT price = £6.23

- **Elocon** (Merck Sharp & Dohme Ltd)

**Mometasone furoate 1 mg per 1 gram** Elocon 0.1% cream | 30 gram [PoM] £4.80 DT price = £1.87 | 100 gram [PoM] £15.10 DT price = £6.23

### Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Beeswax, propylene glycol

- **Mometasone furoate (Non-proprietary)**

**Mometasone furoate 1 mg per 1 gram** Mometasone 0.1% ointment | 15 gram [PoM] £4.32 | 30 gram [PoM] £4.45 DT price = £1.77 | 50 gram [PoM] £12.44 | 100 gram [PoM] £12.82 DT price = £5.90

- **Elocon** (Merck Sharp & Dohme Ltd)

**Mometasone furoate 1 mg per 1 gram** Elocon 0.1% ointment | 30 gram [PoM] £4.32 DT price = £1.77 | 100 gram [PoM] £12.44 DT price = £5.90

## CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

### Betamethasone with clioquinol

18-Nov-2015

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098.

- **INDICATIONS AND DOSE**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

### POTENCY

Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

- **UNLICENSED USE** Betamethasone and clioquinol preparations is not licensed for use in children under 1 year.

- **PATIENT AND CARER ADVICE** Stains clothing. Patients or carers should be counselled on application of betamethasone with clioquinol preparations.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- **Betamethasone with clioquinol (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram** Betamethasone valerate 0.1% / Clioquinol 3% cream | 30 gram [PoM] £28.88 DT price = £28.88

### Ointment

CAUTIONARY AND ADVISORY LABELS 28

- **Betamethasone with clioquinol (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram** Betamethasone valerate 0.1% / Clioquinol 3% ointment | 30 gram [PoM] £28.88 DT price = £28.88

## Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, clotrimazole p. 758.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

### POTENCY

Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

- **UNLICENSED USE** *Lotriderm*<sup>®</sup> not licensed for use in children under 12 years.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

- ▶ **Lotriderm** (Merck Sharp & Dohme Ltd)

**Betamethasone dipropionate 640 microgram per 1 gram,**

**Clotrimazole 10 mg per 1 gram** Lotriderm cream | 30 gram [PoM]  
£6.34 DT price = £6.34

## Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, fusidic acid p. 527.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

### POTENCY

Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

- **UNLICENSED USE** *Fucibet*<sup>®</sup> *Lipid Cream* is not licensed for use in children under 6 years.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, hydroxybenzoates (parabens)

- ▶ **Betamethasone with fusidic acid (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,**

**Fusidic acid 20 mg per 1 gram** Betamethasone valerate 0.1% / Fusidic acid 2% cream | 30 gram [PoM] £7.71 DT price = £6.38 | 60 gram [PoM] £15.42 DT price = £12.76

- ▶ **Fucibet** (LEO Pharma)

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,**

**Fusidic acid 20 mg per 1 gram** Fucibet cream | 30 gram [PoM] £6.38 DT price = £6.38 | 60 gram [PoM] £12.76 DT price = £12.76  
Fucibet Lipid cream | 30 gram [PoM] £6.74 DT price = £6.38

- ▶ **Xemacort** (Mylan Ltd)

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,**

**Fusidic acid 20 mg per 1 gram** Xemacort cream | 30 gram [PoM]  
£6.05 DT price = £6.38 | 60 gram [PoM] £12.45 DT price = £12.76

## Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, neomycin sulfate p. 480.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN USING OINTMENT, OR TO THE SKIN USING CREAM
- ▶ Child 2–17 years: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

### POTENCY

Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

- **UNLICENSED USE** Betamethasone and neomycin preparations not licensed for use in children under 2 years.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- ▶ **Betamethasone with neomycin (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,**

**Neomycin sulfate 5 mg per 1 gram** Betamethasone valerate 0.1% / Neomycin 0.5% cream | 30 gram [PoM] £28.88 DT price = £17.74 | 100 gram [PoM] £48.00 DT price = £59.14

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Betamethasone with neomycin (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,**

**Neomycin sulfate 5 mg per 1 gram** Betamethasone valerate 0.1% / Neomycin 0.5% ointment | 30 gram [PoM] £28.88 DT price = £17.74 | 100 gram [PoM] £48.00 DT price = £59.14

## Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, salicylic acid p. 1137.

### ● INDICATIONS AND DOSE

#### DIPROSALIC<sup>®</sup> OINTMENT

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, max. 60 g per week
- ▶ Adult: Apply 1–2 times a day, max. 60 g per week

### POTENCY

For *Diprosalic*<sup>®</sup> ointment: Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

**DIPROSALIC® SCALP APPLICATION**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, apply a few drops
- ▶ Adult: Apply 1–2 times a day, apply a few drops

**POTENCY**

For *Diprosalic*® scalp ointment: Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Disodium edetate

- ▶ **Diprosalic** (Merck Sharp & Dohme Ltd)  
Betamethasone (as Betamethasone dipropionate)  
500 microgram per 1 ml, Salicylic acid 20 mg per 1 ml Diprosalic 0.05%/2% scalp application | 100 ml [PoM] £10.10 DT price = £10.10

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Diprosalic** (Merck Sharp & Dohme Ltd)  
Betamethasone (as Betamethasone dipropionate)  
500 microgram per 1 gram, Salicylic acid 30 mg per 1 gram Diprosalic 0.05%/3% ointment | 30 gram [PoM] £3.18 DT price = £3.18 | 100 gram [PoM] £9.14 DT price = £9.14

**Chlortetracycline with triamcinolone**● **INDICATIONS AND DOSE**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (associated with infection) | Psoriasis (associated with infection)**

- ▶ TO THE SKIN
- ▶ Adult: To be applied thinly (consult product literature)

**POTENCY**

Triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3% ointment: potent.

- **PATIENT AND CARER ADVICE** Stains clothing. Patients or carers should be counselled on the application of chlortetracycline with triamcinolone products.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Wool fat and related substances including lanolin

- ▶ **Aureocort** (AMCo)  
Triamcinolone acetonide 1 mg per 1 gram, Chlortetracycline hydrochloride 30.9 mg per 1 gram Aureocort ointment | 15 gram [PoM] £3.51

**Clobetasol propionate with neomycin sulfate and nystatin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 1099, neomycin sulfate p. 480.

● **INDICATIONS AND DOSE**

**Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**POTENCY**

Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**  
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Clobetasol 500microgram / Neomycin 5mg / Nystatin 100,000units/g cream | 30 gram [PoM] £64.00 DT price = £64.00

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**  
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Clobetasol 500microgram / Neomycin 5mg / Nystatin 100,000units/g ointment | 30 gram [PoM] £64.00 DT price = £64.00

**Clobetasone butyrate with nystatin and oxytetracycline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate p. 1099, oxytetracycline p. 523.

● **INDICATIONS AND DOSE**

**Steroid-responsive dermatoses where candidal or bacterial infection is present**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**POTENCY**

Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

- **PATIENT AND CARER ADVICE** Stains clothing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, sodium metabisulfite

- ▶ **Trimovate** (GlaxoSmithKline UK Ltd)  
Clobetasone butyrate 500 microgram per 1 gram, Nystatin 100000 unit per 1 gram, Oxytetracycline (as Oxytetracycline calcium) 30 mg per 1 gram Trimovate cream | 30 gram [PoM] £3.29

## Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1101.

### ● INDICATIONS AND DOSE

**Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

### POTENCY

Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent

- **PATIENT AND CARER ADVICE** Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

- ▶ **Synalar C** (Derma UK Ltd)

**Clioquinol 30 mg per 1 gram, Fluocinolone acetonide 250 microgram per 1 gram** Synalar C cream | 15 gram [PoM](#) £2.66

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin

- ▶ **Synalar C** (Derma UK Ltd)

**Clioquinol 30 mg per 1 gram, Fluocinolone acetonide 250 microgram per 1 gram** Synalar C ointment | 15 gram [PoM](#) £2.66

## Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1101, neomycin sulfate p. 480.

### ● INDICATIONS AND DOSE

**Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection**

- ▶ TO THE SKIN
- ▶ Child 1–17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- ▶ Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

### POTENCY

Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

- ▶ **Synalar N** (Derma UK Ltd)

**Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram** Synalar N cream | 30 gram [PoM](#) £4.36

### Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin

- ▶ **Synalar N** (Derma UK Ltd)

**Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram** Synalar N ointment | 30 gram [PoM](#) £4.36

## Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

15-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102.

### ● INDICATIONS AND DOSE

**Mild inflammatory skin disorders such as eczemas associated with infection**

- ▶ TO THE SKIN
- ▶ Child: Apply 3 times a day until lesion has healed, to be applied thinly
- ▶ Adult: Apply 3 times a day until lesion has healed, to be applied thinly

### POTENCY

Benzalkonium with dimeticone, hydrocortisone acetate 0.5%, and nystatin cream: mild.

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid

- ▶ **Timodine** (Alliance Pharmaceuticals Ltd)

**Benzalkonium chloride 1 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Dimeticone 350 100 mg per 1 gram, Nystatin 100000 unit per 1 gram** Timodine cream | 30 gram [PoM](#) £3.37

## Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, chlorhexidine p. 1064.

### ● INDICATIONS AND DOSE

**Mild inflammatory skin disorders such as eczemas**

- ▶ TO THE SKIN
- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

### POTENCY

Hydrocortisone 0.5% with chlorhexidine hydrochloride 1% and nystatin cream: mild  
Hydrocortisone 1% with chlorhexidine hydrochloride 1% and nystatin ointment: mild

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

▶ **Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)**

Hydrocortisone 5 mg per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine hydrochloride 1% / Hydrocortisone 0.5% cream | 30 gram [PoM] £5.29

▶ **Nystaform HC** (Typharm Ltd)

Hydrocortisone 5 mg per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystaform HC cream | 30 gram [PoM] £2.66

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

▶ **Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)**

Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine acetate 1% / Hydrocortisone 1% ointment | 30 gram [PoM] £5.29

▶ **Nystaform HC** (Typharm Ltd)

Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystaform HC ointment | 30 gram [PoM] £2.66

**Hydrocortisone with clotrimazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, clotrimazole p. 758.

**INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas (associated with fungal infection)**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

**POTENCY**

Clotrimazole with hydrocortisone 1% cream: mild

▶ **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.

▶ **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube is on sale to the public for the treatment of athlete's foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

▶ **Canesten HC** (Bayer Plc)

Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten HC cream | 30 gram [PoM] £2.42 DT price = £2.42

▶ **Canesten Hydrocortisone** (Bayer Plc)

Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten Hydrocortisone cream | 15 gram [P] £3.11 DT price = £3.11

**Hydrocortisone with fusidic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, fusidic acid p. 527.

**INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas**

- ▶ TO THE SKIN
- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

**POTENCY**

Hydrocortisone with fusidic acid cream: mild

▶ **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, potassium sorbate

▶ **Fucidin H (Fusidic acid / Hydrocortisone)** (LEO Pharma)

Hydrocortisone acetate 10 mg per 1 gram, Fusidic acid 20 mg per 1 gram Fucidin H cream | 30 gram [PoM] £6.02 DT price = £6.02 | 60 gram [PoM] £12.05 DT price = £12.05

**Hydrocortisone with miconazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, miconazole p. 760.

**INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas associated with infections**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**POTENCY**

Hydrocortisone 1% with miconazole cream and ointment: mild

▶ **INTERACTIONS** → Appendix 1 (antifungals, imidazole).

▶ **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with miconazole preparations.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary**

May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 7 days.

▶ **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete's foot and candidal intertrigo.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, disodium edetate

▶ **Daktacort** (McNeil Products Ltd, Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort Hydrocortisone cream | 15 gram [P] £3.17 DT price = £3.17

Daktacort 2%/1% cream | 30 gram [PoM] £2.49 DT price = £2.49

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

▶ **Daktacort** (Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram [PoM] £2.50 DT price = £2.50

## Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, oxytetracycline p. 523.

### ● INDICATIONS AND DOSE

#### Mild inflammatory skin disorders such as eczemas

- ▶ TO THE SKIN
- ▶ Child 12-17 years: (consult product literature)
- ▶ Adult: (consult product literature)

#### POTENCY

Hydrocortisone 1% with oxytetracycline ointment: mild.

- **CONTRA-INDICATIONS** Children under 12 years
- **PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child's teeth.
- **BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Terra-Cortril** (Intrapharm Laboratories Ltd)  
Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram [PoM] £5.01 DT price = £5.01

## DERMATOLOGICAL DRUGS > ANTI-INFECTIVES

## Ichthammol

### ● INDICATIONS AND DOSE

#### Chronic lichenified eczema

- ▶ TO THE SKIN
- ▶ Child 1-17 years: Apply 1-3 times a day
- ▶ Adult: Apply 1-3 times a day

### ● UNLICENSED USE

- In children No information available.

### ● SIDE-EFFECTS

- Skin irritation

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

#### Liquid

- ▶ **Ichthammol (Non-proprietary)**  
Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram [GSL] £11.42 DT price = £11.42 | 500 gram [GSL] £34.27

## Ichthammol with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

### ● INDICATIONS AND DOSE

#### Chronic lichenified eczema

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

#### Impregnated dressing

- ▶ **Ichthopaste** (Smith & Nephew Healthcare Ltd)  
Ichthopaste bandage 7.5cm × 6m | 1 bandage £3.72

## DERMATOLOGICAL DRUGS > ANTRACEN DERIVATIVES

## Dithranol

### (Anthralin)

### ● INDICATIONS AND DOSE

#### Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

#### DITHROCREAM<sup>®</sup>

#### Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: For application to skin or scalp, 0.1-0.5% cream suitable for overnight treatment, 1-2% cream for maximum 1 hour (consult product literature)

#### MICANOL<sup>®</sup>

#### Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **CONTRA-INDICATIONS** Acute and pustular psoriasis · hypersensitivity
- **CAUTIONS** Avoid sensitive areas of skin · avoid use near eyes
- **SIDE-EFFECTS** Local burning sensation · local irritation · stains hair · stains skin
- **PREGNANCY** No adverse effects reported.
- **BREAST FEEDING** No adverse effects reported.
- **DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.
- **MICANOL<sup>®</sup>** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.
- **PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.
- **PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

▶ **Dithrocream** (Dermal Laboratories Ltd)

**Dithranol 1 mg per 1 gram** Dithrocream 0.1% cream | 50 gram [P] £3.77

**Dithranol 2.5 mg per 1 gram** Dithrocream 0.25% cream | 50 gram [P] £4.04

**Dithranol 5 mg per 1 gram** Dithrocream 0.5% cream | 50 gram [P] £4.66

**Dithranol 10 mg per 1 gram** Dithrocream HP 1% cream | 50 gram [P] £5.42

**Dithranol 20 mg per 1 gram** Dithrocream 2% cream | 50 gram [PoM] £5.77

▶ **Micanol** (Derma UK Ltd)

**Dithranol 10 mg per 1 gram** Micanol 1% cream | 50 gram [P] £16.18

**Dithranol 30 mg per 1 gram** Micanol 3% cream | 50 gram [PoM] £20.15

Combinations available: *Coal tar with dithranol and salicylic acid*, p. 1110

## Dithranol with salicylic acid and zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol p. 1108, salicylic acid p. 1137.

### INDICATIONS AND DOSE

#### Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Adult: (consult local protocol)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

## DERMATOLOGICAL DRUGS > TARS

### Coal tar

#### INDICATIONS AND DOSE

##### Psoriasis | Chronic atopic eczema

- ▶ TO THE SKIN USING PASTE
- ▶ Child: Apply 1–3 times a day, start application with low-strength preparations
- ▶ Adult: Apply 1–3 times a day, start application with low-strength preparations
- ▶ TO THE SKIN
- ▶ Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child's bath. Use Coal Tar Solution BP
- ▶ Adult: 100 mL/bath, to be added to an adult sized bath. Use Coal Tar Solution BP

#### ALPHOSYL 2 IN 1<sup>®</sup> SHAMPOO

##### Psoriasis | Seborrhoeic dermatitis | Scaling | Itching

- ▶ TO THE SKIN
- ▶ Adult: Apply every 2–3 days

#### Dandruff

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a week as required

### EXOREX<sup>®</sup> LOTION

#### Psoriasis

- ▶ TO THE SKIN
- ▶ Adult: Apply 2–3 times a day, to be applied to skin or scalp; in elderly, lotion can be diluted with a few drops of water before applying

- **CONTRA-INDICATIONS** Avoid broken or inflamed skin · avoid eye area · avoid genital area · avoid mucosal areas · avoid rectal area · infection · sore, acute, or pustular psoriasis
- **CAUTIONS** Application to face · application to skin flexures
- **SIDE-EFFECTS** Acne-like eruptions · photosensitivity · skin irritation
- **PRESCRIBING AND DISPENSING INFORMATION** Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%.
- **HANDLING AND STORAGE** Use suitable chemical protection gloves for extemporaneous preparation. May stain skin, hair and fabric.
- **PATIENT AND CARER ADVICE** May stain skin, hair and fabric.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

#### Bath additive

▶ **Psoriderm** (Dermal Laboratories Ltd)

**Coal tar distilled 400 mg per 1 ml** Psoriderm Emulsion 40% bath additive | 200 ml [P] £2.74

#### Shampoo

EXCIPIENTS: May contain Fragrances, hydroxybenzoates (parabens)

▶ **Coal tar (Non-proprietary)**

**Coal tar extract 20 mg per 1 gram** Coal tar extract 2% shampoo | 125 ml [GS] no price available DT price = £3.61 | 250 ml [GS] no price available DT price = £5.38

▶ Brands may include Alphosyl 2 in 1, Neutrogena T/Gel Therapeutic, Polytar Scalp

#### Cutaneous emulsion

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

▶ **Exorex** (Forest Laboratories UK Ltd)

**Coal tar solution 50 mg per 1 gram** Exorex lotion | 100 ml [GS] £8.11 DT price = £8.11 | 250 ml [GS] £16.24 DT price = £16.24

## Coal tar with arachis oil extract of coal tar, cade oil, light liquid paraffin and tar

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar above.

### INDICATIONS AND DOSE

#### Psoriasis | Eczema | Atopic dermatoses | Pruritic dermatoses

- ▶ TO THE SKIN
- ▶ Child: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes (proportionally less for a child's bath)
- ▶ Adult: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Coal tar with calamine

31-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

### ● INDICATIONS AND DOSE

#### Psoriasis | Chronic atopic eczema (occasionally)

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING  
See Emollient and barrier preparations p. 1075.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment BP, consists of calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
Forms available from special order manufacturers include: ointment.

## Coal tar with coconut oil and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, salicylic acid p. 1137.

### ● INDICATIONS AND DOSE

#### Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child: Apply daily as required
- ▶ Adult: Apply daily as required

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Shampoo

- ▶ Capasal (Dermal Laboratories Ltd)  
Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram,  
Coconut oil 10 mg per 1 gram Capasal Therapeutic shampoo | 250 ml | £4.69

## Coal tar with dithranol and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, dithranol p. 1108, salicylic acid p. 1137.

### ● INDICATIONS AND DOSE

#### Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Child: Apply up to twice daily
- ▶ Adult: Apply up to twice daily

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

## Coal tar with lecithin

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

### ● INDICATIONS AND DOSE

#### PSORIDERM® CREAM

##### Psoriasis

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, cream to be applied to the skin or scalp
- ▶ Adult: Apply 1–2 times a day, cream to be applied to the skin or scalp

#### PSORIDERM® SCALP LOTION

##### Scalp psoriasis

- ▶ TO THE SKIN
- ▶ Child: Apply as required
- ▶ Adult: Apply as required

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Isopropyl palmitate, propylene glycol

- ▶ Psoriderm (Dermal Laboratories Ltd)  
Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram Psoriderm cream | 225 ml | £9.42

#### Shampoo

EXCIPIENTS: May contain Disodium edetate

- ▶ Psoriderm (Dermal Laboratories Ltd)  
Lecithin 3 mg per 1 ml, Coal tar distilled 25 mg per 1 ml Psoriderm scalp lotion | 250 ml | £4.74

## Coal tar with salicylic acid

26-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, salicylic acid p. 1137.

### ● INDICATIONS AND DOSE

#### Psoriasis | Chronic atopic eczema

- ▶ TO THE SKIN USING OINTMENT
- ▶ Adult: Apply 1–2 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING  
See Emollient and barrier preparations p. 1075.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Coal Tar and Salicylic Acid Ointment, BP consists of coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate '80' 4 g, liquid paraffin 7.6 g.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

## Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, salicylic acid p. 1137.

### ● INDICATIONS AND DOSE

#### COCOIS® OINTMENT

**Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**

- ▶ INITIALLY TO THE SKIN USING SCALP OINTMENT
- ▶ Child 6–11 years: Medical supervision required
- ▶ Child 12–17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- ▶ Adult: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

#### SEBCO® OINTMENT

**Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**

- ▶ TO THE SKIN USING SCALP OINTMENT
- ▶ Child 6–11 years: Medical supervision required
- ▶ Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- ▶ Adult: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Cocois** (Focus Pharmaceuticals Ltd)  
Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram    Cocois ointment | 40 gram (GSL) £6.22 | 100 gram (GSL) £11.69
- ▶ **Sebco** (Derma UK Ltd)  
Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram    Sebco ointment | 40 gram (GSL) £5.91 | 100 gram (GSL) £11.11

## Coal tar with zinc oxide

26-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

### ● INDICATIONS AND DOSE

**Psoriasis | Chronic atopic eczema**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day
- ▶ Adult: Apply 1–2 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING  
See Emollient and barrier preparations p. 1075.

- **PRESCRIBING AND DISPENSING INFORMATION** No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

## Extract of coal tar with arachis oil

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

### ● INDICATIONS AND DOSE

**Scalp disorders | Psoriasis | Seborrhoea | Eczema | Pruritus | Dandruff**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a week, to the scalp
- ▶ Adult: Apply 1–2 times a week, to the scalp

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

## Pimecrolimus

### ● INDICATIONS AND DOSE

**Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

**Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- **UNLICENSED USE** Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.
- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site
- **CAUTIONS** Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** Concomitant use with drugs that cause immunosuppression is contra-indicated (may be prescribed in exceptional circumstances by specialists).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Burning sensation · erythema · folliculitis · pruritus · skin infections
  - ▶ **Uncommon** Herpes simplex · herpes zoster · impetigo · molluscum contagiosum
  - ▶ **Rare** Dryness · local reactions including pain · oedema · papilloma · paraesthesia · peeling · skin discoloration · worsening of eczema
  - ▶ **Frequency not known** Skin malignancy
- **PREGNANCY** Manufacturer advises avoid; toxicity in animal studies following systemic administration.
- **BREAST FEEDING** Manufacturer advises caution; ensure infant does not come in contact with treated areas.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 4, 11, 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

▶ **Elidel** (Meda Pharmaceuticals Ltd)

**Pimecrolimus 10 mg per 1 gram** Elidel 1% cream | 30 gram [PoM] £19.69 DT price = £19.69 | 60 gram [PoM] £37.41 DT price = £37.41 | 100 gram [PoM] £59.07 DT price = £59.07

## Tacrolimus

● **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

### INDICATIONS AND DOSE

**Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)**

▶ TO THE SKIN

▶ **Adult:** Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

**Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)**

▶ TO THE SKIN

▶ **Adult:** Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

**Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)**

▶ TO THE SKIN

▶ **Adult:** Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks

● **UNLICENSED USE** Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.

● **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · avoid contact with eyes · avoid contact with mucous membranes · congenital epidermal barrier defects · generalised erythroderma · immunodeficiency · infection at treatment site

● **CAUTIONS** UV light (avoid excessive exposure to sunlight and sunlamps)

● **INTERACTIONS** Interactions do not generally apply to tacrolimus used topically. Concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists). Risk of facial flushing and skin irritation with alcohol consumption (does not apply to tacrolimus taken systemically).

### SIDE-EFFECTS

▶ **Common or very common** Application-site infections · application-site reactions · herpes simplex infection · irritation (at application-site) · Kaposi's varicelliform eruption · pain at application-site · rash

▶ **Uncommon** Acne

▶ **Frequency not known** Cutaneous lymphoma · malignancies · other types of lymphomas · rosacea · skin malignancy

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.

● **PREGNANCY** Manufacturer advises avoid unless essential; toxicity in *animal* studies following systemic administration.

● **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).

● **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.

### NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

▶ Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82

Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

[www.nice.org.uk/TA82](http://www.nice.org.uk/TA82)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2010) that tacrolimus ointment (*Protopic*®) is accepted for restricted use within NHS Scotland for the prevention of flares in patients aged over 2 years with moderate to severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

CAUTIONARY AND ADVISORY LABELS 4, 11, 28

EXCIPIENTS: May contain Beeswax

▶ **Protopic** (LEO Pharma)

**Tacrolimus (as Tacrolimus monohydrate) 1 mg per 1 gram** Protopic 0.1% ointment | 30 gram [PoM] £21.60 DT price = £21.60 | 60 gram [PoM] £39.40 DT price = £39.40

**Tacrolimus (as Tacrolimus monohydrate) 300 microgram per 1 gram** Protopic 0.03% ointment | 30 gram [PoM] £19.44 DT price = £19.44 | 60 gram [PoM] £35.46 DT price = £35.46

## RETINOID AND RELATED DRUGS

### Acitretin

● **DRUG ACTION** Acitretin is a metabolite of etretinate.

### INDICATIONS AND DOSE

**Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmoplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)**

▶ BY MOUTH

▶ **Adult:** Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

**Severe Darier's disease (keratosis follicularis) (under expert supervision)**

▶ BY MOUTH

▶ **Adult:** Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

● **CONTRA-INDICATIONS** Hyperlipidaemia

- **CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps · diabetes (can alter glucose tolerance—initial frequent blood glucose checks) · do not donate blood during and for 2 years after stopping therapy (teratogenic risk) · investigate atypical musculoskeletal symptoms
- **INTERACTIONS** → Appendix 1 (retinoids). Avoid concomitant use of keratolytics.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abnormal hair texture · alopecia (reversible on withdrawal) · arthralgia · brittle nails · dermatitis · diarrhoea · dryness and inflammation of mucous membranes · dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses) · epidermal fragility · erythema · headache · myalgia · nausea · paronychia · peripheral oedema · pruritus · reversible increase in serum-cholesterol (with high doses) · reversible increase in serum-triglyceride concentrations (with high doses) · skin exfoliation · sticky skin · vomiting
  - ▶ **Uncommon** Dizziness · hepatitis · photosensitivity · visual disturbances
  - ▶ **Rare** Peripheral neuropathy
  - ▶ **Very rare** Benign intracranial hypertension · bone pain · exostosis · night blindness · ulcerative keratitis
  - ▶ **Frequency not known** Drowsiness · dry skin · flushing · granulomatous lesions · impaired hearing · initial worsening of psoriasis · malaise · rectal haemorrhage · sweating · taste disturbance · tinnitus
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Exostosis** Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which Acitretin is a metabolite)
  - ▶ **Benign intracranial hypertension** Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used. Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.
- **PREGNANCY** Avoid—teratogenic.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of further impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment; increased risk of toxicity.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
  - ▶ Check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months.

- **PRESCRIBING AND DISPENSING INFORMATION** Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.
- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided. Patient advice required around conception and contraception Females of child-bearing potential must be advised on pregnancy prevention.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### ● Capsule

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

#### ▶ Acitretin (Non-proprietary)

**Acitretin 10 mg** Acitretin 10mg capsules | 60 capsule [PoM] £23.80  
DT price = £23.80

**Acitretin 25 mg** Acitretin 25mg capsules | 60 capsule [PoM] £55.24  
DT price = £55.24

#### ▶ Neotigason (Teva UK Ltd)

**Acitretin 10 mg** Neotigason 10mg capsules | 60 capsule [PoM]  
£17.30 DT price = £23.80 (Hospital only)

**Acitretin 25 mg** Neotigason 25mg capsules | 60 capsule [PoM]  
£43.00 DT price = £55.24 (Hospital only)

## Alitretinoin

#### ● INDICATIONS AND DOSE

##### Severe chronic hand eczema refractory to potent topical corticosteroids

#### ▶ BY MOUTH

- ▶ **Adult** (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

##### Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease

#### ▶ BY MOUTH

- ▶ **Adult** (prescribed by or under supervision of a consultant dermatologist): Initially 10 mg once daily, increased if necessary up to 30 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

- **CONTRA-INDICATIONS** Hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism
- **CAUTIONS** Avoid blood donation during treatment and for at least 1 month after stopping treatment · dry eye syndrome · history of depression
- **INTERACTIONS** → Appendix 1 (retinoids).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anaemia · arthralgia · changes in thyroid function tests · cheilitis · conjunctivitis · dry eyes · dryness of lips · dryness of skin · erythema · eye irritation · flushing · headache · myalgia · raised creatine kinase · raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre)
  - ▶ **Uncommon** Ankylosing spondylitis · asteototic eczema · blurred vision · cataracts · epistaxis · hyperostosis · pruritus
  - ▶ **Rare** Benign intracranial hypertension · vasculitis
  - ▶ **Frequency not known** Decreased tolerance to contact lenses · depression · impaired night vision · keratitis · mood changes · suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Dry eyes Dry eyes may respond to lubricating eye ointment or tear replacement therapy.
- ▶ Benign intracranial hypertension Discontinue treatment if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used.

**Pregnancy prevention** In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle.

Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods.

Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- **PREGNANCY** Avoid—teratogenic.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescribing for women of child-bearing potential Each prescription for alitretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.

Alitretinoin is **teratogenic** and must **not** be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided. Patient advice required around conception and contraception Women of child-bearing potential must be counselled on pregnancy prevention.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE technology appraisals (TAs)**
      - ▶ Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009) NICE TA177
- Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

[www.nice.org.uk/TA177](http://www.nice.org.uk/TA177)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

▶ **Toctino** (Stiefel Laboratories (UK) Ltd)

**Alitretinoin 10 mg** Toctino 10mg capsules | 30 capsule [PoM](#) £411.43

**Tazarotene**

- **INDICATIONS AND DOSE**

**Mild to moderate plaque psoriasis affecting up to 10% of skin area**

▶ TO THE SKIN

▶ Adult: Apply once daily usually for up to 12 weeks, apply in the evening

- **CAUTIONS** Avoid contact with eczematous skin · avoid contact with eyes · avoid contact with face · avoid contact with hair-covered scalp · avoid contact with inflamed skin · avoid contact with intertriginous areas

- **SIDE-EFFECTS**

- ▶ **Rare** Dry or painful skin · stinging and inflamed skin
- ▶ **Frequency not known** Burning · contact dermatitis · desquamation · erythema · local irritation · non-specific rash · pruritus · worsening of psoriasis

- **SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Local irritation Local irritation is more common with higher concentration and may require discontinuation.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required (oral progestogen-only contraceptives not considered effective).

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment). Do not apply emollients or cosmetics within 1 hour of application. Wash hands immediately after use.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polysorbates

▶ **Zorac** (Allergan Ltd)

**Tazarotene 1 mg per 1 gram** Zorac 0.1% gel | 30 gram [PoM](#) £14.80

**Tazarotene 500 microgram per 1 gram** Zorac 0.05% gel | 30 gram [PoM](#) £14.09

**SALICYLIC ACID AND DERIVATIVES****Salicylic acid with zinc oxide**

- **INDICATIONS AND DOSE**

**Hyperkeratotic skin disorders**

▶ TO THE SKIN

▶ Adult: Apply twice daily

- **CAUTIONS** Avoid broken skin · avoid inflamed skin

- **CAUTIONS, FURTHER INFORMATION**

- ▶ Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.

- **SIDE-EFFECTS** Excessive drying · irritation · sensitivity · systemic effects (after widespread use)

- **PRESCRIBING AND DISPENSING INFORMATION** Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

## VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

### Calcipotriol

#### ● INDICATIONS AND DOSE

##### Plaque psoriasis

###### ▶ TO THE SKIN USING OINTMENT

- ▶ **Adult:** Apply 1–2 times a day, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 100 g per week

##### Scalp psoriasis

###### ▶ TO THE SKIN USING SCALP LOTION

- ▶ **Adult:** Apply twice daily, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 60 mL per week

- **CONTRA-INDICATIONS** Calcium metabolism disorders
- **CAUTIONS** Avoid excessive exposure to sunlight and sunlamps · avoid use on face · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Burning · dermatitis · erythema · itching · local skin reactions · paraesthesia
  - ▶ **Rare** Facial dermatitis · perioral dermatitis
  - ▶ **Frequency not known** Aggravation of psoriasis · dry skin · photosensitivity
- **PREGNANCY** Manufacturers advise avoid unless essential.
- **BREAST FEEDING** No information available.
- **PATIENT AND CARER ADVICE**

Advice on application Patient information leaflet for *Dovonex*<sup>®</sup> ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

## 4 Perspiration

### Antiperspirants

#### Overview

Aluminium chloride hexahydrate below is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use glycopyrronium bromide below as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. *Botox*<sup>®</sup> contains botulinum toxin type A complex p. 380 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.

### 4.1 Hyperhidrosis

**Other drugs used for Hyperhidrosis** Botulinum toxin type A, p. 380

#### ANTIMUSCARINICS

### Glycopyrronium bromide (Glycopyrrolate)

17-Oct-2016

#### INDICATIONS AND DOSE

##### Iontophoretic treatment of hyperhidrosis

###### ▶ TO THE SKIN

- ▶ **Adult:** Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

- **CONTRA-INDICATIONS** Infections affecting the treatment site

**CONTRA-INDICATIONS, FURTHER INFORMATION** Contra-indications applicable to systemic use should be

considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

- **CAUTIONS** Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.
- **SIDE-EFFECTS** Tingling at administration site

#### SIDE-EFFECTS, FURTHER INFORMATION

The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

- **PRESCRIBING AND DISPENSING INFORMATION**

##### Palliative care

For further information on the use of glycopyrronium bromide in palliative care, see

[www.palliativedrugs.com/formulary/en/glycopyrronium.html](http://www.palliativedrugs.com/formulary/en/glycopyrronium.html).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for iontophoresis

###### ▶ Glycopyrronium bromide (Non-proprietary)

**Glycopyrronium bromide 1 mg per 1 mg** Glycopyrronium bromide powder for solution for iontophoresis | 3 gram [PoM] £313.92

#### DERMATOLOGICAL DRUGS > ASTRINGENTS

### Aluminium chloride hexahydrate

#### INDICATIONS AND DOSE

##### Hyperhidrosis affecting axillae, hands or feet

###### ▶ TO THE SKIN

- ▶ **Adult:** Apply once daily, apply liquid formulation at night to dry skin, wash off the following morning, reduce frequency as condition improves—do not bathe immediately before use

##### Hyperhidrosis | Bromidrosis | Intertrigo | Prevention of tinea pedis and related conditions

###### ▶ TO THE SKIN

- ▶ **Adult:** Apply powder to dry skin

- **CAUTIONS** Avoid contact with eyes - avoid contact with mucous membranes - avoid use on broken or irritated skin - do not shave axillae or use depilatories within 12 hours of application
- **SIDE-EFFECTS** Skin irritation
- **PATIENT AND CARER ADVICE** Avoid contact with clothing.
- **EXCEPTIONS TO LEGAL CATEGORY** A 30 mL pack of aluminium chloride hexahydrate 20% is on sale to the public.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

CAUTIONARY AND ADVISORY LABELS 15

###### ▶ Aluminium chloride hexahydrate (Non-proprietary)

**Aluminium chloride 200 mg per 1 ml** Aluminium chloride 20% solution | 60 ml [P] no price available DT price = £2.51

###### ▶ Anhydrol (Dermal Laboratories Ltd)

**Aluminium chloride 200 mg per 1 ml** Anhydrol Forte 20% solution | 60 ml [P] £2.51 DT price = £2.51

###### ▶ Driclor (GlaxoSmithKline Consumer Healthcare)

**Aluminium chloride 200 mg per 1 ml** Driclor 20% solution | 75 ml [P] £3.01 DT price = £3.01

## 5 Pruritus

### Topical local antipruritics

#### Overview

*Pruritus* may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An **emollient** may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomenthol **cream** p. 1118 can be used to relieve pruritus; it exerts a cooling effect on the skin. Local antipruritics have a role in the treatment of pruritus in palliative care.

Preparations containing croctamiton below are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% below is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 186 is the treatment of choice.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For *insect stings* and *insect bites*, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** may help in insect stings and in intractable pruritus where sedation is desirable. Oral preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

**Other drugs used for Pruritus** Alimemazine tartrate, p. 265 · Cetirizine hydrochloride, p. 262 · Chlorphenamine maleate, p. 266 · Hydroxyzine hydrochloride, p. 268 · Levocetirizine hydrochloride, p. 263

#### ANTIPRURITICS

### Calamine with zinc oxide

31-Aug-2016

#### ● INDICATIONS AND DOSE

##### Pruritus

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING  
See Emollient and barrier preparations p. 1075.

- **CONTRA-INDICATIONS** Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

##### ▶ Calamine with zinc oxide (Non-proprietary)

Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Glycerol 50 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 150 mg per 1 ml Calamine lotion | 200 ml [GSL] £0.81-£0.96 DT price = £0.96

##### ▶ Cala Soothe (Ennogen Healthcare Ltd)

Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Glycerol 50 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 150 mg per 1 ml Cala Soothe lotion | 200 ml £19.50 DT price = £0.96

##### Cream

CAUTIONARY AND ADVISORY LABELS 15

##### ▶ Calamine with zinc oxide (Non-proprietary)

Phenoxyethanol 5 mg per 1 gram, Zinc oxide 30 mg per 1 gram, Calamine 40 mg per 1 gram, Cetomacrogol emulsifying wax 50 mg per 1 gram, Self-emulsifying glyceryl monostearate 50 mg per 1 gram, Liquid paraffin 200 mg per 1 gram Aqueous calamine cream | 100 gram [GSL] £1.29 DT price = £1.29

##### ▶ Cala Soothe (Ennogen Healthcare Ltd)

Phenoxyethanol 5 mg per 1 gram, Zinc oxide 30 mg per 1 gram, Calamine 40 mg per 1 gram, Cetomacrogol emulsifying wax 50 mg per 1 gram, Self-emulsifying glyceryl monostearate 50 mg per 1 gram, Liquid paraffin 200 mg per 1 gram Cala Soothe cream | 100 ml £18.80

## Crotamiton

#### ● INDICATIONS AND DOSE

##### Pruritus (including pruritus after scabies)

- ▶ TO THE SKIN
- ▶ Child 1 month-2 years (on doctor's advice only): Apply once daily
- ▶ Child 3-17 years: Apply 2-3 times a day
- ▶ Adult: Apply 2-3 times a day

- **CONTRA-INDICATIONS** Acute exudative dermatoses

- **CAUTIONS** Avoid use in buccal mucosa · avoid use near eyes · avoid use on broken skin · avoid use on very inflamed skin · use on doctor's advice for children under 5 years

- **PREGNANCY** Manufacturer advises avoid, especially during the first trimester—no information available.

- **BREAST FEEDING** No information available; avoid application to nipple area.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)

##### ▶ Crotamiton (Non-proprietary)

Crotamiton 100 mg per 1 gram 30 gram [GSL] no price available DT price = £2.50

- ▶ Brands may include Eurax

## Doxepin

#### ● INDICATIONS AND DOSE

##### Pruritus in eczema

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply up to 3 g 3-4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day
- ▶ Adult: Apply up to 3 g 3-4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

- **CAUTIONS** Avoid application to large areas · cardiac arrhythmias · mania · severe heart disease · susceptibility to angle-closure glaucoma · urinary retention
  - **INTERACTIONS** → Appendix 1 (antidepressants, tricyclic).
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Dizziness · drowsiness
    - ▶ **Frequency not known** Antimuscarinic effects · fever · gastro-intestinal disturbances · headache · irritation · local burning · rash · stinging · tingling
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe liver disease.
  - **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.
- Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Cream**

CAUTIONARY AND ADVISORY LABELS 2, 10

**Menthol 50 mg per 1 gram** Dermacool 5% cream | 100 gram £4.69 | 500 gram £17.48

## 6 Rosacea and acne

### Rosacea and Acne

#### Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

*Mild to moderate acne* is generally treated with topical preparations. Systemic treatment with oral antibacterials is generally used for *moderate to severe acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindiol (cyproterone acetate with ethinylestradiol) p. 1119; it is for women only.

*Severe acne*, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1122 for administration by mouth.

#### Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1121 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erythromycin or clindamycin p. 1120 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

#### Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1121 has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

#### Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl

peroxide or azelaic acid may eliminate any resistant propionibacteria);

- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

#### Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene p. 1122 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

#### Other topical preparations for acne

Preparations containing aluminium oxide p. 1121 are not considered beneficial in acne.

A topical preparation of nicotinamide p. 1125 is available for inflammatory acne.

#### Oral preparations for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline p. 523 or tetracycline p. 523 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 521 and lymecycline p. 522 are alternatives to tetracycline.

Although minocycline p. 522 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but *propionibacteria* strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 529 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

#### Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

#### Oral retinoid for acne

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of

life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin p. 1122 use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

#### Rosacea

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1125 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1121, topical ivermectin or to topical metronidazole p. 499. Alternatively oral administration of oxytetracycline p. 523 or tetracycline p. 523, or erythromycin p. 497, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 521 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

## 6.1 Acne

### ANTI-ANDROGENS

#### Co-cyprindiol

##### ● INDICATIONS AND DOSE

**Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism**

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS** Acute porphyria · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease or for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia—seek specialist advice · inflammatory bowel disease including Crohn's disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

#### CAUTIONS, FURTHER INFORMATION

- ▶ Venous thromboembolism There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.
- **INTERACTIONS** → Appendix 1 (oestrogens).
- **SIDE-EFFECTS**
  - ▶ **Rare** Rarely gallstones · systemic lupus erythematosus
  - ▶ **Very rare** Photosensitivity
  - ▶ **Frequency not known** Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps · liver impairment · nausea · nervousness · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB · visual disturbances · vomiting · 'spotting' in early cycles
- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.
- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

#### MEDICINAL FORMS

**RETINOID AND RELATED DRUGS****Adapalene****INDICATIONS AND DOSE****Mild to moderate acne vulgaris**

- ▶ TO THE SKIN
- ▶ Child 12–17 years: Apply once daily, apply thinly in the evening
- ▶ Adult: Apply once daily, apply thinly in the evening

- **CAUTIONS** Avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - caution in sensitive areas such as the neck

- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.

- **PATIENT AND CARER ADVICE** If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens)

▶ **Adapalene (Non-proprietary)**

**Adapalene 1 mg per 1 gram** Adapalene 0.1% cream | 45 gram [PoM] £19.73 DT price = £16.43

▶ **Differin** (Galderma (UK) Ltd)

**Adapalene 1 mg per 1 gram** Differin 0.1% cream | 45 gram [PoM] £16.43 DT price = £16.43

**Gel**

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol

▶ **Adapalene (Non-proprietary)**

**Adapalene 1 mg per 1 gram** Adapalene 0.1% gel | 45 gram [PoM] £19.73 DT price = £16.43

**Adapalene 1 mg per 1 gram** Differin 0.1% gel | 45 gram [PoM] £16.43 DT price = £16.43

**Adapalene with benzoyl peroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene, above, benzoyl peroxide p. 1121.

**INDICATIONS AND DOSE****Acne vulgaris**

- ▶ TO THE SKIN
- ▶ Child 9–17 years: Apply once daily, to be applied thinly in the evening
- ▶ Adult: Apply once daily, to be applied thinly in the evening

- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (March 2014) that *Epiduo*® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol

▶ **Adapalene with benzoyl peroxide (Non-proprietary)**

**Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram** Adapalene 0.1% / Benzoyl peroxide 2.5% gel | 45 gram [PoM] no price available DT price = £19.05

▶ **Epiduo** (Galderma (UK) Ltd)

**Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram** Epiduo 0.1%/2.5% gel | 45 gram [PoM] £19.05 DT price = £19.05

**Isotretinoin****INDICATIONS AND DOSE****Topical treatment of mild to moderate acne**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied thinly
- Severe acne (under expert supervision) | Acne which is associated with psychological problems (under expert supervision) | Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) | Acne with scarring (under expert supervision) | Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)**
- ▶ BY MOUTH

▶ Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

**CONTRA-INDICATIONS**

- ▶ With oral use Hyperlipidaemia · hypervitaminosis A
- ▶ With topical use Perioral dermatitis · rosacea

**CAUTIONS**

- ▶ With oral use Avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression · monitor for depression

- With topical use Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleansers, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck · personal or familial history of non-melanoma skin cancer

#### ● INTERACTIONS

- With oral use → Appendix 1 (retinoids).  
Avoid keratolytics.

#### ● SIDE-EFFECTS

##### ▶ Common or very common

- With oral use Anaemia · arthralgia · dryness of eyes (with blepharitis and conjunctivitis) · dryness of lips (sometimes cheilitis) · dryness of nasal mucosa (with epistaxis) · dryness of pharyngeal mucosa (with hoarseness) · dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus) · epidermal fragility (trauma may cause blistering) · haematuria · headache · myalgia · neutropenia · proteinuria · raised blood-glucose concentration · raised plasma-triglyceride concentration · raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration) · raised serum-transaminase concentration · thrombocytopenia · thrombocytosis

##### ▶ Rare

- With oral use Aggressive behaviour · alopecia · anxiety · depression · mood changes · skin reactions

##### ▶ Very rare

- With oral use Acne fulminans · allergic vasculitis · arthritis · benign intracranial hypertension · blurred vision · bone changes following long-term administration · calcification of tendons and ligaments following long-term administration · cataracts · colour blindness · convulsions · corneal opacities · decreased night vision · decreased tolerance to contact lenses · diabetes mellitus · dizziness · drowsiness · early epiphyseal closure following long-term administration · exacerbation of acne · gastrointestinal haemorrhage · glomerulonephritis · Gram-positive infections of skin and mucous membranes · granulomatous lesions · haemorrhagic diarrhoea · hepatitis · hirsutism · hyperuricaemia · impaired hearing · increased sweating · inflammatory bowel disease · keratitis · lymphadenopathy · malaise · nail dystrophy · nausea · papilloedema · paronychia · photophobia · photosensitivity · psychosis · raised serum-creatinine kinase concentration · reduced bone density following long-term administration · skeletal hyperostosis following long-term administration · skin hyperpigmentation · suicidal ideation · tendinitis · visual disturbances

##### ▶ Frequency not known

- With oral use Stevens-Johnson syndrome · toxic epidermal necrolysis
- With topical use Blistering of skin · burning · crusting of skin · dry or peeling skin · erythema · eye irritation · increased sensitivity to UVB light or sunlight · oedema · pruritus · stinging

#### SIDE-EFFECTS, FURTHER INFORMATION

- Management of side-effects Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Psychiatric side-effects require expert referral.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

#### ● CONCEPTION AND CONTRACEPTION

Pregnancy prevention

- With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.
- With topical use Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- PREGNANCY Contra-indicated in pregnancy (teratogenic).

- BREAST FEEDING Avoid.

#### ● HEPATIC IMPAIRMENT

- With oral use Avoid—further impairment may occur.

#### ● RENAL IMPAIRMENT

- With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

#### ● MONITORING REQUIREMENTS

- With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

- PRESCRIBING AND DISPENSING INFORMATION Isotretinoin is an isomer of tretinoin.

#### ● PATIENT AND CARER ADVICE

- With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

- With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

**MEDICINAL FORMS**

## 7 Scalp and hair conditions

### Scalp and hair conditions

#### Overview

*Dandruff* is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as **pyrithione zinc** (which are widely available) and selenium below may have beneficial effects. Shampoos containing **tar** extracts may be useful and they are also used in *psoriasis*. Ketoconazole shampoo p. 1087 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

**Corticosteroid** gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1110 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in *Psoriasis* p. 1094 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

*Cradle cap* in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

#### Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1127, corticosteroids, anabolic steroids, androgens, danazol p. 678, and progestogens.

Weight loss can reduce hirsutism in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine p. 1127 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1119 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 631 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

#### Androgenetic alopecia

Finasteride p. 720 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

**Other drugs used for Scalp and hair conditions** Coal tar, p. 1109 • Coal tar with lecithin, p. 1110 • Coal tar with salicylic acid and precipitated sulfur, p. 1111 •

### ANTISEPTICS AND DISINFECTANTS > UNDECENOATES

#### Cetrimide with undecenoic acid

##### ● INDICATIONS AND DOSE

**Scalp psoriasis** | **Seborrhoeic dermatitis** | **Dandruff**

- ▶ TO THE SKIN
- ▶ Child: Apply 3 times a week for 1 week, then apply twice weekly
- ▶ Adult: Apply 3 times a week for 1 week, then apply twice weekly

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Shampoo

- ▶ **Ceanel** (Alliance Pharmaceuticals Ltd)  
Undecenoic acid 10 mg per 1 ml, Phenylethyl alcohol 75 mg per 1 ml, Cetrimide 100 mg per 1 ml | Ceanel Concentrate shampoo | 150 ml [P] £3.40 | 500 ml [P] £9.80

### ANTISEPTICS AND DISINFECTANTS > OTHER

#### Benzalkonium chloride

##### ● INDICATIONS AND DOSE

**Seborrhoeic scalp conditions associated with dandruff and scaling**

- ▶ TO THE SKIN
- ▶ Child: Apply as required
- ▶ Adult: Apply as required

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Shampoo

- ▶ **Dermax** (Dermal Laboratories Ltd)  
Benzalkonium chloride 5 mg per 1 ml | Dermax Therapeutic 0.5% shampoo | 250 ml [P] £5.69

### VITAMINS AND TRACE ELEMENTS

#### Selenium

##### ● INDICATIONS AND DOSE

**Seborrhoeic dermatitis** | **Dandruff**

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child 5–17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required
- ▶ Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

**Pityriasis versicolor**

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Adult: Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

● **UNLICENSED USE** The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

● **PATIENT AND CARER ADVICE** Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Shampoo

EXCIPIENTS: May contain Fragrances

- ▶ **Selsun** (Chattam (U.K.) Ltd)  
Selenium sulfide 25 mg per 1 ml | Selsun 2.5% shampoo | 50 ml [P] £1.61 DT price = £1.61 | 100 ml [P] £2.15 DT price = £2.15 | 150 ml [P] £3.06 DT price = £3.06

## 7.1 Alopecia

**Other drugs used for Alopecia** Finasteride, p. 720

### VASODILATORS

#### Minoxidil

##### ● INDICATIONS AND DOSE

##### REGAINE® FOR MEN EXTRA STRENGTH FOAM

##### Androgenetic alopecia

##### ▶ TO THE SKIN

- ▶ Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

##### REGAINE® FOR MEN EXTRA STRENGTH SOLUTION

##### Androgenetic alopecia

##### ▶ TO THE SKIN

- ▶ Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

##### REGAINE® FOR WOMEN REGULAR STRENGTH

##### Androgenetic alopecia

##### ▶ TO THE SKIN

- ▶ Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Avoid contact with broken, infected, shaved, or inflamed skin · avoid contact with eyes · avoid contact with mouth · avoid contact with mucous membranes · avoid inhalation of spray mist · avoid occlusive dressings

##### CAUTIONS, FURTHER INFORMATION

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- **INTERACTIONS** Caution—avoid topical drugs which enhance absorption.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Headache · local irritation
  - ▶ **Uncommon** Changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks) · hypotension
- **SIDE-EFFECTS, FURTHER INFORMATION**

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).
- **PREGNANCY** Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **PATIENT AND CARER ADVICE** Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Foam

CAUTIONARY AND ADVISORY LABELS 15

**Minoxidil 20 mg per 1 ml** Regaine for Women Regular Strength 2% solution | 60 ml [GSL] £14.16

**Minoxidil 50 mg per 1 ml** Regaine for Men Extra Strength 5% solution | 180 ml [P] £39.71

## 7.2 Hirsutism

**Other drugs used for Hirsutism** Co-cyprindiol, p. 1119

### ANTIPROTOZOALS

#### Eflornithine

- **DRUG ACTION** An antiprotozoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

##### ● INDICATIONS AND DOSE

##### Adjunct to laser therapy for facial hirsutism in women

##### ▶ TO THE SKIN

- ▶ Adult: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Acne · burning at application site · rash · stinging at application site
- ▶ **Uncommon** Abnormal hair growth · abnormal hair texture
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **PATIENT AND CARER ADVICE** Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflornithine, do not wash treated area for 4 hours after application.

##### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- ▶ **Vaniqu** (Almirall Ltd)

## 8 Skin cleansers, antiseptics and desloughing agents

### Skin cleansers, antiseptics and desloughing agents

#### Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or

emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1129 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1130, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10000 below, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

### Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulfate p. 480 or lanolin.

## ANTISEPTICS AND DISINFECTANTS

### Potassium permanganate

#### ● INDICATIONS AND DOSE

**Cleansing and deodorising suppurating eczematous reactions and wounds**

- ▶ TO THE SKIN
- ▶ Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

- **CAUTIONS** Irritant to mucous membranes
- **DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.
- **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

##### Tablet for cutaneous solution

- ▶ **Potassium permanganate (Non-proprietary)**  
**Potassium permanganate 400 mg** Potassium permanganate 400mg tablets for cutaneous solution | 30 tablet no price available DT price = £17.50  
EN-Potab 400mg tablets for cutaneous solution | 30 tablet no price available DT price = £17.50
- ▶ **Permitabs** (Alliance Pharmaceuticals Ltd)  
**Potassium permanganate 400 mg** Permitabs 400mg tablets for cutaneous solution | 30 tablet £17.50 DT price = £17.50

## ANTISEPTICS AND DISINFECTANTS > ALCOHOL DISINFECTANTS

### Alcohol

#### (Industrial methylated spirit)

#### ● INDICATIONS AND DOSE

##### Skin preparation before injection

- ▶ TO THE SKIN
- ▶ Child: Apply as required
- ▶ Adult: Apply as required

#### ● CONTRA-INDICATIONS Neonates

- **CAUTIONS** Avoid broken skin - flammable - patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants
- **INTERACTIONS** For the interactions following the *ingestion* of alcohol, see Appendix 1 (alcohol).

#### ● SIDE-EFFECTS

##### Overdose

Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.

For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1204.

- **PRESCRIBING AND DISPENSING INFORMATION** Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

- ▶ **Alcohol (Non-proprietary)**  
Wood naphtha 50 ml per 1 litre, Ethanol 950 ml per 1 litre Industrial methylated spirit 95% | 600 ml £5.04 | 1000 ml £4.42-£12.45  
Industrial methylated spirit 70% | 600 ml £6.00

## ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

### Povidone-iodine

#### ● INDICATIONS AND DOSE

##### Skin disinfection

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

##### BETADINE® DRY POWDER SPRAY

**Skin disinfection, particularly minor wounds and infections**

- ▶ TO THE SKIN
- ▶ Adult: Not for use in serous cavities (consult product literature)

##### SAVLON® DRY

**Skin disinfection of minor wounds**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

##### VIDENE® SOLUTION

**Skin disinfection**

- ▶ TO THE SKIN
- ▶ Child: Apply undiluted in pre-operative skin disinfection and general antiseptics
- ▶ Adult: Apply undiluted in pre-operative skin disinfection and general antiseptics

**VIDENE® SURGICAL SCRUB®****Skin disinfection**

- ▶ TO THE SKIN
- ▶ Child: Use as a pre-operative scrub for hand and skin disinfection
- ▶ Adult: Use as a pre-operative scrub for hand and skin disinfection

**VIDENE® TINCTURE****Skin disinfection**

- ▶ TO THE SKIN
- ▶ Adult: Apply undiluted in pre-operative skin disinfection

- **CONTRA-INDICATIONS** Avoid regular use in patients with thyroid disorders (in adults) · concomitant use of lithium · corrected gestational age under 32 weeks · infants body-weight under 1.5 kg · regular use in neonates
- **CAUTIONS** Broken skin · large open wounds
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.
- **VIDENE® TINCTURE** Procedures involving hot wire cauterly and diathermy
- **SIDE-EFFECTS**
  - ▶ Rare Sensitivity
- **PREGNANCY** Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.
- **BREAST FEEDING** Avoid regular or excessive use.
- **RENAL IMPAIRMENT** Avoid regular application to inflamed or broken skin or mucosa.
- **EFFECT ON LABORATORY TESTS** May interfere with thyroid function tests.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Liquid**

CAUTIONARY AND ADVISORY LABELS 15 (Only for use with alcoholic solutions)

- ▶ **Videne** (Ecolab Healthcare Division)
  - ▶ Povidone-iodine 75 mg per 1 ml Videne 7.5% surgical scrub solution | 500 ml [P] £7.30
  - ▶ Povidone-iodine 100 mg per 1 ml Videne 10% antiseptic solution | 500 ml [GS] £7.30

## 8.1 Minor cuts and abrasions

### Minor cuts and abrasions

#### Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine above may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1130 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony p. 1132) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

## ANTISEPTICS AND DISINFECTANTS

## Glycerol with magnesium sulfate and phenol

## ● INDICATIONS AND DOSE

**Treat carbuncles and boils**

- ▶ TO THE SKIN
- ▶ Adult: To be applied under dressing

- **DIRECTIONS FOR ADMINISTRATION** Paste should be stirred before use.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Paste**

- ▶ **Glycerol with magnesium sulfate and phenol (Non-proprietary)**  
Phenol 5 mg per 1 gram, Magnesium sulfate dried 450 mg per 1 gram, Glycerol 550 mg per 1 gram. Magnesium sulfate paste | 25 gram [GSU] £1.25 | 50 gram [GSU] £2.49 DT price = £2.48

## DERMATOLOGICAL DRUGS &gt; COLLODIONS

## Castor oil with collodion and colophony

.5 gram • NHS indicative price = £5.50 • Drug Tariff (Part IXa)

## 9 Skin disfigurement

## Camouflagers

## Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

## Borderline substances

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

## Camouflages

● **CAMOUFLAGES**

**Covermark classic foundation** (Derma UK Ltd)  
15 ml (ACBS) • NHS indicative price = £11.86

35 gram (ACBS) • NHS indicative price = £24.58

## 10 Sun protection and photodamage

## Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium gel p. 1133 is suitable for the treatment of superficial

lesions in mild disease. Fluorouracil cream below is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid below is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1136 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. A short course of ingenol mebutate p. 1134 is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in combination with methyl-5-aminolevulinic acid (Metvix<sup>®</sup>, available from Galderma) or 5-aminolevulinic acid gel (Ameluz<sup>®</sup>, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinic acid is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

### Diclofenac sodium

#### INDICATIONS AND DOSE

##### SOLARAZE<sup>®</sup>

##### Actinic keratosis

###### ▶ TO THE SKIN

- ▶ **Adult:** Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

● **CAUTIONS** Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

● **INTERACTIONS** → Appendix 1 (NSAIDs).

Interactions do not generally apply to topical NSAIDs.

● **SIDE-EFFECTS** Paraesthesia · photosensitivity · rash (discontinue use if develops)

#### SIDE-EFFECTS, FURTHER INFORMATION

Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

● **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

● **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Gel

EXCIPIENTS: May contain Benzyl alcohol, fragrances, propylene glycol

##### ▶ Solaraze (Almirall Ltd)

**Diclofenac sodium 30 mg per 1 gram** Solaraze 3% gel | 50 gram [PoM] £38.30 DT price = £38.30 | 100 gram [PoM] £76.60

## ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

### Fluorouracil

#### INDICATIONS AND DOSE

##### Superficial malignant and pre-malignant skin lesions

###### ▶ TO THE SKIN USING CREAM

- ▶ **Adult:** Apply 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm<sup>2</sup> (e.g. 23 cm × 23 cm) treated at one time, alternative regimens may be used in some settings

● **CAUTIONS** Avoid contact with eyes and mucous membranes · do not apply to bleeding lesions

● **SIDE-EFFECTS** Erythema multiforme · local irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) · photosensitivity

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

● **PREGNANCY** Manufacturers advise avoid (teratogenic).

● **BREAST FEEDING** Manufacturers advise avoid.

● **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

##### ▶ Fluorouracil (Non-proprietary)

**Fluorouracil 5 mg per 1 gram** Carac 0.5% cream | 30 gram [PoM] no price available

##### ▶ Efidux (Meda Pharmaceuticals Ltd)

**Fluorouracil 50 mg per 1 gram** Efidux 5% cream | 40 gram [PoM] £32.90 DT price = £32.90

### Fluorouracil with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1137.

#### INDICATIONS AND DOSE

##### Low or moderately thick hyperkeratotic actinic keratosis

###### ▶ TO THE SKIN

- ▶ **Adult:** Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm<sup>2</sup> (e.g. 5 cm × 5 cm)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cutaneous solution**

CAUTIONARY AND ADVISORY LABELS 15

▶ **Actikerall** (Almirall Ltd)

Fluorouracil 5 mg/g, Salicylic acid 100 mg/g Actikerall 5mg/g / 100mg/g cutaneous solution | 25 ml **[POM]** £38.30

**PROTEIN KINASE C ACTIVATORS****Ingenol mebutate****INDICATIONS AND DOSE****Actinic keratosis on face and scalp**

▶ TO THE SKIN

▶ Adult: Apply once daily for 3 days, use the 150 microgram/g gel

**Actinic keratosis on trunk and extremities**

▶ TO THE SKIN

▶ Adult: Apply once daily for 2 days, use the 500 microgram/g gel

- **CAUTIONS** Avoid contact with broken skin · avoid contact with eyes · avoid contact with inside of ears · avoid contact with inside of nostrils · avoid contact with lips · avoid occlusive dressings on treated area

**SIDE-EFFECTS**

- ▶ **Common or very common** Blistering · crusting · erosion · erythema · exfoliation · headache · infection · local reactions · oedema · pain · pruritus
- ▶ **Uncommon** Local ulceration · paraesthesia

- **PREGNANCY** Not absorbed from skin, but manufacturer advises avoid.

- **BREAST FEEDING** Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

- **DIRECTIONS FOR ADMINISTRATION** One tube covers skin area of 25 cm<sup>2</sup>. Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Benzyl alcohol

▶ **Picato** (LEO Pharma) ▼

Ingenol mebutate 150 microgram per 1 gram Picato 150micrograms/g gel | 1.41 gram **[POM]** £65.00

Ingenol mebutate 500 microgram per 1 gram Picato 500micrograms/g gel | .94 gram **[POM]** £65.00

## 11 Superficial soft-tissue injuries and superficial thrombophlebitis

### Topical circulatory preparations

**Overview**

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

**HEPARINOIDS****Heparinoid****INDICATIONS AND DOSE****Superficial thrombophlebitis | Bruising | Haematoma**

▶ TO THE SKIN

▶ Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS** Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes
- **LESS SUITABLE FOR PRESCRIBING** *Hirudoïd*<sup>®</sup> is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

▶ **Hirudoïd** (Genus Pharmaceuticals Ltd)

Heparinoid 3 mg per 1 gram Hirudoïd 0.3% cream | 50 gram **[P]** £3.99 DT price = £3.99

**Gel**

EXCIPIENTS: May contain Fragrances, propylene glycol

▶ **Hirudoïd** (Genus Pharmaceuticals Ltd)

Heparinoid 3 mg per 1 gram Hirudoïd 0.3% gel | 50 gram **[P]** £3.99 DT price = £3.99

## 12 Warts and calluses

### Warts and calluses

**Overview**

Warts (verrucae) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1137, formaldehyde p. 1135, glutaraldehyde p. 1135 or silver nitrate p. 1136 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a colloidion basis are available but some patients may develop an allergy to colophony in the formulation; colloidion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

**Anogenital warts**

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin, p. 1135, (the major active ingredient of podophyllum) may be used for *soft, non-keratinised* external anogenital warts. Patients with a limited number of external warts or *keratinised* lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod p. 1136 cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis.

Inosine pranobex p. 585 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

## ANTINEOPLASTIC DRUGS &gt; PLANT ALKALOIDS

## Podophyllotoxin

## ● INDICATIONS AND DOSE

## CONDYLINE®

**Condylomata acuminata affecting the penis or the female external genitalia**

- ▶ TO THE LESION
- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm<sup>2</sup> in the male, maximum 50 single applications ('loops') per session (consult product literature)

## WARTICON® CREAM

**Condylomata acuminata affecting the penis or the female external genitalia**

- ▶ TO THE LESION
- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm<sup>2</sup>

## WARTICON® LIQUID

**Condylomata acuminata affecting the penis or the female external genitalia**

- ▶ TO THE LESION
- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm<sup>2</sup>, maximum 50 single applications ('loops') per session (consult product literature)

- **CAUTIONS** Avoid normal skin · avoid open wounds · keep away from face · very irritant to eyes

- **SIDE-EFFECTS** Local irritation

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Condyline** (Takeda UK Ltd)  
**Podophyllotoxin 5 mg per 1 ml** Condyline 0.5% solution | 3.5 ml [PoM] £14.49
- ▶ **Warticon** (Stiefel Laboratories (UK) Ltd)  
**Podophyllotoxin 5 mg per 1 ml** Warticon 0.5% solution | 3 ml [PoM] £14.86

**Cream**

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid

- ▶ **Warticon** (Stiefel Laboratories (UK) Ltd)  
**Podophyllotoxin 1.5 mg per 1 gram** Warticon 0.15% cream | 5 gram [PoM] £17.83 DT price = £17.83

## ANTISEPTICS AND DISINFECTANTS &gt; ALDEHYDES AND DERIVATIVES

## Formaldehyde

● **INDICATIONS AND DOSE****Warts, particularly plantar warts**

- ▶ TO THE LESION
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Impaired peripheral circulation · not suitable for application to anogenital region · not suitable for application to face · not suitable for application to large areas · patients with diabetes at risk of neuropathic ulcers · protect surrounding skin and avoid broken skin · significant peripheral neuropathy
- **SIDE-EFFECTS** Skin irritation · skin ulceration (with high concentrations)

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Liquid**

- ▶ **Formaldehyde (Non-proprietary)**  
**Formaldehyde 40 mg per 1 ml** Formaldehyde (Buffered) 4% solution | 1000 ml £3.90

**Gel**

- ▶ **Veracur** (Typharm Ltd)  
**Formaldehyde 7.5 mg per 1 gram** Veracur 0.75% gel | 15 gram [GSL] £2.41

**Liquid**

- ▶ **Formaldehyde (Non-proprietary)**  
**Formaldehyde 350 mg per 1 gram** Formaldehyde solution | 500 ml £5.84 DT price = £5.84 | 2000 ml £16.67

## Glutaraldehyde

● **INDICATIONS AND DOSE****Warts, particularly plantar warts**

- ▶ TO THE LESION
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Not for application to anogenital areas · not for application to face · not for application to mucosa · protect surrounding skin
- **SIDE-EFFECTS** Rashes · skin irritation (discontinue if severe) · stains skin brown

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Paint**

- ▶ **Glutarol** (Dermal Laboratories Ltd)  
**Glutaraldehyde 100 mg per 1 ml** Glutarol 10% cutaneous solution | 10 ml [P] £2.07 DT price = £2.07

## ANTISEPTICS AND DISINFECTANTS &gt; OTHER

## Silver nitrate

## ● INDICATIONS AND DOSE

**Common warts**

## ▶ TO THE LESION

- ▶ Child: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- ▶ Adult: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

**Verrucas**

## ▶ TO THE LESION

- ▶ Child: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- ▶ Adult: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

**Umbilical granulomas**

## ▶ TO THE SKIN

- ▶ Child: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin
- ▶ Adult: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin

- **UNLICENSED USE** No age range specified by manufacturer.

- **CAUTIONS** Avoid broken skin · not suitable for application to ano-genital region · not suitable for application to face · not suitable for application to large areas · protect surrounding skin

- **SIDE-EFFECTS** Chemical burns on surrounding skin · stains skin

- **PATIENT AND CARER ADVICE** Patients should be advised that silver nitrate may stain fabric.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Stick**▶ **Silver nitrate (Non-proprietary)**

**Silver nitrate 400 mg per 1 gram** Silver nitrate 40% caustic pencils | 1 applicator P no price available

▶ **Avoca** (Bray Group Ltd)

**Silver nitrate 400 mg per 1 gram** Avoca 40% silver nitrate pencils | 1 applicator P £1.03

**Silver nitrate 750 mg per 1 gram** Avoca 75% silver nitrate applicators | 100 applicator P £44.48  
Avoca 75% silver nitrate applicators with thick handles | 50 applicator P £43.41

**Silver nitrate 950 mg per 1 gram** Avoca 95% silver nitrate applicators | 100 applicator P £44.52  
Avoca 95% silver nitrate pencils | 1 applicator P £1.99 DT price = £2.44

## ANTIVIRALS &gt; IMMUNE RESPONSE MODIFIERS

## Imiquimod

## ● INDICATIONS AND DOSE

**ALDARA®****Warts (external genital and perianal)**

## ▶ TO THE LESION

- ▶ Adult: Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

**Superficial basal cell carcinoma**

## ▶ TO THE LESION

- ▶ Adult: Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment

**Actinic keratosis**

## ▶ TO THE LESION

- ▶ Adult: Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses

**ZYCLARA®****Actinic keratosis**

## ▶ TO THE SKIN

- ▶ Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day

- **CAUTIONS** Autoimmune disease · avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with nostrils · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin)

● **SIDE-EFFECTS**

- ▶ **Common or very common** Burning sensation · erosion · erythema · excoriation · headache · influenza-like symptoms · itching · local reactions · myalgia · oedema · scabbing
- ▶ **Uncommon** Alopecia · local ulceration
- ▶ **Rare** Cutaneous lupus erythematosus-like effect · Stevens-Johnson syndrome
- ▶ **Very rare** Dysuria
- ▶ **Frequency not known** Permanent hyperpigmentation · permanent hypopigmentation

- **CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.

- **PREGNANCY** No evidence of teratogenicity or toxicity in *animal* studies; manufacturer advises caution.

- **BREAST FEEDING** No information available.

● **DIRECTIONS FOR ADMINISTRATION****ZYCLARA®**

- ▶ **Important** Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

**ALDARA®**

- ▶ **Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates

▶ **Aldara** (Meda Pharmaceuticals Ltd)

**Imiquimod 50 mg per 1 gram** Aldara 5% cream 250mg sachets | 12 sachet [PoM] £48.60 DT price = £48.60

▶ **Zyclara** (Meda Pharmaceuticals Ltd)

**Imiquimod 37.5 mg per 1 gram** Zyclara 3.75% cream 250mg sachets | 28 sachet [PoM] £113.00

## SALICYLIC ACID AND DERIVATIVES

### Salicylic acid

#### INDICATIONS AND DOSE

##### OCCLUSAL®

#### Common and plantar warts

▶ TO THE LESION

▶ Child: Apply daily, treatment may need to be continued for up to 3 months

▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

##### VERRUGON®

#### For plantar warts

▶ TO THE LESION

▶ Child: Apply daily, treatment may need to be continued for up to 3 months

▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

● **UNLICENSED USE** Not licensed for use in children under 2 years.

● **CAUTIONS** Avoid broken skin · impaired peripheral circulation · not suitable for application to anogenital region · not suitable for application to face · not suitable for application to large areas · patients with diabetes at risk of neuropathic ulcers · significant peripheral neuropathy

● **SIDE-EFFECTS** Skin irritation · skin ulceration (with high concentrations)

● **PATIENT AND CARER ADVICE** Advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Liquid

CAUTIONARY AND ADVISORY LABELS 15

▶ **Occlusal** (Alliance Pharmaceuticals Ltd)

**Salicylic acid 260 mg per 1 ml** Occlusal 26% solution | 10 ml [P] £3.56 DT price = £3.56

#### Ointment

▶ **Verrugon** (Optima Consumer Health Ltd)

**Salicylic acid 500 mg per 1 gram** Verrugon complete 50% ointment | 6 gram [P] £3.61 DT price = £3.61

## Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid, above.

<b>2 Post-exposure prophylaxis</b>	1144	<b>4 Vaccination</b>	1145

## 1 Immunoglobulin therapy

### IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

#### Immunoglobulins

##### Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1141 and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult [www.ivig.nhs.uk](http://www.ivig.nhs.uk) and *Clinical Guidelines for Immunoglobulin Use*, [www.gov.uk/dh](http://www.gov.uk/dh).

Further information on the use of immunoglobulins is included in Public Health England's *Immunoglobulin Handbook* [www.gov.uk/phe](http://www.gov.uk/phe), and in the Department of Health's publication, *Immunisation against Infectious Disease*, [www.gov.uk/dh](http://www.gov.uk/dh).

##### Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

**Disease-specific immunoglobulins** are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1143 which is available from

BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1143 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1141 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the *Welsh Blood Service* (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

##### Normal immunoglobulin

Human normal immunoglobulin ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

##### Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for *intravenous administration* is used as *replacement therapy* for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult *Clinical Guidelines for Immunoglobulin Use* ([www.gov.uk/dh](http://www.gov.uk/dh)).

##### Hepatitis A

Hepatitis A vaccine p. 1164 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

#### Measles

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1169 for prophylaxis following exposure to measles.

#### Rubella

Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1169.

#### Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* ([www.gov.uk/phe](http://www.gov.uk/phe)).

There are no specific immunoglobulins for hepatitis A, measles, or rubella— normal immunoglobulin p. 1141 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

#### Hepatitis B immunoglobulin

Disease-specific hepatitis B immunoglobulin p. 1141 ('HBIG') is available for use in association with hepatitis B vaccine p. 1165 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not

inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

#### Rabies immunoglobulin

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1143 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1170 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

#### Tetanus immunoglobulin

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1143 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 499 and wound cleansing, should also be used for the treatment of established cases of tetanus.

#### Varicella-zoster immunoglobulin

Varicella-zoster immunoglobulin p. 1144 (VZIG) is recommended for individuals who are at increased risk of severe varicella *and* who have no antibodies to varicella-zoster virus *and* who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks' gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; *children* 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; *adults* about 40 mg daily for more than 1 week.

**Important:** for full details consult *Immunisation against Infectious Disease*. Varicella-zoster vaccine p. 1171 is available.

#### Anti-D (Rh<sub>0</sub>) immunoglobulin

Anti-D (Rh<sub>0</sub>) immunoglobulin p. 1140 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh<sub>0</sub>) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh<sub>0</sub>) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh<sub>0</sub>) immunoglobulin is also given when significant foeto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (Rh<sub>0</sub>) immunoglobulin is

determined according to the level of exposure to rhesus-positive blood.

Use of routine *antenatal* anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, *postpartum* anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh<sub>0</sub>) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

#### MMR vaccine

Measles, mumps and rubella vaccine, live may be given in the postpartum period with anti-D (Rh<sub>0</sub>) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

## Anti-D (Rh<sub>0</sub>) immunoglobulin

### ● INDICATIONS AND DOSE

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, antenatal prophylaxis

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following Rh<sub>0</sub>(D) incompatible blood transfusion

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

### RHOPHYLAC®

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, antenatal prophylaxis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following Rh<sub>0</sub>(D) incompatible blood transfusion

- ▶ BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients · treatment of idiopathic thrombocytopenia purpura in splenectomised patients
- **CAUTIONS** Immunoglobulin A deficiency · possible interference with live virus vaccines
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ MMR vaccine MMR vaccine may be given in the postpartum period with anti-D (Rh<sub>0</sub>) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.
- **INTERACTIONS** → Appendix 1 (immunoglobulins).
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - ▶ Rare Anaphylaxis · dyspnoea · hypotension · tachycardia · urticaria
    - ▶ Frequency not known Abdominal pain · arthralgia · asthenia · back pain · diarrhoea · dizziness · drowsiness · fever ·

headache · hypertension · hypotension · injection site pain · malaise · myalgia · nausea · pruritus · rash · sweating · vomiting

#### SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Abdominal distension · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156**  
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.  
[www.nice.org.uk/TA156](http://www.nice.org.uk/TA156)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- ▶ **D-Gam** (Bio Products Laboratory Ltd)  
**Anti-D (RH<sub>0</sub>) immunoglobulin 250 unit** D-Gam Anti-D immunoglobulin 250unit solution for injection vials | 1 vial [PoM](#) £23.75  
**Anti-D (RH<sub>0</sub>) immunoglobulin 500 unit** D-Gam Anti-D immunoglobulin 500unit solution for injection vials | 1 vial [PoM](#) £33.75  
**Anti-D (RH<sub>0</sub>) immunoglobulin 1500 unit** D-Gam Anti-D immunoglobulin 1,500unit solution for injection vials | 1 vial [PoM](#) £58.00
- ▶ **Rhophylac** (CSL Behring UK Ltd)  
**Anti-D (RH<sub>0</sub>) immunoglobulin 750 unit per 1 ml** Rhophylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £39.52

dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

- ▶ **Adult** (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Injection site reactions
- ▶ **Uncommon** Abdominal pain · anaphylaxis · arthralgia · buccal ulceration · chest pain · dizziness · dyspnoea · glossitis · headache · tremor

##### SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Abdominal distension · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events

#### ● PRESCRIBING AND DISPENSING INFORMATION

Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- ▶ **Hepatitis B immunoglobulin (Non-proprietary)**  
**Hepatitis B immunoglobulin human 200 unit** Hepatitis B immunoglobulin human 200unit solution for injection vials | 1 vial [PoM](#) £122.44  
**Hepatitis B immunoglobulin human 500 unit** Hepatitis B immunoglobulin human 500unit solution for injection vials | 1 vial [PoM](#) £266.33
- ▶ **Zutectra** (Biotest (UK) Ltd)  
Zutectra 500units/1ml solution for injection pre-filled syringes | 5 syringe [PoM](#) £1,275.00

##### Solution for infusion

- ▶ **Hepatec CP** (Biotest (UK) Ltd)  
**Hepatitis B immunoglobulin human 50 unit per 1 ml** Hepatec CP 100units/2ml solution for infusion vials | 1 vial [PoM](#) £51.00  
Hepatec CP 2000units/40ml solution for infusion vials | 1 vial [PoM](#) £935.00  
Hepatec CP 500units/10ml solution for infusion vials | 1 vial [PoM](#) £255.00  
Hepatec CP 5000units/100ml solution for infusion vials | 1 vial [PoM](#) £2,337.50
- ▶ **Omri-Hep-B** (Imported (Israel))  
**Hepatitis B immunoglobulin human 50 unit per 1 ml** Omri-Hep-B 5000units/100ml solution for infusion vials | 1 vial [PoM](#) no price available

## Hepatitis B immunoglobulin

#### ● INDICATIONS AND DOSE

##### Prophylaxis against hepatitis B infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Adult:** 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

##### Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

##### Prevention of hepatitis B in haemodialysed patients

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** (consult product literature)

##### Prophylaxis against re-infection of transplanted liver

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** (consult product literature)

##### Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult** (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly,

## Normal immunoglobulin

#### ● INDICATIONS AND DOSE

##### To control outbreaks of hepatitis A

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ **Adult:** 500 mg

##### Rubella in pregnancy, prevention of clinical attack

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 750 mg continued →

**Antibody deficiency syndromes**

- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: (consult product literature)

**SUBGAM®****Hepatitis A prophylaxis in outbreaks**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 750 mg

● **UNLICENSED USE**

**SUBGAM®** Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

● **CONTRA-INDICATIONS** Patients with selective IgA deficiency who have known antibody against IgA

**PRIVIGEN®** Hyperprolinaemia (contains -proline)

**GAMMAPLEX®** Hereditary fructose intolerance (contains sorbitol)

**HIZENTRA®** Hyperprolinaemia (contains -proline)

**FLEBOGAMMA® DIF** Hereditary fructose intolerance (contains sorbitol)

● **CAUTIONS** Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency · interference with live virus vaccines**CAUTIONS, FURTHER INFORMATION**

- ▶ Interference with live virus vaccines Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given at **least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

**OCTAGAM®** Falsely elevated results with blood glucose testing systems (contains maltose)

● **INTERACTIONS** → Appendix 1 (immunoglobulins).● **SIDE-EFFECTS**

- ▶ **Rare** Acute renal failure · anaphylaxis · aseptic meningitis · cutaneous skin reactions · hypotension
- ▶ **Frequency not known** Arthralgia · chills · diarrhoea · dizziness · fever · headache · low back pain · muscle spasms · myalgia · nausea

**SIDE-EFFECTS, FURTHER INFORMATION**

Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

● **MONITORING REQUIREMENTS** Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.● **DIRECTIONS FOR ADMINISTRATION**

Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route **not** for patients with thrombocytopenia or other bleeding disorders.

**GAMUNEX® KIOVIC®** Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

● **PRESCRIBING AND DISPENSING INFORMATION** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

- ▶ With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

● **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

 Vigam Liquid 10g/200ml solution for infusion vials | 1 vial [PoM] £418.00

## Rabies immunoglobulin

### ● INDICATIONS AND DOSE

#### Post-exposure prophylaxis against rabies infection

- ▶ BY LOCAL INFILTRATION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)
- ▶ Adult: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

### ● SIDE-EFFECTS

- ▶ **Rare** Anaphylaxis · arthralgia · buccal ulceration · chest tightness · dizziness · dyspnoea · glossitis · tremor
- ▶ **Frequency not known** Facial oedema · injection site pain · injection site swelling

- **PRESCRIBING AND DISPENSING INFORMATION** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.

Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Selection for injection

##### ▶ Rabies immunoglobulin (Non-proprietary)

**Rabies immunoglobulin human 500 unit** Rabies immunoglobulin human 500unit solution for injection vials | 1 vial [PoM] £412.13

## Tetanus immunoglobulin

### ● INDICATIONS AND DOSE

#### Post-exposure prophylaxis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
- ▶ Adult: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

continued →

**Treatment of tetanus infection**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 150 units/kg, dose may be given over multiple sites
- ▶ Adult: 150 units/kg, dose may be given over multiple sites

- **CAUTIONS** IgA deficiency · interference with live virus vaccines
- **SIDE-EFFECTS**
  - ▶ Rare Anaphylaxis · arthralgia (in children) · buccal ulceration (in children) · chest tightness (in children) · dizziness (in children) · dyspnoea (in children) · glossitis (in children) · tremor (in children)
  - ▶ Frequency not known Facial oedema (in children) · injection site swelling · pain at injection site
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection**
    - ▶ **Tetanus immunoglobulin (Non-proprietary)**  
Tetanus immunoglobulin human 250 unit solution for injection vials | 1 vial **[PoM]** £45.00

## Varicella-zoster immunoglobulin

### (Antivaricella-zoster Immunoglobulin)

● **INDICATIONS AND DOSE****Prophylaxis against varicella infection**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease

- **CAUTIONS** IgA deficiency · interference with live virus vaccines
- **SIDE-EFFECTS**
  - ▶ Rare Anaphylaxis
  - ▶ Frequency not known Injection site pain · injection site swelling
- **DIRECTIONS FOR ADMINISTRATION** Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.
- **PRESCRIBING AND DISPENSING INFORMATION** Available from selected Public Health England and NHS laboratories (also from BPL).
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Varicella-Zoster** (Bio Products Laboratory Ltd)  
Varicella-Zoster immunoglobulin human 250mg solution for injection vials | 1 vial **[PoM]** £350.00

## 2 Post-exposure prophylaxis

### IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

#### Botulinum antitoxin

- **DRUG ACTION** A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.
- **INDICATIONS AND DOSE**
  - Post exposure prophylaxis of botulinum**
    - ▶ BY INTRAMUSCULAR INJECTION
    - ▶ Adult: (consult product literature)
- **SIDE-EFFECTS** Hypersensitivity reactions
  - SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Hypersensitivity reactions It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.
- **PRE-TREATMENT SCREENING** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).
- **PRESCRIBING AND DISPENSING INFORMATION** Available from local designated centres, for details see TOXBASE (requires registration) [www.toxbase.org](http://www.toxbase.org). For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.
 

The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ▶ **Botulism-antitoxin** (Novartis Vaccines and Diagnostics Ltd)  
Botulinum antitoxin type E 50 unit per 1 ml, Botulinum antitoxin type B 500 unit per 1 ml, Botulinum antitoxin type A 750 unit per 1 ml  
Botulism-Antitoxin Behring 25g/250ml solution for infusion bottles | 1 bottle **[PoM]** no price available

#### Diphtheria antitoxin

##### (Dip/Ser)

● **INDICATIONS AND DOSE****Passive immunisation in suspected cases of diphtheria**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Dose should be given without waiting for bacteriological confirmation (consult product literature)

## ● CAUTIONS

### CAUTIONS, FURTHER INFORMATION

- ▶ **Hypersensitivity** Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

## ● SIDE-EFFECTS

- ▶ **Common or very common** Hypersensitivity reactions
- ▶ **PRE-TREATMENT SCREENING** Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### ▶ Diphtheria antitoxin (Non-proprietary)

Diphtheria antitoxin 1000 unit per 1 ml Antidiphtheria serum  
10,000units/10ml solution for injection ampoules | 1 ampoule POM  
no price available

## 3 Tuberculosis diagnostic test

### DIAGNOSTIC AGENTS > OTHER

## Tuberculin purified protein derivative (Tuberculin PPD)

### ● INDICATIONS AND DOSE

#### Mantoux test

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 2 units for one dose
- ▶ Adult: 2 units for one dose

#### Mantoux test (if first test is negative and a further test is considered appropriate)

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 10 units for 1 dose
- ▶ Adult: 10 units for 1 dose

### DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- ▶ 10 units is equivalent to 0.1 mL of 100 units/mL strength.

## ● CAUTIONS

### CAUTIONS, FURTHER INFORMATION

- ▶ **Mantoux test** Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### Solution for injection

#### ▶ Tuberculin purified protein derivative (Non-proprietary)

Tuberculin purified protein derivative 20 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSI 20 tuberculin units/ml solution for injection 1.5ml vials | 1 vial no price available

#### Tuberculin purified protein derivative 100 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSI 100 tuberculin units/ml solution for injection 1.5ml vials | 1 vial no price available

## 4 Vaccination

### Vaccines

#### Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a *live attenuated* form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- *inactivated* preparations of the virus (e.g. influenza vaccine) or bacteria, or
- *detoxified exotoxins* produced by a micro-organism (e.g. tetanus vaccine), or
- *extracts* of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

**Live attenuated vaccines** usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

**Inactivated vaccines** may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook (including updates since 2013) are available at [www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

#### Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or from **ImmForm** ([www.immform.dh.gov.uk](http://www.immform.dh.gov.uk))—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

For the most up to date immunisation schedule consult 'The complete routine immunisation schedule', available at [www.gov.uk](http://www.gov.uk).

#### Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the

### Routine immunisation schedule

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only (see BCG vaccine and Hepatitis B vaccine, below)	<ul style="list-style-type: none"> <li>▶ Bacillus Calmette-Guérin vaccine p. 1159</li> <li>▶ Hepatitis B vaccine p. 1165</li> </ul>
2 months	<ul style="list-style-type: none"> <li>▶ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1158 First dose</li> <li>▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161 First dose</li> <li>▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1162 First dose</li> <li>▶ Rotavirus vaccine p. 1170 First dose</li> </ul>
3 months	<ul style="list-style-type: none"> <li>▶ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1158 Second dose</li> <li>▶ Rotavirus vaccine p. 1170 Second dose</li> </ul>
4 months	<ul style="list-style-type: none"> <li>▶ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1158 Third dose</li> <li>▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161 Second dose</li> <li>▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1162 Second dose</li> </ul>
12-13 months	<ul style="list-style-type: none"> <li>▶ Measles, mumps and rubella vaccine, live p. 1169 First dose</li> <li>▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161 Single booster dose</li> <li>▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1162 Single booster dose</li> <li>▶ Haemophilus influenzae type B with meningococcal group C vaccine p. 1160 Single booster dose</li> </ul>
2-7 years (including children in school years 1,2 and 3)	<ul style="list-style-type: none"> <li>▶ Influenza vaccine p. 1167 Each year from September. <b>Note:</b> Flu nasal spray is recommended (<i>Fluenz Tetra</i><sup>®</sup>). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine</li> </ul>
Between 3 years and 4 months, and 5 years	<ul style="list-style-type: none"> <li>▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1158 Single booster dose. <b>Note:</b> Preferably allow interval of at least 3 years after completing primary course</li> <li>▶ Measles, mumps and rubella vaccine, live p. 1169 Second dose</li> </ul>
11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-13 years of age in Scotland.	<ul style="list-style-type: none"> <li>▶ Human papillomavirus vaccines p. 1167 2 doses; second dose 6-24 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, since 2012, only <i>Gardasil</i><sup>®</sup> is offered as part of the national immunisation programme; for those females who started the schedule with <i>Cervarix</i><sup>®</sup> under the national immunisation programme, but did not complete the vaccination course, the course can be completed with <i>Gardasil</i><sup>®</sup>.</li> </ul>
13-15 years	<ul style="list-style-type: none"> <li>▶ Meningococcal groups A with C and W135 and Y vaccine p. 1161 Single booster dose</li> </ul>
13-18 years	<ul style="list-style-type: none"> <li>▶ Diphtheria with poliomyelitis and tetanus vaccine p. 1158 Single booster dose. <b>Note:</b> Can be given at the same time as the dose of meningococcal group A with C and W135 and Y vaccine at 13-15 years of age.</li> </ul>
During adult life, women of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> <li>▶ Measles, mumps and rubella vaccine, live p. 1169 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation.</li> </ul>
Pregnant women	<ul style="list-style-type: none"> <li>▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1158 (<i>Boostrix-IPV</i><sup>®</sup>) 1 dose from the 16th week of pregnancy, preferably after the foetal anomaly scan (weeks 18-20)</li> <li>▶ Influenza vaccine p. 1167 (inactivated), Single dose administered from September, regardless of the stage of pregnancy</li> </ul>
Under 25 years, those entering university who are at risk of meningococcal disease	<ul style="list-style-type: none"> <li>▶ Meningococcal groups A with C and W135 and Y vaccine p. 1161 Single dose. <b>Note:</b> Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine p. 1161 over the age of 10 years</li> </ul>
During adult life, if not previously immunised	<ul style="list-style-type: none"> <li>▶ Diphtheria with poliomyelitis and tetanus vaccine p. 1158</li> </ul>
65 years	<ul style="list-style-type: none"> <li>▶ Pneumococcal polysaccharide vaccine p. 1162</li> </ul>
From 65 years	<ul style="list-style-type: none"> <li>▶ Influenza vaccine p. 1167 Each year from September</li> </ul>
70 years	<ul style="list-style-type: none"> <li>▶ Varicella-zoster vaccine p. 1171 Single dose</li> </ul>

second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

#### Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella-zoster

immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus;

and the following inactivated vaccines:

- anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should **not** receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought)

The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by *British HIV Association (BHIVA)* are available at [www.bhiva.org](http://www.bhiva.org) and, *Immunisation of HIV-infected Children* issued by *Children's HIV Association (CHIVA)* are available at [www.chiva.org.uk](http://www.chiva.org.uk)

### Vaccines and asplenia

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type B with meningococcal group C vaccine p. 1160;
- Influenza vaccine p. 1167;
- Meningococcal groups A with C and W135 and Y vaccine p. 1161 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161;
- pneumococcal polysaccharide vaccine.

*Children first diagnosed under 1 year of age* should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

*Children first diagnosed between 1 and 2 years of age* should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

*Children first diagnosed over 2 years of age* should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type B with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

### Vaccines and antisera availability

Anthrax vaccine p. 1159 and yellow fever vaccine, live p. 1172, botulism antitoxin p. 1144, diphtheria antitoxin p. 1144, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency treatment of poisoning p. 1204.

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department  
Public Health England  
Wellington House  
133–155 Waterloo Road  
London  
SE1 8UG  
[vaccinesupply@phe.gov.uk](mailto:vaccinesupply@phe.gov.uk)

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff  
CF14 4XW  
(029) 2074 2979

In Northern Ireland:

Pharmacy and Medicines Management Centre  
Northern Health and Social Care Trust  
Beech House  
Antrim Hospital Site  
Bush Road  
Antrim  
BT41 2RL  
[rphps.admin@northerntrust.hscni.net](mailto:rphps.admin@northerntrust.hscni.net)

For further details of availability, see under individual vaccines.

### Anthrax vaccine

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *B. anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis. Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

### BCG vaccine

Bacillus Calmette-Guérin vaccine p. 1159 should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette-Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should **not** be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculin hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;

- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.gov.uk/phe](http://www.gov.uk/phe).

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 533 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

### Tuberculosis Diagnostic Agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative (PPD) p. 1145.

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantiferON® TB Gold* and *T-SPOT® TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.gov.uk/phe](http://www.gov.uk/phe).

### Botulism antitoxin

A polyvalent botulism antitoxin p. 1144 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

### Cholera vaccine

Cholera vaccine p. 1160 (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

*Injectable cholera vaccine* provides unreliable protection and is no longer available in the UK.

### Diphtheria vaccine

Diphtheria-containing vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of **diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed)** (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive *either* **adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Individuals aged over 10 years should receive **adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

### Diphtheria-containing vaccines for children over 10 years and adults

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

### Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** should be administered.

### Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. **Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

### Haemophilus influenzae type B conjugate vaccine

**Haemophilus influenzae type b (Hib) vaccine** is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1158. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

### Invasive Haemophilus influenzae type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 535 in the prevention of secondary cases of *Haemophilus influenzae* type b disease.

### Hepatitis A vaccine

Hepatitis A vaccine p. 1164 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas;

- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix<sup>®</sup> can also be used.

Intramuscular normal immunoglobulin p. 1141 is recommended for use in addition to hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others (unlicensed use); in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

### Hepatitis B vaccine

Hepatitis B vaccine p. 1165 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and *hepatitis B immunoglobulin* given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother's e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients' tissues;

- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances. Generally, three or four doses are required for primary immunisation; an 'accelerated schedule' is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis.

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at [www.dh.gov.uk](http://www.dh.gov.uk)). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease*. Specific hepatitis B immunoglobulin p. 1141 ('HBIG') is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection.

A combined hepatitis A and B vaccine p. 1163 is also available.

### Human papillomavirus vaccine

Human papillomavirus vaccine is available as a bivalent vaccine (*Cervarix*<sup>®</sup>) or a quadrivalent vaccine (*Gardasil*<sup>®</sup>). Since 2012, only *Gardasil*<sup>®</sup> is offered as part of the national immunisation programme. *Cervarix*<sup>®</sup> is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil* is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed

since the first dose or if the girl is then aged 15 years or more.

Females receiving their first dose aged 15 years or older require a 3-dose schedule (see *Cervarix*<sup>®</sup> and *Gardasil*<sup>®</sup>), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the human papillomavirus vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

### Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1167 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Immunisation is recommended for *persons at high risk*, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: *adult and child over 20 kg*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine (inactivated) is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals. The Joint Committee on Vaccination and Immunisation (JCVI) has also advised that morbidly obese people (defined as BMI greater than 40 kg/m<sup>2</sup>) could also benefit from influenza vaccination.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved

in patient care. Employers of social care workers should consider similar action.

Unless contra-indicated, the live influenza vaccine, *Fluenz Tetra*<sup>®</sup>, is preferred in children aged 2–17 years because it provides a higher level of protection than inactivated influenza vaccine. In the 2016/2017 national influenza immunisation programme, seasonal influenza vaccine will also be offered to all children aged 2–7 years (including those in school years 1, 2 and 3).

Information on pandemic influenza, avian influenza and swine influenza may be found at [www.gov.uk/guidance/pandemic-flu](http://www.gov.uk/guidance/pandemic-flu) and at [www.gov.uk/phe](http://www.gov.uk/phe).

### Japanese encephalitis vaccine

Japanese encephalitis vaccine p. 1168 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre ([www.nathnac.net](http://www.nathnac.net)).

### Measles, Mumps and Rubella vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine, live p. 1169 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live p. 1169 should be used to protect against rubella in *seronegative women of child-bearing age* (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously *unimmunised and seronegative post-partum women* (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants

arriving after the age of school immunisation are particularly likely to require immunisation.

### Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

### Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

### Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C.

**Meningococcal group C conjugate vaccine** protects only against infection by serogroup C and **Meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A **meningococcal group B vaccine**, *Bexsero*<sup>®</sup>, is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B and is recommended in the Immunisation Schedule. *Bexsero*<sup>®</sup> contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation**

**Meningococcal group C conjugate vaccine** provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type B with meningococcal group C vaccine p. 1160) and a second dose given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1161) (see Immunisation Schedule).

**Meningococcal group B vaccine** provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see *Immunisation Schedule* above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type B with meningococcal group C vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

**Travel**

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre ([www.nathnac.net](http://www.nathnac.net)).

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts**

For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidance for Public Health Management of Meningococcal Disease in the UK at [www.gov.uk/phe](http://www.gov.uk/phe). Also

see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

**Pertussis vaccine**

**Pertussis vaccine** is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a *pertussis-containing* vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

**Vaccination of pregnant women against pertussis**

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; *Boostrix-IPV*<sup>®</sup>) between 16 and 32 weeks of pregnancy. Public Health England has advised (2016) that the vaccine is probably best offered after the foetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

**Contacts**

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

**Side-effects**

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;

- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

### Pneumococcal vaccine

Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1162 protects against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. **Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine (adsorbed)** contains polysaccharide from either 10 capsular types (*Synflorix*<sup>®</sup>) or 13 capsular types (*Prevenar 13*<sup>®</sup>) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13*<sup>®</sup>) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule).

Pneumococcal polysaccharide conjugate vaccine (adsorbed) is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological conditions;
- complement disorders;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *adult and child over 20 kg*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease;
- at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

#### Choice of vaccine

Children under 2 years at increased risk of pneumococcal infection (see list) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at

12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

#### Revaccination

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

#### Poliomyelitis vaccine

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated** poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

**Live (oral) poliomyelitis vaccine** is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

#### Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from [www.travax.nhs.uk](http://www.travax.nhs.uk) or from the National Travel Health Network and Centre ([www.nathnac.net](http://www.nathnac.net)).

## Rabies vaccine

Rabies vaccine p. 1170 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

### Pre-exposure prophylaxis

Immunisation should be offered to those at high risk of exposure to rabies— laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre ([www.nathnac.net](http://www.nathnac.net)) and, in Scotland, from Health Protection Scotland ([www.hps.scot.nhs.uk](http://www.hps.scot.nhs.uk)).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

### Post-exposure management

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England's Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales Local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given

between day 3–7. Rabies immunoglobulin p. 1143 is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin p. 1143 is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine p. 1170. The immunisation course can be discontinued if it is proved that the individual was not at risk.

## Rotavirus vaccine

Rotavirus vaccine p. 1170 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

## Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at [www.gov.uk/phe](http://www.gov.uk/phe).

## Tetanus vaccine

**Tetanus vaccine** contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster

should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

### Wounds

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) *or* show much devitalised tissue *or* are septic *or* are compound fractures *or* contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)
- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

### Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine, inactivated p. 1171 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

### Typhoid vaccine

Typhoid vaccine p. 1163 is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely
- laboratory personnel who, in the course of their work, may be exposed to *Salmonella typhi*.

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular **polysaccharide** typhoid vaccine is usually given by *intramuscular injection*. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

**Oral** typhoid vaccine p. 1163 is a **live attenuated** vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

### Varicella-zoster vaccine

The live varicella-zoster vaccine p. 1171, *Varilrix*<sup>®</sup> and *Varivax*<sup>®</sup>, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

### National shingles immunisation programme

The aim of the national shingles immunisation programme is to lower the incidence and severity of shingles in older people using the high potency, live varicella-zoster vaccine, *Zostavax*<sup>®</sup>. It is recommended that vaccination is routinely offered to people aged 70 years. A catch-up programme has also been rolled out (since 2013) in those aged 70–79 years, as this age group is likely to have the greatest benefit from vaccination.

In the 2016–2017 immunisation programme, varicella-zoster vaccine is recommended in adults who were 70 or 78 years of age on 1st September 2016. Patients who were eligible for vaccination in the first 3 years of the programme but have not been vaccinated against *herpes zoster* remain eligible until their 80th birthday; this includes patients who were aged 71–73 or 79 on 1st September 2016. Patients who have reached 80 years are no longer eligible for vaccination. A single dose of *Zostavax*<sup>®</sup> is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although *Zostavax*<sup>®</sup> is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella-zoster immunoglobulin p. 1144 is used to protect susceptible individuals at increased risk of varicella infection.

## Yellow fever vaccine

Yellow fever vaccine, live p. 1172 is indicated for those travelling or living in areas where infection is endemic and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

## Vaccines for travel

### Immunisation

See advice on Malaria, treatment p. 566.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from [www.gov.uk/phe](http://www.gov.uk/phe)); it should preferably be given 3 months or more before departure.

**Yellow fever** immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, [www.dh.gov.uk](http://www.dh.gov.uk)).

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world.

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.

**Hepatitis B** vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may

not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

**Typhoid vaccine** is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on **diphtheria**, on **Japanese encephalitis**, and on **tick-borne encephalitis** is included in *Health Information for Overseas Travel*.

### Food hygiene

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

### Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: [www.nathnac.net](http://www.nathnac.net).

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for *healthcare professionals* regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

## VACCINES

## Vaccines

## IMPORTANT SAFETY INFORMATION

## MHRA/CHM ADVICE (APRIL 2016)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF- $\alpha$ ) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF- $\alpha$  inhibitors and other biological medicines in utero, any live attenuated vaccination should be deferred until the infant is age 6 months, after which time vaccination should be considered.

- **CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

- **CAUTIONS** Acute illness · minor illnesses

**CAUTIONS, FURTHER INFORMATION**

Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- ▶ Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: **adults**, at least 40 mg daily for more than 1 week; **children**, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child* (2002) (available at [www.rcpch.ac.uk](http://www.rcpch.ac.uk)).

- ▶ Predisposition to neurological problems When there is a personal or family history of *febrile* convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

- **INTERACTIONS** → Appendix 1 (vaccines).

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Fatigue · fever · gastro-intestinal disturbances · headache · irritability · loss of appetite · lymphangitis · malaise · myalgia
- ▶ **Very rare** Anaphylaxis (can be fatal) · angioedema (can be fatal) · bronchospasm (can be fatal) · hypersensitivity reactions (can be fatal) · urticaria (can be fatal)
- ▶ **Frequency not known** Arthralgia · asthenia · dizziness · drowsiness · influenza-like symptoms · lymphadenopathy · paraesthesia · rash

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**

- ▶ With intradermal use or intramuscular use or subcutaneous use Induration may develop at the injection site · inflammation · local reactions · pain · redness · sterile abscess may develop at the injection site

**SIDE-EFFECTS, FURTHER INFORMATION**

Occasionally serious adverse reactions can occur—these should always be reported to the CHM.

- ▶ Post-immunisation pyrexia in infants The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, paracetamol can be given. Ibuprofen can be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).
- **PREGNANCY** Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.
- **BREAST FEEDING** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.
- **DIRECTIONS FOR ADMINISTRATION** If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also *Bacillus Calmette-Guérin vaccine* p. 1159.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with **bleeding disorders**

such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

- **HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

## VACCINES > BACTERIAL AND VIRAL VACCINES, COMBINED

### Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

#### ● INDICATIONS AND DOSE

##### Primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2 months–10 years: 0.5 mL every month for 3 doses

- **UNLICENSED USE** *Infanrix-IPV+ Hib*<sup>®</sup> not licensed for use in children over 36 months; *Pediacel* not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.
- **SIDE-EFFECTS** Atopic dermatitis · hypotonia · restlessness · sleep disturbances · unusual crying in infants
- **SIDE-EFFECTS, FURTHER INFORMATION** Side effects of vaccines containing pertussis The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contraindicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ▶ **Pediacel** (sanofi pasteur MSD Ltd)  
Pediacel vaccine suspension for injection 0.5mL vials | 1 vial [PoM] £32.00

##### Powder and suspension for suspension for injection

- ▶ **Infanrix-IPV + Hib** (GlaxoSmithKline UK Ltd)  
Infanrix-IPV + Hib vaccine powder and suspension for suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £27.86

### Diphtheria with pertussis, poliomyelitis vaccine and tetanus

#### ● INDICATIONS AND DOSE

##### First booster dose

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–9 years: 0.5 mL, to be given 3 years after primary immunisation

##### Vaccination of pregnant women against pertussis (using low dose vaccines)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 0.5 mL for 1 dose

- **SIDE-EFFECTS** Restlessness · sleep disturbances · unusual crying in infants

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Side effects of vaccines containing pertussis The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contraindicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.
- **PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.
- **PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include *Boostrix-IPV*<sup>®</sup> or *Repevax*<sup>®</sup>).
- Available as part of childhood immunisation schedule from health organisations or ImmForm.
- Available for vaccination of pregnant women from ImmForm.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ▶ **Boostrix-IPV** (GlaxoSmithKline UK Ltd)  
Boostrix-IPV suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £22.74
- ▶ **Infanrix-IPV** (GlaxoSmithKline UK Ltd)  
Infanrix-IPV vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £17.56
- ▶ **Repevax** (sanofi pasteur MSD Ltd)  
Repevax vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.00

### Diphtheria with poliomyelitis and tetanus vaccine

#### ● INDICATIONS AND DOSE

##### Primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10–17 years: 0.5 mL every month for 3 doses
- ▶ Adult: 0.5 mL every month for 3 doses

**Booster doses**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10-17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
- ▶ Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine

- **SIDE-EFFECTS** Restlessness · sleep disturbances · unusual crying in infants
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ▶ **Revaxis** (sanofi pasteur MSD Ltd)  
Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.50

**VACCINES > BACTERIAL VACCINES****Anthrax vaccine****INDICATIONS AND DOSE****Pre-exposure immunisation against anthrax | Post-exposure immunisation**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 dose every 3 weeks for 3 doses, followed by 1 dose after 6 months, to be administered in the deltoid region, 1 dose is equivalent to 0.5 mL

**Booster**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 dose every 12 months, to be administered in deltoid region, 1 dose is equivalent to 0.5 mL

- **PRESCRIBING AND DISPENSING INFORMATION** Available from Public Health England's Centre for Emergency Preparedness and Response (Porton Down).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Thiomersal

- ▶ **Anthrax vaccine (Non-proprietary)**  
Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5ml ampoules | 5 ampoule [PoM] no price available

**Bacillus Calmette-Guérin vaccine (BCG Vaccine)**

- **DRUG ACTION** BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

**INDICATIONS AND DOSE****Immunisation against tuberculosis**

- ▶ BY INTRADERMAL INJECTION
- ▶ Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**
- ▶ Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**
- ▶ Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

- **CONTRA-INDICATIONS** Generalised septic skin conditions
- CONTRA-INDICATIONS, FURTHER INFORMATION**  
A lesion-free site should be used to administer BCG vaccine to patients with eczema.

**CAUTIONS****CAUTIONS, FURTHER INFORMATION**

BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

**SIDE-EFFECTS**

- ▶ **Rare** Disseminated complications · osteitis · osteomyelitis
- ▶ **Frequency not known** Prolonged ulceration at the injection site · subcutaneous abscess at the injection site
- **PRE-TREATMENT SCREENING** Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin protein (see tuberculin purified protein derivative p. 1145). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.
- **DIRECTIONS FOR ADMINISTRATION**  
Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb ≡ 0.1 mL injection, 3 mm bleb ≡ 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.
- **PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm [www.immform.dh.gov.uk](http://www.immform.dh.gov.uk) (SSI brand, multidose vial with diluent).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**▶ **Bacillus calmette-guérin vaccine (Non-proprietary)**

Bacillus Calmette-Guérin vaccine powder and solvent for suspension for injection vials | 10 vial [PoM] no price available

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**▶ **Dukoral** (Valvea UK Ltd)

Dukoral cholera vaccine oral suspension | 2 dose [PoM] £23.42

F 1157

**Cholera vaccine****INDICATIONS AND DOSE**

**Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)**

▶ **BY MOUTH**

- ▶ Child 2-5 years: 1 dose every 1-6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- ▶ Child 6-17 years: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- ▶ Adult: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

**Booster**▶ **BY MOUTH**

- ▶ Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
- ▶ Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- ▶ Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**CONTRA-INDICATIONS** Acute gastro-intestinal illness**SIDE-EFFECTS**

- ▶ **Rare** Cough · respiratory symptoms · rhinitis
- ▶ **Very rare** Insomnia · sore throat
- ▶ **Frequency not known** Abdominal pain and cramps · diarrhoea · nausea · vomiting

**DIRECTIONS FOR ADMINISTRATION**

- ▶ In children Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2-5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- ▶ In adults Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

- ▶ **PATIENT AND CARER ADVICE** Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is **essential**.

**Haemophilus influenzae type B with meningococcal group C vaccine****INDICATIONS AND DOSE**

**Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component) and primary immunisation against *Neisseria meningitidis***

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 12-13 months: 0.5 mL for 1 dose

**Immunisation against *Neisseria meningitidis* in an unimmunised patient**

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 1-9 years: 0.5 mL for 1 dose

**Booster dose (for children who have not been immunised against *Haemophilus influenzae* type b) | Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)**

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 1-9 years: 0.5 mL for 1 dose

**Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)**

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 1-17 years: 0.5 mL for 1 dose
- ▶ Adult: 0.5 mL for 1 dose

**Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)**

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type B vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

**Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)**

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)
- ▶ Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine

- ▶ **UNLICENSED USE** Not licensed for use in patients over 2 years.

**SIDE-EFFECTS**

- ▶ **Rare** Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- ▶ **Frequency not known** Atopic dermatitis · hypotonia

- ▶ **PRESCRIBING AND DISPENSING INFORMATION** Available as part of the childhood immunisation schedule from ImmForm.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

- ▶ **Menitorix** (GlaxoSmithKline UK Ltd)  
Menitorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £37.76

## Meningococcal group B vaccine (rDNA, component, adsorbed)

### ● INDICATIONS AND DOSE

#### **Immunisation against *Neisseria meningitidis*, primary immunisation**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 414.
- ▶ Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 414.

#### **Immunisation against *Neisseria meningitidis*, primary immunisation booster dose**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

#### **Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1-2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 12-23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12-24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 2-10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 11-17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region
- ▶ Adult: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

### ● SIDE-EFFECTS

- ▶ **Rare** Kawasaki disease (in children) · symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- ▶ **Frequency not known** Unusual crying (in children)

**Typhoid vaccine****INDICATIONS AND DOSE****Immunisation against typhoid fever in children at high risk of typhoid fever**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

**Immunisation against typhoid fever**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- ▶ Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- ▶ BY MOUTH
- ▶ Child 6-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)
- ▶ Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

- **UNLICENSED USE** Not licensed for use in children under 2 years.

**CONTRA-INDICATIONS**

- ▶ With oral use Acute gastro-intestinal illness

**INTERACTIONS** Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- *Mefloquine* should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

**SIDE-EFFECTS**

- ▶ With oral use Abdominal cramps · abdominal pain · diarrhoea · nausea · vomiting

**DIRECTIONS FOR ADMINISTRATION** Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.**HANDLING AND STORAGE**

- ▶ With oral use It is important to store capsules in a refrigerator.

**PATIENT AND CARER ADVICE**

- ▶ With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Combinations available: **Hepatitis A with typhoid vaccine**, p. 1165

**VACCINES > VIRAL VACCINES****Hepatitis A and B vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1164, hepatitis B vaccine p. 1165.

**INDICATIONS AND DOSE****AMBIRIX®****Immunisation against hepatitis A and hepatitis B infection (primary course)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® ADULT****Immunisation against hepatitis A and hepatitis B infection (primary course)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- ▶ Adult: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Immunisation against hepatitis A and hepatitis B infection—accelerated schedule for travellers departing within 1 month**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- ▶ Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® PAEDIATRIC****Immunisation against hepatitis A and hepatitis B infection (primary course)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**IMPORTANT SAFETY INFORMATION**

*Ambirix*® and *Twinrix*® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

**● PRESCRIBING AND DISPENSING INFORMATION**

**TWINRIX® PAEDIATRIC** Primary course should be completed with *Twinrix*® (single component vaccines given at appropriate intervals may be used for booster dose).

**AMBIRIX®** Primary course should be completed with *Ambirix*® (single component vaccines given at appropriate intervals may be used for booster dose).

**TWINRIX® ADULT** Primary course should be completed with *Twinrix*® (single component vaccines given at appropriate intervals may be used for booster dose).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Neomycin

- ▶ **Ambirix** (GlaxoSmithKline UK Ltd)  
Ambirix vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £31.18
- ▶ **Twinrix** (GlaxoSmithKline UK Ltd)  
Twinrix Paediatric vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.79  
Twinrix Adult vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £33.31 | 10 pre-filled disposable injection [PoM] £333.13

P 1157

**Hepatitis A vaccine****● INDICATIONS AND DOSE****AVAXIM®****Immunisation against hepatitis A infection**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

**HAVRIX MONODOSE®****Immunisation against hepatitis A infection**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ▶ Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ▶ Adult: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

**VAQTA® ADULT****Immunisation against hepatitis A infection**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 mL for 1 dose, then 1 mL after 6-18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

**VAQTA® PAEDIATRIC****Immunisation against hepatitis A infection**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Neomycin

- ▶ **Avaxim** (sanofi pasteur MSD Ltd)  
Avaxim vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £18.10 | 10 pre-filled disposable injection [PoM] £181.00
- ▶ **Havrix** (GlaxoSmithKline UK Ltd)  
Havrix Monodose vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £22.14 | 10 pre-filled disposable injection [PoM] £221.43  
Havrix Junior Monodose vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.77 | 10 pre-filled disposable injection [PoM] £167.68  
Havrix Junior Monodose vaccine suspension for injection 0.5mL vials | 1 vial [PoM] £16.77  
Havrix Monodose vaccine suspension for injection 1mL vials | 1 vial [PoM] £22.14
- ▶ **VAQTA** (sanofi pasteur MSD Ltd)  
VAQTA Adult vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £18.10  
VAQTA Adult vaccine suspension for injection 1mL vials | 1 vial [PoM] £18.10  
VAQTA Paediatric vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.74

## Hepatitis A with typhoid vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1164, typhoid vaccine p. 1163.

### ● INDICATIONS AND DOSE

#### HEPATYRIX®

##### Immunisation against hepatitis A and typhoid infection (primary course)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 15–17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
- ▶ Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

#### VIATIM®

##### Immunisation against hepatitis A and typhoid infection (primary course)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16–17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
- ▶ Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

EXCIPIENTS: May contain Neomycin

- ▶ **Hepatyrix** (GlaxoSmithKline UK Ltd)  
Hepatyrix vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £37.21 | 10 pre-filled disposable injection [PoM] £372.10
- ▶ **VIATIM** (sanofi pasteur MSD Ltd)  
VIATIM vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £29.80

1157

## Hepatitis B vaccine

### ● INDICATIONS AND DOSE

#### ENGERIX B®

##### Immunisation against hepatitis B infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

- ▶ Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

##### Immunisation against hepatitis B infection (accelerated schedule)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- ▶ Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

##### Immunisation against hepatitis B infection, alternative accelerated schedule

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 11–15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

##### Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

##### Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration →

concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

#### Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

##### ► BY INTRAMUSCULAR INJECTION

- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

#### FENDRIX®

#### Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

##### ► BY INTRAMUSCULAR INJECTION

- Child 15-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

#### HBVAXPRO®

#### Immunisation against hepatitis B infection

##### ► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

#### Immunisation against hepatitis B infection (accelerated schedule)

##### ► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

#### Neonate born to hepatitis B surface antigen-positive mother

##### ► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

#### Chronic haemodialysis patients

##### ► BY INTRAMUSCULAR INJECTION

- Child 16-17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

EXCIPIENTS: May contain Thiomersal

- **Engerix B** (GlaxoSmithKline UK Ltd)

**Hepatitis B virus surface antigen 20 microgram per 1 ml** Engerix B 20micrograms/1ml vaccine suspension for injection vials | 1 vial [PoM] £12.34 | 10 vial [PoM] £123.41  
 Engerix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.67  
 Engerix B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.99 | 10 pre-filled disposable injection [PoM] £129.92

- **Fendrix** (GlaxoSmithKline UK Ltd)  
**Hepatitis B virus surface antigen 40 microgram per 1 ml** Fendrix 20micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £38.10
- **HBVAXPRO** (sanofi pasteur MSD Ltd)  
**Hepatitis B virus surface antigen 10 microgram per 1 ml** HBVAXPRO 10micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.20  
**HBVAXPRO 5micrograms/0.5ml vaccine suspension for injection pre-filled syringes** | 1 pre-filled disposable injection [PoM] £8.95
- **Hepatitis B virus surface antigen 40 microgram per 1 ml** HBvaxPRO 40micrograms/1ml vaccine suspension for injection vials | 1 vial [PoM] £27.60

F 1157

## Human papillomavirus vaccines

### ● INDICATIONS AND DOSE

#### CERVARIX®

##### Prevention of premalignant genital lesions and cervical cancer

- ▶ BY INTRAMUSCULAR INJECTION
- Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
- Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

#### GARDASIL®

##### Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

- ▶ BY INTRAMUSCULAR INJECTION
- Child 9–13 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
- Child 14–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after

the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

##### Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)

- ▶ BY INTRAMUSCULAR INJECTION
- Child 9–13 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

- **PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.
- **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

- ▶ **Cervarix** (GlaxoSmithKline UK Ltd)  
Cervarix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £80.50
- ▶ **Gardasil** (sanofi pasteur MSD Ltd)  
Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £86.50

F 1157

## Influenza vaccine

### ● INDICATIONS AND DOSE

#### Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)

- ▶ BY INTRAMUSCULAR INJECTION
- Child 6 months–9 years: 0.5 mL for 1 dose, followed by 0.5 mL after at least 4 weeks for 1 dose
- ▶ BY INTRANASAL ADMINISTRATION
- Child 2–9 years: 0.1 mL for 1 dose, followed by 0.1 mL after at least 4 weeks for 1 dose, 0.1 mL dose to be administered into each nostril

#### Annual immunisation against seasonal influenza

- ▶ BY INTRAMUSCULAR INJECTION
- Child 6 months–17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose
- ▶ BY INTRADERMAL INJECTION
- Adult 18–59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
- Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region
- ▶ BY INTRANASAL ADMINISTRATION
- Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

- **UNLICENSED USE** Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.
- **FLUVIRIN®** Not licensed for use in children under 4 years.
- **FLUARIX TETRA®** Not licensed for use in children under 3 years of age.

**OPTAFLU®** Not licensed for use in children and adolescents under 18 years.

- **CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years— increased risk of febrile convulsions

**FLUENZ TETRA®** Active wheezing · concomitant use with antiviral therapy for influenza · severe asthma

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ Concomitant use with antivirals Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.

**ENZIRA®** Child under 5 years—increased risk of febrile convulsions

- **CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

**ENZIRA®** Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Uncommon** Epistaxis
- ▶ **Frequency not known** Febrile convulsions · transient thrombocytopenia · vasculitis (in adults)

**SPECIFIC SIDE-EFFECTS**

- ▶ With intranasal use Rhinorrhoea
- **ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

**FLUENZ TETRA®** Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

**FLUENZ TETRA®** Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

**FLUARIX TETRA®** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**

**FLUENZ TETRA®** Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Gentamicin, kanamycin, neomycin penicillins, polymyxin b, thiomersal

- ▶ **Influenza vaccine (Non-proprietary)**

Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.00–£6.59 | 10 pre-filled disposable injection [PoM] £65.90

Influenza vaccine (surface antigen, inactivated) suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection [PoM] £41.50

- ▶ **Agrippal** (Seqirus Ltd)

Agrippal vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection [PoM] £58.50

- ▶ **Enzira** (Pfizer Ltd)

Enzira vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.25 | 10 pre-filled disposable injection [PoM] £52.50

- ▶ **Fluarix Tetra** (GlaxoSmithKline UK Ltd) ▼

Fluarix Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.94 | 10 pre-filled disposable injection [PoM] £99.40

- ▶ **Imuvac** (BGP Products Ltd)

Imuvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.59 | 10 pre-filled disposable injection [PoM] £65.90

- ▶ **Influvac Sub-unit** (BGP Products Ltd)

Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.22 | 10 pre-filled disposable injection [PoM] £52.20

- ▶ **Intanza** (sanofi pasteur MSD Ltd)

Intanza 15microgram strain vaccine suspension for injection 0.1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.05 | 10 pre-filled disposable injection [PoM] £90.50

- ▶ **Optafu** (Novartis Vaccines and Diagnostics Ltd)

Optafu vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.59

**Spray**

EXCIPIENTS: May contain Gelatin, gentamicin

- ▶ **FluMist Quadrivalent** (AstraZeneca UK Ltd)

FluMist Quadrivalent vaccine nasal suspension 0.2ml unit dose | 10 unit dose [PoM] £180.00

- ▶ **Fluenz Tetra** (AstraZeneca UK Ltd) ▼

Fluenz Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose [PoM] £180.00

F 1157

## Japanese encephalitis vaccine

- **INDICATIONS AND DOSE**

**Immisation against Japanese encephalitis**

- ▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 2 months–2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders
- ▶ Child 3–17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders
- ▶ Adult: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders

**Booster dose**

- ▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Adult: 0.5 mL after 1–2 years, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders, for those at continued risk, the booster dose should be given 1 year after completing the primary course

- **SIDE-EFFECTS**

- ▶ **Uncommon** Cough (in children) · migraine (in adults) · vertigo (in adults)
- ▶ **Rare** Dyspnoea (in adults) · neuritis (in adults) · palpitation (in adults) · tachycardia (in adults) · thrombocytopenia (in adults)
- **PREGNANCY** Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

- **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Japanese encephalitis vaccine (Non-proprietary)**

F 1157

**Measles, mumps and rubella vaccine, live****● INDICATIONS AND DOSE****Primary immunisation against measles, mumps, and rubella (first dose)**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 12–13 months: 0.5 mL for 1 dose

**Primary immunisation against measles, mumps, and rubella (second dose)**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 40 months–5 years: 0.5 mL for 1 dose

**Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: (consult product literature or local protocols)

**Children presenting for pre-school booster, who have not received the primary immunisation (first dose) | Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 6 months–17 years: (consult product literature or local protocols)
- ▶ Adult: (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in children under 9 months.

**IMPORTANT SAFETY INFORMATION****MMR VACCINATION AND BOWEL DISEASE OR AUTISM**

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

- **CAUTIONS** Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation

**CAUTIONS, FURTHER INFORMATION**

- ▶ Administration with other vaccines MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be

given at any interval and an additional dose of the vaccine given second may be considered.

**● SIDE-EFFECTS**

- ▶ **Uncommon** Parotid swelling (usually in the third week) · sleep disturbances · unusual crying in infants
- ▶ **Rare** Arthropathy (2 to 3 weeks after immunisation) · idiopathic thrombocytopenic purpura
- ▶ **Frequency not known** Optic neuritis · peripheral neuritis

**SIDE-EFFECTS, FURTHER INFORMATION**

Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol).

Febrile seizures—occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection)

- ▶ Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura *within 6 weeks* of the first dose of MMR.
- ▶ Aseptic meningitis Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.
- ▶ Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- **ALLERGY AND CROSS-SENSITIVITY** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

- **CONTRACEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmForm [www.immform.dh.gov.uk](http://www.immform.dh.gov.uk).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

EXCIPIENTS: May contain Neomycin

- ▶ **Priorix** (GlaxoSmithKline UK Ltd)  
Priorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £7.64

M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £11.00

## Rabies vaccine

### ● INDICATIONS AND DOSE

#### Pre-exposure prophylaxis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel
- ▶ Adult: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

#### Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies
- ▶ Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

#### Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants
- ▶ Adult: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region

#### Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary
- ▶ Adult (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary

#### Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be

discontinued if it is proved that the individual was not at risk

- ▶ Adult (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

### ● SIDE-EFFECTS Paresis

- **PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

## Rotavirus vaccine

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

### ● INDICATIONS AND DOSE

#### Immunisation against gastro-enteritis caused by rotavirus

- ▶ BY MOUTH
- ▶ Child 6-23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

- **CONTRA-INDICATIONS** History of intussusception · predisposition to intussusception · severe combined immunosuppression

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Immunosuppression With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.
- **CAUTIONS** Diarrhoea (postpone vaccination) · immunosuppressed close contacts · vomiting (postpone vaccination)

#### CAUTIONS, FURTHER INFORMATION

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

- **SIDE-EFFECTS** Abdominal cramps · abdominal pain · diarrhoea · nausea · vomiting
- **PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral suspension

- ▶ **Rotarix** (GlaxoSmithKline UK Ltd)  
Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose [PoM] £34.76

F 1157

## Tick-borne encephalitis vaccine, inactivated

#### INDICATIONS AND DOSE

##### Initial immunisation against tick-borne encephalitis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- ▶ Child 16-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- ▶ Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- ▶ Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

##### Immunisation against tick-borne encephalitis, booster doses

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)
- ▶ Adult: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be

administered in deltoid region (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

EXCIPIENTS: May contain Gentamicin, neomycin

- ▶ **TicoVac** (Masta Ltd)  
TicoVac Junior vaccine suspension for injection 0.25ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £28.00  
TicoVac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £32.00

F 1157

## Varicella-zoster vaccine

#### INDICATIONS AND DOSE

##### VARILRIX®

##### Prevention of varicella infection (chickenpox)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region
- ▶ Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region

##### VARIVAX®

##### Prevention of varicella infection (chickenpox)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
- ▶ Child 13-17 years: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region
- ▶ Adult: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region

##### Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh in young children)

##### ZOSTAVAX®

##### Prevention of herpes zoster (shingles)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult 70-79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region

- **CAUTIONS** Post-vaccination close contact with susceptible individuals

#### CAUTIONS, FURTHER INFORMATION

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- Administration with MMR vaccine Varicella-zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- SIDE-EFFECTS**

- **Rare** Thrombocytopenia
- **Frequency not known** Conjunctivitis · varicella-like rash
- **CONCEPTION AND CONTRACEPTION** Avoid pregnancy for 3 months after vaccination.

- PRESCRIBING AND DISPENSING INFORMATION**

**ZOSTAVAX®** Advice in the BNF may differ from that in product literature.

- MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

EXCIPIENTS: May contain Neomycin

- **Varilrix** (GlaxoSmithKline UK Ltd)  
Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £27.31

**Powder and solvent for suspension for injection**

EXCIPIENTS: May contain Gelatin, neomycin

- **Varivax** (sanofi pasteur MSD Ltd)  
Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial [PoM] £30.28
- **Zostavax** (sanofi pasteur MSD Ltd)  
Zostavax vaccine powder and solvent for suspension for injection 0.65ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £99.96

specialist in individuals with evidence of previous anaphylactic reaction to egg.

- **PREGNANCY** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.
- **BREAST FEEDING** Avoid; seek specialist advice if exposure to virus cannot be avoided.

- MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- **Stamaril** (sanofi pasteur MSD Ltd)  
Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial [PoM] £33.10

## Yellow fever vaccine, live

- INDICATIONS AND DOSE**

**Immunisation against yellow fever**

- BY DEEP SUBCUTANEOUS INJECTION
- Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- Child 9 months–17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

- **CONTRA-INDICATIONS** Children under 6 months · history of thymus dysfunction

- **CAUTIONS** Individuals over 60 years—greater risk of vaccine-associated adverse effects

**CAUTIONS, FURTHER INFORMATION**

- Administration with MMR vaccine Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.
- **SIDE-EFFECTS** Neurotropic disease · viscerotropic disease
- SIDE-EFFECTS, FURTHER INFORMATION**
- Vaccine-associated adverse effects *Very rare* adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These *very rare* adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.
- **ALLERGY AND CROSS-SENSITIVITY** Yellow fever vaccine should only be considered under the guidance of a

## General anaesthesia

### General anaesthesia

#### Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

#### Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'); lower doses may be required in premedicated patients.

#### Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to

predicted plasma-drug concentrations in ventilated adult patients.

#### Drugs used for intravenous anaesthesia

Propofol p. 1175, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental sodium p. 316 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1175 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1189 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 321 or midazolam p. 318.

#### Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1177 is being administered.

### Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isflurane p. 1177 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1177 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1178 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

### Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox<sup>®</sup>, Equanox<sup>®</sup>) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

### Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1181 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1191 is used in the treatment of malignant hyperthermia.

## Sedation, anaesthesia, and resuscitation in dental practice

### Overview

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 321 and temazepam p. 451 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Standards for Conscious Sedation in the Provision of Dental Care*; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 [www.rcseeng.ac.uk/dental-faculties/fds/publications-guidelines/standards-for-conscious-sedation-in-the-provision-of-dental-care](http://www.rcseeng.ac.uk/dental-faculties/fds/publications-guidelines/standards-for-conscious-sedation-in-the-provision-of-dental-care)

## Surgery and long-term medication

### Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Insulins and anti-diabetic drugs p. 627, Diabetes and surgery.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 125 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 723; for advice on hormone replacement therapy, see Sex hormones p. 686. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 434. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can

be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

## ANAESTHETICS, GENERAL > INTRAVENOUS ANAESTHETICS

### Etomidate

#### ● INDICATIONS AND DOSE

##### Induction of anaesthesia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)
- ▶ Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)

#### IMPORTANT SAFETY INFORMATION

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · Acute porphyrias p. 930 (avoid) · adrenal insufficiency · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia

#### CAUTIONS, FURTHER INFORMATION

- ▶ Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

- **INTERACTIONS** → Appendix 1 (anaesthetics, general).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Apnoea · hyperventilation · hypotension · nausea · rash · stridor · vomiting
- ▶ **Uncommon** Arrhythmias · cough · hiccups · hypersalivation · hypertension · phlebitis
- ▶ **Frequency not known** AV block · cardiac arrest · extraneous muscle movement (high incidence) · pain on injection · respiratory depression · seizures · shivering · Stevens-Johnson syndrome

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Pain on injection Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.
- ▶ Extraneous muscle movement Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

- **PREGNANCY** May depress neonatal respiration if used during delivery.

- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **HEPATIC IMPAIRMENT** Reduce dose in liver cirrhosis.

- **DIRECTIONS FOR ADMINISTRATION** To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends

to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

EXCIPIENTS: May contain Propylene glycol

- ▶ **Hypnomidate** (Janssen-Cilag Ltd)

**Etomidate 2 mg per 1 ml** Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule (PoM) £6.90

##### Emulsion for injection

- ▶ **Etomidate-Lipuro** (B.Braun Medical Ltd)

**Etomidate 2 mg per 1 ml** Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule (PoM) £15.62

### Propofol

#### ● INDICATIONS AND DOSE

##### Induction of anaesthesia using 0.5% or 1% injection

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response, for debilitated patients use dose for 55 years and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

##### Induction of anaesthesia using 2% injection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

##### Maintenance of anaesthesia using 1% injection

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
- ▶ Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response

##### Maintenance of anaesthesia using 2% injection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
- ▶ Elderly: Usual dose 3–6 mg/kg/hour

##### Sedation of ventilated patients in intensive care using 1% or 2% injection

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

##### Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

##### Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by continued →

(by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

#### Maintenance of sedation for surgical and diagnostic procedures using 1% injection

##### ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

#### Maintenance of sedation for surgical and diagnostic procedures using 2% injection

##### ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

#### IMPORTANT SAFETY INFORMATION

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · cardiac impairment · cardiovascular disease · elderly · epilepsy · fixed cardiac output · hypotension · hypovolaemia · raised intracranial pressure · respiratory impairment
- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Headache · hypotension · tachycardia · transient apnoea
- ▶ **Uncommon** Phlebitis · thrombosis
- ▶ **Rare** Myalgia · arrhythmia · convulsions (onset can be delayed) · delayed recovery from anaesthesia · euphoria
- ▶ **Very rare** Discoloration of urine · pancreatitis · pulmonary oedema · sexual disinhibition
- ▶ **Frequency not known** Bradycardia · pain on intravenous injection · propofol infusion syndrome · significant extraneous muscle movements

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Bradycardia** Bradycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.
- ▶ **Extraneous muscle movement** Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
- ▶ **Pain on injection** Can be reduced by intravenous lidocaine.
- ▶ **Propofol infusion syndrome** Prolonged infusion of propofol doses exceeding 4 mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.
- **PREGNANCY** Max. dose for maintenance of anaesthesia 6 mg/kg/hour. May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

- **MONITORING REQUIREMENTS** Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- **DIRECTIONS FOR ADMINISTRATION** Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% **emulsion** for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% **emulsion** for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (*Diprivan*<sup>®</sup>) or (*Propofol-Lipuro*<sup>®</sup>) or Sodium chloride 0.9% (*Propofol-Lipuro*<sup>®</sup> only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% **emulsion** for infusion; do not dilute.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Emulsion for injection

###### ▶ *Diprivan* (AstraZeneca UK Ltd)

**Propofol 10 mg per 1 ml** *Diprivan* 1% emulsion for injection 20ml ampoules | 5 ampoule **[POM]** £15.36 (Hospital only)

###### ▶ *Propofol-Lipuro* (B.Braun Melsungen AG)

**Propofol 5 mg per 1 ml** *Propofol-Lipuro* 0.5% emulsion for injection 20ml ampoules | 5 ampoule **[POM]** £14.71

##### Emulsion for infusion

###### ▶ *Diprivan* (AstraZeneca UK Ltd)

**Propofol 10 mg per 1 ml** *Diprivan* 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection **[POM]** £10.68

**Propofol 20 mg per 1 ml** *Diprivan* 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection **[POM]** £15.16

## ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS

### Volatile halogenated anaesthetics

#### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia
- **CAUTIONS** Can trigger malignant hyperthermia · raised intracranial pressure (can increase cerebrospinal pressure)
- **SIDE-EFFECTS**
- ▶ **Common or very common** Arrhythmias · cardiorespiratory depression · hypotension
- ▶ **Frequency not known** Convulsions · mood changes (that can last several days)
- **ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.
- **DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the

carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

## Desflurane

1176

#### ● INDICATIONS AND DOSE

##### Induction of anaesthesia (but not recommended)

- ▶ BY INHALATION
- ▶ Adult: 4–11 %, to be inhaled through specifically calibrated vapouriser

##### Maintenance of anaesthesia (in nitrous oxide–oxygen)

- ▶ BY INHALATION
- ▶ Adult: 2–6 %, to be inhaled through a specifically calibrated vapouriser

##### Maintenance of anaesthesia (in oxygen or oxygen-enriched air)

- ▶ BY INHALATION
- ▶ Adult: 2.5–8.5 %, to be inhaled through a specifically calibrated vapouriser

- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Apnoea · breath-holding · cough · increased secretions · laryngospasm
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
 Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Inhalation vapour

- ▶ **Desflurane (Non-proprietary)**  
 Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml PoM  
 no price available (Hospital only)

## Isoflurane

1176

#### ● INDICATIONS AND DOSE

##### Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)

- ▶ BY INHALATION
- ▶ Adult: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vapouriser

##### Maintenance of anaesthesia (in nitrous oxide–oxygen)

- ▶ BY INHALATION
- ▶ Adult: 1–2.5 %, to be administered using specifically calibrated vapouriser; an additional 0.5–1% may be required when given with oxygen alone

#### Maintenance of anaesthesia in caesarean section (in nitrous oxide–oxygen)

- ▶ BY INHALATION
- ▶ Adult: 0.5–0.75 %, to be administered using specifically calibrated vapouriser

- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Breath-holding · cough · irritate mucous membrane · laryngospasm
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
 Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Inhalation vapour

- ▶ **Isoflurane (Non-proprietary)**  
 Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml PoM £35.29 (Hospital only)  
 Isoflurane volatile liquid | 250 ml P £47.50 (Hospital only)
- ▶ **AErrane** (Baxter Healthcare Ltd)  
 Isoflurane 1 ml per 1 ml AErrane volatile liquid | 250 ml P no price available (Hospital only)

## Nitrous oxide

#### ● INDICATIONS AND DOSE

##### Maintenance of anaesthesia in conjunction with other anaesthetic agents

- ▶ BY INHALATION
- ▶ Adult: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

##### Analgesia

- ▶ BY INHALATION
- ▶ Adult: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs

#### IMPORTANT SAFETY INFORMATION

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Entrapped air following recent underwater dive · pneumothorax · presence of intracranial air after head injury · recent intra-ocular gas injection
- CAUTIONS, FURTHER INFORMATION**  
 Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.
- **INTERACTIONS** → Appendix 1 (anaesthetics, general).

- **SIDE-EFFECTS** Depression of white cell formation · hypoxia · megaloblastic anaemia · neurological toxic effects

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hypoxia Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.
- ▶ Prolonged exposure Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B<sub>12</sub>; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **MONITORING REQUIREMENTS**
  - ▶ Assessment of plasma-vitamin B<sub>12</sub> concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
  - ▶ Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
- **DIRECTIONS FOR ADMINISTRATION** For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox<sup>®</sup>, Equanox<sup>®</sup>) is used.
- **HANDLING AND STORAGE** Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

F 1176

## Sevoflurane

#### • INDICATIONS AND DOSE

##### Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)

###### ▶ BY INHALATION

- ▶ Adult: Initially 0.5–1%, then increased to up to 8%, increased gradually, according to response, to be administered using specifically calibrated vaporiser

##### Maintenance of anaesthesia (in oxygen or nitrous oxide-oxygen)

###### ▶ BY INHALATION

- ▶ Adult: 0.5–3%, adjusted according to response, to be administered using specifically calibrated vaporiser

- **CAUTIONS** Susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1 (anaesthetics, general). Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.
- **SIDE-EFFECTS** Cardiac arrest · dystonia · leucopenia · torsade de pointes · urinary retention
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **RENAL IMPAIRMENT** Use with caution.

#### • PATIENT AND CARER ADVICE

## 1 Anaesthesia adjuvants

### Pre-medication and peri-operative drugs

#### Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A **H<sub>2</sub>-receptor antagonist** can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H<sub>2</sub>-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; 'clear' (non-particulate) antacids such as sodium citrate p. 721 are preferred.

#### Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 983 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 1175 and suxamethonium chloride p. 1181.

Atropine sulfate p. 1179 is now rarely used for premedication but still has an emergency role in the

treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 409 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 1180 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

**Phenothiazines** do not effectively reduce secretions when used alone.

### Sedative drugs

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

#### Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1213 is used to antagonise the effects of benzodiazepines.

Diazepam p. 321 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 451 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 317 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 318 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

#### Other drugs for sedation

Dexmedetomidine p. 1190 and clonidine hydrochloride p. 136 are  $\alpha_2$ -adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride

[unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

### Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1214. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become re-sedated.

Doxapram hydrochloride p. 280 is a central and respiratory stimulant but is of limited value in anaesthesia.

## ANTIMUSCARINICS

### Atropine sulfate

#### ● INDICATIONS AND DOSE

##### Bradycardia due to acute massive overdose of beta-blockers

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 40 micrograms/kg (max. per dose 3 mg)
- ▶ Adult: 3 mg

##### Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
- ▶ Adult: 2 mg every 5–10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

##### Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Adult: 0.6–1.2 mg daily, dose to be taken at night

#### Premedication

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- ▶ Adult: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
- ▶ Adult: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

#### Intra-operative bradycardia

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
- ▶ Adult: 300–600 micrograms, larger doses may be used in emergencies

continued →

**Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 12-17 years: 0.6–1.2 mg
- ▶ Adult: 0.6–1.2 mg

**Excessive bradycardia associated with beta-blocker use**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

**Bradycardia following myocardial infarction (particularly if complicated by hypotension)**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 500 micrograms every 3–5 minutes; maximum 3 mg per course

- **UNLICENSED USE** Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication.

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **PREGNANCY** Not known to be harmful; manufacturer advises caution.
- **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
  - ▶ Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.
- **LESS SUITABLE FOR PRESCRIBING** Atropine tablets less suitable for prescribing. Any clinical benefit as a gastro-intestinal antispasmodic is outweighed by atropinic side-effects.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

**Tablet**

- ▶ **Atropine sulfate (Non-proprietary)**  
Atropine sulfate 600 microgram Atropine 600microgram tablets | 28 tablet [PoM] £52.92 DT price = £49.53

**Solution for injection**

- ▶ **Atropine sulfate (Non-proprietary)**  
Atropine sulfate 100 microgram per 1 ml Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.40-£13.00 | 10 pre-filled disposable injection [PoM] £69.00-£130.00
- Atropine sulfate 1 mg per 1 ml Atropine 1mg/1ml solution for injection ampoules | 10 ampoule [PoM] £68.72-£72.77 DT price = £70.75
- Atropine sulfate 200 microgram per 1 ml Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.08-£13.00 | 10 pre-filled disposable injection [PoM] £130.00

## Glycopyrronium bromide (Glycopyrrolate)

**● INDICATIONS AND DOSE****Premedication at induction**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)

**Intra-operative bradycardia**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary

**Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

**Bowel colic in palliative care | Excessive respiratory secretions in palliative care**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 200 micrograms every 4 hours and when required, hourly use is occasionally necessary, particularly in excessive respiratory secretions
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 0.6–1.2 mg/24 hours

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**● PRESCRIBING AND DISPENSING INFORMATION****Palliative care**

For further information on the use of glycopyrronium bromide in palliative care, see [www.palliativedrugs.com/formulary/en/glycopyrronium.html](http://www.palliativedrugs.com/formulary/en/glycopyrronium.html).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Glycopyrronium bromide (Non-proprietary)**  
Glycopyrronium bromide 200 microgram per 1 ml Glycopyrronium bromide 200micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £14.00 DT price = £10.88  
Glycopyrronium bromide 600micrograms/3ml solution for injection ampoules | 3 ampoule [PoM] £8.00-£9.75 | 10 ampoule [PoM] £11.50

Combinations available: *Neostigmine with glycopyrronium bromide*, p. 1185

## 1.1 Neuromuscular blockade

### Neuromuscular blockade

**Neuromuscular blocking drugs**

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the

neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

#### Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 983. Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium bromide p. 1183, rocuronium bromide p. 1184, and vecuronium bromide p. 1184, and the **benzylisoquinolinium** group, comprising atracurium besilate p. 1182, cisatracurium p. 1183, and mivacurium p. 1183.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride below. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but

vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

#### Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

## NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING

### Suxamethonium chloride

#### (Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

#### ● INDICATIONS AND DOSE

##### Neuromuscular blockade (short duration) during surgery and intubation

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1–1.5 mg/kg

- **UNLICENSED USE** Doses of suxamethonium in BNF may differ from those in product literature.

#### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy · family history of malignant hyperthermia · hyperkalaemia · low plasma-cholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · prolonged immobilisation (risk of hyperkalaemia) · severe burns

- **CAUTIONS** Cardiac disease · neuromuscular disease · raised intra-ocular pressure (avoid in penetrating eye injury) · respiratory disease · severe sepsis (risk of hyperkalaemia)
- **INTERACTIONS** → Appendix 1 (muscle relaxants).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Flushing · hyperkalaemia · increased gastric pressure · increased intra-ocular pressure · myoglobinaemia · myoglobinuria · postoperative muscle pain · rash
  - ▶ **Rare** Apnoea · arrhythmias · bronchospasm · cardiac arrest · limited jaw mobility · prolonged respiratory depression
  - ▶ **Very rare** Anaphylactic reactions · malignant hyperthermia
  - ▶ **Frequency not known** Bradycardia (may occur with repeated doses) · hypertension · hypotension · rhabdomyolysis · tachycardia (occurs with single use)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Bradycardia Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.
- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- **PREGNANCY** Mildly prolonged maternal neuromuscular blockade may occur.
- **BREAST FEEDING** Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.
- **HEPATIC IMPAIRMENT** Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

##### Solution for injection

- ▶ **Suxamethonium chloride (Non-proprietary)**  
Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule **[PoM]** £28.80–£50.00
- ▶ **Anectine** (GlaxoSmithKline UK Ltd)  
Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule **[PoM]** £3.57

## NEUROMUSCULAR BLOCKING DRUGS > NON-DEPOLARISING

### Non-depolarising neuromuscular blocking drugs

#### IMPORTANT SAFETY INFORMATION

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS** Burns (resistance can develop, increased doses may be required) · cardiovascular disease (reduce rate of administration) · electrolyte disturbances (response unpredictable) · fluid disturbances (response unpredictable) · hypothermia (activity prolonged, lower doses required) · myasthenia gravis (activity prolonged, lower doses required) · neuromuscular disorders (response unpredictable)
- **INTERACTIONS** → Appendix 1 (muscle relaxants).
- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported;

caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.
- **BREAST FEEDING** Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

## Atracurium besilate

### (Atracurium besylate)

#### INDICATIONS AND DOSE

##### Neuromuscular blockade (short to intermediate duration) for surgery and intubation

###### INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

##### Neuromuscular blockade during intensive care

###### INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS**
  - ▶ **Very rare** Anaphylactoid reactions
  - ▶ **Frequency not known** Acute myopathy (after prolonged use in intensive care) · bronchospasm · hypotension · seizures · skin flushing · tachycardia
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Cardiovascular effects Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Tracrium*<sup>®</sup>); Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

###### Atracurium besilate (Non-proprietary)

- ▶ **Atracurium besilate 10 mg per 1 ml** Atracurium besilate 250mg/25ml solution for injection vials | 1 vial **[PoM]** £16.50  
Atracurium besilate 25mg/2.5ml solution for injection ampoules | 5 ampoule **[PoM]** £9.25  
Atracurium besilate 50mg/5ml solution for injection ampoules | 5 ampoule **[PoM]** £17.50 | 10 ampoule **[PoM]** £35.00

###### Tracrium (GlaxoSmithKline UK Ltd)

- ▶ **Atracurium besilate 10 mg per 1 ml** Tracrium 250mg/25ml solution for injection vials | 2 vial **[PoM]** £25.81  
Tracrium 25mg/2.5ml solution for injection ampoules | 5 ampoule **[PoM]** £8.28  
Tracrium 50mg/5ml solution for injection ampoules | 5 ampoule **[PoM]** £15.02

F 1182

## Cisatracurium

### ● INDICATIONS AND DOSE

#### Neuromuscular blockade (intermediate duration) during surgery and intubation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

#### Neuromuscular blockade (intermediate duration) during intensive care

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS** Acute myopathy (after prolonged use in intensive care) · bradycardia
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Nimbex*<sup>®</sup>, *Nimbex Forte*<sup>®</sup>), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Cisatracurium (Non-proprietary)

- Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Cisatracurium besilate 20mg/10ml solution for injection ampoules | 5 ampoule [PoM] £18.01–£32.09
- Cisatracurium besilate 20mg/10ml solution for injection vials | 5 vial [PoM] £37.75 (Hospital only) | 5 vial [PoM] £37.75
- Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Cisatracurium besilate 150mg/30ml solution for injection vials | 1 vial [PoM] £45.00 (Hospital only) | 1 vial [PoM] £25.00–£26.43
- ▶ **Nimbex** (GlaxoSmithKline UK Ltd)
- Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Nimbex 20mg/10ml solution for injection ampoules | 5 ampoule [PoM] £37.75
- Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Nimbex Forte 150mg/30ml solution for injection vials | 1 vial [PoM] £31.09

F 1182

## Mivacurium

### ● INDICATIONS AND DOSE

#### Neuromuscular blockade (short duration) during surgery and intubation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: 70–250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **CAUTIONS** Burns (low plasma cholinesterase activity; dose titration required) · elderly
- **SIDE-EFFECTS**
- ▶ Very rare Anaphylactoid reactions
- ▶ Frequency not known Bronchospasm · hypotension · skin flushing · tachycardia

- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment.

- **RENAL IMPAIRMENT** Clinical effect prolonged in renal failure—reduce dose according to response.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

### ● MEDICINAL FORMS

**Vecuronium bromide 10 mg** Norcuron 10mg powder and solvent for solution for injection vials | 10 vial [PoM](#) £33.73 (Hospital only)

## 1.2 Neuromuscular blockade reversal

### Neuromuscular blockade reversal

#### Drugs for reversal of neuromuscular blockade

##### Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 1180 or alternatively atropine sulfate p. 1179, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

##### Other drugs for reversal of neuromuscular blockade

Sugammadex p. 1185 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In

practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

## ANTICHOLINESTERASES

### Neostigmine with glycopyrronium bromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 983, glycopyrronium bromide p. 1180.

#### ● INDICATIONS AND DOSE

##### Reversal of non-depolarising neuromuscular blockade

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1–2 mL, repeated if necessary, alternatively 0.02 mL/kg, repeated if necessary; maximum 2 mL per course

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over 10–30 seconds.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- ▶ **Neostigmine with glycopyrronium bromide (Non-proprietary)**  
Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine methylsulfate 2.5 mg per 1 mL Neostigmine 2.5mg/1ml / Glycopyrronium bromide 500micrograms/1ml solution for injection ampoules | 10 ampoule (PoM) £11.50

## ANTIDOTES AND CHELATORS

### Sugammadex

#### ● INDICATIONS AND DOSE

##### Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 2–4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details

##### Immediate reversal of neuromuscular blockade induced by rocuronium

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 16 mg/kg (consult product literature)

#### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS** Cardiovascular disease (recovery may be delayed) · elderly (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade—monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium · wait 24 hours before re-administering vecuronium
- **INTERACTIONS** → Appendix 1 (sugammadex).
- **SIDE-EFFECTS** Bradycardia · bronchospasm · cardiac arrest · hypersensitivity reactions
- **PREGNANCY** Use with caution—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium*, has advised (February 2013) that sugammadex (*Bridion*®) is accepted for restricted use within NHS Scotland for the routine reversal

of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Bridion** (Merck Sharp & Dohme Ltd)

**Sugammadex (as Sugammadex sodium) 100 mg per 1 mL** Bridion 500mg/5ml solution for injection vials | 10 vial (PoM) £1,491.00 (Hospital only)  
**Bridion** 200mg/2ml solution for injection vials | 10 vial (PoM) £596.40 (Hospital only)

## 1.3 Peri-operative analgesia

### Peri-operative analgesia

#### Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Acemetacin p. 989, diclofenac sodium p. 993, diclofenac potassium p. 992, flurbiprofen p. 998, ibuprofen p. 999, ketoprofen p. 1002, paracetamol p. 414, parecoxib p. 1187, and ketorolac trometamol p. 1186, are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

#### Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 1178.

#### Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 1187, fentanyl p. 424, and remifentanyl p. 1188 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by

nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanyl should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

## ANAESTHETICS, LOCAL

### Bupivacaine with fentanyl

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1193, fentanyl p. 424.

#### ● INDICATIONS AND DOSE

##### During labour (once epidural block established)

- ▶ BY CONTINUOUS LUMBAR EPIDURAL INFUSION
- ▶ Adult: 10–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 16–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours

##### Postoperative pain (once epidural block established)

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 4–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

##### Solution for infusion

- ▶ **Buflol** (AMCO)
  - Bupivacaine hydrochloride 1 mg per 1 ml, Fentanyl 2 microgram per 1 ml Buflol 1mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag [PoM] £92.00 (Hospital only) [CD2]
  - Buflol 1mg/ml and 2micrograms/ml 250ml infusion bags | 20 bag [PoM] £170.00 (Hospital only) [CD2]
- ▶ **Bupivacaine hydrochloride 1.25 mg per 1 ml, Fentanyl (as Fentanyl citrate) 2 microgram per 1 ml Buflol** 1.25mg/ml and 2micrograms/ml 250ml infusion bags | 20 bag [PoM] £181.00 (Hospital only) [CD2]
- ▶ Buflol 1.25mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag [PoM] £92.00 (Hospital only) [CD2]

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

### Ketorolac trometamol

#### ● INDICATIONS AND DOSE

##### Short-term management of moderate to severe acute postoperative pain only

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- ▶ Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may

be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day

- ▶ Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

- **CONTRA-INDICATIONS** Active or history of gastro-intestinal bleeding · active or history of gastro-intestinal ulceration · coagulation disorders · complete or partial syndrome of nasal polyps · confirmed or suspected cerebrovascular bleeding · dehydration · following operations with high risk of haemorrhage or incomplete haemostasis · haemorrhagic diatheses · history of gastro-intestinal perforation · hypovolaemia · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).

#### ● SIDE-EFFECTS

- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Abnormal dreams · angioedema · asthma · blood disorders · bradycardia · bronchospasm · chest pain · colitis (induction of or exacerbation of) · confusion · convulsions · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · euphoria · fluid retention (rarely precipitating congestive heart failure) · flushing · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · hallucinations · headache · hearing disturbances · hyperkalaemia · hyperkinesia · hypersensitivity reactions · hypertension · hyponatraemia · insomnia · malaise · myalgia · nausea · nervousness · optic neuritis · pain at injection site · pallor · palpitation · paraesthesia · photosensitivity · psychosis · purpura · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · sweating · taste disturbances · thirst · tinnitus · urinary frequency · vertigo · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over at least 15 seconds.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Ketorolac trometamol (Non-proprietary)

**Ketorolac trometamol 30 mg per 1 ml** Ketorolac 30mg/1ml solution for injection ampoules | 6 ampoule **[PoM]** £6.56

##### ▶ Toradol (Atnahs Pharma UK Ltd)

**Ketorolac trometamol 30 mg per 1 ml** Toradol 30mg/1ml solution for injection ampoules | 5 ampoule **[PoM]** £5.36

## Parecoxib

- **DRUG ACTION** Parecoxib is a selective inhibitor of cyclo-oxygenase-2.

#### ● INDICATIONS AND DOSE

##### Short-term management of acute postoperative pain

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ **Adult:** Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
- ▶ **Elderly (body-weight up to 50 kg):** Initially 20 mg; maximum 40 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · following coronary artery bypass graft surgery · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alveolar osteitis · flatulence · hypoesthesia · hypokalaemia · hypotension · postoperative anaemia · sweating
  - ▶ **Uncommon** Anorexia · arthralgia · bradycardia · cardiovascular events · ecchymosis · hyperglycaemia · malaise · pulmonary embolism
  - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
  - ▶ **Frequency not known** Angioedema · blood disorders · blood pressure may be raised · bronchospasm · circulatory

collapse · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · rashes · renal failure (especially in patients with pre-existing renal impairment) · tachycardia · tinnitus · vertigo

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contra-indicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Halve dose in moderate impairment (max. 40 mg daily). Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (January 2003) that parecoxib is **not** recommended for use within NHS Scotland.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

##### ▶ Dynastat (Pfizer Ltd)

**Parecoxib (as Parecoxib sodium) 40 mg** Dynastat 40mg powder for solution for injection vials | 10 vial **[PoM]** £49.60

#### Powder and solvent for solution for injection

##### ▶ Dynastat (Pfizer Ltd)

**Parecoxib (as Parecoxib sodium) 40 mg** Dynastat 40mg powder and solvent for solution for injection vials | 5 vial **[PoM]** £28.34

## ANALGESICS > OPIOIDS

### Alfentanil

#### ● INDICATIONS AND DOSE

##### Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures

#### ▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

continued →

**Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

**Assisted ventilation: analgesia and suppression of respiratory activity during intensive care for up to 4 days**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**CAUTIONS****CAUTIONS, FURTHER INFORMATION**

- ▶ Repeated intra-operative doses Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

**SIDE-EFFECTS**

- ▶ **Common or very common** Hypertension · myoclonic movements
- ▶ **Uncommon** Arrhythmias · hiccup · laryngospasm
- ▶ **Rare** Epistaxis
- ▶ **Frequency not known** Cardiac arrest · convulsions · cough · muscle rigidity · pyrexia

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Present in milk—withhold breast-feeding for 24 hours.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **DIRECTIONS FOR ADMINISTRATION** 5 mg/mL injection to be diluted before use. For *continuous or intermittent intravenous infusion* dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**▶ **Alfentanil (Non-proprietary)**

**Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml** Alfentanil 5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £21.95-£25.00 [CD2]

**Alfentanil (as Alfentanil hydrochloride) 500 microgram per**

**1 ml** Alfentanil 1mg/2ml solution for injection ampoules | 10

ampoule [PoM] £5.95 [CD2]

Alfentanil 5mg/10ml solution for injection ampoules | 5

ampoule [PoM] £13.90 [CD2]

▶ **Rapifen (Janssen-Cilag Ltd)**

**Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml** Rapifen Intensive Care 5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £23.19 (Hospital only) [CD2]

**Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml** Rapifen 5mg/10ml solution for injection ampoules | 5 ampoule [PoM] £14.50 [CD2]

Rapifen 1mg/2ml solution for injection ampoules | 10 ampoule [PoM] £6.34 [CD2]

**Papaveretum with hyoscine hydrobromide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, papaveretum p. 434, hyoscine hydrobromide p. 409.

**INDICATIONS AND DOSE****Premedication**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5–1 mL

- **LESS SUITABLE FOR PRESCRIBING** Hyoscine hydrobromide with papaveretum is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

F 416

**Remifentanil****INDICATIONS AND DOSE****Analgesia and enhancement of anaesthesia at induction (initial bolus injection)**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia additional doses can be given by *intravenous injection* every 2–5 minutes during the intravenous infusion

**Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

**Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

**Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients**

## ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

**Cardiac surgery**

- ▶ **Adult:** (consult product literature)

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Remifentanyl doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Analgesia in conscious patients
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Hypertension
  - ▶ **Uncommon** Hypoxia
  - ▶ **Rare** Asystole
  - ▶ **Frequency not known** AV block · convulsions
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Muscle rigidity** Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.
  - ▶ **Respiratory depression** In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression.
- **PREGNANCY** No information available.
- **BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** No dose adjustment necessary in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Ultiva®)*, give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).
- **PRESCRIBING AND DISPENSING INFORMATION** Remifentanyl should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**▶ **Remifentanyl (Non-proprietary)**

**Remifentanyl (as Remifentanyl hydrochloride) 1 mg** Remifentanyl 1mg powder for concentrate for solution for injection vials | 5 vial [PoM] £25.58-£25.60 (Hospital only) [CD2]

**Remifentanyl (as Remifentanyl hydrochloride) 2 mg** Remifentanyl 2mg powder for concentrate for solution for injection vials | 5 vial [PoM] £51.13-£51.15 (Hospital only) [CD2]

**Remifentanyl (as Remifentanyl hydrochloride) 5 mg** Remifentanyl 5mg powder for concentrate for solution for injection vials | 5 vial [PoM] £127.75-£127.90 (Hospital only) [CD2]

▶ **Ultiva (GlaxoSmithKline UK Ltd)**

**Remifentanyl (as Remifentanyl hydrochloride) 1 mg** Ultiva 1mg powder for solution for injection vials | 5 vial [PoM] £25.58 (Hospital only) [CD2]

**Remifentanyl (as Remifentanyl hydrochloride) 2 mg** Ultiva 2mg powder for solution for injection vials | 5 vial [PoM] £51.15 (Hospital only) [CD2]

**Remifentanyl (as Remifentanyl hydrochloride) 5 mg** Ultiva 5mg powder for solution for injection vials | 5 vial [PoM] £127.88 (Hospital only) [CD2]

## 1.4 Peri-operative sedation

### Conscious sedation for clinical procedures

**Overview**

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be *monitored carefully*; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

**ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS**

### Ketamine

● **INDICATIONS AND DOSE****Induction and maintenance of anaesthesia for short procedures**

## ▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

## ▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

**Diagnostic manoeuvres and procedures not involving intense pain**

## ▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 4 mg/kg

**Induction and maintenance of anaesthesia for long procedures**

## ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

**IMPORTANT SAFETY INFORMATION**

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · eclampsia · head trauma · hypertension · pre-eclampsia · raised intracranial pressure · severe cardiac disease · stroke
- **CAUTIONS** Acute circulatory failure (shock) · cardiovascular disease · dehydration · elderly · fixed cardiac output · hallucinations · head injury · hypertension · hypovolaemia · increased cerebrospinal fluid pressure · intracranial mass lesions · nightmares · predisposition to seizures · psychotic disorders · raised intra-ocular pressure · respiratory tract infection · thyroid dysfunction
- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diplopia · hallucinations · hypertension · nausea · nightmares · nystagmus · rash · tachycardia · transient psychotic effects · vomiting
  - ▶ **Uncommon** Arrhythmias · bradycardia · hypotension · laryngospasm · respiratory depression
  - ▶ **Rare** Apnoea · cystitis · haemorrhagic cystitis · hypersalivation · insomnia
  - ▶ **Frequency not known** Raised intra-ocular pressure
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Transient psychotic effects Incidence of hallucinations, nightmares, and other transient psychotic effects can be reduced by a benzodiazepine such as diazepam or midazolam.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Avoid for at least 12 hours after last dose.
- **HEPATIC IMPAIRMENT** Consider dose reduction.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia. For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### Solution for injection

##### ▶ Ketamine (Non-proprietary)

**Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml** Ketamine 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] no price available [CD2]

**Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml** Ketamine 500mg/10ml solution for injection vials | 10 vial [PoM] £70.00 [CD2]

**Ketamine 100mg/2ml solution for injection ampoules** | 10 ampoule [PoM] no price available [CD2]

##### ▶ Ketalar (Pfizer Ltd)

**Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml** Ketalar 200mg/20ml solution for injection vials | 1 vial [PoM] £5.06 (Hospital only) [CD2]

**Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml** Ketalar 500mg/10ml solution for injection vials | 1 vial [PoM] £8.77 (Hospital only) [CD2]

## HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

### Dexmedetomidine

#### ● INDICATIONS AND DOSE

##### Maintenance of sedation during intensive care

###### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

#### IMPORTANT SAFETY INFORMATION

Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Acute cerebrovascular disorders · second- or third-degree AV block (unless pacemaker fitted) · uncontrolled hypotension
- **CAUTIONS** Abrupt withdrawal after prolonged use · bradycardia · ischaemic heart disease · malignant hyperthermia · severe cerebrovascular disease (especially at higher doses) · severe neurological disorders · spinal cord injury
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Agitation · blood pressure changes · bradycardia · changes in blood sugar · dry mouth · hyperthermia · myocardial infarction · myocardial ischaemia · nausea · tachycardia · vomiting
  - ▶ **Uncommon** Abdominal distension · AV block · decreased cardiac output · dyspnoea · hallucination · hypoalbuminaemia · metabolic acidosis · thirst
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Dose reduction may be required. Manufacturer advises caution.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor cardiac function.
  - ▶ Monitor respiratory function in non-intubated patients.
- **DIRECTIONS FOR ADMINISTRATION** To be diluted before use. For *intravenous infusion* given continuously in Glucose 5% or Sodium chloride 0.9%, dilute to a concentration of 4 micrograms/mL.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

##### ▶ Dexdor (Orion Pharma (UK) Ltd)

###### Dexmedetomidine (as Dexmedetomidine hydrochloride)

**100 microgram per 1 ml** Dexdor 1mg/10ml concentrate for solution for infusion vials | 4 vial [PoM] £313.20 (Hospital only)

Dexdor 400micrograms/4ml concentrate for solution for infusion vials | 4 vial [PoM] £125.28 (Hospital only)

Dexdor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £78.30 (Hospital only) | 25 ampoule [PoM] £391.50 (Hospital only)

## 2 Malignant hyperthermia

### MUSCLE RELAXANTS > DIRECTLY ACTING

#### Dantrolene sodium

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

- **INDICATIONS AND DOSE**

##### Malignant hyperthermia

- ▶ BY RAPID INTRAVENOUS INJECTION

- ▶ Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

##### Chronic severe spasticity of voluntary muscle

- ▶ BY MOUTH

- ▶ Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

#### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

- **CONTRA-INDICATIONS**

- ▶ With oral use Acute muscle spasm · avoid when spasticity is useful, for example, locomotion

- **CAUTIONS**

- ▶ With intravenous use Avoid extravasation (risk of tissue necrosis)
- ▶ With oral use Females (hepatotoxicity) · history of liver disorders (hepatotoxicity) · if doses greater than 400 mg daily (hepatotoxicity) · impaired cardiac function · impaired pulmonary function · patients over 30 years (hepatotoxicity) · therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

- **INTERACTIONS** → Appendix 1 (muscle relaxants).

- ▶ With oral use Caution if concomitant use of hepatotoxic drugs.

- **SIDE-EFFECTS**

- ▶ **Common or very common**

- ▶ With oral use Abdominal pain · anorexia · asthenia · chills · diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction) · dizziness · drowsiness · fatigue · fever · headache · hepatotoxicity · nausea · pericarditis · pleural effusion · rash · respiratory depression · seizures · speech disturbances · visual disturbances · vomiting

- ▶ **Uncommon**

- ▶ With oral use Confusion · constipation · crystalluria · depression · dysphagia · dyspnoea · erratic blood pressure · exacerbation of cardiac insufficiency · haematuria · increased sweating · increased urinary frequency · insomnia · nervousness · tachycardia · urinary incontinence · urinary retention

- ▶ **Frequency not known**

- ▶ With intravenous use Dizziness · erythema · hepatotoxicity · injection-site reactions · pulmonary oedema · rash · swelling · thrombophlebitis · weakness

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hepatotoxicity Potentially life-threatening hepatotoxicity reported—discontinue if abnormal liver function tests or symptoms of liver disorder; re-introduce only if complete reversal of hepatotoxicity.

- **PREGNANCY**

- ▶ With intravenous use Use only if potential benefit outweighs risk.

- ▶ With oral use Avoid use in chronic spasticity—embryotoxic in *animal* studies.

- **BREAST FEEDING**

- ▶ With intravenous use Present in milk—use only if potential benefit outweighs risk.
- ▶ With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.

- **HEPATIC IMPAIRMENT** Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

- **MONITORING REQUIREMENTS**

- ▶ With oral use Test liver function before and at intervals during therapy.

- **PATIENT AND CARER ADVICE**

##### Driving and skilled tasks

- ▶ With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Hepatotoxicity
- ▶ With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Capsule

##### CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Dantrium** (Norgine Pharmaceuticals Ltd)

**Dantrolene sodium 25 mg** Dantrium 25mg capsules | 100 capsule [PoM] £16.87 DT price = £16.87

**Dantrolene sodium 100 mg** Dantrium 100mg capsules | 100 capsule [PoM] £43.07 DT price = £43.07

##### Powder for solution for injection

- ▶ **Dantrium** (Norgine Pharmaceuticals Ltd)

**Dantrolene sodium 20 mg** Dantrium Intravenous 20mg powder for solution for injection vials | 12 vial [PoM] £612.00 (Hospital only) | 36 vial [PoM] £1,836.00 (Hospital only)

## Local anaesthesia

### Local anaesthesia

#### Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intra-thecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1193 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Chloroprocaine hydrochloride p. 1195, a para-aminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.

Levobupivacaine p. 1196, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1197 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 211) is about 90 minutes.

Prilocaine hydrochloride p. 1201 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1202 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1203, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

#### Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should **never** be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

#### Use of vasoconstrictors

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is **not** advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local

anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

#### Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics **articaine** and mepivacaine hydrochloride p. 1200 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

#### Toxicity

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

## Severe local anaesthetic-induced cardiovascular toxicity

### Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid*<sup>®</sup> [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at [www.toxbase.org](http://www.toxbase.org) or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity - Accompanying notes.

**ANAESTHETICS, LOCAL****Adrenaline with articaine hydrochloride****(Carticaine hydrochloride with epinephrine)****● INDICATIONS AND DOSE****Infiltration anaesthesia in dentistry**

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: Consult expert dental sources

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CONTRA-INDICATIONS** Application to damaged skin - application to the middle ear (may cause ototoxicity) - complete heart block - injection into infected tissues - injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Arrhythmias - arteriosclerosis - cardiovascular disease - cerebrovascular disease - cor pulmonale - debilitated patients (consider dose reduction) - diabetes mellitus - elderly (consider dose reduction) - epilepsy - hypercalcaemia - hyperreflexia - hypertension - hyperthyroidism - hypokalaemia - hypovolaemia - impaired cardiac conduction - impaired respiratory function - ischaemic heart disease - myasthenia gravis - obstructive cardiomyopathy - occlusive vascular disease - organic brain damage - phaeochromocytoma - prostate disorders - psychoneurosis - severe angina - shock - susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

- ▶ Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS** Angina - angle-closure glaucoma - anorexia - anxiety - arrhythmias - blurred vision - cardiac arrest - cold extremities - confusion - convulsions - difficulty in micturition - dizziness - drowsiness - dry mouth - dyspnoea - feeling of inebriation - headache - hyperglycaemia - hypersalivation - hypertension (risk of cerebral haemorrhage) - hypokalaemia - insomnia - lightheadedness - metabolic acidosis - methaemoglobinemia - muscle twitching - mydriasis - myocardial depression (resulting in

hypotension and bradycardia) - myocardial infarction - nausea - numbness of the tongue and perioral region - pallor - palpitation - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - psychosis - pulmonary oedema (on excessive dosage or extreme sensitivity) - restlessness - sweating - tachycardia - tinnitus - tissue necrosis at injection site and of extremities, bowel, liver and kidneys - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremor - urinary retention - vomiting - weakness

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**● ALLERGY AND CROSS-SENSITIVITY**

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Use only if potential benefit outweighs risk - no information available.
- **BREAST FEEDING** Avoid breast-feeding for 48 hours after administration.
- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.
- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- **MONITORING REQUIREMENTS** Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Sulfités

- ▶ **Septanest** (Septodont Ltd)

**Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 mL, Articaine hydrochloride 40 mg per 1 mL** Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge [PoM] no price available

**Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 mL, Articaine hydrochloride 40 mg per 1 mL** Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge [PoM] no price available

**Bupivacaine hydrochloride****● INDICATIONS AND DOSE****Surgical anaesthesia, lumbar epidural block**

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution

**Surgical anaesthesia, field block**

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

continued →

**Surgical anaesthesia, thoracic epidural block**

- ▶ BY THORACIC EPIDURAL
- ▶ Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, caudal epidural block**

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, major nerve block**

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

**Acute pain, intra-articular block**

- ▶ BY INTRA-ARTICULAR INJECTION
- ▶ Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

**Acute pain, thoracic epidural block**

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute pain, labour**

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

**Acute pain, lumbar epidural block**

- ▶ INITIALLY BY LUMBAR EPIDURAL
- ▶ Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute pain, field block**

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

**MARCAIN HEAVY®****Intrathecal anaesthesia for surgery**

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: 10–20 mg

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to

damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · cerebral atheroma · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypertension · hypotension · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · myocardial depression may be more severe and more resistant to treatment · shock
- **INTERACTIONS** → Appendix 1 (bupivacaine).
- **SIDE-EFFECTS** Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**
- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaïne, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.

## Bupivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1193, adrenaline/epinephrine p. 211.

### • INDICATIONS AND DOSE

#### Surgical anaesthesia

- ▶ BY LUMBAR EPIDURAL, OR BY LOCAL INFILTRATION, OR BY CAUDAL EPIDURAL
- ▶ Adult: (consult product literature)

#### Acute pain management

- ▶ BY LUMBAR EPIDURAL, OR BY LOCAL INFILTRATION
- ▶ Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

### • CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Bupivacaine with adrenaline (Non-proprietary)**  
**Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 2.5 mg per 1 ml** Bupivacaine 25mg/10ml (0.25%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule [PoM] £40.00  
**Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride anhydrous 2.5 mg per 1 ml** Carbostesin-adrenaline 0.25% / 100micrograms/20ml (1 in 200,000) solution for injection ampoules | 1 ampoule [PoM] no price available  
**Carbostesin-adrenaline 0.25% / 25micrograms/5ml (1 in 200,000) solution for injection ampoules** | 1 ampoule [PoM] no price available  
**Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 5 mg per 1 ml** Bupivacaine 50mg/10ml (0.5%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule [PoM] £45.00  
**Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride anhydrous 5 mg per 1 ml** Carbostesin-adrenaline 0.5% / 25micrograms/5ml (1 in 200,000) solution for injection ampoules | 1 ampoule [PoM] no price available  
**Carbostesin-adrenaline 0.5% / 100micrograms/20ml (1 in 200,000) solution for injection ampoules** | 1 ampoule [PoM] no price available

## Chloroprocaine hydrochloride

### • INDICATIONS AND DOSE

**Intrathecal anaesthesia for surgical procedures lasting up to 40 minutes**

- ▶ BY SLOW INTRATHECAL INJECTION
- ▶ Adult: 40–50 mg, dose depends on desired length of block

### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

### IMPORTANT SAFETY INFORMATION

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · severe anaemia · should not be applied to damaged skin

### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Acute porphyrias p. 930 · cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- **INTERACTIONS** → Appendix 1 (chloroprocaine).

### • SIDE-EFFECTS

- ▶ **Uncommon** Hypertension
- ▶ **Frequency not known** Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

### • ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local

anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaïne, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaïne, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Ampres (AMCo)

Chlorprocaine hydrochloride 10 mg per 1 ml Ampres 50mg/5ml solution for injection ampoules | 10 ampoule (PcM) £87.50

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1 (levobupivacaine).

- **SIDE-EFFECTS** Anaemia · arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · pyrexia · restlessness · sweating · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

#### ● ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaïne, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaïne, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in *animal studies*. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **DIRECTIONS FOR ADMINISTRATION** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

## Levobupivacaine

### ● INDICATIONS AND DOSE

#### Acute postoperative pain

##### ▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

#### Acute labour pain

##### ▶ BY LUMBAR EPIDURAL

- ▶ Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

##### ▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 5–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

#### Surgical anaesthesia, peripheral nerve block

##### ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

#### Surgical anaesthesia, peribulbar nerve block

##### ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 37.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia for caesarean section

##### ▶ BY LUMBAR EPIDURAL

- ▶ Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

#### Surgical anaesthesia

##### ▶ BY LUMBAR EPIDURAL

- ▶ Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution

##### ▶ BY INTRATHECAL INJECTION

- ▶ Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution

##### ▶ BY LOCAL INFILTRATION

- ▶ Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

### IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

## ● PRESCRIBING AND DISPENSING INFORMATION

Levobupivacaine is an isomer of bupivacaine.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### ▶ Chirocaine (AbbVie Ltd)

**Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml** Chirocaine 25mg/10ml solution for injection ampoules | 10 ampoule [PoM] £14.11 (Hospital only)

**Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml** Chirocaine 50mg/10ml solution for injection ampoules | 10 ampoule [PoM] £16.15 (Hospital only)

**Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml** Chirocaine 75mg/10ml solution for injection ampoules | 10 ampoule [PoM] £24.23 (Hospital only)

### Infusion

#### ▶ Chirocaine (AbbVie Ltd)

**Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml** Chirocaine 125mg/100ml infusion bags | 24 bag [PoM] £174.22  
**Chirocaine 250mg/200ml infusion bags | 12 bag [PoM]** no price available

## Lidocaine hydrochloride

(Lignocaine hydrochloride)

## ● INDICATIONS AND DOSE

### Infiltration anaesthesia

#### ▶ BY LOCAL INFILTRATION

▶ **Adult:** Dose to be given according to patient's weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

### DOSES AT EXTREMES OF BODY-WEIGHT

▶ When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

### Intravenous regional anaesthesia and nerve block

#### ▶ BY REGIONAL ADMINISTRATION

▶ **Adult:** Seek expert advice

**Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis) | Lubricant in cystoscopy | Lubricant in proctoscopy**

#### ▶ TO THE SKIN USING OINTMENT

▶ **Adult:** Apply 1–2 mL as required, avoid long-term use

### Sore nipples from breast-feeding

#### ▶ TO THE SKIN USING OINTMENT

▶ **Adult:** Apply using gauze and wash off immediately before next feed

### LMX 4®

### Anaesthesia before venous cannulation or venepuncture

#### ▶ TO THE SKIN

▶ **Child 1–2 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes

▶ **Child 3–11 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes

▶ **Child 1–17 years:** Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

▶ **Adult:** Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

### VERSATIS®

### Postherpetic neuralgia

#### ▶ TO THE SKIN

▶ **Adult:** Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

### XYLOCAINE®

### During delivery in obstetrics

#### ▶ TO THE SKIN

▶ **Adult:** Up to 20 doses

## IMPORTANT SAFETY INFORMATION

▶ When used by local infiltration

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

## ● CONTRA-INDICATIONS

▶ When used by regional administration All grades of atrioventricular block - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) - severe myocardial depression - should not be applied to damaged skin - sino-atrial disorders

### CONTRA-INDICATIONS, FURTHER INFORMATION

▶ When used by regional administration Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

## ● CAUTIONS

▶ When used by regional administration Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

● **INTERACTIONS** → Appendix 1 (lidocaine).

Interactions less likely when lidocaine used topically.

## ● SIDE-EFFECTS

### ▶ Common or very common

▶ When used by regional administration Bradycardia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - drowsiness (particularly if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression

### ▶ Rare

▶ When used by regional administration Anaphylaxis

### ► Frequency not known

- When used by regional administration Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · arrhythmias · blurred vision · cardiac arrest · feeling of inebriation · headache · hypoglycaemia (following intrathecal or extradural administration) · methaemoglobinemia · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · nystagmus · peripheral vasodilatation (resulting in hypotension and bradycardia) · rash · restlessness · tinnitus · tremors · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- Topical application A single application of a topical lidocaine preparation does not generally cause systemic side-effects.
- Toxic effects
- When used by regional administration Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.
- Methaemoglobinemia
- When used by regional administration Methaemoglobinemia can be treated with an intravenous injection of methylthioninium chloride.

### ● ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- BREAST FEEDING** Present in milk but amount too small to be harmful.

- HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

### ● MONITORING REQUIREMENTS

- With systemic use Monitor ECG and have resuscitation facilities available.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Lidocaine ointment 5% may be prescribed.  
Spray may be prescribed as Lidocaine Spray 10%

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### VERSATIS®

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2008) that *Versatis*® is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### Solution for injection

##### ► Lidocaine hydrochloride (Non-proprietary)

- Lidocaine hydrochloride 5 mg per 1 ml** Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule [PoM] £7.00
- Lidocaine hydrochloride 10 mg per 1 ml** Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £10.89
- Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule [PoM] £4.40 DT price = £4.01

#### Spray

- **Xylocaïne** (AstraZenica UK Ltd)

**Lidocaine 10 mg per actuation** Xylocaïne 10mg/dose spray | 50 ml [P] £6.29

#### Cream

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

- **LMX 4** (Ferndale Pharmaceuticals Ltd)

**Lidocaine 40 mg per 1 gram** LMX 4 cream | 5 gram [P] £2.98 DT price = £2.98 | 30 gram [P] £14.90 DT price = £14.90

#### Ointment

- **Lidocaine hydrochloride (Non-proprietary)**

**Lidocaine hydrochloride 50 mg per 1 gram** Lidocaine 5% ointment | 15 gram [P] £6.50 DT price = £6.18

#### Medicated plaster

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol

- **Versatis** (Grunenthal Ltd)

**Lidocaine 50 mg per 1 gram** Versatis 5% medicated plasters | 30 plaster [PoM] £72.40 DT price = £72.40

## Lidocaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, adrenaline/epinephrine p. 211.

### ● INDICATIONS AND DOSE

#### Local anaesthesia

- **BY LOCAL INFILTRATION**

- **Adult:** Dosed according to the type of nerve block required (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

**PROFESSION SPECIFIC INFORMATION****Dental information**

A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

EXCIPIENTS: May contain Sulfites

- ▶ **Lignospan Special** (Kent Pharmaceuticals Ltd)  
Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Lignospan Special 2% injection 2.2ml cartridges | 50 cartridge [PoM] £19.95
- ▶ **Rexocaine** (Henry Schein Ltd)  
Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Rexocaine 2% injection 2.2ml cartridges | 50 cartridge [PoM] no price available
- ▶ **Xylocaine with Adrenaline** (AstraZeneca UK Ltd)  
Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 10 mg per 1 ml Xylocaine 1% with Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £9.66 DT price = £9.66  
Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Xylocaine 2% with Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £8.85 DT price = £8.85

**Lidocaine with phenylephrine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, phenylephrine hydrochloride p. 179.

**INDICATIONS AND DOSE****Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose**

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: Up to 8 sprays

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- ▶ **Lidocaine with phenylephrine (Non-proprietary)**  
Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine hydrochloride 50 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml [PoM] £12.45 DT price = £12.09

**Lidocaine with prilocaine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, prilocaine hydrochloride p. 1201.

**INDICATIONS AND DOSE****Anaesthesia before minor skin procedures including venepuncture**

▶ TO THE SKIN

- ▶ Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- ▶ Child 3-11 months: Apply up to 2 g for maximum 4 hours before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- ▶ Child 1-11 years: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- ▶ Child 12-17 years: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
- ▶ Adult: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

**Anaesthesia on genital skin before injection of local anaesthetics**

▶ TO THE SKIN

- ▶ Adult: Apply for 15 minutes (in adult men) and 60 minutes (in adult women), to be applied under occlusive dressing

**Anaesthesia before surgical treatment of lesions on genital mucosa**

▶ TO THE SKIN

- ▶ Adult: Apply up to 10 g, to be applied 5-10 minutes before procedure

**Anaesthesia before cervical curettage**

▶ TO THE SKIN

- ▶ Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

**Anaesthesia before mechanical cleansing or debridement of leg ulcer**

▶ TO THE SKIN

- ▶ Adult: Apply up to 10 g for 30-60 minutes, to be applied under occlusive dressing

- **CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: EMLA cream for local anaesthesia [www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia](http://www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**▶ **Lidocaine with prilocaine (Non-proprietary)**

**Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram** Lidocaine 2.5% / Prilocaine 2.5% cream | 5 gram [P] no price available

▶ **Denela** (Teva UK Ltd)

**Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram** Denela 5% cream | 5 gram [P] £2.84-£3.29 | 25 gram [P] £12.99 | 30 gram [P] £14.75 DT price = £12.30

▶ **Emla** (AstraZeneca UK Ltd)

**Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram** Emla 5% cream | 5 gram [P] £2.25-£2.99 | 25 gram [P] £11.70 | 30 gram [P] £12.30 DT price = £12.30

**CONTRA-INDICATIONS, FURTHER INFORMATION**

▶ **Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

● **CAUTIONS** Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

● **SIDE-EFFECTS** Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ **Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

● **ALLERGY AND CROSS-SENSITIVITY**

▶ **Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

● **PREGNANCY** Use with caution in early pregnancy.

● **BREAST FEEDING** Use with caution.

● **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

● **RENAL IMPAIRMENT** Use with caution; increased risk of side-effects.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**▶ **Scandonest plain** (Deproco UK Ltd)

**Mepivacaine hydrochloride 30 mg per 1 ml** Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge [PoM] no price available

**Lidocaine with tetracaine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, tetracaine p. 1203.

● **INDICATIONS AND DOSE****Anaesthesia before dermatological procedures and venepuncture**▶ **TO THE SKIN**

▶ **Adult:** Apply 1 mm layer using a spatula 30 minutes before procedure, then peel off immediately before procedure; max. application area 400 cm<sup>2</sup>, application time of 60 minutes indicated for certain procedures, such as laser-assisted tattoo removal and laser leg vein ablation

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

▶ **Pliaglis** (Galderma (UK) Ltd)

**Lidocaine 70 mg, Tetracaine 70 mg** Pliaglis 70mg/g / 70mg/g cream | 15 gram [PoM] £22.95

**Mepivacaine hydrochloride**● **INDICATIONS AND DOSE****Infiltration anaesthesia and nerve block in dentistry**

▶ **Child 3-17 years:** Consult expert dental sources

▶ **Adult:** Consult expert dental sources

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

● **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

## Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 1200, adrenaline/epinephrine p. 211.

### ● INDICATIONS AND DOSE

#### Infiltration anaesthesia and nerve block in dentistry

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Sulfites

- ▶ **Scandonest special** (Deproco UK Ltd)

Adrenaline 10 microgram per 1 mL, Mepivacaine hydrochloride 20 mg per 1 mL Scandonest special 2% solution for injection 2.2 mL cartridges | 50 cartridge [POM](#) | no price available

## Prilocaine hydrochloride

### ● INDICATIONS AND DOSE

#### CITANEST 1%®

#### Infiltration anaesthesia | Nerve block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 100–200 mg/minute, alternatively may be given in incremental doses; dose adjusted according to site of administration and response, and in elderly and debilitated patients (smaller doses may be required); maximum 400 mg per course

#### PRILOTEKAL®

#### Spinal anaesthesia

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: Usual dose 40–60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acquired methaemoglobinaemia · anaemia · application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · congenital methaemoglobinaemia · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Acute porphyrias p. 930 · cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · severe or untreated hypertension · shock
- **INTERACTIONS** → Appendix 1 (prilocaine). Caution with concomitant use of drugs that cause methaemoglobinaemia.
- **SIDE-EFFECTS** Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · hypertension · lightheadedness · methaemoglobinaemia (with high doses) · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ▶ Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of **methylthionium chloride**.
- **ALLERGY AND CROSS-SENSITIVITY**
- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Lower doses may be required for intrathecal anaesthesia. Use with caution.
- **RENAL IMPAIRMENT** Lower doses may be required for intrathecal anaesthesia. Use with caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **PRILOTEKAL®**
- **Scottish Medicines Consortium (SMC) Decisions**
- ▶ With intrathecal use The *Scottish Medicines Consortium* has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (*Prilotekal®*) is accepted for

restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

## Ropivacaine hydrochloride

### ● INDICATIONS AND DOSE

#### Acute pain, peripheral nerve block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

#### Acute pain, field block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution

#### Acute pain, lumbar epidural block

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

#### Acute labour pain

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

#### Acute postoperative pain

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

#### Postoperative pain, thoracic epidural block

- ▶ BY CONTINUOUS EPIDURAL INFUSION
- ▶ Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

#### Surgical anaesthesia, field block

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia, major nerve block (brachial plexus block)

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)

- ▶ BY THORACIC EPIDURAL
- ▶ Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia for caesarean section

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia, lumbar epidural block

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 113–200 mg, dose administered using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

#### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Acute porphyrias p. 930 · cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

### 16 Emergency treatment of poisoning

#### Overview

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** be consulted when there is doubt about the degree of risk or about management.

#### Hospital admission

Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 114, iron, paracetamol p. 414, tricyclic antidepressants, and co-phenotrope p. 62 (diphenoxylate with atropine, *Lomotil*®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

#### Further information

**TOXBASE**, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at [www.toxbase.org](http://www.toxbase.org) (a backup site is available at [www.toxbasebackup.org](http://www.toxbasebackup.org) if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the **UK National Poisons Information Service** on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from **TOXBASE** or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

#### General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information

should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The **National Poisons Information Service** should be consulted when there is doubt about any aspect of suspected poisoning.

#### Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

#### Blood pressure

Hypertension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 914 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amfetamines, phencyclidine, and cocaine.

#### Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis,

or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

### Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

### Convulsions

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 317 or diazepam p. 321 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 318 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam can be administered as a rectal solution.

### Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthionium chloride p. 1216 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthionium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthionium chloride can itself cause methaemoglobinaemia.

### Removal and elimination

#### Prevention of absorption

Given by mouth, charcoal, activated p. 1211 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

#### Active elimination techniques

Repeated doses of charcoal, activated p. 1211 by mouth enhance the *elimination* of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of

charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should **not** be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

#### Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of *emesis* (e.g. with ipecacuanha) is **not** recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

*Whole bowel irrigation* (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

### Alcohol

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

### Aspirin

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Patients whose plasma-paracetamol concentrations are on or above the **treatment line** should be treated with acetylcysteine by intravenous infusion.

The prognostic accuracy after 15 hours is uncertain, but a plasma-paracetamol concentration on or above the treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

### Opioids

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1214 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment

with sodium bicarbonate p. 910 or magnesium sulfate p. 924, or both. Arrhythmias may occur for up to 12 hours.

### Paracetamol

In cases of **intravenous paracetamol poisoning** contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1215 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National

Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine p. 1215 should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

#### Acute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 1211 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line ('treatment line') joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the *treatment line* on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the *treatment line* on the paracetamol treatment graph, provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the *treatment line* on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

#### 'Staggered' overdose, uncertain time of overdose, or therapeutic excess

A 'staggered' overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a 'staggered' overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine p. 291, efavirenz p. 593, nevirapine p. 594,

phenobarbital p. 313, phenytoin p. 302, primidone p. 313, rifabutin p. 530, rifampicin p. 535, St John's wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient's risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

#### Acetylcysteine dose and administration

For paracetamol overdosage, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose intravenous infusion 5% p. 915.

First infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare first infusion
40–49 kg	34 mL
50–59 kg	42 mL
60–69 kg	49 mL
70–79 kg	57 mL
80–89 kg	64 mL
90–99 kg	72 mL
100–109 kg	79 mL
≥110 kg	83 mL (max. dose)

*First infusion* (based on an acetylcysteine dose of approx. 150 mg/kg)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 200 mL Glucose Intravenous Infusion 5%; infuse over 1 hour.

Second infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare second infusion
40–49 kg	12 mL
50–59 kg	14 mL
60–69 kg	17 mL
70–79 kg	19 mL
80–89 kg	22 mL
90–99 kg	24 mL
100–109 kg	27 mL
≥110 kg	28 mL (max. dose)

*Second infusion* (based on an acetylcysteine dose of approx. 50 mg/kg; start immediately after completion of first infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 500 mL Glucose Intravenous Infusion 5%; infuse over 4 hours.

**Third infusion**

Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare third infusion
40–49 kg	23 mL
50–59 kg	28 mL
60–69 kg	33 mL
70–79 kg	38 mL
80–89 kg	43 mL
90–99 kg	48 mL
100–109 kg	53 mL
≥110 kg	55 mL (max. dose)

*Third infusion* (based on an acetylcysteine dose of approx. 100 mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose Intravenous Infusion 5%; infuse over 16 hours.

**Antidepressants****Tricyclic and related antidepressants**

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see *Convulsions*). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

**Antimalarials**

Overdose with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include

arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**Antipsychotics****Phenothiazines and related drugs**

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 384 or diazepam p. 321 (emulsion preferred).

**Second-generation antipsychotic drugs**

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1211 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

**Benzodiazepines**

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1213 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

**Beta blockers**

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions.

*Acute massive overdose* must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1179 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 660 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

### Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 919 or calcium gluconate p. 920 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

### Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 902, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

### Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within

1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

### Stimulants

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 321 or lorazepam p. 317; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

### Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

### Ecstasy

Ecstasy (methylenedioxyamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxyamfetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

### Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 406 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 929 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

## Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE, see under the National Poisons Information Service.

### Cyanides

**Oxygen** should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1212 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should **not** be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1212 followed by sodium thiosulfate p. 1212 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 899 (*Cyanokit*<sup>®</sup>)—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

### Ethylene glycol and methanol

**Fomepizole** (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, **ethanol** (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

### Heavy metals

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

## Noxious gases

### Carbon monoxide

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow **oxygen** 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 217. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

### Sulfur dioxide, chlorine, phosgene, ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary

oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

## CS Spray

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

## Nerve agents

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 1212 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

## Pesticides

### Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1179 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

## Snake bites and animal stings

### Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with **adrenaline/epinephrine** p. 211. Indications for european viper snake venom antiserum p. 1216 treatment include **systemic envenoming**, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of **severe envenoming** (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the european viper snake venom antiserum is recommended; if symptoms of **systemic envenoming** persist contact the National Poisons Information Service. Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the european viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

### Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular **adrenaline/epinephrine**; self-administered intramuscular adrenaline/epinephrine (e.g. *EpiPen*<sup>®</sup>) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

### Marine stings

The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater.

Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

### Other poisons

Consult either the National Poisons Information Service or TOXBASE.

## 1 Active elimination from the gastro-intestinal tract

### ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

#### Charcoal, activated

##### ● INDICATIONS AND DOSE

##### Reduction of absorption of poisons in the gastro-intestinal system

- ▶ BY MOUTH
- ▶ Child 1 month-11 years: 1 g/kg (max. per dose 50 g)
- ▶ Child 12-17 years: 50 g
- ▶ Adult: 50 g

##### Active elimination of poisons

- ▶ BY MOUTH
- ▶ Child 1 month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
- ▶ Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy
- ▶ Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

##### Accelerated elimination of teriflunomide

- ▶ BY MOUTH USING GRANULES
- ▶ Adult: 50 g every 12 hours for 11 days

##### Accelerated elimination of leflunomide (washout procedure)

- ▶ BY MOUTH USING GRANULES
- ▶ Adult: 50 g 4 times a day for 11 days

- **UNLICENSED USE** Activated charcoal doses in BNF may differ from those in product literature.
- **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration—ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)
- **SIDE-EFFECTS** Black stools
- **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Granules

- ▶ **Carbomix** (Beacon Pharmaceuticals Ltd)  
Activated charcoal **813 mg per 1 gram** Carbomix 81.3% granules sugar-free | 50 gram **£11.90**

##### Oral suspension

- ▶ **Actidose-Aqua Advance** (Alliance Pharmaceuticals Ltd)  
Activated charcoal **208 mg per 1 ml** Actidose-Aqua Advance 1.04g/5ml oral suspension | 240 ml **£12.89**
- ▶ **Charcodote** (Teva UK Ltd)  
Activated charcoal **200 mg per 1 ml** Charcodote 200mg/ml oral suspension sugar-free | 250 ml **£11.88**

## 2 Chemical toxicity

### 2.1 Cyanide toxicity

#### ANTIDOTES AND CHELATORS

##### Dicobalt edetate

###### ● INDICATIONS AND DOSE

###### Severe poisoning with cyanides

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: Consult the National Poisons Information Service
- ▶ Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- **SIDE-EFFECTS** Anaphylactoid reactions · cardiac abnormalities · facial oedema · hypotension · laryngeal oedema · tachycardia · vomiting
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

###### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Solution for injection

- ▶ **Dicobalt edetate (Non-proprietary)**  
Dicobalt edetate 15 mg per 1 mL Dicobalt edetate 300mg/20mL solution for injection ampoules | 6 ampoule (PoM) £117.20

##### Sodium nitrite

###### ● INDICATIONS AND DOSE

###### Poisoning with cyanides (used in conjunction with sodium thiosulfate)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 4–10 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
- ▶ Adult: 300 mg, to be given over 5–20 minutes (as sodium nitrite injection 30 mg/mL)

###### DOSE EQUIVALENCE AND CONVERSION

- ▶ 4–10 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.
- ▶ Dose max. of 300 mg equates to 10 mL of a 3% solution.

- **SIDE-EFFECTS** Flushing (due to vasodilatation) · headache (due to vasodilatation)
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

###### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

##### Sodium thiosulfate

###### ● INDICATIONS AND DOSE

###### Poisoning with cyanides (used in conjunction with sodium nitrite)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
- ▶ Adult: 12.5 g, to be given over 10 minutes (as sodium thiosulfate injection 500 mg/mL), dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

###### DOSE EQUIVALENCE AND CONVERSION

- ▶ 400 mg/kg equates to 0.8 mL/kg of a 50% solution.
- ▶ 12.5 g equates to 25 mL of a 50% solution.

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

###### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

### 2.2 Organophosphorus toxicity

**Other drugs used for Organophosphorus toxicity** Atropine sulfate, p. 1179

#### ANTIDOTES AND CHELATORS

##### Pralidoxime chloride

###### ● INDICATIONS AND DOSE

###### Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
- ▶ Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

- **UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature. Licensed for use in children (age range not specified by manufacturer).
- **CONTRA-INDICATIONS** Poisoning with carbamates · poisoning with organophosphorus compounds without anticholinesterase activity
- **CAUTIONS** Myasthenia gravis
- **SIDE-EFFECTS** Disturbances of vision · dizziness · drowsiness · headache · hyperventilation · muscular weakness · nausea · tachycardia
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
  - ▶ With intravenous use in children For *intravenous infusion*, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh

Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for injection**

###### ▶ Pralidoxime chloride (Non-proprietary)

**Pralidoxime chloride 1 gram** Protopam Chloride 1g powder for solution for injection vials | 6 vial **[POM]** no price available

## 3 Drug toxicity

### 3.1 Benzodiazepine toxicity

#### ANTIDOTES AND CHELATORS > BENZODIAZEPINE ANTAGONISTS

##### Flumazenil

#### ● INDICATIONS AND DOSE

##### **Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures**

###### ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course

##### **Reversal of sedative effects of benzodiazepines in intensive care**

###### ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

##### **Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)**

###### ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection) 300 micrograms, adjusted according to response

#### IMPORTANT SAFETY INFORMATION

Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines
- **CAUTIONS** Avoid rapid injection following major surgery · avoid rapid injection in high-risk or anxious patients · benzodiazepine dependence (may precipitate withdrawal symptoms) · elderly · ensure neuromuscular blockade cleared before giving · head injury (rapid reversal of benzodiazepine sedation may cause convulsions) · history of panic disorders (risk of recurrence) · prolonged benzodiazepine therapy for epilepsy (risk of convulsions) · short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Nausea · vomiting
  - ▶ **Uncommon** Anxiety · fear · palpitation
  - ▶ **Frequency not known** Agitation · chills · convulsions (particularly in those with epilepsy) · dizziness · flushing · sensory disturbance · sweating · tachycardia · transient hypertension
- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Carefully titrate dose.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Solution for injection**

###### ▶ Flumazenil (Non-proprietary)

**Flumazenil 100 microgram per 1 ml** Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule **[POM]** £65.50-£72.46

### 3.2 Digoxin toxicity

#### ANTIDOTES AND CHELATORS > ANTIBODIES

##### Digoxin-specific antibody

#### ● INDICATIONS AND DOSE

**Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary**

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
- ▶ Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ In adults For *intravenous infusion (DigiFab<sup>®</sup>)*, given intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for infusion**

###### ▶ DigiFab (BTG International Ltd)

**Digoxin-specific antibody fragments 40 mg** DigiFab 40mg powder for solution for infusion vials | 1 vial **[POM]** £750.00 (Hospital only)

### 3.3 Heparin toxicity

#### ANTIDOTES AND CHELATORS

##### Protamine sulfate

#### ● INDICATIONS AND DOSE

##### **Overdosage with intravenous injection of unfractionated heparin**

###### ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg

continued →

**Overdosage with intravenous infusion of unfractionated heparin**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

**Overdosage with subcutaneous injection of unfractionated heparin**

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course

**Overdosage with subcutaneous injection of low molecular weight heparin**

- ▶ BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg

- **CAUTIONS** Excessive doses can have an anticoagulant effect
- **SIDE-EFFECTS** Anaphylaxis · angioedema · back pain · bradycardia · dyspnoea · flushing · hypersensitivity reactions · hypertension · hypotension · lassitude · nausea · pulmonary oedema · rebound bleeding · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).
- **MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.
- **PRESCRIBING AND DISPENSING INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Protamine sulfate (Non-proprietary)**
- ▶ Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules | 5 ampoule [PoM] no price available
- ▶ Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] £49.55

## 3.4 Opioid toxicity

### OPIOID RECEPTOR ANTAGONISTS

#### Naloxone hydrochloride

**INDICATIONS AND DOSE****Overdosage with opioids**

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates

- ▶ Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates
- ▶ Adult: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative *intravenous injection* dose is that which maintained satisfactory ventilation for at least 15 minutes
- ▶ Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative *intravenous injection* dose is that which maintained satisfactory ventilation for at least 15 minutes

**Overdosage with opioids in a non-medical setting****BY INTRAMUSCULAR INJECTION**

- ▶ Adult: 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

**Reversal of postoperative respiratory depression****INITIALLY BY INTRAVENOUS INJECTION**

- ▶ Child 1 month–11 years: 1 microgram/kg, repeated every 2–3 minutes if required
- ▶ Child 12–17 years: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours
- ▶ Adult: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

**PHARMACOKINETICS**

Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

**Important:** Only give by subcutaneous or intramuscular routes if intravenous route is not feasible; intravenous administration has more rapid onset of action.

- **UNLICENSED USE** Naloxone doses in BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION****SAFE PRACTICE**

Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

- **CAUTIONS** Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) · maternal physical dependence on opioids (may precipitate withdrawal in newborn) · pain · physical dependence on opioids (precipitates withdrawal)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Titration of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Cardiac arrest (in children) · dizziness · dyspnoea (in children) · headache · hypertension · hyperventilation (in children) · hypotension · nausea · pulmonary oedema (in children) · tachycardia · ventricular fibrillation (in children) · vomiting
- ▶ **Uncommon** Agitation (in children) · arrhythmia (in adults) · bradycardia (in adults) · diarrhoea · dry mouth · excitement (in children) · hyperventilation (in adults) · paraesthesia (in children) · sweating · tremor
- ▶ **Rare** Seizures (in adults)
- ▶ **Very rare** Anaphylaxis (in adults) · cardiac arrest (in adults) · erythema multiforme · hypersensitivity reactions (in adults) · pulmonary oedema (in adults) · seizures (in children) · ventricular fibrillation (in adults)
- ▶ **Frequency not known** Agitation (in adults)
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Not orally bioavailable.
- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intravenous use in adults For *intravenous infusion* (Minijet<sup>®</sup> Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Naloxone hydrochloride (Non-proprietary)**  
Naloxone hydrochloride 1 mg per 1 mL Naloxone 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.80
- Naloxone hydrochloride 20 microgram per 1 mL Naloxone 40micrograms/2ml solution for injection ampoules | 10 ampoule [PoM] £55.00
- Naloxone hydrochloride 400 microgram per 1 mL Naloxone 400micrograms/1ml solution for injection ampoules | 3 ampoule [PoM] £17.70 | 10 ampoule [PoM] £41.00-£53.70
- ▶ **Prenoxad** (Martindale Pharmaceuticals Ltd)  
Naloxone hydrochloride 1 mg per 1 mL Prenoxad 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.30

administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%

- ▶ Child (body-weight 20-39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- ▶ Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%
- ▶ Adult (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%

- **CAUTIONS** Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time

- **SIDE-EFFECTS** Hypersensitivity-like reactions · slight increase in INR and prothrombin time · rashes

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hypersensitivity-like reactions Hypersensitivity-like reactions are managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta<sub>2</sub> agonist)—contact the National Poisons Information Service if reaction severe.

#### DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.
- ▶ With intravenous use in adults For *intravenous infusion* (Parvolex<sup>®</sup>), give continuously in Glucose 5% or Sodium chloride 0.9%. Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

#### Acetylcysteine (Non-proprietary)

- ▶ **Acetylcysteine 200 mg per 1 mL** Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule [PoM] £21.26-£24.99
- ▶ **Parvolex** (Phoenix Labs Ltd)  
Acetylcysteine 200 mg per 1 mL Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £22.50

## 3.5 Paracetamol toxicity

### ANTIDOTES AND CHELATORS

#### Acetylcysteine

##### INDICATIONS AND DOSE

##### Paracetamol overdosage

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be

## 4 Methaemoglobinaemia

### ANTIDOTES AND CHELATORS

#### Methylthionium chloride

(Methylene blue)

##### ● INDICATIONS AND DOSE

###### Drug- or chemical-induced methaemoglobinaemia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
- ▶ Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

###### Aniline- or dapsone-induced methaemoglobinaemia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
- ▶ Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

- **CAUTIONS** Children under 3 months (more susceptible to methaemoglobinaemia from high doses of methylthionium) · chlorate poisoning (reduces efficacy of methylthionium) · G6PD deficiency (seek advice from National Poisons Information Service) · methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) · pulse oximetry may give false estimation of oxygen saturation

- **INTERACTIONS** → Appendix 1 (methylthionium).

- **SIDE-EFFECTS** Abdominal pain · agitation · anxiety · arrhythmia · blue-green discoloration of faeces · blue-green discoloration of skin · blue-green discoloration of urine · chest pain · confusion · dizziness · dyspnoea · fever · haemolytic anaemia · headache · hyperbilirubinaemia (in infants) · hypertension · hypotension · methaemoglobinaemia · mydriasis · nausea · sweating · tachypnoea · tremor · vomiting

- **PREGNANCY** No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

- **RENAL IMPAIRMENT** Use with caution in severe impairment; dose reduction may be required.

##### ● DIRECTIONS FOR ADMINISTRATION

- ▶ In children For *intravenous injection*, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

###### Solution for injection

- ▶ Methylthionium chloride (Non-proprietary)

Methylthionium chloride 5 mg per 1 ml Methylthionium chloride Provelblue 50mg/10ml solution for injection ampoules | 5 ampoule [PoM] £167.36

## 5 Snake bites

### IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

#### European viper snake venom antiserum

##### ● INDICATIONS AND DOSE

###### Systemic envenoming from snake bites | Marked local envenoming

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- ▶ Adult: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

###### Severe systemic envenoming from snake bites in patients presenting with clinical features

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- ▶ Adult: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **DIRECTIONS FOR ADMINISTRATION** By *intravenous injection* given over 10–15 minutes or by *intravenous infusion* over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

- **PRESCRIBING AND DISPENSING INFORMATION** To order, email [immform@dh.gsi.gov.uk](mailto:immform@dh.gsi.gov.uk).

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

###### Solution for injection

- ▶ European viper snake venom antiserum (Non-proprietary)

European viper snake venom antiserum 100 mg per 1 ml Viper venom antiserum, European (equine) 1g/10ml solution for injection vials | 1 vial [PoM] no price available

# Appendix 1

## Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs), as for other adverse drug reactions.

Drug interactions may be **pharmacodynamic** or **pharmacokinetic**.

### Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

### Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

**Affecting absorption** The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

**Due to changes in protein binding** To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

**Affecting metabolism** Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of *in-vitro* information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

**Affecting renal excretion** Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

### Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

**Serious interactions** The symbol ● has been placed against interactions that are **potentially serious** and where concomitant administration of the drugs involved should be **avoided** (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.

## List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

### Abacavir

- Analgesics: abacavir possibly reduces plasma concentration of **METHADONE**
- Antibacterials: plasma concentration of abacavir possibly reduced by **RIFAMPICIN**
- Antiepileptics: plasma concentration of abacavir possibly reduced by **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- Antivirals: abacavir possibly reduces effects of ● **RIBAVIRIN**; plasma concentration of abacavir reduced by ● **TIPRANA VIR**
- Orlistat: absorption of abacavir possibly reduced by ● **ORLISTAT**

### Abatacept

- Cytotoxics: increased risk of side-effects when abatacept given with **ADALIMUMAB**; avoid concomitant use of abatacept with ● **CERTOLIZUMAB PEGOL**, ● **GOLIMUMAB** or ● **INFLIXIMAB**
- Etanercept: avoid concomitant use of abatacept with ● **ETANERCEPT**
- Vaccines: risk of generalised infections when abatacept given with live ● **VACCINES**—avoid concomitant use

### Abiraterone

- Analgesics: abiraterone increases plasma concentration of **DEXTRORHETHORPHAN**
- Antibacterials: plasma concentration of abiraterone possibly reduced by ● **RIFABUTIN**—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by ● **RIFAMPICIN**—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by ● **ST JOHN'S WORT**—manufacturer of abiraterone advises avoid concomitant use
- Antiepileptics: plasma concentration of abiraterone possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of abiraterone advises avoid concomitant use
- Diuretics: manufacturer of abiraterone advises avoid concomitant use with **SPIRONOLACTONE**

**Acarbose** see Antidiabetics

### ACE Inhibitors

- Alcohol: enhanced hypotensive effect when ACE inhibitors given with **ALCOHOL**
- Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with **ALDESLEUKIN**
- Alliskiren: increased risk of hyperkalaemia, hypotension, and impaired renal function when ACE inhibitors given with ● **ALLISKIREN**—avoid concomitant use
- Allopurinol: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with **ALLOPURINOL** especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with **ALPHA-BLOCKERS**
- Anaesthetics, General: enhanced hypotensive effect when ACE inhibitors given with **GENERAL ANAESTHETICS**
- Analgesics: increased risk of renal impairment when ACE inhibitors given with **NSAIDS**, also hypotensive effect antagonised
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia, hypotension, and impaired renal function when ACE inhibitors given with ● **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**—avoid concomitant use
- Antacids: absorption of ACE inhibitors possibly reduced by **ANTACIDS**; absorption of captopril, enalapril and fosinopril reduced by **ANTACIDS**
- Antibacterials: plasma concentration of active metabolite of midapril reduced by **RIFAMPICIN** (reduced antihypertensive effect); quinapril tablets reduce absorption of **TETRACYCLINES** (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with **TRIMETHOPRIM**
- ACE Inhibitors** (continued)
  - Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with **HEPARINS**
  - Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by **MAOIS**
  - Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of **INSULIN**, **METFORMIN** and **SULFONYLUREAS**
  - Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with **ANTIPSYCHOTICS**
  - Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with **ANXIOLYTICS AND HYPNOTICS**
  - Avanafil: hypotensive effect of enalapril possibly enhanced by **AVANAFIL**
  - Azathioprine: increased risk of anaemia or leucopenia when captopril given with **AZATHIOPRINE** especially in renal impairment; increased risk of anaemia when enalapril given with **AZATHIOPRINE** especially in renal impairment
  - Bee Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with ● **BEE VENOM EXTRACTS**
  - Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with **BETA-BLOCKERS**
  - Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with **CALCIUM-CHANNEL BLOCKERS**
  - Cardiac Glycosides: captopril possibly increases plasma concentration of **DIGOXIN**
  - Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ● **CYCLOSPORIN**
  - Clonidine: enhanced hypotensive effect when ACE inhibitors given with **CLONIDINE**; antihypertensive effect of captopril possibly delayed by previous treatment with **CLONIDINE**
  - Corticosteroids: hypotensive effect of ACE inhibitors antagonised by **CORTICOSTEROIDS**
  - Cytotoxics: increased risk of angioedema when ACE inhibitors given with ● **EVEROLIMUS**
  - Diazoxide: enhanced hypotensive effect when ACE inhibitors given with **DIAZOXIDE**
  - Diuretics: increased risk of severe hyperkalaemia when ACE inhibitors given with ● **EPLERENONE** and ● **SPIRONOLACTONE**—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when ACE inhibitors given with ● **AMILORIDE**, ● **POTASSIUM CANRENOATE** or ● **TRIAMTERENE**; enhanced hypotensive effect when ACE inhibitors given with ● **DIURETICS**
  - Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**
  - Lithium: ACE inhibitors reduce excretion of ● **LITHIUM** (increased plasma concentration)
  - Methyldopa: enhanced hypotensive effect when ACE inhibitors given with **METHYLDOPA**
  - Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with **MOXISYLYTE**
  - Moxonidine: enhanced hypotensive effect when ACE inhibitors given with **MOXONIDINE**
  - Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with **BACLOFEN** or **TIZANIDINE**
  - Nitrates: enhanced hypotensive effect when ACE inhibitors given with **NITRATES**
  - Oestrogens: hypotensive effect of ACE inhibitors antagonised by **OESTROGENS**
  - Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with ● **POTASSIUM SALTS**
  - Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with **ALPROSTADIL**
  - Sacubitril: manufacturer of sacubitril advises avoid ACE inhibitors for 36 hours before or after ● **SACUBITRIL**
  - Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with ● **SODIUM AUROTHIOMALATE**
  - Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
  - Wasp Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with ● **WASP VENOM EXTRACTS**

**Acetabutool** see Beta-blockers

**Accelefenac** see NSAIDs

**Acemetacin** see NSAIDs

**Acenocoumarol** see Coumarins

**Acetazolamide** see Diuretics

### Aciclovir

- NOTE** Interactions do not apply to topical aciclovir preparations
- ▶ Aminophylline: aciclovir possibly increases plasma concentration of **AMINOPHYLLINE**
  - ▶ Clodsporin: increased risk of nephrotoxicity when aciclovir given with **CYCLOSPORIN**
  - ▶ Mycophenolate: plasma concentration of aciclovir increased by **MYCOPHENOLATE**, also plasma concentration of inactive metabolite of mycophenolate increased
  - ▶ Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with **TACROLIMUS**
  - ▶ Theophylline: aciclovir possibly increases plasma concentration of **THEOPHYLLINE**

**Acitretin** see Retinoids

**Acidiniium** see Antimuscarinics

**Acrivastine** see Antihistamines

### Adalimumab

- ▶ Abatacept: increased risk of side-effects when adalimumab given with **ABATACEPT**
- Anakinra: avoid concomitant use of adalimumab with
  - **ANAKINRA**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

### Adefovir

- ▶ Antivirals: avoidance of adefovir advised by manufacturer of **TENOFOVIR**
- ▶ Interferons: manufacturer of adefovir advises caution with **PEGINTERFERON ALFA**

### Adenosine

- NOTE** Possibility of interaction with drugs tending to impair myocardial conduction
- ▶ Aminophylline: anti-arrhythmic effect of adenosine antagonised by **AMINOPHYLLINE**—manufacturer of adenosine advises avoid aminophylline for 24 hours before adenosine
  - ▶ Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE**, **LEVOBUPIVACAINE**, **PRILOCAINE** or **ROPIVACAINE**
  - Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ● **ANTI-ARRHYTHMICS**
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
    - **ANTIPSYCHOTICS** that prolong the QT interval
  - Beta-blockers: increased myocardial depression when anti-arrhythmics given with ● **BETA-BLOCKERS**
  - ▶ Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by **CAFFEINE CITRATE**—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
  - Dipyradamole: effect of adenosine enhanced and extended by
    - **DIPYRIDAMOLE** (important risk of toxicity)—reduce dose of adenosine, see p. 101
  - ▶ Nicotine: effects of adenosine possibly enhanced by **NICOTINE**
  - ▶ Theophylline: anti-arrhythmic effect of adenosine antagonised by **THEOPHYLLINE**—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine

**Adrenaline (epinephrine)** see Sympathomimetics

### Adrenergic Neurone Blockers

- ▶ Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with **ALCOHOL**
- ▶ Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **ALPHA-BLOCKERS**
- Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with ● **GENERAL ANAESTHETICS**
- ▶ Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by **NSAIDS**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**

**Adrenergic Neurone Blockers** (continued)

- ▶ Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with **MAOIS**; hypotensive effect of adrenergic neurone blockers antagonised by **TRICYCLICS**
- ▶ Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by **HALOPERIDOL**; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of **CHLORPROMAZINE**; enhanced hypotensive effect when adrenergic neurone blockers given with **PHENOTHIAZINES**
- ▶ Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with **ANXIOLYTICS AND HYPNOTICS**
- ▶ Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **BETA-BLOCKERS**
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with **CLONIDINE**
- ▶ Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by **CORTICOSTEROIDS**
- ▶ Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with **DIAZOXIDE**
- ▶ Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with **DIURETICS**
- ▶ Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with **CO-BENEDOPA**, **CO-CARELDOPA** or **LEVODOPA**
- ▶ Methylidopa: enhanced hypotensive effect when adrenergic neurone blockers given with **METHYLDOPA**
- ▶ Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with **MOXISYLYTE**
- ▶ Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with **MOXONIDINE**
- ▶ Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with **BACLOFEN** or **TIZANIDINE**
- ▶ Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with **NITRATES**
- ▶ Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by **OESTROGENS**
- ▶ Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by **PIZOTIFEN**
- ▶ Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with **ALPROSTADIL**
- Sympathomimetics: increased risk of hypertension when guanethidine given with ● **ADRENALINE (EPINEPHRINE)**; hypotensive effect of guanethidine antagonised by
  - **DEXAMFETAMINE** and ● **LISDEXAMFETAMINE**; hypotensive effect of adrenergic neurone blockers antagonised by ● **EPHEDRINE**, ● **ISOMETHEPTENE**, ● **METARAMINOL**, ● **METHYLPHENIDATE**, ● **NORADRENALINE (NOREPINEPHRINE)**, ● **OXYMETAZOLINE**, ● **PHENYLEPHRINE**, ● **PSEUDOPHEDRINE** and ● **XYLOMETAZOLINE**; avoidance of guanethidine advised by manufacturer of **MIDDORINE**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Adsorbents** see Kaolin

### Afatinib

- ▶ Anti-arrhythmics: plasma concentration of afatinib possibly increased by **AMIODARONE**—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours
- ▶ Antibacterials: plasma concentration of afatinib possibly increased by **ERYTHROMYCIN**—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by **RIFAMPICIN**
- ▶ Antifungals: plasma concentration of afatinib possibly increased by **ITRACONAZOLE** and **KETOCONAZOLE**—manufacturer of afatinib advises separating administration of itraconazole and ketoconazole by 6 to 12 hours
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ Antivirals: plasma concentration of afatinib increased by **RITONAVIR**—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma

**Afatinib**

Antivirals (continued)

- concentration of afatinib possibly increased by **SAQUINAVIR**—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours
- Calcium-channel Blockers: plasma concentration of afatinib possibly increased by **VERAPAMIL**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours
- Ciclosporin: plasma concentration of afatinib possibly increased by **CICLOSPORIN**—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours
- Tacrolimus: plasma concentration of afatinib possibly increased by **TACROLIMUS**—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours

**Agalsidase Alfa and Beta**

- Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by **AMIODARONE** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antibacterials: effects of agalsidase alfa and beta possibly inhibited by **GENTAMICIN** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antimalarials: effects of agalsidase alfa and beta possibly inhibited by **CHLOROQUINE** and **HYDROXYCHLOROQUINE** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

**Agomelatine**

- Antibacterials: manufacturer of agomelatine advises avoid concomitant use with **CIPROFLOXACIN**
- Antidepressants: metabolism of agomelatine inhibited by **FLUVOXAMINE** (increased plasma concentration)
- Antimalarials: avoidance of antidepressants advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE** and **ARTENIMOL WITH PIPERAQUINE**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**

**Albendazole**

- Anthelmintics: plasma concentration of both drugs possibly reduced when albendazole given with **LEVAMISOLE**
- Antiepileptics: plasma concentration of albendazole reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**—consider increasing albendazole dose when given for systemic infections
- Antivirals: plasma concentration of active metabolite of albendazole reduced by **RITONAVIR**—consider increasing albendazole dose when given for systemic infections
- Corticosteroids: plasma concentration of active metabolite of albendazole increased by **DEXAMETHASONE**
- Grapefruit Juice: plasma concentration of active metabolite of albendazole increased by **GRAPEFRUIT JUICE**
- Ulcer-healing Drugs: effects of albendazole possibly enhanced by **CIMETIDINE**

**Albiglutide** see Antidiabetics**Alcohol**

- ACE Inhibitors: enhanced hypotensive effect when alcohol given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with **ADRENERGIC NEURONE BLOCKERS**
- Alpha-blockers: increased sedative effect when alcohol given with **INDORAMIN**; enhanced hypotensive effect when alcohol given with **ALPHA-BLOCKERS**
- Analgesics: enhanced hypotensive and sedative effects when alcohol given with **OPIOID ANALGESICS**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Anthelmintics: possibility of disulfiram-like reaction when alcohol given with **LEVAMISOLE**
- Antibacterials: disulfiram-like reaction when alcohol given with **METRONIDAZOLE**; possibility of disulfiram-like reaction when alcohol given with **TINIDAZOLE**; increased risk of convulsions when alcohol given with **CYCLOSERINE**
- Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with **COUMARINS** or **PHENINDIONE**

**Alcohol** (continued)

- Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with **MAOIS** (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with **SSRIS**; increased sedative effect when alcohol given with **MIRTAZAPINE**, **TRICYCLIC-RELATED ANTIDEPRESSANTS** or **TRICYCLICS**
- Antidiabetics: alcohol enhances hypoglycaemic effect of **ANTIDIABETICS**; increased risk of lactic acidosis when alcohol given with **METFORMIN**
- Antiepileptics: alcohol possibly increases CNS side-effects of **CARBAMAZEPINE**; chronic heavy consumption of alcohol possibly reduces plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**; increased sedative effect when alcohol given with **PHENOBARBITAL** or **PRIMIDONE**; increased risk of blurred vision when alcohol given with **RETIGABINE**
- Antifungals: possibility of disulfiram-like reaction when alcohol given with **KETOCONAZOLE**; effects of alcohol possibly enhanced by **GRISEOFULVIN**
- Antihistamines: increased sedative effect when alcohol given with **ANTIHISTAMINES** (possibly less effect with non-sedating antihistamines)
- Antimuscarinics: increased sedative effect when alcohol given with **HYOSCINE**
- Antipsychotics: increased sedative effect when alcohol given with **ANTIPSYCHOTICS**
- Anxiolytics and Hypnotics: increased sedative effect when alcohol given with **ANXIOLYTICS AND HYPNOTICS**
- Avanafil: possible enhanced hypotensive effect when alcohol given with **AVANAFIL**
- Beta-blockers: enhanced hypotensive effect when alcohol given with **BETA-BLOCKERS**
- Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with **CALCIUM-CHANNEL BLOCKERS**; plasma concentration of alcohol possibly increased by **VERAPAMIL**
- Clonidine: enhanced hypotensive effect when alcohol given with **CLONIDINE**
- Cytotoxics: disulfiram-like reaction when alcohol given with **PROCARBAZINE**; avoidance of alcohol advised by manufacturer of **TRABECTEDIN**
- Dapoxetine: increased sedative effect when alcohol given with **DAPOXETINE**
- Diazoxide: enhanced hypotensive effect when alcohol given with **DIAZOXIDE**
- Disulfiram: disulfiram reaction when alcohol given with **DISULFIRAM**
- Diuretics: enhanced hypotensive effect when alcohol given with **DIURETICS**
- Dopaminergics: alcohol reduces tolerance to **BROMOCRIPTINE**
- Guanfacine: sedative effects possibly increased when alcohol given with **GUANFACINE**
- Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of **LOMITAPIDE**
- Lofexidine: increased sedative effect when alcohol given with **LOFEXIDINE**
- Methyldopa: enhanced hypotensive effect when alcohol given with **METHYLDOPA**
- Metoclopramide: absorption of alcohol possibly increased by **METOCLOPRAMIDE**
- Moxonidine: enhanced hypotensive effect when alcohol given with **MOXONIDINE**
- Muscle Relaxants: increased sedative effect when alcohol given with **BACLOFEN**, **METHOCARBAMOL** or **TIZANIDINE**
- Nicorandil: alcohol possibly enhances hypotensive effect of **NICORANDIL**
- Nitrates: enhanced hypotensive effect when alcohol given with **NITRATES**
- Paraldehyde: increased sedative effect when alcohol given with **PARALDEHYDE**
- Retinoids: presence of alcohol causes etretinate to be formed from **ACITRETIN** (increased risk of teratogenicity in women of child-bearing potential)
- Sympathomimetics: alcohol possibly enhances effects of **METHYLPHENIDATE**

**Alcohol** (continued)

- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Aldesleukin**

- ▶ ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with **ACE INHIBITORS**
- ▶ Alpha-blockers: enhanced hypotensive effect when aldesleukin given with **ALPHA-BLOCKERS**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Antivirals: aldesleukin possibly increases plasma concentration of **INDINAVIR**
- ▶ Beta-blockers: enhanced hypotensive effect when aldesleukin given with **BETA-BLOCKERS**
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when aldesleukin given with **CLONIDINE**
- Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with ● **CORTICOSTEROIDS**
- Cytotoxics: manufacturer of aldesleukin advises avoid concomitant use with ● **CISPLATIN**, ● **DACARBAZINE** and ● **VINBLASTINE**
- Diazoxide: enhanced hypotensive effect when aldesleukin given with **DIAZOXIDE**
- ▶ Diuretics: enhanced hypotensive effect when aldesleukin given with **DIURETICS**
- ▶ Methyldopa: enhanced hypotensive effect when aldesleukin given with **METHYLDOPA**
- ▶ Moxonidine: enhanced hypotensive effect when aldesleukin given with **MOXONIDINE**
- ▶ Nitrates: enhanced hypotensive effect when aldesleukin given with **NITRATES**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Allosterone Antagonists** see Diuretics

**Alemtuzumab**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Alemdronic Acid** see Bisphosphonates

**Affalcadicol** see Vitamins

**Alfentanil** see Opioid Analgesics

**Alfuzosin** see Alpha-blockers

**Alimemazine** see Antihistamines

**Alirocumab**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Aliskiren**

- ACE Inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ● **ACE INHIBITORS**—avoid concomitant use
- ▶ Analgesics: hypotensive effect of aliskiren possibly antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ● **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**—avoid concomitant use; plasma concentration of aliskiren possibly reduced by **IRBESARTAN**
- ▶ Antibacterials: plasma concentration of aliskiren reduced by **RIFAMPICIN**
- ▶ Anticoagulants: increased risk of hyperkalaemia when aliskiren given with **HEPARINS**
- Antifungals: plasma concentration of aliskiren increased by **KETOCONAZOLE**; plasma concentration of aliskiren increased by ● **ITRACONAZOLE**—avoid concomitant use
- ▶ Calcium-channel Blockers: plasma concentration of aliskiren increased by **VERAPAMIL**
- Ciclosporin: plasma concentration of aliskiren increased by ● **CYCLOSPORIN**—avoid concomitant use

**Aliskiren** (continued)

- ▶ Diuretics: aliskiren reduces plasma concentration of **FUROSEMIDE**; increased risk of hyperkalaemia when aliskiren given with **ALDOSTERONE ANTAGONISTS** or **POTASSIUM-SPARING DIURETICS**

- Grapefruit Juice: plasma concentration of aliskiren reduced by ● **GRAPEFRUIT JUICE**—avoid concomitant use

- ▶ Potassium Salts: increased risk of hyperkalaemia when aliskiren given with **POTASSIUM SALTS**

**Alitretinoin** see Retinoids

**Alkylating Drugs** see Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiotepa

**Allopurinol**

- ▶ ACE Inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when allopurinol given with **ACE INHIBITORS** especially in renal impairment
- ▶ Aminophylline: allopurinol possibly increases plasma concentration of **AMINOPHYLLINE**
- ▶ Antibacterials: increased risk of rash when allopurinol given with **AMOXICILLIN**, **AMPICILLIN** or **CO-AMOXICLAV**
- ▶ Anticoagulants: allopurinol possibly enhances anticoagulant effect of **COUMARINS**
- Antivirals: allopurinol increases plasma concentration of ● **DIDANOSINE** (risk of toxicity)—avoid concomitant use
- Azathioprine: allopurinol enhances effects and increases toxicity of ● **AZATHIOPRINE** (reduce dose of azathioprine to one quarter of usual dose)
- ▶ Ciclosporin: allopurinol possibly increases plasma concentration of **CYCLOSPORIN** (risk of nephrotoxicity)
- Cytotoxics: avoidance of allopurinol advised by manufacturer of ● **CAPECITABINE**; allopurinol enhances effects and increases toxicity of ● **MERCAPTOPYRINE** (reduce dose of mercaptopurine to one quarter of usual dose)
- ▶ Diuretics: increased risk of hypersensitivity when allopurinol given with **THIAZIDES AND RELATED DIURETICS** especially in renal impairment
- ▶ Theophylline: allopurinol possibly increases plasma concentration of **THEOPHYLLINE**

**Almotriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)

**Alogliptin** see Antidiabetics

**Alpha<sub>2</sub>-adrenoceptor Stimulants** see Apraclonidine, Brimonidine, Clonidine, and Methyldopa

**Alpha-blockers**

- ▶ ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with **ACE INHIBITORS**
- ▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with **ADRENERGIC NEURONE BLOCKERS**
- ▶ Alcohol: enhanced hypotensive effect when alpha-blockers given with **ALCOHOL**; increased sedative effect when indoramin given with **ALCOHOL**
- ▶ Aldesleukin: enhanced hypotensive effect when alpha-blockers given with **ALDESLEUKIN**
- Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with ● **GENERAL ANAESTHETICS**
- ▶ Analgesics: hypotensive effect of alpha-blockers antagonised by **NSAIDs**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Antidepressants: manufacturer of indoramin advises avoid concomitant use with ● **MAOIs**; enhanced hypotensive effect when alpha-blockers given with **MAOIs**
- Antifungals: plasma concentration of alfuzosin possibly increased by **KETOCONAZOLE**; plasma concentration of tamsulosin increased by ● **KETOCONAZOLE**
- ▶ Antipsychotics: enhanced hypotensive effect when alpha-blockers given with **ANTI PSYCHOTICS**
- Antivirals: plasma concentration of doxazosin and tamsulosin possibly increased by **BOCEPREVIR**—manufacturer of boceprevir advises avoid concomitant use; plasma concentration of alfuzosin possibly increased by ● **RITONAVIR**—avoid concomitant use; avoidance of alfuzosin advised by manufacturer of ● **TELAPREVIR**

**Alpha-blockers** (continued)

- ▶ Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with **ANXIOLYTICS AND HYPNOTICS**
- Avanafil: enhanced hypotensive effect when alpha-blockers given with ● **AVANAFIL**—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with ● **BETA-BLOCKERS**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with ● **CALCIUM-CHANNEL BLOCKERS**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin; plasma concentration of tamsulosin increased by **VERAPAMIL**
- ▶ Cardiac Glycosides: prazosin increases plasma concentration of **DIGOXIN**
- ▶ Clonidine: enhanced hypotensive effect when alpha-blockers given with **CLONIDINE**
- Cobicistat: plasma concentration of alfuzosin possibly increased by ● **COBICISTAT**—manufacturer of cobicistat advises avoid concomitant use
- ▶ Corticosteroids: hypotensive effect of alpha-blockers antagonised by **CORTICOSTEROIDS**
- ▶ Cytotoxics: avoidance of alfuzosin advised by manufacturer of **IDELALISIB**
- ▶ Diazoxide: enhanced hypotensive effect when alpha-blockers given with **DIAZOXIDE**
- Diuretics: enhanced hypotensive effect when alpha-blockers given with ● **DIURETICS**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- ▶ Dopaminergics: enhanced hypotensive effect when alpha-blockers given with **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**
- ▶ Methyldopa: enhanced hypotensive effect when alpha-blockers given with **METHYLDOPA**
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with ● **MOXISYLYTE**
- ▶ Moxonidine: enhanced hypotensive effect when alpha-blockers given with **MOXONIDINE**
- ▶ Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with **BACLOFEN** or **TIZANIDINE**
- ▶ Nitrates: enhanced hypotensive effect when alpha-blockers given with **NITRATES**
- ▶ Oestrogens: hypotensive effect of alpha-blockers antagonised by **OESTROGENS**
- ▶ Prostaglandins: enhanced hypotensive effect when alpha-blockers given with **ALPROSTADIL**
- Sildenafil: enhanced hypotensive effect when alpha-blockers given with ● **SILDENAFIL** (avoid alpha-blockers for 4 hours after sildenafil)—when patient is stable on the alpha blocker initiate sildenafil at the lowest possible dose
- Sympathomimetics: avoid concomitant use of tolazoline with ● **ADRENALINE (EPINEPHRINE)** or ● **DOPAMINE**; alpha-blockers possibly antagonise effects of **MIDODRINE**
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with ● **TADALAFIL**—when patient is stable on the alpha blocker initiate tadalafil at the lowest possible dose; enhanced hypotensive effect when doxazosin given with ● **TADALAFIL**—manufacturer of tadalafil advises avoid concomitant use
- Ulcer-healing Drugs: effects of tolazoline antagonised by ● **CIMETIDINE** and ● **RANITIDINE**
- Vardenafil: enhanced hypotensive effect when alpha-blockers given with ● **VARDENAFIL**—when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose—separate doses by 6 hours (except with tamsulosin)
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Alpha-blockers (post-synaptic)** see Alpha-blockers

**Alprazolam** see Anxiolytics and Hypnotics

**Alprostadil** see Prostaglandins

**Aluminium Hydroxide** see Antacids

**Amantadine**

- ▶ Antimalarials: plasma concentration of amantadine possibly increased by **QUININE**
- ▶ Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with **ANTI-PSYCHOTICS**
- ▶ Bupropion: increased risk of side-effects when amantadine given with **BUPROPION**
- Memantine: increased risk of CNS toxicity when amantadine given with ● **MEMANTINE** (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by **MEMANTINE**
- ▶ Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with **METHYLDOPA**; antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- ▶ Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with **TETRABENAZINE**

**Ambrisentan**

- ▶ Antibacterials: plasma concentration of ambrisentan possibly increased by **RIFAMPICIN**
- Closporin: plasma concentration of ambrisentan increased by ● **CYCLOSPORIN** (see under Ambrisentan, p. 174)

**Amikacin** see Aminoglycosides

**Amiloride** see Diuretics

**Aminoglycosides**

- ▶ Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of **AGALSIDASE ALFA AND BETA** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
  - ▶ Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by **INDOMETACIN**
  - Antibacterials: neomycin reduces absorption of **PHENOXYMETHYLPENICILLIN**; increased risk of nephrotoxicity when aminoglycosides given with **COLISTIMETHATE SODIUM** or **POLYMYXINS**; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with **CAPREOMYCIN** or ● **VANCOMYCIN**; possible increased risk of nephrotoxicity when aminoglycosides given with **CEPHALOSPORINS**
  - Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with ● **COUMARINS** or ● **PHENINDIONE**
  - ▶ Antidiabetics: neomycin possibly enhances hypoglycaemic effect of **ACARBOSE**, also severity of gastro-intestinal effects increased
  - ▶ Antifungals: increased risk of nephrotoxicity when aminoglycosides given with **AMPHOTERICIN**
  - ▶ Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with **BISPHOSPHONATES**
  - ▶ Cardiac Glycosides: gentamicin possibly increases plasma concentration of **DIGOXIN**; neomycin reduces absorption of **DIGOXIN**
  - Closporin: increased risk of nephrotoxicity when aminoglycosides given with ● **CYCLOSPORIN**
  - Cytotoxics: neomycin possibly reduces absorption of **METHOTREXATE**; neomycin reduces bioavailability of **SORAFENIB**; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with ● **PLATINUM COMPOUNDS**
  - Diuretics: increased risk of ototoxicity when aminoglycosides given with ● **LOOP DIURETICS**
  - ▶ Mannitol: manufacturer of tobramycin advises avoid concomitant use with **MANNITOL**
  - Muscle Relaxants: aminoglycosides enhance effects of ● **NON-DEPOLARISING MUSCLE RELAXANTS** and ● **SUXAMETHONIUM**
  - Parasympathomimetics: aminoglycosides antagonise effects of ● **NEOSTIGMINE** and ● **PYRIDOSTIGMINE**
  - Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with ● **TACROLIMUS**
  - ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNF C
  - ▶ Vitamins: neomycin possibly reduces absorption of **VITAMIN A**
- Aminophylline**
- ▶ Allopurinol: plasma concentration of aminophylline possibly increased by **ALLOPURINOL**
  - ▶ Anaesthetics, General: increased risk of convulsions when aminophylline given with **KETAMINE**
  - ▶ Anti-arrhythmics: aminophylline antagonises anti-arrhythmic effect of **ADENOSINE**—manufacturer of adenosine advises

**Aminophylline**

- Anti-arrhythmics (continued)
- avoid aminophylline for 24 hours before adenosine; plasma concentration of aminophylline increased by **PROPAFENONE**
- Antibacterials: plasma concentration of aminophylline possibly increased by **CLARITHROMYCIN** and **ISONIAZID**; plasma concentration of aminophylline increased by • **ERYTHROMYCIN** (also aminophylline may reduce absorption of *oral* erythromycin); plasma concentration of aminophylline increased by • **CIPROFLOXACIN** and • **NORFLOXACIN**; metabolism of aminophylline accelerated by **RIFAMPICIN** (reduced plasma concentration); possible increased risk of convulsions when aminophylline given with • **QUINOLONES**
- Antidepressants: plasma concentration of aminophylline increased by • **FLUVOXAMINE** (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma–aminophylline concentration); plasma concentration of aminophylline possibly reduced by **ST JOHN'S WORT**
- Antiepileptics: metabolism of aminophylline accelerated by **CARBAMAZEPINE**, • **PHENOBARBITAL** and • **PRIMIDONE** (reduced effect); plasma concentration of both drugs reduced when aminophylline given with • **FOSPHENYTOIN** and • **PHENYTOIN**
- Antifungals: plasma concentration of aminophylline possibly increased by • **FLUCONAZOLE** and • **KETOCONAZOLE**
- Antivirals: plasma concentration of aminophylline possibly increased by **ACICLOVIR** and **VALACICLOVIR**; metabolism of aminophylline accelerated by • **RITONAVIR** (reduced plasma concentration)
- Anxiolytics and Hypnotics: aminophylline possibly reduces effects of **BENZODIAZEPINES**
- Caffeine citrate: avoidance of aminophylline advised by manufacturer of **CAFFEINE CITRATE**
- Calcium-channel Blockers: plasma concentration of aminophylline possibly increased by • **CALCIUM-CHANNEL BLOCKERS** (enhanced effect); plasma concentration of aminophylline increased by **DILTIAZEM**; plasma concentration of aminophylline increased by • **VERAPAMIL** (enhanced effect)
- Corticosteroids: increased risk of hypokalaemia when aminophylline given with **CORTICOSTEROIDS**
- Cytotoxics: plasma concentration of aminophylline possibly increased by **METHOTREXATE**
- Deferasirox: plasma concentration of aminophylline increased by • **DEFERASIROX** (consider reducing dose of aminophylline)
- Disulfiram: metabolism of aminophylline inhibited by **DISULFIRAM** (increased risk of toxicity)
- Diuretics: increased risk of hypokalaemia when aminophylline given with **ACETAZOLAMIDE**, **LOOP DIURETICS** or **THIAZIDES AND RELATED DIURETICS**
- Doxapram: increased CNS stimulation when aminophylline given with **DOXAPRAM**
- Interferons: metabolism of aminophylline inhibited by • **INTERFERON ALFA** and • **PEGINTERFERON ALFA** (consider reducing dose of aminophylline)
- Leukotriene Receptor Antagonists: plasma concentration of aminophylline possibly increased by **ZAFIRLUKAST**, also plasma concentration of zafirlukast reduced
- Lithium: aminophylline increases excretion of **LITHIUM** (reduced plasma concentration)
- Oestrogens: plasma concentration of aminophylline increased by **OESTROGENS** (consider reducing dose of aminophylline)
- Pentoxifylline: plasma concentration of aminophylline increased by **PENTOXIFYLLINE**
- Roflumilast: avoidance of aminophylline advised by manufacturer of **ROFLUMILAST**
- Sulfipyrazone: plasma concentration of aminophylline reduced by **SULFINPYRAZONE**
- Sympathomimetics: manufacturer of aminophylline advises avoid concomitant use with **EPHEDRINE** in children
- Sympathomimetics, Beta<sub>2</sub>: increased risk of hypokalaemia when aminophylline given with high doses of **BETA<sub>2</sub> SYMPATHOMIMETICS**
- Ulcer-healing Drugs: metabolism of aminophylline inhibited by • **CIMETIDINE** (increased plasma concentration); absorption of aminophylline possibly reduced by **SUCRALFATE** (give at least 2 hours apart)

**Aminophylline** (continued)

- Vaccines: plasma concentration of aminophylline possibly increased by **INFLUENZA VACCINE**

**Aminosalicylates** see individual drugs**Amiodarone**

- NOTE** Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped
- Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of **AGALSIDASE ALFA AND BETA** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE**, **LEVOBUPIVACAINE**, **PRILCAINE** or **ROPIVACAINE**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other • **ANTI-ARRHYTHMICS**; increased risk of ventricular arrhythmias when amiodarone given with • **DISOPYRAMIDE** or • **DRONEDARONE**—avoid concomitant use; amiodarone increases plasma concentration of • **FLECAINIDE** (halve dose of flecainide)
- Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with *parenteral* • **ERYTHROMYCIN**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with • **LEVOFLOXACIN** or • **MOXIFLOXACIN**—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with **SULFAMETHOXAZOLE** and **TRIMETHOPRIM** (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; increased risk of ventricular arrhythmias when amiodarone given with • **DELAMANID**; avoidance of amiodarone advised by manufacturer of **FIDAXOMICIN**; possible increased risk of ventricular arrhythmias when amiodarone given with • **TELITROMYCIN**
- Anticoagulants: amiodarone inhibits metabolism of • **COUMARINS** and • **PHENINDIONE** (enhanced anticoagulant effect); amiodarone increases plasma concentration of • **DABIGATRAN** (see under Dabigatran Etxelilate, p. 128)
- Antidepressants: avoidance of amiodarone advised by manufacturer of • **CITALOPRAM**, • **ESCITALOPRAM** and • **VENLAFAXINE** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with • **TRICYCLICS**—avoid concomitant use
- Antiepileptics: amiodarone inhibits metabolism of • **FOSPHENYTOIN** and • **PHENYTOIN** (increased plasma concentration)
- Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with • **MIZOLASTINE**—avoid concomitant use
- Antimalarials: avoidance of amiodarone advised by manufacturer of • **ARTEMETER WITH LUMEFANTRINE** (risk of ventricular arrhythmias); avoidance of amiodarone advised by manufacturer of • **ARTEMIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with • **CHLOROQUINE**, • **HYDROXYCHLOROQUINE**, • **MEFLOQUINE** or • **QUININE**—avoid concomitant use
- Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with • **TOLTERODINE**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with • **ANTI-PSYCHOTICS** that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with • **BENPERIDOL**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with • **AMISULPRIDE**, • **DROPERIDOL**, • **HALOPERIDOL**, • **PHENOTHIAZINES**, • **PIMOZIDE** or • **ZUCLOPENTHIXOL**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with • **SULPIRIDE**
- Antivirals: plasma concentration of amiodarone possibly increased by • **ATAZANAVIR**; possible increased risk of bradycardia when amiodarone given with • **DACLATASVIR**, • **LEDIPASVIR** and • **SIMEPREVIR** (with sofosbuvir)—see under Amiodarone, p. 99; plasma concentration of amiodarone possibly increased by • **FOSAMPRENAVIR** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by

**Amiodarone**

- Antivirals (continued)
  - **INDINAVIR**—avoid concomitant use; plasma concentration of amiodarone increased by ● **RITONAVIR** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with ● **SAQUINAVIR**—avoid concomitant use; possible increased risk of bradycardia when amiodarone given with ● **SOFOSBUVIR**—see under Amiodarone, p. 99; avoidance of amiodarone advised by manufacturer of ● **TELAPREVIR** (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with ● **ATOMOXETINE**
- Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ● **BETA-BLOCKERS**; increased myocardial depression when anti-arrhythmics given with ● **BETA-BLOCKERS**; increased risk of ventricular arrhythmias when amiodarone given with ● **SOTALOL**—avoid concomitant use
- Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ● **DILTIAZEM** or ● **VERAPAMIL**
- Cardiac Glycosides: amiodarone increases plasma concentration of ● **DIGOXIN** (halve dose of digoxin)
  - ▶ Ciclosporin: amiodarone possibly increases plasma concentration of **CICLOSPORIN**
- Cobicistat: plasma concentration of amiodarone possibly increased by ● **COBICISTAT**—manufacturer of cobicistat advises avoid concomitant use
- Colchicine: amiodarone possibly increases risk of ● **COLCHICINE** toxicity
- Cytotoxics: amiodarone possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with ● **BOSUTINIB** and ● **CERTINIB**; amiodarone possibly increases the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); avoidance of amiodarone advised by manufacturer of **IDELALISIB**; possible increased risk of ventricular arrhythmias when amiodarone given with ● **VANDETANIB**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ● **ARSENIC TRIOXIDE**
- ▶ Diuretics: amiodarone increases plasma concentration of **EPLERENONE** (reduce dose of eplerenone); increased cardiac toxicity with amiodarone if hypokalaemia occurs with **ACETAZOLAMIDE**, **LOOP DIURETICS** or **THIAZIDES AND RELATED DIURETICS**
- Fingolimod: possible increased risk of bradycardia when amiodarone given with ● **FINGOLIMOD**
- ▶ Grapefruit Juice: plasma concentration of amiodarone increased by **GRAPEFRUIT JUICE**
- Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with ● **IVABRADINE**
- Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with ● **SIMVASTATIN** (see under Simvastatin, p. 194); separating administration from amiodarone by 12 hours advised by manufacturer of **LOMITAPIDE**
- Lithium: manufacturer of amiodarone advises avoid concomitant use with ● **LITHIUM** (risk of ventricular arrhythmias)
  - ▶ Orlistat: plasma concentration of amiodarone possibly reduced by **ORLISTAT**
- Panobinostat: possible increased risk of ventricular arrhythmias when amiodarone given with ● **PANOBINOSTAT**—avoid concomitant use
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with ● **PENTAMIDINE ISETIONATE**—avoid concomitant use
  - ▶ Tacrolimus: amiodarone possibly increases plasma concentration of **TACROLIMUS**
- ▶ Thyroid Hormones: amiodarone can affect serum concentrations of **THYROID HORMONES**—monitor thyroid function closely
- ▶ Ulcer-healing Drugs: plasma concentration of amiodarone increased by **CIMETIDINE**

**Amisulpride** see Antipsychotics

**Amitriptyline** see Antidepressants, Tricyclic

**Amoldipine** see Calcium-channel Blockers

**Amoxicillin** see Penicillins

**Amphotericin**

- NOTE** Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics
- ▶ Antibacterials: increased risk of nephrotoxicity when amphotericin given with **AMINOGLYCOSIDES** or **POLYMYXINS**; possible increased risk of nephrotoxicity when amphotericin given with **VANCOMYCIN**
  - ▶ Antifungals: amphotericin reduces renal excretion and increases cellular uptake of **FLUCYTOSINE** (toxicity possibly increased); effects of amphotericin possibly antagonised by **IMIDAZOLES** and **TRIAZOLES**; plasma concentration of amphotericin possibly increased by **MICAFUNGIN**
  - Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with ● **CARDIAC GLYCOSIDES**
  - Ciclosporin: increased risk of nephrotoxicity when amphotericin given with ● **CICLOSPORIN**
  - Corticosteroids: increased risk of hypokalaemia when amphotericin given with ● **CORTICOSTEROIDS**—avoid concomitant use unless corticosteroids needed to control reactions
  - Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with ● **ARSENIC TRIOXIDE**
  - ▶ Diuretics: increased risk of hypokalaemia when amphotericin given with **LOOP DIURETICS** or **THIAZIDES AND RELATED DIURETICS**
  - ▶ Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with **PENTAMIDINE ISETIONATE**
  - Sodium Stibogluconate: possible increased risk of arrhythmias when amphotericin given after ● **SODIUM STIBOGLUCONATE**—manufacturer of sodium stibogluconate advises giving 14 days apart
  - Tacrolimus: increased risk of nephrotoxicity when amphotericin given with ● **TACROLIMUS**

**Ampicillin** see Penicillins

**Anabolic Steroids**

- Anticoagulants: anabolic steroids enhance anticoagulant effect of ● **COUMARINS** and ● **PHENINDIONE**
- ▶ Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of **ANTI-DIABETICS**

**Anaesthetics, General**

**NOTE** See also Surgery and Long-term Medication, under General Anaesthesia in BNF

- ▶ ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with ● **ADRENERGIC NEURONE BLOCKERS**
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with ● **ALPHA-BLOCKERS**
- Aminophylline: increased risk of convulsions when ketamine given with **AMINOPHYLLINE**
- ▶ Analgesics: metabolism of etomidate inhibited by **FENTANYL** (consider reducing dose of etomidate); effects of thiopental possibly enhanced by **ASPIRIN**; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by **OPIOID ANALGESICS**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Antibacterials: increased risk of hepatotoxicity when isoflurane given with **ISONIAZID**; effects of thiopental enhanced by **SULFONAMIDES**; hypersensitivity-like reactions can occur when general anaesthetics given with **INTRAVENOUS VANCOMYCIN**
- ▶ Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with **TRICYCLICS**
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with ● **ANTIPSYCHOTICS**; effects of thiopental enhanced by **DROPERIDOL**
- ▶ Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with **ANXIOLYTICS AND HYPNOTICS**
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with **BETA-BLOCKERS**

**Anaesthetics, General** (continued)

- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with **CALCIUM-CHANNEL BLOCKERS**; general anaesthetics enhance hypotensive effect of **VERAPAMIL** (also AV delay)
- ▶ Clonidine: enhanced hypotensive effect when general anaesthetics given with **CLONIDINE**
- Cytotoxics: nitrous oxide increases antifolate effect of ● **METHOTREXATE**—avoid concomitant use
- ▶ Diazoxide: enhanced hypotensive effect when general anaesthetics given with **DIAZOXIDE**
- ▶ Diuretics: enhanced hypotensive effect when general anaesthetics given with **DIURETICS**
- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with ● **CO-BENELDOPA**, ● **CO-CARELDOPA** or ● **LEVODOPA**
- Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with ● **DOXAPRAM** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
- Memantine: increased risk of CNS toxicity when ketamine given with ● **MEMANTINE** (manufacturer of memantine advises avoid concomitant use)
- ▶ Methyldopa: enhanced hypotensive effect when general anaesthetics given with **METHYLDOPA**
- ▶ Metoclopramide: effects of thiopental enhanced by **METOCLOPRAMIDE**
- ▶ Moxonidine: enhanced hypotensive effect when general anaesthetics given with **MOXONIDINE**
- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with ● **SUXAMETHONIUM**; volatile liquid general anaesthetics enhance effects of **NON-DEPOLARISING MUSCLE RELAXANTS** and **SUXAMETHONIUM**; ketamine enhances effects of **ATRACURIUM**
- ▶ Nitrates: enhanced hypotensive effect when general anaesthetics given with **NITRATES**
- ▶ Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with **OXYTOCIN**
- Sympathomimetics: manufacturer of isoflurane advises avoid concomitant use with ● **SYMPATHOMIMETICS** (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with ● **ADRENALINE (EPINEPHRINE)** or ● **NORADRENALINE (NOREPINEPHRINE)**; increased risk of hypertension when volatile liquid general anaesthetics given with ● **METHYLPHENIDATE**
- ▶ Theophylline: increased risk of convulsions when ketamine given with **THEOPHYLLINE**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Anaesthetics, General (intravenous)** see Anaesthetics, General

**Anaesthetics, General (volatile liquids)** see Anaesthetics, General

**Anaesthetics, Local** see Bupivacaine, Chloroprocaine,

Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine

**Angrelide**

- Cilostazol: manufacturer of angrelide advises avoid concomitant use with ● **CILOSTAZOL**
- Phosphodiesterase Type-3 Inhibitors: manufacturer of angrelide advises avoid concomitant use with ● **ENOXIMONE** and ● **MILRINONE**

**Anakinra**

- Cytotoxics: avoid concomitant use of anakinra with ● **ADALIMUMAB**, ● **CERTOLIZUMAB PEGOL**, ● **GOLIMUMAB** or ● **INFLIXIMAB**
- Etanercept: avoid concomitant use of anakinra with ● **ETANERCEPT**
- Vaccines: risk of generalised infections when anakinra given with live ● **VACCINES**—avoid concomitant use

**Analgesics** see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

**Angiotensin-II Receptor Antagonists**

- ACE Inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor

**Angiotensin-II Receptor Antagonists**

- ACE Inhibitors (continued) antagonists given with ● **ACE INHIBITORS**—avoid concomitant use
- ▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ADRENERGIC NEURONE BLOCKERS**
- ▶ Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ALCOHOL**
- ▶ Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ALDESLEUKIN**
- Aliskiren: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor antagonists given with ● **ALISKIREN**—avoid concomitant use; irbesartan possibly reduces plasma concentration of **ALISKIREN**
- ▶ Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ALPHA-BLOCKERS**
- ▶ Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **GENERAL ANAESTHETICS**
- ▶ Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with **NSAIDS**, also hypotensive effect antagonised
- ▶ Antibacterials: plasma concentration of losartan and its active metabolite reduced by **RIFAMPICIN**; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **TRIMETHOPRIM**
- ▶ Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **HEPARIN**
- ▶ Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by **MAOIS**
- ▶ Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ANTIPSYCHOTICS**
- ▶ Antivirals: plasma concentration of candesartan, losartan and valsartan possibly increased by **PARITAPREVIR**—manufacturer of paritaprevir advises reduce dose of candesartan, losartan and valsartan
- ▶ Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ANXIOLYTICS AND HYPNOTICS**
- ▶ Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **BETA-BLOCKERS**
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **CALCIUM-CHANNEL BLOCKERS**
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ● **CICLOSPORIN**
- ▶ Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **CLONIDINE**
- ▶ Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by **CORTICOSTEROIDS**
- ▶ Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **DIAZOXIDE**
- Diuretics: increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with ● **EPLERENONE** and ● **SPIRONOLACTONE**—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with ● **AMILORIDE**, ● **POTASSIUM CANRENOATE** or ● **TRIAMTERENE**; enhanced hypotensive effect when angiotensin-II receptor antagonists given with ● **DIURETICS**; valsartan reduces plasma concentration of **FUROSEMIDE**
- ▶ Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**
- Lithium: angiotensin-II receptor antagonists reduce excretion of ● **LITHIUM** (increased plasma concentration)
- ▶ Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **METHYLDOPA**
- ▶ Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **MOXISYLYTE**
- ▶ Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **MOXONIDINE**

**Angiotensin-II Receptor Antagonists** (continued)

- ▶ Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **BACLOFEN** or **TIZANIDINE**
- ▶ Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **NITRATES**
- ▶ Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by **OESTROGENS**
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ● **POTASSIUM SALTS**
- ▶ Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **ALPROSTADIL**
- ▶ Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **TACROLIMUS**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Antacids**

**NOTE** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

- ▶ ACE Inhibitors: antacids possibly reduce absorption of **ACE INHIBITORS**; antacids reduce absorption of **CAPTOPRIL**, **ENALAPRIL** and **FOSINOPRIL**
- ▶ Analgesics: antacids possibly reduce absorption of **ACEMETACIN**; alkaline urine due to some antacids increases excretion of **ASPIRIN**
- ▶ Anthelmintics: sodium bicarbonate reduces excretion of **DIETHYLCARBAMAZINE**
- ▶ Antibacterials: antacids reduce absorption of **CEFAZOLIN**, **ISONIAZID**, **NORFLOXACIN** and **RIFAMPICIN**; antacids reduce absorption of **AZITHROMYCIN** (give at least 2 hours before or 1 hour after antacids); antacids reduce absorption of **CIPROFLOXACIN** and **LEVOFLOXACIN** (give at least 2 hours before or 4 hours after ciprofloxacin and levofloxacin); antacids reduce absorption of **MOXIFLOXACIN** (give at least 6 hours apart); antacids reduce absorption of **OFLOXACIN** (give at least 2 hours apart); avoid concomitant use of antacids with **METHENAMINE**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **NITROFURANTOIN**; antacids possibly reduce absorption of **TETRACYCLINES** (give at least 2 to 3 hours apart)
- ▶ Antiepileptics: antacids reduce absorption of **FOSPHENYTOIN**, **GABAPENTIN** and **PHENYTOIN**
- ▶ Antifungals: antacids reduce absorption of **ITRACONAZOLE** and **KETOCONAZOLE**
- ▶ Antihistamines: antacids reduce absorption of **FEXOFENADINE**
- ▶ Antimalarials: antacids reduce absorption of **CHLOROQUINE** and **HYDROXYCHLOROQUINE**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **PROGUANIL**
- ▶ Antipsychotics: antacids reduce absorption of **PHENOTHIAZINES** and **SULPIRID**
- ▶ Antivirals: antacids reduce absorption of **ATAZANAVIR** (give at least 2 hours before or 1 hour after antacids); oral magnesium salts reduce absorption of **DOLUTEGRAVIR**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral magnesium salts; aluminium hydroxide reduces absorption of **DOLUTEGRAVIR**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium salts reduce absorption of **ELVITEGRAVIR** (give at least 4 hours apart); aluminium hydroxide reduces absorption of **ELVITEGRAVIR** (give at least 4 hours apart); separating administration from antacids by 4 hours advised by manufacturer of **LEDIPASVIR**; aluminium hydroxide reduces plasma concentration of **RALTEGRAVIR**—manufacturer of raltegravir advises avoid concomitant use; oral magnesium salts reduce plasma concentration of **RALTEGRAVIR**—manufacturer of raltegravir advises avoid concomitant use; manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after **RILPIVIRINE**; antacids reduce absorption of **TIPRANAVIR** (give at least 2 hours apart)
- ▶ Bile Acids: antacids possibly reduce absorption of **BILE ACIDS**; aluminium hydroxide probably reduces effects of **CHOLIC ACID** (manufacturer of cholic acid advises give at least 5 hours apart)

**Antacids** (continued)

- ▶ Bisphosphonates: antacids reduce absorption of **BISPHOSPHONATES**
- ▶ Cardiac Glycosides: antacids possibly reduce absorption of **DIGOXIN**
- ▶ Corticosteroids: antacids reduce absorption of **DEFLAZACORT**
- Cytotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of **ESTRAMUSTINE**—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of **FOBUSUTINIB**; antacids possibly reduce absorption of ● **DASATINIB** (give at least 2 hours apart); antacids possibly reduce plasma concentration of ● **ERLOTINIB**—give antacids at least 4 hours before or 2 hours after erlotinib
- ▶ Deferasirox: antacids containing aluminium possibly reduce absorption of **DEFERASIROX** (manufacturer of deferasirox advises avoid concomitant use)
- ▶ Deferiprone: antacids containing aluminium possibly reduce absorption of **DEFERIPRONE** (manufacturer of deferiprone advises avoid concomitant use)
- ▶ Dipyrindamole: antacids possibly reduce absorption of **DIPYRIDAMOLE**
- ▶ Eltrombopag: antacids reduce absorption of **ELTROMBOPAG** (give at least 4 hours apart)
- ▶ Folates: antacids possibly reduce absorption of **FOLIC ACID** (manufacturer of folic acid advises give at least 2 hours apart)
- ▶ Iron Salts: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral **IRON SALTS**
- ▶ Lipid-regulating Drugs: antacids reduce absorption of **ROSUVASTATIN**
- ▶ Lithium: sodium bicarbonate increases excretion of **LITHIUM** (reduced plasma concentration)
- ▶ Misoprostol: antacids possibly reduce absorption of **MISOPROSTOL**
- ▶ Mycophenolate: antacids reduce absorption of **MYCOPHENOLATE**
- ▶ Penicillamine: antacids reduce absorption of **PENICILLAMINE**
- ▶ Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with **POLYSTYRENE SULFONATE RESINS**; risk of metabolic alkalosis when oral magnesium salts given with **POLYSTYRENE SULFONATE RESINS**
- ▶ Riociguat: antacids reduce absorption of **RIOCIGUAT** (give at least 2 hours before or 1 hour after riociguat)
- ▶ Sympathomimetics: aluminium hydroxide possibly increases absorption of **PSEUDOEPHEDRINE**
- ▶ Thyroid Hormones: antacids possibly reduce absorption of **LEVOTHYROXINE**
- ▶ Ulcer-healing Drugs: antacids possibly reduce absorption of **LANSOPRAZOLE**
- Antazoline** see Antihistamines
- Anthelmintics** see individual drugs
- Anthrax Vaccine** see Vaccines
- Anti-D Immunoglobulins** see Immunoglobulins
- Anti-arrhythmics** see Adenosine, Amiodarone, Disopyramide, Dronedarone, Flecainide, Lidocaine, and Propafenone
- Antibacterials** see individual drugs
- Antibiotics (cytotoxic)** see Bleomycin, Daunorubicin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, Mitoxantrone, and Pixantrone
- Anticoagulants** see Apixaban, Argatroban, Bivalirudin, Coumarins, Dabigatran, Danaparoid, Edoxaban, Fondaparinux, Heparins, Phenindione, and Rivaroxaban
- Antidepressants** see Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Venlafaxine; Vortioxetine
- Antidepressants, Noradrenaline Re-uptake Inhibitors** see Reboxetine
- Antidepressants, SSRI**
- NOTE** see also Dapoxetine
- ▶ Alcohol: sedative effects possibly increased when SSRIs given with **ALCOHOL**
- Aminophylline: fluvoxamine increases plasma concentration of ● **AMINOPHYLLINE** (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma-aminophylline concentration)

**Antidepressants, SSRI** (continued)

- ▶ Anaesthetics, Local: fluvoxamine inhibits metabolism of **ROPIVACAINE**—avoid prolonged administration of ropivacaine
- Analgesics: increased risk of bleeding when SSRIs given with
  - **NSAIDS** or ● **ASPIRIN**; possible increased serotonergic effects when SSRIs given with **FENTANYL**; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of **METHADONE**; increased risk of CNS toxicity when SSRIs given with ● **TRAMADOL**
- Anti-arrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **AMIODARONE** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **DISOPYRAMIDE** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **DRONEDARONE** (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of **FLECAINIDE**; fluoxetine and paroxetine possibly inhibit metabolism of **PROPAFENONE**
- Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with *intravenous*
  - **ERYTHROMYCIN** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **MOXIFLOXACIN** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with ● **TELITHROMYCIN**
- Anticoagulants: SSRIs possibly enhance anticoagulant effect of
  - **COUMARINS**; possible increased risk of bleeding when SSRIs given with ● **DABIGATRAN**
- Antidepressants: avoidance of fluvoxamine advised by manufacturer of ● **REBOXETINE**; possible increased serotonergic effects when SSRIs given with **DULOXETINE**; fluvoxamine inhibits metabolism of ● **DULOXETINE**—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping ● **MAOIS**, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping ● **MAOIS**, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by ● **MAOIS** (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with ● **MOCLOBEMIDE**, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start ● **MOCLOBEMIDE** for at least 1 week; after stopping fluoxetine do not start ● **MOCLOBEMIDE** for 5 weeks; increased serotonergic effects when SSRIs given with ● **ST JOHN'S WORT**—avoid concomitant use; fluvoxamine inhibits metabolism of ● **AGOMELATINE** (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with **MIRTAZAPINE**; SSRIs increase plasma concentration of some ● **TRICYCLICS**; manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **TRICYCLICS** (risk of ventricular arrhythmias); possible increased risk of convulsions when SSRIs given with ● **VORTIOXETINE**; fluoxetine and paroxetine possibly increase plasma concentration of **VORTIOXETINE** (consider reducing dose of vortioxetine)
- Antiepileptics: SSRIs antagonise anticonvulsant effect of
  - **ANTIPILEPTICS** (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of ● **CARBAMAZEPINE**; fluoxetine and fluvoxamine increase plasma concentration of ● **FOSPHENYTOIN**; plasma concentration of sertraline possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of paroxetine reduced by **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**; fluoxetine and fluvoxamine increase plasma concentration of ● **PHENYTOIN**
- ▶ Antifungals: plasma concentration of paroxetine possibly increased by **TERBINAFINE**
- Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **MIZOLASTINE** (risk of ventricular arrhythmias); antidepressant effect of SSRIs possibly antagonised by **CYPROHEPTADINE**

**Antidepressants, SSRI** (continued)

- Antimalarials: avoidance of antidepressants advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** and ● **ARTENIMOL WITH PIPERAQUINE**; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ● **ARTEMETHER WITH LUMEFANTRINE**—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ● **ARTENIMOL WITH PIPERAQUINE**—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram and escitalopram given with ● **CHLOROQUINE**; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ● **QUININE**—avoid concomitant use
- ▶ Antimuscarinics: paroxetine increases plasma concentration of **DARIFENACIN** and **PROCYCLIDINE**
- Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of ● **DROPERIDOL** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **HALOPERIDOL** (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of ● **CLOZAPINE**, ● **HALOPERIDOL** and **RISPERIDONE**; fluvoxamine possibly increases plasma concentration of **ASENAPINE** and **HALOPERIDOL**; paroxetine inhibits metabolism of **PERPHENAZINE** (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of ● **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by **ASENAPINE**; fluvoxamine, paroxetine and sertraline increase plasma concentration of ● **CLOZAPINE**; citalopram possibly increases plasma concentration of **CLOZAPINE** (increased risk of toxicity); fluvoxamine increases plasma concentration of **OLANZAPINE**; manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **PHENOTHIAZINES** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **PIMOZIDE** (risk of ventricular arrhythmias); SSRIs possibly increase plasma concentration of ● **PIMOZIDE** (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of **RISPERIDONE** (increased risk of toxicity)
- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by **DARUNAVIR**; plasma concentration of SSRIs possibly increased by ● **RITONAVIR**; plasma concentration of paroxetine possibly reduced by **RITONAVIR**
- Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of **ALPRAZOLAM**; fluvoxamine increases plasma concentration of some **BENZODIAZEPINES**; fluvoxamine increases plasma concentration of ● **MELATONIN**—avoid concomitant use; sedative effects possibly increased when sertraline given with **ZOLPIDEM**
- ▶ Atomoxetine: possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**; fluoxetine and paroxetine possibly inhibit metabolism of **ATOMOXETINE**
- Beta-blockers: citalopram and escitalopram increase plasma concentration of **METOPROLOL**; paroxetine possibly increases the plasma concentration of ● **METOPROLOL**—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of **PROPRANOLOL**; increased risk of ventricular arrhythmias when citalopram given with ● **SOTALOL**—avoid concomitant use; manufacturer of escitalopram advises avoid concomitant use with ● **SOTALOL** (risk of ventricular arrhythmias)
- ▶ Bupropion: plasma concentration of citalopram possibly increased by **BUPROPION**
- ▶ Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of **NIFEDIPINE** (increased plasma concentration)
- Clodigrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of ● **CLOPIDOGREL**
- Dapoxetine: possible increased risk of serotonergic effects when SSRIs given with ● **DAPOXETINE** (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)

## Antidepressants, SSRI (continued)

- Dopaminergics: increased risk of CNS toxicity when SSRIs given with ● **RASAGILINE**; fluvoxamine should not be started until 2 weeks after stopping ● **RASAGILINE**; fluoxetine should not be started until 2 weeks after stopping ● **RASAGILINE**, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; avoidance of citalopram and escitalopram advised by manufacturer of ● **SELEGILINE**; increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with ● **SELEGILINE** (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when paroxetine given with ● **SELEGILINE** (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with ● **SELEGILINE** (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline)
- ▶ Grapefruit Juice: plasma concentration of sertraline possibly increased by ● **GRAPEFRUIT JUICE**
- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of ● **TAMOXIFEN** to active metabolite (avoid concomitant use)
- 5HT<sub>2</sub>-receptor Agonists: increased risk of CNS toxicity when citalopram given with ● **5HT<sub>2</sub> AGONISTS** (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of ● **FROVATRIPATAN**; possible increased serotonergic effects when SSRIs given with ● **NARATRIPTAN**; CNS toxicity reported when sertraline given with ● **SUMATRIPTAN**; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with ● **SUMATRIPTAN**; fluvoxamine possibly inhibits metabolism of ● **ZOLMITRIPTAN** (reduce dose of zolmitriptan)
- ▶ 5HT<sub>2</sub>-receptor Antagonists: possible increased serotonergic effects when SSRIs given with ● **5HT<sub>2</sub> ANTAGONISTS**
- ▶ Lipid-regulating Drugs: separating administration from fluoxetine and fluvoxamine by 12 hours advised by manufacturer of ● **LOMITAPIDE**
- Lithium: Increased risk of CNS effects when SSRIs given with ● **LITHIUM** (lithium toxicity reported)
- Methylthionium: risk of CNS toxicity when SSRIs given with ● **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
- ▶ Metoclopramide: CNS toxicity reported when SSRIs given with ● **METOCLOPRAMIDE**
- Muscle Relaxants: fluvoxamine increases plasma concentration of ● **TIZANIDINE** (increased risk of toxicity)—avoid concomitant use
- ▶ Parasympathomimetics: paroxetine increases plasma concentration of ● **GALANTAMINE**
- Pentamine Isetionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with ● **PENTAMINE ISETIONATE** (risk of ventricular arrhythmias)
- Pirfenidone: fluvoxamine increases plasma concentration of ● **PIRFENIDONE**—manufacturer of pirfenidone advises avoid concomitant use
- Pomalidomide: fluvoxamine increases plasma concentration of ● **POMALIDOMIDE**
- ▶ Ranolazine: paroxetine increases plasma concentration of ● **RANOLAZINE**
- ▶ Roflumilast: fluvoxamine inhibits the metabolism of ● **ROFLUMILAST**
- ▶ Sympathomimetics: metabolism of SSRIs possibly inhibited by ● **METHYLPHENIDATE**
- Theophylline: fluvoxamine increases plasma concentration of ● **THEOPHYLLINE** (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)
- ▶ Ticagrelor: possible increased risk of bleeding when citalopram, paroxetine or sertraline given with ● **TICAGRELOR**
- ▶ Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by ● **CIMETIDINE**; fluvoxamine possibly increases plasma concentration of

## Antidepressants, SSRI

## Ulcer-healing Drugs (continued)

- **LANSOPRAZOLE**; plasma concentration of escitalopram increased by ● **OMEPRAZOLE**

## Antidepressants, SSRI (related) see Duloxetine and Venlafaxine Antidepressants, Tricyclic

▶ Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of ● **ADRENERGIC NEURONE BLOCKERS**

- Alcohol: increased sedative effect when tricyclics given with ● **ALCOHOL**
- ▶ Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of ● **APRACLONIDINE** and ● **BRIMONIDINE**
- ▶ Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with ● **GENERAL ANAESTHETICS**
- Analgesics: increased risk of CNS toxicity when tricyclics given with ● **TRAMADOL**; side-effects possibly increased when tricyclics given with ● **NEFOPAM**; sedative effects possibly increased when tricyclics given with ● **OPIOID ANALGESICS**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with ● **AMIODARONE**—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with ● **DISOPYRAMIDE** or ● **FLECAINIDE**; avoidance of tricyclics advised by manufacturer of ● **DRONEDARONE** (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with ● **PROPAFENONE**
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with ● **MOXIFLOXACIN**—avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics that prolong the QT interval given with ● **DELANIDAN**; possible increased risk of ventricular arrhythmias when tricyclics given with ● **TELITHROMYCIN**
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of ● **COUMARINS**
- Antidepressants: avoidance of tricyclics advised by manufacturer of ● **CITALOPRAM** and ● **ESCITALOPRAM** (risk of ventricular arrhythmias); possible increased serotonergic effects when amitriptyline or clomipramine given with ● **DULOXETINE**; increased risk of hypertension and CNS excitation when tricyclics given with ● **MAOIS**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start ● **MOCLOBEMIDE** for at least 1 week; plasma concentration of some tricyclics increased by ● **SSRIS**; plasma concentration of amitriptyline reduced by ● **ST JOHN'S WORT**; possible increased risk of convulsions when tricyclics given with ● **VORTIOXETINE**
- Antiepileptics: tricyclics antagonise anticonvulsant effect of ● **ANTIEPILEPTICS** (convulsive threshold lowered); metabolism of tricyclics accelerated by ● **CARBAMAZEPINE** (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by ● **FOSPHENYTOIN** and ● **PHENYTOIN**; metabolism of tricyclics possibly accelerated by ● **PHENOBARBITAL** and ● **PRIMIDONE** (reduced plasma concentration)
- ▶ Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by ● **FLUCONAZOLE**; plasma concentration of tricyclics possibly increased by ● **TERBINAFINE**
- ▶ Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with ● **ANTIHISTAMINES**
- Antimalarials: avoidance of antidepressants advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** and ● **ARTENIMOL WITH PIPERAQUINE**
- ▶ Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with ● **ANTIMUSCARINICS**
- Antipsychotics: avoidance of tricyclics advised by manufacturer of ● **DROPERIDOL**, ● **FLUPHENAZINE**, ● **HALOPERIDOL**, ● **SULPIRIDE** and ● **ZUCLOPENTHIXOL** (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with ● **CLOZAPINE**; increased risk of antimuscarinic side-effects when tricyclics given with ● **PHENOTHIAZINES**; possible increased risk of ventricular arrhythmias when tricyclics given with ● **RISPERIDONE**
- Antivirals: plasma concentration of tricyclics possibly increased by ● **RITONAVIR**; increased risk of ventricular

**Antidepressants, Tricyclic**

- Antivirals (continued)
  - arrhythmias when tricyclics given with ● **SAQUINAVIR**—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with **ANXIOLYTICS AND HYPNOTICS**
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with ● **ATOMOXETINE**; possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**
- Beta-blockers: plasma concentration of imipramine increased by **LABETALOL** and **PROPRANOLOL**; increased risk of ventricular arrhythmias when tricyclics given with ● **SOTALOL**
- Bupropion: plasma concentration of tricyclics possibly increased by **BUPROPION** (possible increased risk of convulsions)
- Calcium-channel Blockers: plasma concentration of imipramine increased by **DILTIAZEM** and **VERAPAMIL**; plasma concentration of tricyclics possibly increased by **DILTIAZEM** and **VERAPAMIL**
- Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with **CANNABIS EXTRACT**
- Clonidine: tricyclics antagonise hypotensive effect of ● **CLONIDINE**, also increased risk of hypertension on clonidine withdrawal
- Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with ● **ARSENIC TRIOXIDE**
- Dapoxetine: possible increased risk of serotonergic effects when tricyclics given with ● **DAPOXETINE** (manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
- Disulfiram: metabolism of tricyclics inhibited by **DISULFIRAM** (increased plasma concentration); concomitant amitriptyline reported to increase **DISULFIRAM** reaction with alcohol
- Diuretics: increased risk of postural hypotension when tricyclics given with **DIURETICS**
- Dopaminergics: caution with tricyclics advised by manufacturer of **ENTACAPONE**; increased risk of CNS toxicity when tricyclics given with ● **RASAGILINE**; CNS toxicity reported when tricyclics given with ● **SELEGILINE**
- Histamine: tricyclics theoretically antagonise effects of **HISTAMINE**—manufacturer of histamine advises avoid concomitant use
- Lithium: risk of toxicity when tricyclics given with **LITHIUM**
- Methylthionium: risk of CNS toxicity when clomipramine given with ● **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
- Moxonidine: tricyclics possibly antagonise hypotensive effect of **MOXONIDINE** (manufacturer of moxonidine advises avoid concomitant use)
- Muscle Relaxants: tricyclics enhance muscle relaxant effect of **BACLOFEN**
- Nicorandil: tricyclics possibly enhance hypotensive effect of **NICORANDIL**
- Nitrates: tricyclics reduce effects of sublingual tablets of **NITRATES** (failure to dissolve under tongue owing to dry mouth)
- Oestrogens: antidepressant effect of tricyclics antagonised by **OESTROGENS** (but side-effects of tricyclics possibly increased due to increased plasma concentration)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with ● **PENTAMIDINE ISETIONATE**
- Sodium Oxybate: increased risk of side-effects when tricyclics given with **SODIUM OXYBATE**
- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with ● **ADRENALINE (EPINEPHRINE)** (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by **METHYLPHENIDATE**; avoidance of tricyclics advised by manufacturer of **MIDODRINE**; increased risk of hypertension and arrhythmias when tricyclics given with ● **NORADRENALINE (NOREPINEPHRINE)** or **PHENYLEPHRINE**

**Antidepressants, Tricyclic (continued)**

- Thyroid Hormones: effects of tricyclics possibly enhanced by **THYROID HORMONES**; effects of amitriptyline and imipramine enhanced by **THYROID HORMONES**
- Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by **CIMETIDINE**; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by **CIMETIDINE** (increased plasma concentration)

**Antidepressants, Tricyclic (related)**

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with ● **ALCOHOL**
  - Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of **APRACLONIDINE** and **BRIMONIDINE**
  - Antibacterials: plasma concentration of trazodone possibly increased by **CLARITHROMYCIN**
  - Anticoagulants: trazodone may enhance or reduce anticoagulant effect of **WARFARIN**
  - Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping ● **MAOIS**, also MAOIS should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start ● **MOCLOBEMIDE** for at least 1 week
  - Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of ● **ANTIEPILEPTICS** (convulsive threshold lowered); plasma concentration of mianserin and trazodone reduced by ● **CARBAMAZEPINE**; plasma concentration of mianserin reduced by ● **FOSPHENYTOIN** and ● **PHENYTOIN**; metabolism of mianserin accelerated by ● **PHENOBARBITAL** and ● **PRIMIDONE** (reduced plasma concentration)
  - Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with **ANTIHISTAMINES**
  - Antimalarials: avoidance of antidepressants advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** and ● **ARTENIMOL WITH PIPERAQUINE**
  - Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with **ANTIMUSCARINICS**
  - Antivirals: plasma concentration of trazodone increased by ● **RITONAVIR** (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with ● **SAQUINAVIR**—avoid concomitant use; plasma concentration of trazodone possibly increased by **TELAPREVIR**
  - Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with **ANXIOLYTICS AND HYPNOTICS**
  - Atomoxetine: possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**
  - Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with **DIAZOXIDE**
  - Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of **NITRATES** (failure to dissolve under tongue owing to dry mouth)
  - Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with **HYDRALAZINE** or **SODIUM NITROPRUSSIDE**
- Antidiabetics**
- NOTE** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption
- NOTE** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption
- ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by **ACE INHIBITORS**
  - Alcohol: hypoglycaemic effect of antidiabetics enhanced by **ALCOHOL**; increased risk of lactic acidosis when metformin given with **ALCOHOL**
  - Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by **ANABOLIC STEROIDS**

**Antidiabetics** (continued)

- Analgesics: effects of sulfonylureas possibly enhanced by
  - **NSAIDS**; lixisenatide possibly reduces the absorption of **PARACETAMOL** when given 1 to 4 hours before paracetamol
- ▷ Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by **DISOPYRAMIDE**
- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by **NEOMYCIN**, also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by **CLARITHROMYCIN**; effects of glibenclamide possibly enhanced by **NORFLOXACIN**; plasma concentration of canagliflozin and nateglinide reduced by • **RIFAMPICIN**; effects of linagliptin possibly reduced by **RIFAMPICIN**; hypoglycaemic effect of repaglinide possibly antagonised by **RIFAMPICIN**; effects of sulfonylureas enhanced by • **CHLORAMPHENICOL**; metabolism of tolbutamide accelerated by • **RIFAMYCINS** (reduced effect); metabolism of sulfonylureas possibly accelerated by
  - **RIFAMYCINS** (reduced effect); effects of sulfonylureas rarely enhanced by **SULFONAMIDES** and **TRIMETHOPRIM**;
 hypoglycaemic effect of sulfonylureas possibly enhanced by **TETRACYCLINES**; hypoglycaemic effect of repaglinide possibly enhanced by **TRIMETHOPRIM**—manufacturer advises avoid concomitant use
- Anticoagulants: exenatide possibly enhances anticoagulant effect of **WARFARIN**; hypoglycaemic effect of sulfonylureas possibly enhanced by • **COUMARINS**, also possible changes to anticoagulant effect
  - ▷ Antidepressants: hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by **MAOIS**; hypoglycaemic effect of antidiabetics possibly enhanced by **MAOIS**
  - ▷ Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with **PIOGLITAZONE**; plasma concentration of dulaglutide increased by **SITAGLIPTIN**
  - ▷ Anti-epileptics: tolbutamide transiently increases plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN** (possibility of toxicity); plasma concentration of metformin possibly increased by **TOPIRAMATE**; plasma concentration of glibenclamide possibly reduced by **TOPIRAMATE**
- Antifungals: plasma concentration of pioglitazone, saxagliptin and tolbutamide increased by **KETOCONAZOLE**; plasma concentration of sulfonylureas increased by • **FLUCONAZOLE** and • **MICONAZOLE**; hypoglycaemic effect of gliclazide and glipizide enhanced by • **MICONAZOLE**—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by **FLUCONAZOLE**; plasma concentration of metformin increased by **ISAVUCONAZOLE**; hypoglycaemic effect of repaglinide possibly enhanced by **ITRACONAZOLE**; hypoglycaemic effect of glipizide possibly enhanced by **POSACONAZOLE**; plasma concentration of sulfonylureas possibly increased by **VORICONAZOLE**
- ▷ Antihistamines: thrombocyte count depressed when metformin given with **KETOTIFEN** (manufacturer of ketotifen advises avoid concomitant use)
- ▷ Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by **PHENOTHIAZINES**
- ▷ Antivirals: plasma concentration of metformin increased by **DOLUTEGRAVIR**—consider reducing dose of metformin; plasma concentration of tolbutamide possibly increased by **RITONAVIR**; plasma concentration of metformin increased by **TELAPREVIR** (consider reducing dose of metformin)
- ▷ Aprepitant: plasma concentration of tolbutamide reduced by **APREPITANT**
- ▷ Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with **BETA-BLOCKERS**; hypoglycaemic effect of insulin enhanced by **BETA-BLOCKERS**
- Bosentan: increased risk of hepatotoxicity when glibenclamide given with • **BOSENTAN**—avoid concomitant use
- ▷ Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with **NIFEDIPINE**
- ▷ Cardiac glycosides: acarbose possibly reduces plasma concentration of **DIGOXIN**; canagliflozin and sitagliptin increase plasma concentration of **DIGOXIN**
- ▷ Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by **CICLOSPORIN**

**Antidiabetics** (continued)

- ▷ Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by **CORTICOSTEROIDS**
  - Cytotoxics: avoidance of repaglinide advised by manufacturer of • **LAPATINIB**; plasma concentration of metformin possibly increased by **VANDETANIB** (consider reducing dose of metformin)
  - ▷ Deferasirox: plasma concentration of repaglinide increased by **DEFERASIROX**
  - ▷ Diazoxide: hypoglycaemic effect of antidiabetics antagonised by **DIAZOXIDE**
  - ▷ Diuretics: canagliflozin possibly enhances diuretic effect of **DIURETICS**; dapagliflozin possibly enhances diuretic effect of **LOOP DIURETICS** and **THIAZIDES AND RELATED DIURETICS**; manufacturer of canagliflozin advises avoid concomitant use with **LOOP DIURETICS**; hypoglycaemic effect of antidiabetics antagonised by **LOOP DIURETICS** and **THIAZIDES AND RELATED DIURETICS**
  - ▷ Fosaprepitant: plasma concentration of tolbutamide reduced by **FOSAPREPITANT**
  - ▷ Hormone Antagonists: requirements for antidiabetics possibly reduced by **LANREOTIDE**, **OCTREOTIDE** and **PASIREOTIDE**
  - ▷ Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by **LEFLUNOMIDE**
  - Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by **COLESEVELAM**; absorption of glimepiride reduced by **COLESEVELAM**—manufacturer of glimepiride advises give at least 4 hours before colesevelam; hypoglycaemic effect of acarbose possibly enhanced by **COLESTYRAMINE**; hypoglycaemic effect of nateglinide possibly enhanced by **GEMFIBROZIL**; increased risk of severe hypoglycaemia when repaglinide given with • **GEMFIBROZIL**—avoid concomitant use; plasma concentration of glibenclamide possibly increased by **FLUVASTATIN**; manufacturer of canagliflozin advises give at least 1 hour before or 4–6 hours after **BILE ACID SEQUESTRANTS**; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with **FIBRATES**; separating administration from linagliptin by 12 hours advised by manufacturer of **LOMITAPIDE**
  - ▷ Oestrogens: hypoglycaemic effect of antidiabetics antagonised by **OESTROGENS**
  - ▷ Orlistat: avoidance of acarbose advised by manufacturer of **ORLISTAT**
  - ▷ Pancreatin: hypoglycaemic effect of acarbose antagonised by **PANCREATIN**
  - ▷ Progestogens: hypoglycaemic effect of antidiabetics antagonised by **PROGESTOGENS**
  - Sulfinpyrazone: effects of sulfonylureas enhanced by
    - **SULFINPYRAZONE**
  - ▷ Teriflunomide: plasma concentration of repaglinide increased by **TERIFLUNOMIDE**
  - ▷ Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by **TESTOSTERONE**
  - ▷ Ulcer-healing Drugs: excretion of metformin reduced by **CIMETIDINE** (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by **CIMETIDINE**
- Anti-epileptics** see Carbamazepine, Eslicarbazepine, Ethosuximide, Fosphenytoin, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenobarbital, Phenytoin, Pregabalin, Primidone, Retigabine, Rufinamide, Sodium valproate, Stiripentol, Tiagabine, Topiramate, Valproic acid, Vigabatrin, and Zonisamide
- Antifungals** see Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Fluocytosine; Griseofulvin; Micafungin; Terbinafine
- Antifungals, imidazole**
- ▷ Alcohol: possibility of disulfiram-like reaction when ketoconazole given with **ALCOHOL**
  - ▷ Aliskiren: ketoconazole increases plasma concentration of **ALISKIREN**
  - Alpha-blockers: ketoconazole possibly increases plasma concentration of **ALFUZOSIN**; ketoconazole increases plasma concentration of • **TAMSULOSIN**
  - Aminophylline: ketoconazole possibly increases plasma concentration of • **AMINOPHYLLINE**

**Antifungals, Imidazole** (continued)

- Analgesics: ketoconazole inhibits metabolism of
  - **BUPRENORPHINE** (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when ketoconazole given with ● **METHADONE**—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of ● **OXYCODONE**; manufacturer of ketoconazole advises avoid concomitant use with ● **PARACETAMOL**
- ▶ Antacids: absorption of ketoconazole reduced by ● **ANTACIDS**
- ▶ Anthelmintics: ketoconazole increases plasma concentration of ● **PRAZIQUANTEL**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with ● **DISOPYRAMIDE**—avoid concomitant use; ketoconazole increases plasma concentration of ● **DRONEDARONE**—avoid concomitant use
- Antibacterials: manufacturer of ketoconazole advises avoid concomitant ● **CLARITHROMYCIN** in severe renal impairment; metabolism of ketoconazole accelerated by ● **RIFAMPICIN** (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; ketoconazole increases plasma concentration of ● **BEDAQUILINE**—avoid concomitant use if ketoconazole given for more than 14 days; avoidance of ketoconazole advised by manufacturer of ● **FIDAXOMICIN**; plasma concentration of ketoconazole possibly reduced by ● **ISONIAZID**; ketoconazole increases the plasma concentration of ● **TELITHROMYCIN**—avoid in severe renal and hepatic impairment
- Anticoagulants: ketoconazole increases plasma concentration of ● **APIXABAN**—manufacturer of apixaban advises avoid concomitant use; ketoconazole enhances anticoagulant effect of ● **COUMARINS**; miconazole (including oral gel and possibly vaginal and topical formulations) greatly enhances the anticoagulant effect of ● **COUMARINS**—avoid concomitant use if possible; ketoconazole increases plasma concentration of ● **DABIGATRAN** and ● **RIVAROXABAN**—avoid concomitant use; ketoconazole increases plasma concentration of ● **EDOXABAN** (reduce dose of edoxaban—see under Edoxaban, p. 118)
- Antidepressants: avoidance of imidazoles advised by manufacturer of ● **REBOXETINE**; ketoconazole increases plasma concentration of ● **MIRTAZAPINE**
- Antidiabetics: miconazole enhances hypoglycaemic effect of ● **GLICLAZIDE** and ● **GLIPIZIDE**—avoid concomitant use; ketoconazole increases plasma concentration of ● **PIOGLITAZONE**, ● **SAXAGLIPTIN** and ● **TOLBUTAMIDE**; miconazole increases plasma concentration of ● **SULFONYLUREAS**
- Antiepileptics: plasma concentration of ketoconazole possibly reduced by ● **CARBAMAZEPINE**, also plasma concentration of carbamazepine possibly increased; miconazole possibly increases plasma concentration of ● **CARBAMAZEPINE**; miconazole enhances anticonvulsant effect of ● **FOSPHENYTOIN** and ● **PHENYTOIN** (plasma concentration of fosphenytoin and phenytoin increased); plasma concentration of ketoconazole reduced by ● **FOSPHENYTOIN** and ● **PHENYTOIN**; ketoconazole increases plasma concentration of ● **PERAMPANEL**
- Antifungals: imidazoles possibly antagonise effects of ● **AMPHOTERICIN**; ketoconazole increases plasma concentration of ● **ISAVUCONAZOLE**—avoid concomitant use
- Antihistamines: imidazoles possibly inhibit metabolism of ● **MIZOLASTINE** (avoid concomitant use)
- Antimalarials: avoidance of imidazoles advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; avoidance of imidazoles advised by manufacturer of ● **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias); ketoconazole increases plasma concentration of ● **MEFLOQUINE**
- Antimuscarinics: absorption of ketoconazole reduced by ● **ANTIMUSCARINICS**; ketoconazole increases plasma concentration of ● **DARIFENACIN**—avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketoconazole given with ● **FESOTERODINE**—consult fesoterodine product literature; ketoconazole increases plasma concentration of ● **OXYBUTYNYN**; ketoconazole increases plasma concentration of ● **SOLIFENACIN**—see under Solifenacin, p. 713; avoidance of ketoconazole advised by manufacturer of ● **TOLTERODINE**

**Antifungals, Imidazole** (continued)

- Antipsychotics: ketoconazole inhibits metabolism of
  - **ARIPIPRAZOLE** (reduce dose of aripiprazole); ketoconazole increases plasma concentration of ● **LURASIDONE**—avoid concomitant use; increased risk of ventricular arrhythmias when imidazoles given with ● **PIMOZIDE**—avoid concomitant use; imidazoles possibly increase plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: ketoconazole increases plasma concentration of ● **BOCEPREVIR**; ketoconazole increases the plasma concentration of ● **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); plasma concentration of both drugs increased when ketoconazole given with ● **DARUNAVIR**; plasma concentration of both drugs increased when ketoconazole given with ● **DASABUVIR** and ● **PARITAPREVIR**—avoid concomitant use; plasma concentration of ketoconazole reduced by ● **EFAVIREN**; plasma concentration of ketoconazole increased by ● **FOSAMPRENAVIR** (also plasma concentration of fosamprenavir possibly increased); ketoconazole increases plasma concentration of ● **INDINAVIR** and ● **MARAVIROC** (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by ● **NEVIRAPINE**—avoid concomitant use; avoidance of ketoconazole advised by manufacturer of ● **OMBITASVIR** and ● **SIMEPREVIR**; plasma concentration of ketoconazole increased by ● **RITONAVIR** (reduce dose of ketoconazole); ketoconazole increases plasma concentration of ● **SAQUINAVIR**—manufacturer of ketoconazole advises avoid concomitant use; imidazoles possibly increase plasma concentration of ● **SAQUINAVIR**; plasma concentration of both drugs possibly increased when ketoconazole given with ● **TELAPREVIR** (increased risk of ventricular arrhythmias)—reduce dose of ketoconazole
- Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of ● **ALPRAZOLAM**—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of ● **MIDAZOLAM** (risk of prolonged sedation—avoid concomitant use of oral midazolam); ketoconazole increases plasma concentration of ● **ZOLPIDEM**
- ▶ Aprepitant: ketoconazole increases plasma concentration of ● **APREPITANT**
- Avafil: ketoconazole increases plasma concentration of ● **AVANAFIL**—avoid concomitant use
- ▶ Beta-blockers: ketoconazole possibly increases plasma concentration of ● **NADOLOL**
- ▶ Bosentan: ketoconazole increases plasma concentration of ● **BOSENTAN**
- Calcium-channel Blockers: ketoconazole inhibits metabolism of ● **FELODIPINE** (increased plasma concentration)—manufacturer of ketoconazole advises avoid concomitant use; avoidance of ketoconazole advised by manufacturer of ● **LERCANIDIPINE**; ketoconazole possibly inhibits metabolism of ● **DIHYDROPYRIDINES** (increased plasma concentration)
- ▶ Cannabis Extract: ketoconazole increases plasma concentration of ● **CANNABIS EXTRACT**
- Cyclosporin: ketoconazole inhibits metabolism of ● **CYCLOSPORIN** (increased plasma concentration); miconazole possibly inhibits metabolism of ● **CYCLOSPORIN** (increased plasma concentration)
- Cilostazol: ketoconazole increases plasma concentration of ● **CILOSTAZOL** (see under Cilostazol, p. 221)
- ▶ Cinacalcet: ketoconazole inhibits metabolism of ● **CINACALCET** (increased plasma concentration)
- Clopidogrel: ketoconazole possibly reduces antiplatelet effect of ● **CLOPIDOGREL**
- ▶ Cobicistat: plasma concentration of ketoconazole possibly increased by ● **COBICISTAT**—manufacturer of cobicistat advises reduce dose of ketoconazole
- Colchicine: ketoconazole possibly increases risk of ● **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ketoconazole possibly inhibits metabolism of ● **CORTICOSTEROIDS**; ketoconazole increases the plasma concentration of *inhaled* and *oral* (and possibly also *intranasal*)

**Antifungals, Imidazole**

- Corticosteroids (continued) and *rectal* • **BUDESONIDE**; ketoconazole increases plasma concentration of active metabolite of • **CICLESONIDE**; ketoconazole possibly increases plasma concentration of *inhaled* **FLUTICASONE**; ketoconazole inhibits the metabolism of **METHYLPREDNISOLONE**; ketoconazole increases plasma concentration of *inhaled* **MMETASONE**
- Cytotoxics: ketoconazole inhibits the metabolism of **IFOSFAMIDE**; possible increased risk of neutropenia when ketoconazole given with • **BRENTUXIMAB VEDOTIN**; ketoconazole possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of ketoconazole by 6 to 12 hours; ketoconazole increases plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); ketoconazole increases the plasma concentration of • **BOSONITINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ketoconazole increases plasma concentration of **BORTEZOMIB**, **CABOZANTINIB**, **DABRAFENIB**, **ETOPOSIDE**, **IDELALISIB**, **IMATINIB**, • **NINTEDANIB** and **PONATINIB**; ketoconazole increases plasma concentration of • **CERTINIB**—avoid concomitant use or consider reducing the dose of ceritinib (see under Certinib, p. 861); ketoconazole increases plasma concentration of • **CRIZOTINIB**, • **LAPATINIB**, • **NILOTINIB** and • **REGORAFENIB**—avoid concomitant use; ketoconazole possibly increases plasma concentration of **DASATINIB**; ketoconazole inhibits metabolism of **ERLOTINIB** and **SUNITINIB** (increased plasma concentration); ketoconazole increases plasma concentration of • **EVEROLIMUS**—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of • **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); ketoconazole increases plasma concentration of • **PAZOPANIB** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ketoconazole given with • **RUXOLITINIB**—consult ruxolitinib product literature; ketoconazole increases plasma concentration of active metabolite of • **TEMSIROLIMUS**—avoid concomitant use; avoidance of ketoconazole advised by manufacturer of • **CABAZITAXEL**; *in vitro* studies suggest a possible interaction between ketoconazole and **DOCETAXEL** (consult docetaxel product literature); ketoconazole reduces plasma concentration of • **IRINOTECAN** (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; ketoconazole increases plasma concentration of • **VINFLUNINE**—manufacturer of vinflunine advises avoid concomitant use
- Dapoxetine: ketoconazole increases plasma concentration of • **DAPOXETINE**—manufacturer of dapoxetine advises avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of • **EPILERENONE**—avoid concomitant use
- Domperidone: manufacturer of ketoconazole advises avoid concomitant use with • **DOMPERIDONE** (risk of ventricular arrhythmias)
- Ergot Alkaloids: manufacturer of ketoconazole advises avoid concomitant use with • **ERGOT ALKALOIDS**; increased risk of ergotism when imidazoles given with • **ERGOTAMINE**—avoid concomitant use
- Fingolimod: ketoconazole increases plasma concentration of • **FINGOLIMOD**
  - ▶ Fosaprepitant: ketoconazole increases plasma concentration of **FOSAPREPITANT**
- Guanfacine: ketoconazole increases plasma concentration of • **GUANFACINE** (halve dose of guanfacine)
  - ▶ Hormone Antagonists: manufacturer of ketoconazole advises avoid concomitant use with **PASIREOTIDE**
- 5HT<sub>2</sub>-receptor Agonists: ketoconazole increases plasma concentration of **ALMOTRIPTAN** (increased risk of toxicity); ketoconazole increases plasma concentration of • **ELETRIPTAN** (risk of toxicity)—avoid concomitant use
- Ivabradine: ketoconazole increases plasma concentration of • **IVABRADINE**—avoid concomitant use

**Antifungals, Imidazole** (continued)

- Ivacaftor: ketoconazole increases plasma concentration of • **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNF, and Lumacaftor with Ivacaftor in BNF or BNF)
  - ▶ Lanthanum: absorption of ketoconazole possibly reduced by **LANTHANUM** (give at least 2 hours apart)
- Lenalidomide: ketoconazole possibly increases plasma concentration of • **LENALIDOMIDE** (increased risk of toxicity)
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with **ATORVASTATIN**; possible increased risk of myopathy when ketoconazole given with • **ATORVASTATIN**—manufacturer of ketoconazole advises avoid concomitant use; increased risk of myopathy when ketoconazole given with • **SIMVASTATIN** (avoid concomitant use); possible increased risk of myopathy when miconazole given with • **SIMVASTATIN**; ketoconazole increases plasma concentration of • **LOMITAPIDE**—avoid concomitant use
- Lumacaftor: plasma concentration of ketoconazole possibly reduced by • **LUMACAFTOR**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNF)
  - ▶ Macitentan: ketoconazole increases plasma concentration of **MACITENTAN**
  - ▶ Mirabegron: when given with ketoconazole avoid or reduce dose of **MIRABEGRON** in hepatic or renal impairment—see Mirabegron, p. 715
- Naloxegol: ketoconazole increases plasma concentration of • **NALOXEGOL**—avoid concomitant use
  - ▶ Netupitant: ketoconazole possibly increases plasma concentration of **NETUPITANT**
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with **OESTROGENS**; ketoconazole increases plasma concentration of **ETHINYLESTRADIOL**
- Panobinostat: ketoconazole increases plasma concentration of • **PANOBINOSTAT** (reduce dose of panobinostat—see under Panobinostat, p. 834)
  - ▶ Parasympathomimetics: ketoconazole increases plasma concentration of **GALANTAMINE**
  - ▶ Progestogens: ketoconazole increases plasma concentration of **DROSPIRENONE**
- Ranolazine: ketoconazole increases plasma concentration of • **RANOLAZINE**—avoid concomitant use
- Retinoids: ketoconazole increases plasma concentration of **ALITRETIINOIN**; ketoconazole possibly increases risk of • **TRETIINOIN** toxicity
  - ▶ Riociguat: avoidance of ketoconazole advised by manufacturer of **RIOCIGUAT**
- Sildenafil: ketoconazole increases plasma concentration of • **SILDENAFIL**—reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension
- Sirolimus: ketoconazole increases plasma concentration of • **SIROLIMUS**—avoid concomitant use; miconazole increases plasma concentration of • **SIROLIMUS**
- Sympathomimetics, Beta<sub>2</sub>: ketoconazole increases plasma concentration of **LODATEROL**; ketoconazole inhibits metabolism of • **SALMETEROL** (increased plasma concentration)
- Tacrolimus: ketoconazole increases plasma concentration of • **TACROLIMUS** (consider reducing dose of tacrolimus); miconazole *oral gel* possibly increases plasma concentration of • **TACROLIMUS**
- Tadalafil: ketoconazole increases plasma concentration of • **TADALAFIL**—avoid concomitant use of tadalafil for pulmonary hypertension
- Theophylline: ketoconazole possibly increases plasma concentration of • **THEOPHYLLINE**
- Ticagrelor: ketoconazole increases plasma concentration of • **TICAGRELOR**—manufacturer of ticagrelor advises avoid concomitant use
  - ▶ Tolvaptan: ketoconazole increases plasma concentration of **TOLVAPTAN**—manufacturer of ketoconazole advises avoid concomitant use
  - ▶ Ulcer-healing Drugs: absorption of ketoconazole reduced by **HISTAMINE H<sub>2</sub>-ANTAGONISTS**, **PROTON PUMP INHIBITORS** and **SUCRALFATE**

**Antifungals, Imidazole** (continued)

- Ulipristal: ketoconazole increases plasma concentration of *low-dose* **ULIPRISTAL**—manufacturer of *low-dose* ulipristal advises avoid concomitant use
- Vardenafil: ketoconazole increases plasma concentration of ● **VARDENAFIL**—avoid concomitant use
- Vitamins: miconazole possibly reduces effects of **ALFACALCIDOL**, **CALCIOTRIOL**, **COLECALCIFEROL**, **DIHYDROTACHYSTEROL**, **ERGOCALCIFEROL**, **PARICALCITOL** and **VITAMIN D**; ketoconazole possibly increases plasma concentration of **PARICALCITOL**

**Antifungals, Polyene** see Amphotericin

**Antifungals, Triazole**

**NOTE** In general, fluconazole interactions relate to multiple-dose treatment

- Aliskiren: itraconazole increases plasma concentration of ● **ALISKIREN**—avoid concomitant use
- Aminophylline: fluconazole possibly increases plasma concentration of ● **AMINOPHYLLINE**
- Analgesics: fluconazole increases plasma concentration of **CELECOXIB** (halve dose of celecoxib); voriconazole increases plasma concentration of **DICLOFENAC**, **IBUPROFEN** and ● **OXYCODONE**; fluconazole increases plasma concentration of **FLURBIPROFEN**, **IBUPROFEN** and **METHADONE**; fluconazole increases plasma concentration of **PARECOXIB** (reduce dose of parecoxib); voriconazole increases plasma concentration of ● **ALFENTANIL** and ● **METHADONE** (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of **ALFENTANIL** (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of **ALFENTANIL**; triazoles possibly increase plasma concentration of ● **FENTANYL**; itraconazole possibly increases plasma concentration of ● **METHADONE** (increased risk of ventricular arrhythmias); itraconazole increases plasma concentration of **OXYCODONE**
- Antacids: absorption of itraconazole reduced by **ANTACIDS**
- Anti-arrhythmic: manufacturer of itraconazole advises avoid concomitant use with ● **DISOPYRAMIDE**; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ● **DRONEDARONE**
- Antibacterials: plasma concentration of itraconazole increased by **CLARITHROMYCIN**; manufacturer of fluconazole advises avoid concomitant use with **ERYTHROMYCIN**; triazoles possibly increase plasma concentration of ● **RIFABUTIN** (increased risk of uveitis—reduce rifabutin dose); plasma concentration of isavuconazole possibly reduced by ● **RIFABUTIN**—avoid concomitant use; posaconazole increases plasma concentration of ● **RIFABUTIN** (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ● **RIFABUTIN**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ● **RIFABUTIN** (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ● **RIFABUTIN** and ● **RIFAMPICIN**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of isavuconazole and voriconazole reduced by ● **RIFAMPICIN**—avoid concomitant use; plasma concentration of posaconazole reduced by ● **RIFAMPICIN**; metabolism of fluconazole accelerated by ● **RIFAMPICIN** (reduced plasma concentration); fluconazole possibly increases plasma concentration of **BEDAQUILINE**—avoid concomitant use if fluconazole given for more than 14 days
- Anticoagulants: avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of **APIXABAN**; fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ● **COUMARINS**; avoidance of itraconazole advised by manufacturer of **DABIGATRAN** and **RIVAROXABAN**; avoidance of posaconazole and voriconazole advised by manufacturer of **RIVAROXABAN**
- Antidepressants: avoidance of triazoles advised by manufacturer of ● **REBOXETINE**; fluconazole possibly increases plasma concentration of **AMITRIPTYLINE** and **NORTRIPTYLINE**; plasma concentration of voriconazole reduced by ● **ST JOHN'S WORT**—avoid concomitant use; plasma concentration of isavuconazole possibly reduced by ● **ST JOHN'S WORT**—avoid concomitant use

**Antifungals, Triazole** (continued)

- Antidiabetics: isavuconazole increases plasma concentration of **METFORMIN**; posaconazole possibly enhances hypoglycaemic effect of **GLIPIZIDE**; fluconazole possibly enhances hypoglycaemic effect of **NATEGLINIDE**; itraconazole possibly enhances hypoglycaemic effect of **REPAGLINIDE**; fluconazole increases plasma concentration of ● **SULFONYLUREAS**; voriconazole possibly increases plasma concentration of **SULFONYLUREAS**
- Antiepileptics: plasma concentration of itraconazole and posaconazole possibly reduced by ● **CARBAMAZEPINE**; plasma concentration of isavuconazole and voriconazole possibly reduced by ● **CARBAMAZEPINE**—avoid concomitant use; fluconazole possibly increases plasma concentration of **CARBAMAZEPINE**; plasma concentration of isavuconazole possibly reduced by ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—avoid concomitant use; plasma concentration of itraconazole reduced by ● **FOSPHENYTOIN** and ● **PHENYTOIN**—avoid concomitant use; fluconazole increases plasma concentration of ● **FOSPHENYTOIN** and ● **PHENYTOIN** (consider reducing dose of fosphenytoin and phenytoin); voriconazole increases plasma concentration of ● **FOSPHENYTOIN** and ● **PHENYTOIN**, also fosphenytoin and phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for fosphenytoin and phenytoin toxicity); plasma concentration of posaconazole reduced by ● **FOSPHENYTOIN** and ● **PHENYTOIN**; plasma concentration of voriconazole possibly reduced by ● **PHENOBARBITAL** and ● **PRIMIDONE**—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ● **PHENOBARBITAL**; plasma concentration of itraconazole and posaconazole possibly reduced by ● **PRIMIDONE**
- Antifungals: plasma concentration of isavuconazole increased by ● **KETOCONAZOLE**—avoid concomitant use; triazoles possibly antagonise effects of **AMPHOTERICIN**; monitoring for increased voriconazole side effects advised by manufacturer of **FLUCONAZOLE** if voriconazole given after fluconazole; plasma concentration of itraconazole increased by **MICAFUNGIN** (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by **TERBINAFINE**
- Antihistamines: itraconazole inhibits metabolism of ● **MIZOLASTINE**—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; avoidance of triazoles advised by manufacturer of ● **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias)
- Antimuscarinics: avoidance of itraconazole advised by manufacturer of **DARIFENACIN** and **TOLTERODINE**; manufacturer of fesoterodine advises dose reduction when itraconazole given with **FESOTERODINE**—consult fesoterodine product literature; itraconazole possibly increases plasma concentration of ● **SOLIFENACIN**—see under Solifenacin, p. 713
- Antipsychotics: itraconazole possibly increases plasma concentration of **HALOPERIDOL**; itraconazole possibly increases plasma concentration of ● **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ● **LURASIDONE**—avoid concomitant use; fluconazole possibly increases the plasma concentration of ● **LURASIDONE** (see under Lurasidone, p. 373); increased risk of ventricular arrhythmias when triazoles given with ● **PIMOZIDE**—avoid concomitant use; triazoles possibly increase plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of **RISPERIDONE**
- Antivirals: plasma concentration of voriconazole increased or decreased by ● **ATAZANAVIR** and plasma concentration of atazanavir also reduced; posaconazole increases plasma concentration of ● **ATAZANAVIR**; itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of ● **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); plasma concentration of voriconazole possibly affected by **DARUNAVIR**; plasma concentration of both drugs possibly increased when itraconazole and posaconazole

**Antifungals, Triazole**

- Antivirals (continued) given with • **DASABUVIR**—avoid concomitant use; plasma concentration of itraconazole and posaconazole reduced by • **EFAVIRENZ**; plasma concentration of voriconazole reduced by • **EFAVIRENZ**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); manufacturer of isavuconazole advises avoid concomitant use with **EFAVIRENZ** and **ETRAVIRINE**; plasma concentration of posaconazole possibly reduced by **FOSAMPRENAVIR**; plasma concentration of both drugs may increase when itraconazole given with **FOSAMPRENAVIR**; isavuconazole reduces plasma concentration of **INDINAVIR**; itraconazole increases plasma concentration of • **INDINAVIR** (consider reducing dose of indinavir); plasma concentration of isavuconazole increased by **LOPINAVIR** (also plasma concentration of lopinavir reduced); fluconazole increases plasma concentration of • **NEVIRAPINE**, **RITONAVIR** and **TIPRANAVIR**; plasma concentration of itraconazole possibly reduced by **NEVIRAPINE**—consider increasing dose of itraconazole; plasma concentration of both drugs possibly increased when itraconazole and posaconazole given with • **PARITAPREVR**—avoid concomitant use; plasma concentration of isavuconazole increased by **RITONAVIR** (also plasma concentration of ritonavir reduced)—avoid concomitant use of *high-dose* ritonavir; combination of itraconazole with • **RITONAVIR** may increase plasma concentration of either drug (or both); plasma concentration of voriconazole reduced by • **RITONAVIR**—avoid concomitant use; triazoles possibly increase plasma concentration of **SAQUINAVIR**; fluconazole, itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • **SIMEPREVIR**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of voriconazole possibly affected by • **TELAPREVR** (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by • **TELAPREVR** (increased risk of ventricular arrhythmias); plasma concentration of itraconazole possibly increased by **TELAPREVR**; fluconazole increases plasma concentration of • **ZIDOVUDINE** (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of **ALPRAZOLAM**; fluconazole and voriconazole increase plasma concentration of • **DIAZEPAM** (risk of prolonged sedation); isavuconazole increases plasma concentration of **MIDAZOLAM**; fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of • **MIDAZOLAM** (risk of prolonged sedation); itraconazole increases plasma concentration of **BUSPIRONE** (reduce dose of buspirone)
- Avanafil: itraconazole and voriconazole possibly increase plasma concentration of • **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use; fluconazole possibly increases plasma concentration of • **AVANAFIL**—see under Avanafil, p. 744
- Bosentan: fluconazole possibly increases plasma concentration of • **BOSENTAN**—avoid concomitant use; itraconazole possibly increases plasma concentration of **BOSENTAN**
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with **CALCIUM-CHANNEL BLOCKERS**; itraconazole inhibits metabolism of • **FELODIPINE** (increased plasma concentration); avoidance of itraconazole advised by manufacturer of **LERCANIDIPINE**; itraconazole possibly inhibits metabolism of **DIHYDROPYRIDINES** (increased plasma concentration)
- Cardiac Glycosides: isavuconazole and itraconazole increase plasma concentration of • **DIGOXIN**
- Ciclosporin: isavuconazole increases plasma concentration of **CYCLOSPORIN**; fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of • **CYCLOSPORIN** (increased plasma concentration)
- Cilostazol: itraconazole possibly increases plasma concentration of • **CILOSTAZOL** (see under Cilostazol, p. 221)
- Clopidogrel: fluconazole, itraconazole and voriconazole possibly reduce antiplatelet effect of • **CLOPIDOGREL**

**Antifungals, Triazole (continued)**

- Cobicistat: plasma concentration of itraconazole possibly increased by **COBICISTAT**—manufacturer of cobicistat advises reduce dose of itraconazole
- Colchicine: itraconazole possibly increases risk of • **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: itraconazole possibly inhibits metabolism of **CORTICOSTEROIDS** and **METHYLPREDNISOLONE**; itraconazole increases the plasma concentration of *inhaled* and *oral* (and possibly also *intranasal* and *rectal*) • **BUDESONIDE**; itraconazole increases plasma concentration of *inhaled* **FLUTICASON**
- Cytotoxics: itraconazole inhibits metabolism of **BUSULFAN** (increased risk of toxicity); fluconazole and itraconazole possibly increase side-effects of **CYCLOPHOSPHAMIDE**; itraconazole possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours; itraconazole possibly increases plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); fluconazole, itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of • **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; itraconazole possibly increases plasma concentration of **CABOZANTINIB**; itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • **CERITINIB**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861); itraconazole and voriconazole possibly increase plasma concentration of • **CRIZOTINIB**—manufacturer of crizotinib advises avoid concomitant use; avoidance of itraconazole advised by manufacturer of **DASATINIB** and • **TEMSIROLIMUS** (plasma concentration of dasatinib and temsirolimus possibly increased); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • **EVEROLIMUS**—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of **GEFITINIB**; fluconazole, itraconazole and voriconazole possibly increase the plasma concentration of • **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of • **LAPATINIB**; avoidance of itraconazole and voriconazole advised by manufacturer of • **NILOTINIB**; itraconazole and voriconazole possibly increase plasma concentration of • **PAZOPANIB** (reduce dose of pazopanib); itraconazole and voriconazole possibly increase plasma concentration of **PONATINIB**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when fluconazole, itraconazole, posaconazole and voriconazole given with • **RUXOLITINIB**—consult ruxolitinib product literature; itraconazole and voriconazole possibly increase the plasma concentration of • **CABAZITAXEL**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; itraconazole and voriconazole possibly increase plasma concentration of • **DOCETAXEL**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of toxicity when itraconazole given with • **IRINOTECAN**—avoid concomitant use; fluconazole possibly increases plasma concentration of • **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881); itraconazole increases plasma concentration of • **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881); itraconazole possibly increases risk of • **VINBLASTINE**, • **VINDesine**, • **VINFLUNINE** and • **VINORELBINE** toxicity; posaconazole possibly inhibits metabolism of • **VINBLASTINE** and • **VINCRIStINE** (increased risk of neurotoxicity); itraconazole increases risk of • **VINCRIStINE** toxicity
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fluconazole given with **DAPOXETINE** (see under Dapoxetine, p. 751); avoidance of itraconazole advised by manufacturer of • **DAPOXETINE** (increased risk of toxicity)
- Diuretics: fluconazole increases plasma concentration of **EPLERENONE** (reduce dose of eplerenone); itraconazole increases plasma concentration of • **EPLERENONE**—avoid

**Antifungals, Triazole**

- Diuretics (continued)
  - concomitant use; plasma concentration of fluconazole increased by **HYDROCHLOROTHIAZIDE**
- Domperidone: possible increased risk of ventricular arrhythmias when itraconazole or voriconazole given with
  - **DOMPERIDONE**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when voriconazole given with
  - **ERGOMETRINE**—avoid concomitant use; manufacturer of itraconazole advises avoid concomitant use with
    - **ERGOMETRINE** (increased risk of ergotism); increased risk of ergotism when triazoles given with
      - **ERGOTAMINE**—avoid concomitant use
- Guanfacine: fluconazole, itraconazole and posaconazole possibly increase the plasma concentration of
  - **GUANFACINE** (half dose of guanfacine)
- 5HT<sub>1</sub>-receptor Agonists: itraconazole increases plasma concentration of
  - **ELETRIPATAN** (risk of toxicity)—avoid concomitant use
- Ivabradine: fluconazole increases plasma concentration of
  - **IVABRADINE**—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of
    - **IVABRADINE**—avoid concomitant use
- Ivacaftor: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of
  - **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC); fluconazole increases plasma concentration of
    - **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor, p. 275)
- Lenalidomide: itraconazole possibly increases plasma concentration of
  - **LENALIDOMIDE** (increased risk of toxicity)
- Leukotriene Receptor Antagonists: fluconazole increases plasma concentration of
  - **ZAFIRLUKAST**
- Lipid-regulating Drugs: isavuconazole increases plasma concentration of
  - **ATORVASTATIN**; increased risk of myopathy when itraconazole, posaconazole or voriconazole given with
    - **ATORVASTATIN**; possible increased risk of myopathy when fluconazole given with
      - **ATORVASTATIN** or
        - **SIMVASTATIN**;
    - fluconazole increases plasma concentration of
      - **FLUVAZATIN**—possible increased risk of myopathy; itraconazole increases plasma concentration of
        - **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with
          - **SIMVASTATIN** (avoid concomitant use); increased risk of myopathy when voriconazole given with
            - **SIMVASTATIN**;
        - avoidance of triazoles advised by manufacturer of
          - **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
    - Lumacaftor: plasma concentration of posaconazole and voriconazole possibly reduced by
      - **LUMACAFTOR**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFC); plasma concentration of itraconazole reduced by
        - **LUMACAFTOR**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFC)
    - Mirabegron: when given with itraconazole avoid or reduce dose of
      - **MIRABEGRON** in hepatic or renal impairment—see Mirabegron, p. 715
    - Mycophenolate: isavuconazole increases plasma concentration of
      - **MYCOPHENOLATE**
    - Naloxegol: itraconazole possibly increases plasma concentration of
      - **NALOXEGOL**—avoid concomitant use
    - Oestrogens: plasma concentration of voriconazole increased by
      - **OESTROGENS**
    - Panobinostat: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of
      - **PANOBINOSTAT** (reduce dose of panobinostat—see under Panobinostat, p. 834)
    - Progestogens: plasma concentration of voriconazole possibly increased by
      - **PROGESTOGENS**
    - Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of
      - **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
    - Retinoids: fluconazole and voriconazole possibly increase risk of
      - **TRETINOIN** toxicity

**Antifungals, Triazole** (continued)

- Riociguat: avoidance of itraconazole and voriconazole advised by manufacturer of
  - **RIOCIQUAT**
- Sildenafil: itraconazole increases plasma concentration of
  - **SILDENAFIL**—reduce initial dose of sildenafil
- Sirolimus: isavuconazole increases plasma concentration of
  - **SIROLIMUS**; fluconazole and posaconazole possibly increase plasma concentration of
    - **SIROLIMUS**; itraconazole and voriconazole increase plasma concentration of
      - **SIROLIMUS**—avoid concomitant use
- Tacrolimus: isavuconazole increases plasma concentration of
  - **TACROLIMUS**; fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of
    - **TACROLIMUS** (consider reducing dose of tacrolimus)
- Tadalafil: itraconazole possibly increases plasma concentration of
  - **TADALAFIL**
- Theophylline: fluconazole possibly increases plasma concentration of
  - **THEOPHYLLINE**
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by
  - **CIMETIDINE** and
    - **ESOMEPRAZOLE**—manufacturer of posaconazole *suspension* advises avoid concomitant use; plasma concentration of posaconazole possibly reduced by
      - **FAMOTIDINE**,
        - **LANSOPRAZOLE**,
          - **NIZATIDINE**,
            - **OMEPRAZOLE**,
              - **PANTOPRAZOLE**,
                - **RABEPRAZOLE** and
                  - **RANITIDINE**—manufacturer of posaconazole *suspension* advises avoid concomitant use; voriconazole possibly increases plasma concentration of
                    - **ESOMEPRAZOLE**; voriconazole increases plasma concentration of
                      - **OMEPRAZOLE** (consider reducing dose of omeprazole); absorption of itraconazole reduced by
                        - **HISTAMINE H<sub>2</sub>-ANTAGONISTS** and
                          - **PROTON PUMP INHIBITORS**
          - Ulipristal: avoidance of itraconazole advised by manufacturer of
            - **ULIPRISTAL**
          - Vardenafil: itraconazole possibly increases plasma concentration of
            - **VARDENAFIL**—avoid concomitant use

**Antihistamines**

- NOTE** Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)
- Alcohol: increased sedative effect when antihistamines given with
    - **ALCOHOL** (possibly less effect with non-sedating antihistamines)
  - Analgesics: sedative effects possibly increased when sedating antihistamines given with
    - **OPIOID ANALGESICS**
  - Antacids: absorption of fexofenadine reduced by
    - **ANTACIDS**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with
    - **AMIODARONE**,
      - **DISOPYRAMIDE** or
        - **FLECAINIDE**—avoid concomitant use; manufacturer of mizolastine advises avoid concomitant use with
          - **PROPAFENONE** (possible risk of ventricular arrhythmias)
    - Antibacterials: manufacturer of loratadine advises plasma concentration possibly increased by
      - **ERYTHROMYCIN**; metabolism of mizolastine inhibited by
        - **ERYTHROMYCIN**—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with
          - **MOXIFLOXACIN**—avoid concomitant use; effects of fexofenadine possibly reduced by
            - **RIFAMPICIN**; metabolism of mizolastine possibly inhibited by
              - **MACROLIDES** (avoid concomitant use)
        - Antidepressants: avoidance of mizolastine advised by manufacturer of
          - **CITALOPRAM** and
            - **ESCITALOPRAM** (risk of ventricular arrhythmias); increased antimuscarinic and sedative effects when antihistamines given with
              - **MAOIS** or
                - **TRICYCLICS**; manufacturer of promethazine advises avoid for 2 weeks after stopping
                  - **MAOIS**; manufacturer of hydroxyzine advises avoid concomitant use with
                    - **MAOIS**; cyproheptadine possibly antagonises antidepressant effect of
                      - **SSRIS**; possible increased antimuscarinic and sedative effects when antihistamines given with
                        - **TRICYCLIC-RELATED ANTIDEPRESSANTS**
                - Antidiabetics: thrombocyte count depressed when ketotifen given with
                  - **METFORMIN** (manufacturer of ketotifen advises avoid concomitant use)
                - Antifungals: metabolism of mizolastine inhibited by
                  - **ITRACONAZOLE**—avoid concomitant use; metabolism of mizolastine possibly inhibited by
                    - **IMIDAZOLES** (avoid concomitant use)

**Antihistamines** (continued)

- Antimalarials: avoidance of mizolastine advised by manufacturer of ● **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias)
- ▶ Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with **ANTIMUSCARINICS**
- Antivirals: plasma concentration of chlorphenamine possibly increased by **LOPINAVIR**; plasma concentration of non-sedating antihistamines possibly increased by **RITONAVIR**; increased risk of ventricular arrhythmias when mizolastine given with ● **SAQUINAVIR**—avoid concomitant use
- ▶ Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with **ANXIOLYTICS AND HYPNOTICS**
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with ● **SOTALOL**—avoid concomitant use
- ▶ Betahistines: antihistamines theoretically antagonise effect of **BETAHISTINE**
- Cytotoxics: possible increased risk of ventricular arrhythmias when mizolastine given with ● **VANDETANIB**—avoid concomitant use
- ▶ Grapefruit Juice: plasma concentration of bilastine reduced by **GRAPEFRUIT JUICE**
- ▶ Histamine: antihistamines theoretically antagonise effects of **HISTAMINE**—manufacturer of histamine advises avoid concomitant use
- ▶ Sympathomimetics: avoidance of antihistamines advised by manufacturer of **MIDODRINE**
- ▶ Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by **CIMETIDINE**; plasma concentration of hydroxyzine increased by **CIMETIDINE**
- ▶ Ulipristal: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after **ULIPRISTAL**

**Antihistamines, Non-sedating** see Antihistamines

**Antihistamines, Sedating** see Antihistamines

**Antimalarials** see Artemether with Lumefantrine, Artemimol with Piperazine, Chloroquine, Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Quinine

**Antimetabolites** see Capecitabine, Cladribine, Cytarabine, Decitabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, Tegafur, and Tioguanine

**Antimuscarinics**

- NOTE** Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation
- ▶ Alcohol: increased sedative effect when hyoscine given with **ALCOHOL**
  - ▶ Analgesics: possible increased risk of antimuscarinic side-effects when antimuscarinics given with **CODEINE**; increased risk of antimuscarinic side-effects when antimuscarinics given with **NEFOPAM**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with ● **AMIODARONE**, ● **DISOPYRAMIDE** or ● **FLECAINIDE**; increased risk of antimuscarinic side-effects when antimuscarinics given with **DISOPYRAMIDE**
  - Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with **CLARITHROMYCIN** and **TELITHROMYCIN**—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with **CLARITHROMYCIN** and **ERYTHROMYCIN**; plasma concentration of darifenacin possibly increased by **ERYTHROMYCIN**; plasma concentration of active metabolite of fesoterodine reduced by ● **RIFAMPICIN**—avoid concomitant use
  - Antidepressants: plasma concentration of darifenacin and procyclidine increased by **PAROXETINE**; increased risk of antimuscarinic side-effects when antimuscarinics given with **MAOIS** or **TRICYCLICS**; plasma concentration of active metabolite of fesoterodine possibly reduced by ● **ST JOHN'S WORD**—manufacturer of fesoterodine advises avoid concomitant use; possible increased antimuscarinic side-effects when antimuscarinics given with **TRICYCLIC-RELATED ANTIDEPRESSANTS**

**Antimuscarinics** (continued)

- Antiepileptics: plasma concentration of active metabolite of fesoterodine possibly reduced by ● **CARBAMAZEPINE**, ● **PHENOBARBITAL** and ● **PHENYTOIN**—manufacturer of fesoterodine advises avoid concomitant use
  - Antifungals: antimuscarinics reduce absorption of **KETOCONAZOLE**; manufacturer of fesoterodine advises dose reduction when fesoterodine given with **ITRACONAZOLE** and **KETOCONAZOLE**—consult fesoterodine product literature; plasma concentration of darifenacin increased by **KETOCONAZOLE**—avoid concomitant use; plasma concentration of solifenacin increased by ● **KETOCONAZOLE**—see under Solifenacin, p. 713; plasma concentration of oxybutynin increased by **KETOCONAZOLE**; manufacturer of tolterodine advises avoid concomitant use with **ITRACONAZOLE** and ● **KETOCONAZOLE**; manufacturer of darifenacin advises avoid concomitant use with **ITRACONAZOLE**; plasma concentration of solifenacin possibly increased by ● **ITRACONAZOLE**—see under Solifenacin, p. 713
  - ▶ Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with **ANTIHISTAMINES**
  - ▶ Antipsychotics: antimuscarinics possibly reduce effects of **HALOPERIDOL**; increased risk of antimuscarinic side-effects when antimuscarinics given with **CLOZAPINE**; antimuscarinics reduce plasma concentration of **PHENOTHIAZINES**, but risk of antimuscarinic side-effects increased
  - Antivirals: manufacturer of darifenacin advises avoid concomitant use with **ATAZANAVIR**, **FOSAMPRENAVIR**, **INDINAVIR**, **LOPINAVIR**, **RITONAVIR**, **SAQUINAVIR** and **TIPRANAVIR**; manufacturer of fesoterodine advises dose reduction when fesoterodine given with **ATAZANAVIR**, **INDINAVIR**, **RITONAVIR** and **SAQUINAVIR**—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with **FOSAMPRENAVIR**, **INDINAVIR**, **LOPINAVIR**, **RITONAVIR** and **SAQUINAVIR**; plasma concentration of solifenacin possibly increased by ● **RITONAVIR**—see under Solifenacin, p. 713
  - Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with ● **SOTALOL**
  - ▶ Calcium-channel Blockers: plasma concentration of solifenacin increased by **VERAPAMIL**; manufacturer of darifenacin advises avoid concomitant use with **VERAPAMIL**
  - ▶ Cardiac Glycosides: darifenacin possibly increases plasma concentration of **DIGOXIN**
  - ▶ Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with **CYCLOSPORIN**
  - ▶ Domperidone: antimuscarinics antagonise effects of **DOMPERIDONE** on gastro-intestinal activity
  - ▶ Dopaminergics: antimuscarinics possibly reduce absorption of **CO-BENELDOPA**, **CO-CARELDOPA** and **LEVODOPA**
  - ▶ Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxybutynin given with **PASIREOTIDE**
  - ▶ Memantine: effects of antimuscarinics possibly enhanced by **MEMANTINE**
  - ▶ Metoclopramide: antimuscarinics antagonise effects of **METOCLOPRAMIDE** on gastro-intestinal activity
  - ▶ Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of **NITRATES** (failure to dissolve under tongue owing to dry mouth)
  - ▶ Parasympathomimetics: antimuscarinics antagonise effects of **PARASYMPATHOMIMETICS**
- Antipsychotics**
- NOTE** Increased risk of toxicity with myelosuppressive drugs
- NOTE** Avoid concomitant use with drugs that have a substantial potential for causing agranulocytosis
- ▶ ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with **ACE INHIBITORS**
  - ▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with **ADRENERGIC NEURONE BLOCKERS**; higher doses of chlorpromazine antagonise hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**; haloperidol antagonises hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**
  - ▶ Adsorbents: absorption of phenothiazines possibly reduced by **KAOLIN**
  - ▶ Alcohol: increased sedative effect when antipsychotics given with **ALCOHOL**

**Antipsychotics** (continued)

- ▶ Alpha-blockers: enhanced hypotensive effect when antipsychotics given with **ALPHA-BLOCKERS**
- Anaesthetics, General: droperidol enhances effects of **THIOPENTAL**; enhanced hypotensive effect when antipsychotics given with ● **GENERAL ANAESTHETICS**
- Analgesics: possible severe drowsiness when haloperidol given with **ACETAMIN** or **INDOMETACIN**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ● **METHADONE**; increased risk of ventricular arrhythmias when amisulpride given with ● **METHADONE**—avoid concomitant use; increased risk of convulsions when antipsychotics given with **TRAMADOL**; enhanced hypotensive and sedative effects when antipsychotics given with **OPIOID ANALGESICS**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Antacids: absorption of phenothiazines and sulpiride reduced by **ANTACIDS**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ● **ANTI-ARRHYTHMICS** that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimoizide or zuclopendithol given with ● **AMIODARONE**—avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with ● **AMIODARONE** or ● **DISOPYRAMIDE**; increased risk of ventricular arrhythmias when benperidol given with ● **AMIODARONE**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ● **DISOPYRAMIDE**; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimoizide or zuclopendithol given with ● **DISOPYRAMIDE**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with ● **DISOPYRAMIDE**—avoid concomitant use; avoidance of phenothiazines advised by manufacturer of ● **DRONEDARONE** (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with ● **FLECAINIDE**
- Antibacterials: plasma concentration of lurasidone possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—avoid concomitant use; increased risk of ventricular arrhythmias when pimoizide given with ● **CLARITHROMYCIN**, ● **MOXIFLOXACIN** or ● **TELITHROMYCIN**—avoid concomitant use; plasma concentration of quetiapine possibly increased by ● **CLARITHROMYCIN**—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of lurasidone possibly increased by ● **ERYTHROMYCIN** (see under Lurasidone, p. 373); increased risk of ventricular arrhythmias when amisulpride given with ● **ERYTHROMYCIN**—avoid concomitant use; plasma concentration of clozapine possibly increased by ● **ERYTHROMYCIN** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimoizide given with ● **ERYTHROMYCIN**—avoid concomitant use; plasma concentration of quetiapine increased by ● **ERYTHROMYCIN**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with *parenteral* ● **ERYTHROMYCIN**; increased risk of ventricular arrhythmias when zuclopendithol given with *parenteral* ● **ERYTHROMYCIN**—avoid concomitant use; plasma concentration of clozapine increased by **CIPROFLOXACIN**; plasma concentration of olanzapine possibly increased by **CIPROFLOXACIN**; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopendithol given with ● **MOXIFLOXACIN**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with ● **MOXIFLOXACIN**—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by ● **RIFABUTIN** and ● **RIFAMPICIN** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of lurasidone reduced by ● **RIFAMPICIN**—avoid concomitant use; plasma concentration of clozapine possibly reduced by **RIFAMPICIN**; metabolism of haloperidol accelerated by

**Antipsychotics**● **Antibacterials** (continued)

- **RIFAMPICIN** (reduced plasma concentration); avoid concomitant use of clozapine with ● **CHLORAMPHENICOL** or ● **SULFONAMIDES** (increased risk of agranulocytosis); increased risk of ventricular arrhythmias when droperidol, haloperidol or pimoizide given with ● **DELAMANID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with ● **DELAMANID**; manufacturer of droperidol advises avoid concomitant use with ● **MACROLIDES** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when chlorpromazine given with ● **TELITHROMYCIN**; plasma concentration of quetiapine possibly increased by **TELITHROMYCIN**
- Antidepressants: plasma concentration of clozapine possibly increased by **CITALOPRAM** (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimoizide advised by manufacturer of ● **CITALOPRAM** (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimoizide advised by manufacturer of ● **ESCITALOPRAM** (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by ● **FLUOXETINE** and ● **PAROXETINE** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by ● **FLUOXETINE**; manufacturer of droperidol advises avoid concomitant use with ● **FLUOXETINE**, ● **FLUVOXAMINE**, ● **SERTRALINE** and ● **TRICYCLICS** (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by **FLUVOXAMINE**; plasma concentration of clozapine and olanzapine increased by ● **FLUVOXAMINE**; asenapine possibly increases plasma concentration of **PAROXETINE**; plasma concentration of clozapine increased by ● **PAROXETINE** and ● **SERTRALINE**; plasma concentration of risperidone possibly increased by **PAROXETINE** (increased risk of toxicity); metabolism of perphenazine inhibited by **PAROXETINE** (reduce dose of perphenazine); plasma concentration of haloperidol increased by **VENLAFAXINE**; clozapine possibly increases CNS effects of ● **MAOIS**; plasma concentration of pimoizide possibly increased by ● **SSRIS** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of lurasidone possibly reduced by ● **ST JOHN'S WORT**—avoid concomitant use; plasma concentration of aripiprazole possibly reduced by ● **ST JOHN'S WORT** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); possible increased risk of ventricular arrhythmias when risperidone given with ● **TRICYCLICS**; possible increased antimuscarinic side-effects when clozapine given with **TRICYCLICS**; manufacturer of fluphenazine, haloperidol, sulpiride and zuclopendithol advises avoid concomitant use with ● **TRICYCLICS** (risk of ventricular arrhythmias); increased risk of antimuscarinic side-effects when phenothiazines given with **TRICYCLICS**; possible increased risk of convulsions when butyrophenones, phenothiazines or thioxanthenes given with ● **VORTIOXETINE**
- ▶ Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of **SULFONYLUREAS**
- Antiepileptics: antipsychotics antagonise anticonvulsant effect of ● **ANTIPILEPTICS** (convulsive threshold lowered); plasma concentration of lurasidone possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—avoid concomitant use; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by **CARBAMAZEPINE** (reduced plasma concentration); metabolism of clozapine accelerated by ● **CARBAMAZEPINE** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by ● **CARBAMAZEPINE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paliperidone reduced by **CARBAMAZEPINE**; plasma concentration of haloperidol reduced by **FOSPHENYTOIN** and **PHENYTOIN**; chlorpromazine possibly increases or decreases

## Antipsychotics

- Antiepileptics (continued)
  - plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**; metabolism of clozapine and quetiapine accelerated by **FOSPHENYTOIN** (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by
    - **FOSPHENYTOIN**, • **PHENOBARBITAL**, • **PHENYTOIN** and
    - **PRIMIDONE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine possibly reduced by **PHENOBARBITAL** and **PRIMIDONE**; metabolism of haloperidol accelerated by **PHENOBARBITAL** and **PRIMIDONE** (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with **PHENOBARBITAL** and **PRIMIDONE**; metabolism of clozapine and quetiapine accelerated by **PHENYTOIN** (reduced plasma concentration); increased risk of side-effects including neutropenia when olanzapine given with • **SODIUM VALPROATE** and • **VALPROIC ACID**; plasma concentration of clozapine possibly increased or decreased by **SODIUM VALPROATE** and **VALPROIC ACID**
  - Antifungals: plasma concentration of lurasidone increased by • **KETOCONAZOLE**—avoid concomitant use; metabolism of aripiprazole inhibited by • **KETOCONAZOLE** (reduce dose of aripiprazole); plasma concentration of lurasidone possibly increased by • **FLUCONAZOLE** (see under Lurasidone, p. 373); plasma concentration of lurasidone possibly increased by • **ITRACONAZOLE**, • **POSACONAZOLE** and • **VORICONAZOLE**—avoid concomitant use; plasma concentration of aripiprazole possibly increased by • **ITRACONAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); side-effects of risperidone possibly increased by **ITRACONAZOLE**; plasma concentration of haloperidol possibly increased by **ITRACONAZOLE**; increased risk of ventricular arrhythmias when pimozide given with • **IMIDAZOLES** or • **TRIAZOLES**—avoid concomitant use; plasma concentration of quetiapine possibly increased by • **IMIDAZOLES** and • **TRIAZOLES**—manufacturer of quetiapine advises avoid concomitant use
- Antimalarials: avoidance of antipsychotics advised by manufacturer of • **ARTEMETHER WITH LUMEFANTRINE**; avoidance of droperidol, haloperidol, phenothiazines and pimozide advised by manufacturer of • **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when droperidol given with
  - **CHLOROQUINE**, • **HYDROXYCHLOROQUINE** or • **QUININE**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with • **MEFLOQUINE** or • **QUININE**—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when risperidone given with • **MEFLOQUINE**; increased risk of ventricular arrhythmias when pimozide given with • **MEFLOQUINE** or • **QUININE**—avoid concomitant use; manufacturer of amisulpride advises avoid concomitant use with **MEFLOQUINE**; possible increased risk of ventricular arrhythmias when risperidone given with • **QUININE**
- ▶ Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with **ANTIMUSCARINICS**; plasma concentration of phenothiazines reduced by **ANTIMUSCARINICS**, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by **ANTIMUSCARINICS**
- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozide or sulpiride given with • **DROPERIDOL**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with • **DROPERIDOL**—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of • **FLUPENTIXOL**, • **FLUPHENAZINE**, • **HALOPERIDOL**, • **RISPERIDONE** or • **ZUCLOPENTHIXOL** as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with • **HALOPERIDOL**; chlorpromazine possibly increases plasma concentration of **HALOPERIDOL**; increased risk of ventricular arrhythmias when droperidol given with • **HALOPERIDOL**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with • **PHENOTHIAZINES**—avoid concomitant use; lurasidone possibly increases plasma concentration of

## Antipsychotics

- Antipsychotics (continued)
  - PIMOZIDE** (increased risk of toxicity); possible increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with • **RISPERIDONE**; increased risk of ventricular arrhythmias when pimozide given with • **SULPIRIDE**
- Antivirals: plasma concentration of quetiapine possibly increased by • **ATAZANAVIR**, • **BOCEPREVIR**, • **DARUNAVIR**, • **FOSAMPRENNAVIR**, • **INDINAVIR**, • **LOPINAVIR**, • **RITONAVIR**, • **SAQUINAVIR**, • **TELAPREVIR** and • **TIPRANAVIR**—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of pimozide possibly increased by
  - **ATAZANAVIR**—avoid concomitant use; plasma concentration of aripiprazole possibly increased by • **ATAZANAVIR**, • **DARUNAVIR**, • **FOSAMPRENNAVIR**, • **INDINAVIR**, • **LOPINAVIR**, • **RITONAVIR**, • **SAQUINAVIR** and • **TIPRANAVIR** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of lurasidone possibly increased by
  - **BOCEPREVIR**, • **INDINAVIR**, • **RITONAVIR**, • **SAQUINAVIR** and • **TELAPREVIR**—avoid concomitant use; avoidance of pimozide advised by manufacturer of • **BOCEPREVIR** and • **TELAPREVIR**; plasma concentration of aripiprazole possibly reduced by
  - **EFAVIRENZ** and • **NEVIRAPINE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by • **EFAVIRENZ**, • **INDINAVIR** and • **SAQUINAVIR** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by • **FOSAMPRENNAVIR** and • **RITONAVIR** (increased risk of ventricular arrhythmias—avoid concomitant use); avoidance of clozapine advised by manufacturer of
  - **RITONAVIR** (increased risk of toxicity); plasma concentration of antipsychotics possibly increased by • **RITONAVIR**; plasma concentration of olanzapine reduced by **RITONAVIR**—consider increasing dose of olanzapine; increased risk of ventricular arrhythmias when clozapine, haloperidol or phenothiazines given with • **SAQUINAVIR**—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with **ANXIOLYTICS AND HYPNOTICS**; plasma concentration of haloperidol possibly increased by **ALPRAZOLAM**; lurasidone increases plasma concentration of **MIDAZOLAM**; serious adverse events reported with concomitant use of clozapine and • **BENZODIAZEPINES** (causality not established); increased risk of hypotension, bradycardia and respiratory depression when *intramuscular* olanzapine given with *parenteral* • **BENZODIAZEPINES**; plasma concentration of haloperidol increased by **BUSPIRONE**
- Aprepitant: avoidance of pimozide advised by manufacturer of • **APREPITANT**
- Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with • **ATOMOXETINE**
- Beta-blockers: enhanced hypotensive effect when phenothiazines given with **BETA-BLOCKERS**; plasma concentration of both drugs may increase when chlorpromazine given with • **PROPRANOLOL**; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with • **SOTALOL**; increased risk of ventricular arrhythmias when droperidol or zuclopentixol given with • **SOTALOL**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with • **SOTALOL**—avoid concomitant use; possible increased risk of ventricular arrhythmias when risperidone given with • **SOTALOL**
- Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with **CALCIUM-CHANNEL BLOCKERS**; plasma concentration of lurasidone increased by • **DILTIAZEM** (see under Lurasidone, p. 373); plasma concentration of lurasidone possibly increased by • **VERAPAMIL** (see under Lurasidone, p. 373)
- ▶ Clonidine: enhanced hypotensive effect when phenothiazines given with **CLONIDINE**
- Cobicistat: plasma concentration of lurasidone possibly increased by • **COBICISTAT**—avoid concomitant use; plasma concentration of pimozide possibly increased by

**Antipsychotics**

- **Cobicistat** (continued)
  - **COBICISTAT**—manufacturer of cobicistat advises avoid concomitant use
- **Cytotoxics**: avoid concomitant use of clozapine with
  - **CYTOTOXICS** (increased risk of agranulocytosis); possible increased risk of ventricular arrhythmias when haloperidol given with ● **BOSUTINIB** and ● **CERITINIB**; avoidance of pimozide advised by manufacturer of **CERITINIB**, **IDELALISIB** and ● **LAPATINIB**; possible increased risk of ventricular arrhythmias when droperidol given with ● **CERITINIB**; caution with pimozide advised by manufacturer of ● **CRIZOTINIB**; avoidance of quetiapine advised by manufacturer of **IDELALISIB**; possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopentixol given with ● **VANDETANIB**—avoid concomitant use; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ● **ARSENIC TRIOXIDE**; increased risk of ventricular arrhythmias when haloperidol given with ● **ARSENIC TRIOXIDE**
- **Deferasirox**: avoidance of clozapine advised by manufacturer of **DEFERASIROX**
- **Desferrioxamine**: manufacturer of levomepromazine advises avoid concomitant use with **DESFERRIOXAMINE**; avoidance of prochlorperazine advised by manufacturer of **DESFERRIOXAMINE**
- **Diazoxide**: enhanced hypotensive effect when phenothiazines given with **DIAZOXIDE**
- **Diuretics**: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by ● **DIURETICS**; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by ● **DIURETICS** (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with **DIURETICS**
- **Dopaminergics**: increased risk of extrapyramidal side-effects when antipsychotics given with **AMANTADINE**; antipsychotics antagonise effects of **APOMORPHINE**, **CO-BENELDOPA**, **CO-CARELDOPA**, **LEVODOPA** and **PERGOLIDE**; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of **BROMOCRPTINE** and **CABERGOLINE**; manufacturer of amisulpride advises avoid concomitant use of **CO-BENELDOPA**, **CO-CARELDOPA** and **LEVODOPA** (antagonism of effect); avoidance of antipsychotics advised by manufacturer of **PRAMIPEXOLE**, **ROPINIROLE** and **ROTIGOTINE** (antagonism of effect)
- **Ergot Alkaloids**: lurasidone possibly increases plasma concentration of **ERGOT ALKALOIDS** (increased risk of toxicity)
- **Fosaprepitant**: avoidance of pimozide advised by manufacturer of ● **FOSAPREPITANT**
- **Grapefruit Juice**: manufacturer of lurasidone and pimozide advises avoid concomitant use with **GRAPEFRUIT JUICE**; plasma concentration of quetiapine possibly increased by ● **GRAPEFRUIT JUICE**—manufacturer of quetiapine advises avoid concomitant use
- **Guanfacine**: sedative effects possibly increased when antipsychotics given with **GUANFACINE**
- **Histamine**: antipsychotics theoretically antagonise effects of **HISTAMINE**—manufacturer of histamine advises avoid concomitant use
- **Hormone Antagonists**: manufacturer of droperidol advises avoid concomitant use with ● **TAMOXIFEN** (risk of ventricular arrhythmias)
- **Ivabradine**: increased risk of ventricular arrhythmias when pimozide given with ● **IVABRADINE**
- **Lithium**: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopentixol given with ● **LITHIUM**; possible risk of toxicity when olanzapine given with **LITHIUM**; extrapyramidal side-effects of quetiapine possibly increased by **LITHIUM**; increased risk of extrapyramidal side-effects when sulpiride given with **LITHIUM**
- **Memantine**: effects of antipsychotics possibly reduced by **MEMANTINE**
- **Methylidopa**: enhanced hypotensive effect when antipsychotics given with **METHYLDOPA** (also increased risk of extrapyramidal effects)

**Antipsychotics** (continued)

- **Metoclopramide**: increased risk of extrapyramidal side-effects when antipsychotics given with **METOCLOPRAMIDE**
  - **Moxonidine**: enhanced hypotensive effect when phenothiazines given with **MOXONIDINE**
  - **Muscle Relaxants**: promazine possibly enhances effects of **SUXAMETHONIUM**
  - **Nitrates**: enhanced hypotensive effect when phenothiazines given with **NITRATES**
  - **Panobinostat**: possible increased risk of ventricular arrhythmias when pimozide given with ● **PANOBINOSTAT**—avoid concomitant use
  - **Penicillamine**: increased risk of haematological toxicity when clozapine given with ● **PENICILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
  - **Pentamidine Isetionate**: increased risk of ventricular arrhythmias when amisulpride or droperidol given with ● **PENTAMIDINE ISETIONATE**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ● **PENTAMIDINE ISETIONATE**
  - **Sodium Benzoate**: haloperidol possibly reduces effects of **SODIUM BENZOATE**
  - **Sodium Oxybate**: antipsychotics possibly enhance effects of **SODIUM OXYBATE**
  - **Sodium Phenylbutyrate**: haloperidol possibly reduces effects of **SODIUM PHENYLBUTYRATE**
  - **Sympathomimetics**: antipsychotics antagonise hypertensive effect of **SYMPATHOMIMETICS**; antipsychotic effects of chlorpromazine possibly antagonised by **DEXAMFETAMINE**; chlorpromazine possibly reduces effects of **LISDEXAMFETAMINE**; side-effects of risperidone possibly increased by **METHYLPHENIDATE**
  - **Tacrolimus**: manufacturer of droperidol advises avoid concomitant use with ● **TACROLIMUS** (risk of ventricular arrhythmias)
  - **Tetrabenazine**: increased risk of extrapyramidal side-effects when antipsychotics given with **TETRABENAZINE**
  - **Ulcer-healing Drugs**: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by **CIMETIDINE**; plasma concentration of clozapine possibly reduced by **OMEPRAZOLE**; absorption of sulpiride reduced by **SUCRALFATE**
  - **Vasodilator Antihypertensives**: enhanced hypotensive effect when phenothiazines given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- Antivirals** see individual drugs
- Anxiolytics and Hypnotics**
- **ACE Inhibitors**: enhanced hypotensive effect when anxiolytics and hypnotics given with **ACE INHIBITORS**
  - **Adrenergic Neurone Blockers**: enhanced hypotensive effect when anxiolytics and hypnotics given with **ADRENERGIC NEURONE BLOCKERS**
  - **Alcohol**: increased sedative effect when anxiolytics and hypnotics given with **ALCOHOL**
  - **Alpha-blockers**: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with **ALPHA-BLOCKERS**
  - **Aminophylline**: effects of benzodiazepines possibly reduced by **AMINOPHYLLINE**
  - **Anaesthetics, General**: increased sedative effect when anxiolytics and hypnotics given with **GENERAL ANAESTHETICS**
  - **Analgesics**: metabolism of midazolam possibly inhibited by **FENTANYL**; increased sedative effect when anxiolytics and hypnotics given with **OPIOID ANALGESICS**
  - **Angiotensin-II Receptor Antagonists**: enhanced hypotensive effect when anxiolytics and hypnotics given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
  - **Antibacterials**: metabolism of midazolam inhibited by ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** and ● **TELITHROMYCIN** (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by **ERYTHROMYCIN** (reduce dose of buspirone); metabolism of zopiclone inhibited by **ERYTHROMYCIN**; manufacturer of zolpidem advises avoid concomitant use with **CIPROFLOXACIN**; metabolism of benzodiazepines possibly accelerated by **RIFAMPICIN** (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by **RIFAMPICIN** (reduced plasma concentration); metabolism of buspirone possibly

**Anxiolytics and Hypnotics**

- **Antibacterials** (continued)
  - accelerated by **RIFAMPICIN**; metabolism of zolpidem accelerated by **RIFAMPICIN** (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by **RIFAMPICIN**; metabolism of diazepam inhibited by **ISONIAZID**
- ▶ **Anticoagulants**: chloral may transiently enhance anticoagulant effect of **COUMARINS**
- **Antidepressants**: plasma concentration of alprazolam increased by **FLUOXETINE**; plasma concentration of melatonin increased by ● **FLUVOXAMINE**—avoid concomitant use; plasma concentration of some benzodiazepines increased by **FLUVOXAMINE**; sedative effects possibly increased when zolpidem given with **SERTRALINE**; manufacturer of buspirone advises avoid concomitant use with **MAOIS**; avoidance of buspirone for 14 days after stopping ● **TRANLYCPROMINE** advised by manufacturer of tranlycypromine; plasma concentration of *oral* midazolam possibly reduced by **ST JOHN'S WORT**; increased sedative effect when anxiolytics and hypnotics given with **MIRTAZAPINE**, **TRICYCLIC-RELATED ANTIDEPRESSANTS** or **TRICYCLICS**
- ▶ **Antiepileptics**: plasma concentration of midazolam reduced by **CARBAMAZEPINE** and **PERAMPANEL**; plasma concentration of clonazepam often reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**; diazepam increases or decreases plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**; benzodiazepines possibly increase or decrease plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**; increased sedative effect when anxiolytics and hypnotics given with **PHENOBARBITAL** or **PRIMIDONE**; plasma concentration of diazepam and lorazepam possibly increased by **SODIUM VALPROATE**; increased risk of side-effects when clonazepam given with **SODIUM VALPROATE** or **VALPROIC ACID**; clobazam possibly increases plasma concentration of **SODIUM VALPROATE** and **VALPROIC ACID**; plasma concentration of clonazepam increased by **STIRIPENTOL**; plasma concentration of diazepam and lorazepam possibly increased by **VALPROIC ACID**
- **Antifungals**: plasma concentration of alprazolam increased by ● **KETOCONAZOLE**—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of midazolam increased by ● **KETOCONAZOLE** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam); plasma concentration of zolpidem increased by **KETOCONAZOLE**; plasma concentration of diazepam and midazolam increased by ● **FLUCONAZOLE** (risk of prolonged sedation); plasma concentration of midazolam increased by **ISAVUCONAZOLE**; plasma concentration of alprazolam increased by **ITRACONAZOLE**; plasma concentration of midazolam increased by ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE** (risk of prolonged sedation); plasma concentration of buspirone increased by **ITRACONAZOLE** (reduce dose of buspirone); plasma concentration of diazepam increased by ● **VORICONAZOLE** (risk of prolonged sedation)
- ▶ **Antihistamines**: increased sedative effect when anxiolytics and hypnotics given with **ANTIHISTAMINES**
- **Antipsychotics**: increased sedative effect when anxiolytics and hypnotics given with **ANTIPSYCHOTICS**; alprazolam possibly increases plasma concentration of **HALOPERIDOL**; buspirone increases plasma concentration of **HALOPERIDOL**; serious adverse events reported with concomitant use of benzodiazepines and ● **CLOZAPINE** (causality not established); plasma concentration of midazolam increased by **LURASIDONE**; increased risk of hypotension, bradycardia and respiratory depression when *parenteral* benzodiazepines given with *intramuscular* ● **OLANZAPINE**
- **Antivirals**: plasma concentration of midazolam possibly increased by ● **ATAZANAVIR**—avoid concomitant use of *oral* midazolam; plasma concentration of *oral* midazolam increased by ● **BOCEPREVIR**—manufacturer of boceprevir advises avoid concomitant use; increased risk of prolonged sedation when midazolam given with ● **EFAVIRENZ**—avoid concomitant use; plasma concentration of midazolam possibly increased by ● **FOSAMPRENAVIR**, ● **INDINAVIR**, ● **RITONAVIR** and ● **TELAPREVIR** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam); increased risk of

**Anxiolytics and Hypnotics**

- **Antivirals** (continued)
  - prolonged sedation when alprazolam given with ● **INDINAVIR**—avoid concomitant use; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ● **RITONAVIR** (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of anxiolytics and hypnotics possibly increased by ● **RITONAVIR**; plasma concentration of buspirone increased by **RITONAVIR** (increased risk of toxicity); plasma concentration of midazolam increased by ● **SAQUINAVIR** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam); plasma concentration of *oral* midazolam increased by **SIMEPREVIR**
- ▶ **Appetitant**: plasma concentration of midazolam increased by **APREPITANT** (risk of prolonged sedation)
- ▶ **Beta-blockers**: enhanced hypotensive effect when anxiolytics and hypnotics given with **BETA-BLOCKERS**
- ▶ **Calcium-channel Blockers**: enhanced hypotensive effect when anxiolytics and hypnotics given with **CALCIUM-CHANNEL BLOCKERS**; midazolam increases absorption of **LERCANIDIPINE**; metabolism of midazolam inhibited by **DILTIAZEM** and **VERAPAMIL** (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by **DILTIAZEM** and **VERAPAMIL** (reduce dose of buspirone)
- ▶ **Cardiac Glycosides**: alprazolam increases plasma concentration of **DIGOXIN** (increased risk of toxicity)
- ▶ **Clonidine**: enhanced hypotensive effect when anxiolytics and hypnotics given with **CLONIDINE**
- **Cobicistat**: avoidance of *oral* midazolam advised by manufacturer of ● **COBICISTAT**
- **Cytotoxics**: plasma concentration of midazolam increased by ● **CRIZOTINIB** and **NILOTINIB**; avoidance of *oral* midazolam advised by manufacturer of **IDELALISIB**
- ▶ **Deferasirox**: plasma concentration of midazolam possibly reduced by **DEFERASIROX**
- ▶ **Diazoxide**: enhanced hypotensive effect when anxiolytics and hypnotics given with **DIAZOXIDE**
- ▶ **Disulfiram**: metabolism of benzodiazepines inhibited by **DISULFIRAM** (increased sedative effects); increased risk of temazepam toxicity when given with **DISULFIRAM**
- ▶ **Diuretics**: enhanced hypotensive effect when anxiolytics and hypnotics given with **DIURETICS**; administration of chloral with *parenteral* **FUROSEMIDE** may displace thyroid hormone from binding sites
- ▶ **Dopaminergics**: benzodiazepines possibly antagonise effects of **CO-BENELDOPA**, **CO-CARELDOPA** and **LEVODOPA**
- ▶ **Fosaprepitant**: plasma concentration of midazolam increased by **FOSAPREPITANT** (risk of prolonged sedation)
- ▶ **Grapefruit Juice**: plasma concentration of *oral* midazolam possibly increased by **GRAPEFRUIT JUICE**; plasma concentration of buspirone increased by **GRAPEFRUIT JUICE**
- ▶ **Guanfacine**: sedative effects possibly increased when anxiolytics and hypnotics given with **GUANFACINE**
- **Hormone Antagonists**: plasma concentration of midazolam reduced by ● **ENZALUTAMIDE**
- ▶ **Ivacaftor**: plasma concentration of midazolam increased by **IVACAFTOR**
- ▶ **Lipid-regulating Drugs**: plasma concentration of *intravenous* midazolam increased by **ATORVASTATIN**; separating administration from alprazolam by 12 hours advised by manufacturer of **LOMITAPIDE**
- ▶ **Lithium**: increased risk of neurotoxicity when clonazepam given with **LITHIUM**
- ▶ **Lofexidine**: increased sedative effect when anxiolytics and hypnotics given with **LOFEXIDINE**
- ▶ **Lumacaftor**: plasma concentration of midazolam possibly reduced by **LUMACAFTOR**—manufacturer of lumacaftor advises avoid concomitant use
- ▶ **Methyldopa**: enhanced hypotensive effect when anxiolytics and hypnotics given with **METHYLDOPA**
- **Methylthionium**: possible risk of CNS toxicity when buspirone given with ● **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Anxiolytics and Hypnotics** (continued)

- ▶ **Moxonidine**: enhanced hypotensive effect when anxiolytics and hypnotics given with **MOXONIDINE**; sedative effects possibly increased when benzodiazepines given with **MOXONIDINE**
- ▶ **Muscle Relaxants**: increased sedative effect when anxiolytics and hypnotics given with **BACLOFEN** or **TIZANIDINE**
- ▶ **Netupitant**: plasma concentration of midazolam increased by **NETUPITANT**
- ▶ **Nitrates**: enhanced hypotensive effect when anxiolytics and hypnotics given with **NITRATES**
- ▶ **Oestrogens**: plasma concentration of melatonin increased by **OESTROGENS**; plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by **OESTROGENS**; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by **OESTROGENS**
- ▶ **Progestogens**: plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by **PROGESTOGENS**; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by **PROGESTOGENS**
- **Sodium Oxybate**: benzodiazepines enhance effects of ● **SODIUM OXYBATE** (avoid concomitant use)
- ▶ **Theophylline**: effects of benzodiazepines possibly reduced by **THEOPHYLLINE**
- ▶ **Ulcer-healing Drugs**: plasma concentration of melatonin increased by **CIMETIDINE**; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by **CIMETIDINE** (increased plasma concentration); metabolism of diazepam possibly inhibited by **ESOMEPRAZOLE** and **OMEPRAZOLE** (increased plasma concentration)
- ▶ **Vasodilator Antihypertensives**: enhanced hypotensive effect when anxiolytics and hypnotics given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Apixaban**

- **Analgesics**: increased risk of haemorrhage when anticoagulants given with *intravenous* ● **DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **KETOROLAC** (avoid concomitant use, including low-dose heparins)
- **Antibacterials**: manufacturer of apixaban advises avoid concomitant use with **CLARITHROMYCIN** and **TELITHROMYCIN**; plasma concentration of apixaban possibly reduced by ● **RIFAMPICIN**—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- **Anticoagulants**: increased risk of haemorrhage when apixaban given with other ● **ANTICOAGULANTS** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with ● **DABIGATRAN**, ● **EDOXABAN** and ● **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- **Antidepressants**: plasma concentration of apixaban possibly reduced by ● **ST JOHN'S WORT**—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- **Antiepileptics**: plasma concentration of apixaban possibly reduced by ● **CARBAMAZEPINE**—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; plasma concentration of apixaban possibly reduced by ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**
- **Antifungals**: plasma concentration of apixaban increased by ● **KETOCONAZOLE**—manufacturer of apixaban advises avoid concomitant use; manufacturer of apixaban advises avoid concomitant use with **ITRACONAZOLE**, **POSACONAZOLE** and **VORICONAZOLE**
- ▶ **Antivirals**: manufacturer of apixaban advises avoid concomitant use with **ATAZANAVIR**, **BOCEPREVIR**, **DARUNAVIR**, **FOSAMPRENAVIR**, **INDINAVIR**, **LOPINAVIR**, **RITONAVIR**, **SAQUINAVIR**, **TELAPREVIR** and **TIPRANAVIR**
- ▶ **Cobicistat**: manufacturer of apixaban advises avoid concomitant use with **COBICISTAT**
- ▶ **Sulfinpyrazone**: increased risk of bleeding when apixaban given with **SULFINPYRAZONE**

**Apomorphine**

- ▶ **Antipsychotics**: effects of apomorphine antagonised by **ANTIPSYCHOTICS**
- **Domperidone**: possible increased risk of ventricular arrhythmias when apomorphine given with ● **DOMPERIDONE**
- ▶ **Dopaminergics**: effects of apomorphine possibly enhanced by **ENTACAPONE**
- **5HT<sub>2</sub>-receptor Antagonists**: possible increased hypotensive effect when apomorphine given with ● **ONDANSETRON**—avoid concomitant use
- ▶ **Memantine**: effects of dopaminergics possibly enhanced by **MEMANTINE**
- ▶ **Methyl dopa**: antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**

**Apraclonidine**

- ▶ **Antidepressants**: manufacturer of apraclonidine advises avoid concomitant use with **MAOIs**, **TRICYCLIC-RELATED ANTIDEPRESSANTS** and **TRICYCLICS**
- ▶ **Sympathomimetics**: manufacturer of apraclonidine advises avoid concomitant use with **SYMPATHOMIMETICS**

**Apremilast**

- **Antibacterials**: plasma concentration of apremilast reduced by ● **RIFAMPICIN**—avoid concomitant use
- **Antidepressants**: plasma concentration of apremilast possibly reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- **Antiepileptics**: plasma concentration of apremilast possibly reduced by ● **CARBAMAZEPINE**, ● **PHENOBARBITAL** and ● **PHENYTOIN**—avoid concomitant use

**Aprepitant**

- ▶ **Antibacterials**: plasma concentration of aprepitant possibly increased by **CLARITHROMYCIN** and **TELITHROMYCIN**; plasma concentration of aprepitant reduced by **RIFAMPICIN**
- ▶ **Anticoagulants**: aprepitant possibly reduces anticoagulant effect of **WARFARIN**
- **Antidepressants**: manufacturer of aprepitant advises avoid concomitant use with ● **ST JOHN'S WORT**
- ▶ **Antidiabetics**: aprepitant reduces plasma concentration of **TOLBUTAMIDE**
- ▶ **Antiepileptics**: plasma concentration of aprepitant possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ **Antifungals**: plasma concentration of aprepitant increased by **KETOCONAZOLE**
- **Antipsychotics**: manufacturer of aprepitant advises avoid concomitant use with ● **PIMOZIDE**
- ▶ **Antivirals**: plasma concentration of aprepitant possibly increased by **RITONAVIR**
- ▶ **Anxiolytics and Hypnotics**: aprepitant increases plasma concentration of **MIDAZOLAM** (risk of prolonged sedation)
- **Avanafil**: aprepitant possibly increases plasma concentration of ● **AVANAFIL**—see under Avanafil, p. 744
- ▶ **Calcium-channel Blockers**: plasma concentration of both drugs may increase when aprepitant given with **DILTIAZEM**
- ▶ **Corticosteroids**: aprepitant inhibits metabolism of **DEXAMETHASONE** and **METHYLPREDNISOLONE** (reduce dose of dexamethasone and methylprednisolone)
- **Cytotoxics**: aprepitant possibly increases the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; aprepitant possibly increases the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
- ▶ **Dapoxetine**: manufacturer of dapoxetine advises dose reduction when aprepitant given with **DAPOXETINE** (see under Dapoxetine, p. 751)
- ▶ **Guanfacine**: aprepitant possibly increases plasma concentration of **GUANFACINE** (halve dose of guanfacine)
- **Oestrogens**: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ● **OESTROGENS** (alternative contraception recommended)
- **Progestogens**: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ● **PROGESTOGENS** (alternative contraception recommended)

**Argatroban**

- **Analgesics**: increased risk of haemorrhage when anticoagulants given with *intravenous* ● **DICLOFENAC** (avoid

**Argatroban**

- Analgesics (continued)
  - concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **KETOROLAC** (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● **APIXABAN**, ● **DABIGATRAN**, ● **EDOXABAN** and ● **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

**Aripiprazole** see Antipsychotics

**Arsenic Trioxide**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **AMIODARONE** or ● **DISOPYRAMIDE**
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **DELAMANID**, ● **ERYTHROMYCIN**, ● **LEVOFLOXACIN** or ● **MOXIFLOXACIN**
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **AMITRIPTYLINE** or ● **CLOMIPRAMINE**
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **AMPHOTERICIN**
- Antimalarials: avoidance of arsenic trioxide advised by manufacturer of ● **ARTEMIMOL WITH PIPERAZINE** (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **ANTIPSYCHOTICS** that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with ● **HALOPERIDOL**; avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **SOTALOL**
- Cytotoxics: possible increased risk of ventricular arrhythmias when arsenic trioxide given with ● **VANDETANIB**—avoid concomitant use
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by ● **ACETAZOLAMIDE**, ● **LOOP DIURETICS** or ● **THIAZIDES AND RELATED DIURETICS**
- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with ● **LITHIUM**

**Artemether with Lumefantrine**

- Anti-arrhythmics: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **AMIODARONE**, ● **DISOPYRAMIDE** and ● **FLECAINIDE** (risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **MACROLIDES** and ● **QUINOLONES**
- Antidepressants: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with ● **CITALOPRAM** or ● **ESCITALOPRAM**—avoid concomitant use; manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **ANTIDEPRESSANTS**
- Antifungals: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **IMIDAZOLES** and ● **TRIAZOLES**
- Antimalarials: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **ANTIMALARIALS**; increased risk of ventricular arrhythmias when artemether with lumefantrine given with ● **QUININE**
- Antipsychotics: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **ANTIPSYCHOTICS**
- Antivirals: manufacturer of artemether with lumefantrine advises caution with **ATAZANAVIR**, **FOSAMPRENNAVIR**, **INDINAVIR**, **LOPINAVIR**, **RITONAVIR**, **SAQUINAVIR** and **TIPRANAVIR**; avoidance of artemether with lumefantrine advised by manufacturer of ● **BOCEPREVIR**; plasma concentration of lumefantrine increased when artemether with lumefantrine given with **DARUNAVIR**; plasma concentration of artemether with lumefantrine reduced by ● **EFAVIRENZ** and **ETRAVIRINE**
- Beta-blockers: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **METOPROLOL** and ● **SOTALOL**

**Artemether with Lumefantrine** (continued)

- Cytotoxics: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with ● **VANDETANIB**—avoid concomitant use
- ▶ Grapefruit Juice: plasma concentration of artemether with lumefantrine possibly increased by **GRAPEFRUIT JUICE**
- ▶ Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
- ▶ Penicillamine: increased risk of haematological toxicity when antimalarials given with **PENICILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
- Ulcer-healing Drugs: manufacturer of artemether with lumefantrine advises avoid concomitant use with ● **CIMETIDINE**
- ▶ Vaccines: antimalarials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNEC

**Artemimol with Piperazine**

- NOTE** Piperazine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped
- Analgesics: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **METHADONE** (possible risk of ventricular arrhythmias)
  - Anti-arrhythmics: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **AMIODARONE** and ● **DISOPYRAMIDE** (possible risk of ventricular arrhythmias)
  - Antibacterials: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **MACROLIDES** and ● **MOXIFLOXACIN** (possible risk of ventricular arrhythmias); manufacturer of artemimol with piperazine advises avoid concomitant use with **RIFAMPICIN**
  - Antidepressants: possible increased risk of ventricular arrhythmias when artemimol with piperazine given with ● **CITALOPRAM** or ● **ESCITALOPRAM**—avoid concomitant use; manufacturer of artemimol with piperazine advises avoid concomitant use with ● **ANTIDEPRESSANTS**
  - ▶ Antiepileptics: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
  - Antifungals: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **IMIDAZOLES** and ● **TRIAZOLES** (possible risk of ventricular arrhythmias)
  - Antihistamines: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **MIZOLASTINE** (possible risk of ventricular arrhythmias)
  - Antimalarials: avoidance of antimalarials advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**
  - Antipsychotics: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **DROPERIDOL**, ● **HALOPERIDOL**, ● **PHENOTHIAZINES** and ● **PIMOZIDE** (possible risk of ventricular arrhythmias)
  - Antivirals: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **SAQUINAVIR** (possible risk of ventricular arrhythmias)
  - Beta-blockers: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **SOTALOL** (possible risk of ventricular arrhythmias)
  - Cytotoxics: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **ARSENIC TRIOXIDE** (possible risk of ventricular arrhythmias); manufacturer of artemimol with piperazine advises avoid concomitant use with ● **VINBLASTINE**, ● **VINCRISTINE**, ● **VINFLUNINE** and ● **VINORELBINE**
  - Domperidone: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **DOMPERIDONE** (possible risk of ventricular arrhythmias)
  - ▶ Grapefruit Juice: manufacturer of artemimol with piperazine advises avoid concomitant use with **GRAPEFRUIT JUICE**
  - ▶ Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
  - ▶ Penicillamine: increased risk of haematological toxicity when antimalarials given with **PENICILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
  - Pentamidine Isetionate: manufacturer of artemimol with piperazine advises avoid concomitant use with ● **PENTAMIDINE ISETIONATE** (possible risk of ventricular arrhythmias)

**Arteminol with Piperaquine** (continued)

- Vaccines: antimalarials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Ascorbic acid** see Vitamins**Asenapine** see Antipsychotics**Aspirin**

- Adsorbents: absorption of aspirin possibly reduced by **KAOLIN**
- Anaesthetics, General: aspirin possibly enhances effects of **THIOPENTAL**
- Analgesics: avoid concomitant use of aspirin with ● **NSAIDS** (increased side-effects); antiplatelet effect of aspirin possibly reduced by **IBUPROFEN**
- Antacids: excretion of aspirin increased by alkaline urine due to some **ANTACIDS**
- Anticoagulants: increased risk of bleeding when aspirin given with ● **COUMARINS** or ● **PHENINDIONE** (due to antiplatelet effect); increased risk of bleeding when high-dose aspirin given with ● **EDOXABAN** (avoid concomitant use); aspirin enhances anticoagulant effect of ● **HEPARINS**
- Antidepressants: increased risk of bleeding when aspirin given with ● **SSRIS** or ● **VENLAFAXINE**
- Antiepileptics: aspirin enhances effects of **FOSPHENYTOIN**, **PHENYTOIN**, **SODIUM VALPROATE** and **VALPROIC ACID**
- Clopidogrel: increased risk of bleeding when aspirin given with **CLOPIDOGREL**
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with **CORTICOSTEROIDS**, also corticosteroids reduce plasma concentration of salicylate
- Cytotoxics: aspirin reduces excretion of ● **METHOTREXATE** (increased risk of toxicity); aspirin possibly reduces renal excretion of **PEMETREXED**—consult product literature
- Diuretics: aspirin antagonises diuretic effect of **SPIRONOLACTONE**; increased risk of toxicity when high-dose aspirin given with ● **ACETAZOLAMIDE**; possible increased risk of toxicity when high-dose aspirin given with **LOOP DIURETICS** (also possible reduced effect of loop diuretics)
- Iloprost: increased risk of bleeding when aspirin given with **ILOPROST**
- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of **ZAFIRLUKAST**
- Metoclopramide: rate of absorption of aspirin increased by **METOCLOPRAMIDE** (enhanced effect)
- Nicorandil: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with **NICORANDIL**
- Sulfinpyrazone: aspirin antagonises effects of **SULFINPYRAZONE**

**Atazanavir**

- Analgesics: atazanavir increases plasma concentration of **BUPRENORPHINE**
- Antacids: absorption of atazanavir reduced by **ANTACIDS** (give at least 2 hours before or 1 hour after antacids)
- Anti-arrhythmics: atazanavir possibly increases plasma concentration of ● **AMIODARONE** and ● **LIDOCAINE**
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with **CLARITHROMYCIN**; atazanavir increases plasma concentration of ● **RIFABUTIN** (reduce dose of rifabutin); plasma concentration of atazanavir reduced by ● **RIFAMPICIN**—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of ● **TELITHROMYCIN**
- Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of **WARFARIN**; avoidance of atazanavir advised by manufacturer of **APIXABAN** and **RIVAROXABAN**
- Antidepressants: plasma concentration of atazanavir reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- Antifungals: plasma concentration of atazanavir increased by ● **POSACONAZOLE**; atazanavir increases or decreases the plasma concentration of ● **VORICONAZOLE** and plasma concentration of atazanavir also reduced
- Antimalarials: caution with atazanavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; atazanavir possibly increases plasma concentration of ● **QUININE** (increased risk of toxicity)
- Antimuscarinics: avoidance of atazanavir advised by manufacturer of **DARIFENACIN**; manufacturer of fesoterodine advises dose reduction when atazanavir given with **FESOTERODINE**—consult fesoterodine product literature

**Atazanavir** (continued)

- Antipsychotics: atazanavir possibly increases plasma concentration of ● **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of ● **PIMOZIDE**—avoid concomitant use; atazanavir possibly increases plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of atazanavir reduced by ● **BOCEPREVIR**; atazanavir increases the plasma concentration of ● **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); absorption of atazanavir reduced by **DIDANOSINE tablets** (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with ● **EFAVIRENZ** (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of ● **ELVITEGRAVIR** (reduce dose of elvitegravir); avoid concomitant use of atazanavir with ● **INDINAVIR**; atazanavir increases plasma concentration of ● **MARAVIROC** (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by ● **NEVIRAPINE**—avoid concomitant use; atazanavir increases plasma concentration of ● **PARITAPREVIR**; increased risk of ventricular arrhythmias when atazanavir given with ● **SAQUINAVIR**—avoid concomitant use; atazanavir possibly reduces plasma concentration of **TELAPREVIR**, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by **TENOFOVIR**, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of **TIPRANAVIR** (also plasma concentration of atazanavir reduced)
- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of ● **MIDAZOLAM**—avoid concomitant use of oral midazolam
- Calcium-channel Blockers: atazanavir increases plasma concentration of ● **DILTIAZEM** (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of **VERAPAMIL**
- Ciclosporin: atazanavir possibly increases plasma concentration of ● **CICLOSPORIN**
- Colchicine: atazanavir possibly increases risk of ● **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of ● **CRIZOTINIB** and ● **EVEROLIMUS**—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); atazanavir possibly increases plasma concentration of ● **PAZOPANIB** (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of ● **CABAZITAXEL**; atazanavir possibly inhibits metabolism of ● **IRINOTECAN** (increased risk of toxicity)
- Dapoxetine: avoidance of atazanavir advised by manufacturer of ● **DAPOXETINE** (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ● **ERGOT ALKALOIDS**—avoid concomitant use
  - Guanfacine: atazanavir possibly increases plasma concentration of **GUANFACINE** (halve dose of guanfacine)
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with ● **ATORVASTATIN** or **PRAVASTATIN**; atazanavir increases plasma concentration of ● **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with ● **SIMVASTATIN** (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of **ETHINYLESTRADIOL**
- Orlistat: absorption of atazanavir possibly reduced by ● **ORLISTAT**
- Progestogens: atazanavir increases plasma concentration of **NORETHISTERONE**

**Atazanavir** (continued)

- Ranolazine: atazanavir possibly increases plasma concentration of ● **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: atazanavir possibly increases plasma concentration of ● **SIROLIMUS**
- ▶ Sympathomimetics, Beta<sub>2</sub>: atazanavir possibly increases plasma concentration of ● **SALMETEROL**—manufacturer of atazanavir advises avoid concomitant use
- Tacrolimus: atazanavir possibly increases plasma concentration of ● **TACROLIMUS**
- Ticagrelor: atazanavir possibly increases plasma concentration of ● **TICAGRELOR**—manufacturer of ticagrelor advises avoid concomitant use
- Ulcer-healing Drugs: manufacturer of atazanavir advises doses of both drugs when atazanavir given with ● **CIMETIDINE** and ● **NIZATIDINE**—consult atazanavir product literature; plasma concentration of atazanavir reduced by ● **FAMOTIDINE** and ● **RANITIDINE** (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by ● **PROTON PUMP INHIBITORS**—avoid or adjust dose of both drugs (consult product literature)

**Atenolol** see Beta-blockers

**Atomoxetine**

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with ● **METHADONE**; possible increased risk of convulsions when atomoxetine given with ● **TRAMADOL**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with ● **AMIODARONE** or ● **DISOPYRAMIDE**
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with *parenteral* ● **ERYTHROMYCIN**; increased risk of ventricular arrhythmias when atomoxetine given with ● **MOXIFLOXACIN**
- Antidepressants: metabolism of atomoxetine possibly inhibited by ● **FLUOXETINE** and ● **PAROXETINE**; possible increased risk of convulsions when atomoxetine given with ● **ANTIDEPRESSANTS**; atomoxetine should not be started until 2 weeks after stopping ● **MAOIS**, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with ● **TRICYCLICS**
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with ● **MEFLOQUINE**
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with ● **ANTIPSYCHOTICS** that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with ● **SOTALOL**
- ▶ Bupropion: possible increased risk of convulsions when atomoxetine given with ● **BUPROPION**
- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by ● **DIURETICS**
- ▶ Sympathomimetics, Beta<sub>2</sub>: increased risk of cardiovascular side-effects when atomoxetine given with *parenteral* ● **SALBUTAMOL**

**Atorvastatin** see Statins

**Atovaquone**

- Antibacterials: manufacturer of atovaquone advises avoid concomitant use with ● **RIFABUTIN** (plasma concentration of both drugs reduced); plasma concentration of atovaquone reduced by ● **RIFAMPICIN** (and concentration of rifampicin increased)—avoid concomitant use; plasma concentration of atovaquone reduced by ● **TETRACYCLINE**
- Antivirals: plasma concentration of atovaquone reduced by ● **EFAVIRENZ**—avoid concomitant use; atovaquone possibly reduces plasma concentration of ● **INDINAVIR**; plasma concentration of atovaquone possibly reduced by ● **RITONAVIR**—manufacturer of atovaquone advises avoid concomitant use; atovaquone increases plasma concentration of ● **ZIDOVUDINE** (increased risk of toxicity)
- ▶ Cytotoxics: atovaquone possibly increases plasma concentration of ● **ETOPOSIDE**
- ▶ Histamine: avoidance of atovaquone advised by manufacturer of ● **HISTAMINE**
- ▶ Metoclopramide: plasma concentration of atovaquone reduced by ● **METOCLOPRAMIDE**—avoid concomitant use

**Atracurium** see Muscle Relaxants

**Atropine** see Antimuscarinics

**Avanafil**

- ▶ ACE Inhibitors: avanafil possibly enhances hypotensive effect of ● **ENALAPRIL**
- ▶ Alcohol: possible enhanced hypotensive effect when avanafil given with ● **ALCOHOL**
- Alpha-blockers: enhanced hypotensive effect when avanafil given with ● **ALPHA-BLOCKERS**—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Antibacterials: plasma concentration of avanafil possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by ● **ERYTHROMYCIN**—see under Avanafil, p. 744; plasma concentration of avanafil possibly reduced by ● **RIFAMPICIN**—manufacturer of avanafil advises avoid concomitant use
- ▶ Antiepileptics: plasma concentration of avanafil possibly reduced by ● **CARBAMAZEPINE**, ● **PHENOBARBITAL** and ● **PRIMIDONE**—manufacturer of avanafil advises avoid concomitant use
- Antifungals: plasma concentration of avanafil increased by ● **KETOCONAZOLE**—avoid concomitant use; plasma concentration of avanafil possibly increased by ● **FLUCONAZOLE**—see under Avanafil, p. 744; plasma concentration of avanafil possibly increased by ● **ITRACONAZOLE** and ● **VORICONAZOLE**—manufacturer of avanafil advises avoid concomitant use
- Antivirals: plasma concentration of avanafil possibly reduced by ● **EFAVIRENZ**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by ● **FOSAMPRENAVIR**—see under Avanafil, p. 744; plasma concentration of avanafil possibly increased by ● **INDINAVIR** and ● **SAQUINAVIR**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil significantly increased by ● **RITONAVIR**—avoid concomitant use
- Aprepitant: plasma concentration of avanafil possibly increased by ● **APREPITANT**—see under Avanafil, p. 744
- ▶ Bosentan: plasma concentration of avanafil possibly reduced by ● **BOSENTAN**—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of avanafil possibly increased by ● **DILTIAZEM** and ● **VERAPAMIL**—see under Avanafil, p. 744
- Cobicistat: plasma concentration of avanafil possibly increased by ● **COBICISTAT**—avoid concomitant use
- ▶ Fosaprepitant: plasma concentration of avanafil possibly increased by ● **FOSAPREPITANT**
- ▶ Grapefruit Juice: plasma concentration of avanafil possibly increased by ● **GRAPEFRUIT JUICE**—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Nicorandil: avanafil significantly enhances hypotensive effect of ● **NICORANDIL** (avoid concomitant use)
- Nitrates: avanafil significantly enhances hypotensive effect of ● **NITRATES** (avoid concomitant use)
- Riociguat: possible enhanced hypotensive effect when avanafil given with ● **RIOCIQUAT**—avoid concomitant use

**Axitinib**

- ▶ Antibacterials: plasma concentration of axitinib possibly increased by ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** and ● **TELITHROMYCIN** (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly decreased by ● **RIFABUTIN** (increase dose of axitinib—consult axitinib product literature); plasma concentration of axitinib decreased by ● **RIFAMPICIN** (increase dose of axitinib—consult axitinib product literature)
- ▶ Antidepressants: plasma concentration of axitinib possibly reduced by ● **ST JOHN'S WORT**—consider increasing dose of axitinib
- ▶ Antiepileptics: plasma concentration of axitinib possibly decreased by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE** (increase dose of axitinib—consult axitinib product literature)
- ▶ Antifungals: plasma concentration of axitinib increased by ● **KETOCONAZOLE** (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly

**Axitinib**

- Antifungals (continued)
  - increased by **ITRACONAZOLE** (reduce dose of axitinib—consult axitinib product literature)
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of axitinib possibly increased by **ATAZANAVIR**, **INDINAVIR**, **RITONAVIR** and **SAQUINAVIR** (reduce dose of axitinib—consult axitinib product literature)
- Corticosteroids: plasma concentration of axitinib possibly decreased by **DEXAMETHASONE** (increase dose of axitinib—consult axitinib product literature)
- Grapefruit Juice: plasma concentration of axitinib possibly increased by **GRAPEFRUIT JUICE**

**Azathioprine**

- ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with **CAPTROPIL** especially in renal impairment; increased risk of anaemia when azathioprine given with **ENALAPRIL** especially in renal impairment
- Allopurinol: enhanced effects and increased toxicity of azathioprine when given with ● **ALLOPURINOL** (reduce dose of azathioprine to one quarter of usual dose)
- Analgesics: manufacturer of azathioprine advises possible increased risk of myelosuppression when azathioprine given with **INDOMETACIN**
- Antibacterials: increased risk of haematological toxicity when azathioprine given with ● **SULFAMETHOXAZOLE** (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with ● **TRIMETHOPRIM** (also with co-trimoxazole)
- Anticoagulants: azathioprine possibly reduces anticoagulant effect of ● **ACENOCOUMAROL**; azathioprine reduces anticoagulant effect of ● **WARFARIN**
- Antivirals: myelosuppressive effects of azathioprine possibly enhanced by ● **RIBAVIRIN**
- Febuxostat: avoidance of azathioprine advised by manufacturer of ● **FEBUXOSTAT**
- Ulcer-healing Drugs: manufacturer of azathioprine advises possible increased risk of myelosuppression when azathioprine given with **CIMETIDINE**
- Vaccines: risk of generalised infections when azathioprine given with live ● **VACCINES**—avoid concomitant use

**Azelastine** see Antihistamines

**Azilsartan** see Angiotensin-II Receptor Antagonists

**Azithromycin** see Macrolides

**Aztreonam**

- Anticoagulants: aztreonam possibly enhances anticoagulant effect of ● **COUMARINS**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Baclofen** see Muscle Relaxants

**Bambuterol** see Sympathomimetics, Beta<sub>2</sub>

**Basiliximab**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**BCG Vaccine** see Vaccines

**Beclomethasone** see Corticosteroids

**Bedaquiline**

- Antibacterials: plasma concentration of bedaquiline possibly increased by **CIPROFLOXACIN**, **CLARITHROMYCIN** and **ERYTHROMYCIN**—avoid concomitant use if ciprofloxacin, clarithromycin and erythromycin given for more than 14 days; manufacturer of bedaquiline advises avoid concomitant use with **MOXIFLOXACIN**; plasma concentration of bedaquiline possibly reduced by **RIFABUTIN**—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline reduced by ● **RIFAMPICIN**—manufacturer of bedaquiline advises avoid concomitant use; possible increased risk of ventricular arrhythmias when bedaquiline given with ● **CLOFAZIMINE**
- Anti-depressants: plasma concentration of bedaquiline possibly reduced by **ST JOHN'S WORT**—manufacturer of bedaquiline advises avoid concomitant use

**Bedaquiline** (continued)

- Antiepileptics: plasma concentration of bedaquiline possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN** and ● **PHENYTOIN**—manufacturer of bedaquiline advises avoid concomitant use
- Antifungals: plasma concentration of bedaquiline increased by **KETOCONAZOLE**—avoid concomitant use if ketoconazole given for more than 14 days; plasma concentration of bedaquiline possibly increased by **FLUCONAZOLE**—avoid concomitant use if fluconazole given for more than 14 days
- Antivirals: plasma concentration of bedaquiline possibly reduced by **EFAVIRENZ** and **ETRAVIRINE**—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline possibly increased by **RITONAVIR**—manufacturer of ritonavir advises avoid concomitant use
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Bee Venom Extracts**

- ACE Inhibitors: possible severe anaphylactoid reaction when bee venom extracts given with ● **ACE INHIBITORS**

**Belimumab**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Bendamustine**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)

**Bendroflumethiazide** see Diuretics

**Benperidol** see Antipsychotics

**Benzydiazepines** see Anxiolytics and Hypnotics

**Benzthiazide** see Diuretics

**Benzylpenicillin** see Penicillins

**Beta-blockers**

- NOTE** Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind
- ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with **ACE INHIBITORS**
  - Adrenergic Neuron Blockers: enhanced hypotensive effect when beta-blockers given with **ADRENERGIC NEURONE BLOCKERS**
  - Alcohol: enhanced hypotensive effect when beta-blockers given with **ALCOHOL**
  - Aldesleukin: enhanced hypotensive effect when beta-blockers given with **ADESLEUKIN**
  - Alpha-blockers: enhanced hypotensive effect when beta-blockers given with ● **ALPHA-BLOCKERS**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
  - Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with **GENERAL ANAESTHETICS**
  - Anaesthetics, Local: propranolol increases risk of ● **BUPIVACAINE** toxicity
  - Analgesics: hypotensive effect of beta-blockers antagonised by **NSAIDS**; plasma concentration of esmolol possibly increased by **MORPHINE**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
  - Anti-arrhythmics: increased myocardial depression when beta-blockers given with ● **ANTI-ARRHYTHMICS**; increased risk of ventricular arrhythmias when sotalol given with
    - **AMIODARONE**, ● **DISOPYRAMIDE** or ● **DRONEDARONE**—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with
    - **AMIODARONE**; plasma concentration of metoprolol and propranolol possibly increased by **DRONEDARONE**; increased risk of myocardial depression and bradycardia when beta-blockers given with ● **FLECAINIDE**; nadolol possibly increases risk of **LIDOCAINE** toxicity; propranolol increases risk of ● **LIDOCAINE** toxicity; plasma concentration of metoprolol and propranolol increased by **PROPAFENONE**
  - Antibacterials: increased risk of ventricular arrhythmias when sotalol given with ● **MOXIFLOXACIN**—avoid concomitant use;

**Beta-blockers**

- **Antibacterials** (continued)
  - metabolism of bisoprolol and propranolol accelerated by **RIFAMPICIN** (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by **RIFAMPICIN**; plasma concentration of *oral* timolol possibly reduced by **RIFAMPICIN**; increased risk of ventricular arrhythmias when sotalol given with ● **DELAMANID**
- **Antidepressants**: plasma concentration of metoprolol increased by **CITALOPRAM** and **ESCITALOPRAM**; increased risk of ventricular arrhythmias when sotalol given with ● **CITALOPRAM**—avoid concomitant use; avoidance of sotalol advised by manufacturer of ● **ESCITALOPRAM** and ● **VENLAFAXINE** (risk of ventricular arrhythmias); plasma concentration of propranolol increased by **FLUVOXAMINE**; plasma concentration of metoprolol possibly increased by ● **PAROXETINE**—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); labelatol and propranolol increase plasma concentration of **IMIPRAMINE**; enhanced hypotensive effect when beta-blockers given with **MAOIs**; increased risk of ventricular arrhythmias when sotalol given with ● **TRICYCLICS**
- ▶ **Antidiabetics**: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with **ANTI-DIABETICS**; beta-blockers enhance hypoglycaemic effect of **INSULIN**
- ▶ **Antiepileptics**: plasma concentration of propranolol possibly reduced by **PHENOBARBITAL** and **PRIMIDONE**
- ▶ **Antifungals**: plasma concentration of nadolol possibly increased by **KETOCONAZOLE**
- **Antihistamines**: increased risk of ventricular arrhythmias when sotalol given with ● **MIZOLASTINE**—avoid concomitant use
- **Antimalarials**: avoidance of metoprolol and sotalol advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; avoidance of sotalol advised by manufacturer of ● **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias); increased risk of bradycardia when beta-blockers given with **MFOQUININE**
- **Antimuscarinics**: increased risk of ventricular arrhythmias when sotalol given with ● **TOLTERODINE**
- **Antipsychotics**: increased risk of ventricular arrhythmias when sotalol given with ● **DROPERIDOL** or ● **ZUCLOPENTHIXOL**—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with ● **HALOPERIDOL**—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with ● **CHLORPROPAMAZINE**; increased risk of ventricular arrhythmias when sotalol given with ● **AMISULPRIDE**, ● **PHENOTHIAZINES**, ● **PIMOZIDE** or ● **SULPIRIDE**; enhanced hypotensive effect when beta-blockers given with **PHENOTHIAZINES**; possible increased risk of ventricular arrhythmias when sotalol given with ● **RISPERIDONE**
- **Antivirals**: increased risk of ventricular arrhythmias when sotalol given with ● **SAQUINAVIR**—avoid concomitant use; avoidance of sotalol advised by manufacturer of ● **TELAPREVIR** (risk of ventricular arrhythmias); avoidance of metoprolol for heart failure advised by manufacturer of ● **TIPRANAVIR**
- ▶ **Anxiolytics and Hypnotics**: enhanced hypotensive effect when beta-blockers given with **ANXIOLYTICS AND HYPNOTICS**
- **Atomoxetine**: increased risk of ventricular arrhythmias when sotalol given with ● **ATOMOXETINE**
- **Calcium-channel Blockers**: enhanced hypotensive effect when beta-blockers given with **CALCIUM-CHANNEL BLOCKERS**; possible severe hypotension and heart failure when beta-blockers given with ● **NIFEDIPINE**; increased risk of AV block and bradycardia when beta-blockers given with ● **DILTIAZEM**; asystole, severe hypotension and heart failure when beta-blockers given with ● **VERAPAMIL** (see under Verapamil, p. 155)
- ▶ **Cardiac glycosides**: increased risk of AV block and bradycardia when beta-blockers given with **CARDIAC GLYCOSIDES**
- **Ciclosporin**: carvedilol increases plasma concentration of ● **CYCLOSPORIN**
- **Clonidine**: increased risk of withdrawal hypertension when beta-blockers given with ● **CLONIDINE** (withdraw beta-blockers several days before slowly withdrawing clonidine)
- ▶ **Corticosteroids**: hypotensive effect of beta-blockers antagonised by **CORTICOSTEROIDS**

**Beta-blockers** (continued)

- **Cytotoxics**: possible increased risk of ventricular arrhythmias when sotalol given with ● **BOSUTINIB** and ● **CERITINIB**; possible increased risk of bradycardia when beta-blockers given with **CRIZOTINIB**; possible increased risk of ventricular arrhythmias when sotalol given with ● **VANDETANIB**—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with ● **ARSENIC TRIOXIDE**
  - ▶ **Diazoxide**: enhanced hypotensive effect when beta-blockers given with **DIAZOXIDE**
  - **Diuretics**: enhanced hypotensive effect when beta-blockers given with **DIURETICS**; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by ● **LOOP DIURETICS** or ● **THIAZIDES AND RELATED DIURETICS**
  - ▶ **Dopaminergics**: enhanced hypotensive effect when beta-blockers given with **CO-BENEFDOPA**, **CO-CARELDOPA** or **LEVODOPA**
  - ▶ **Ergot Alkaloids**: increased peripheral vasoconstriction when beta-blockers given with **ERGOT ALKALOIDS**
  - **Fingolimod**: possible increased risk of bradycardia when beta-blockers given with ● **FINGOLIMOD**
  - ▶ **Hormone Antagonists**: possible increased risk of bradycardia when carteolol, metoprolol, propranolol or sotalol given with **PASIREOTIDE**
  - ▶ **5HT<sub>2</sub>-receptor Agonists**: propranolol increases plasma concentration of **RIZATRIPTAN** (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
  - **Ivabradine**: increased risk of ventricular arrhythmias when sotalol given with ● **IVABRADINE**
  - ▶ **Methyldopa**: enhanced hypotensive effect when beta-blockers given with **METHYLDOPA**
  - ▶ **Mirabegron**: plasma concentration of metoprolol increased by **MIRABEGRON**
  - **Moxisylyte**: possible severe postural hypotension when beta-blockers given with ● **MOXISYLYTE**
  - ▶ **Moxonidine**: enhanced hypotensive effect when beta-blockers given with **MOXONIDINE**
  - ▶ **Muscle Relaxants**: propranolol enhances effects of **MUSCLE RELAXANTS**; enhanced hypotensive effect when beta-blockers given with **BACLOFEN**; possible enhanced hypotensive effect and bradycardia when beta-blockers given with **TIZANIDINE**
  - ▶ **Nitrates**: enhanced hypotensive effect when beta-blockers given with **NITRATES**
  - ▶ **Oestrogens**: hypotensive effect of beta-blockers antagonised by **OESTROGENS**
  - **Panobinostat**: possible increased risk of ventricular arrhythmias when sotalol given with ● **PANOBINOSTAT**—avoid concomitant use
  - ▶ **Parasympathomimetics**: propranolol antagonises effects of **NEOSTIGMINE** and **PYRIDOSTIGMINE**; increased risk of arrhythmias when beta-blockers given with **PILOCARPINE**
  - ▶ **Prostaglandins**: enhanced hypotensive effect when beta-blockers given with **ALPROSTADIL**
  - **Ranolazine**: avoidance of sotalol advised by manufacturer of ● **RANOLAZINE**
  - **Sympathomimetics**: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with ● **ADRENALINE (EPINEPHRINE)**, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with ● **DOBUTAMINE**; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with ● **NORADRENALINE (NOREPINEPHRINE)**
  - ▶ **Thyroid Hormones**: metabolism of propranolol accelerated by **LEVOTHYROXINE**
  - ▶ **Ulcer-healing Drugs**: plasma concentration of labelatol, metoprolol and propranolol increased by **CIMETIDINE**; plasma concentration of *oral* timolol possibly increased by **CIMETIDINE**
  - ▶ **Vasodilator Antihypertensives**: enhanced hypotensive effect when beta-blockers given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- Betahistine**
- ▶ **Antihistamines**: effect of betahistine theoretically antagonised by **ANTI-HISTAMINES**
- Betamethasone** see **Corticosteroids**
- Betaxolol** see **Beta-blockers**

**Bethanechol** see Parasympathomimetics

### Bevacizumab

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: avoidance of bevacizumab advised by manufacturer of
  - **PANITUMUMAB**
- Vaccines: risk of generalised infections when monoclonal antibodies given with live
  - **VACCINES**—avoid concomitant use

### Bexarotene

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by
  - **GEMFIBROZIL**—avoid concomitant use

**Bezafibrate** see Fibrates

### Bicalutamide

- Anticoagulants: bicalutamide possibly enhances anticoagulant effect of
  - **COUMARINS**
- Lipid-regulating Drugs: separating administration from bicalutamide by 12 hours advised by manufacturer of
  - **LOMITAPIDE**

**Biguanides** see Antidiabetics

**Bilastine** see Antihistamines

**Bile Acid Sequestrants** see Colesevelam, Colestipol, and Colestyramine

### Bile Acids

- Antacids: absorption of bile acids possibly reduced by
  - **ANTACIDS**; effects of cholic acid probably reduced by **ALUMINIUM HYDROXIDE** (manufacturer of cholic acid advises give at least 5 hours apart)
- Antiepileptics: manufacturer of cholic acid advises avoid concomitant use with
  - **PHENOBARBITAL**
- Ciclosporin: manufacturer of cholic acid advises avoid concomitant use with
  - **CICLOSPORIN**; ursodeoxycholic acid increases absorption of
    - **CICLOSPORIN**
- Lipid-regulating Drugs: effects of cholic acid probably reduced by
  - **COLESEVELAM**, **COLESTIPOL** and **COLESTYRAMINE** (manufacturer of cholic acid advises give at least 5 hours apart); absorption of bile acids possibly reduced by **COLESTIPIOL** and **COLESTYRAMINE**

**Bisoprolol** see Beta-blockers

### Bisphosphonates

- Antacids: absorption of bisphosphonates reduced by
  - **ANTACIDS**
- Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with
  - **AMINOGLYCOSIDES**
- Calcium Salts: absorption of bisphosphonates reduced by
  - **CALCIUM SALTS**
- Cytotoxics: sodium clodronate increases plasma concentration of
  - **ESTRAMUSTINE**
- Iron Salts: absorption of bisphosphonates reduced by
  - **ORAL IRON SALTS**

### Bivalirudin

- Analgesics: increased risk of haemorrhage when anticoagulants given with
  - **INTRAVENOUS DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
    - **KETOROLAC** (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with
  - **APIXABAN**, **DABIGATRAN**, **EDOXABAN** and **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

### Bleomycin

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of
  - **DIGOXIN tablets**
- Cytotoxics: increased risk of pulmonary toxicity when bleomycin given with
  - **BRENTUXIMAB VEDOTIN**—avoid concomitant use; increased pulmonary toxicity when bleomycin given with
    - **CISPLATIN**
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live
  - **VACCINES**—avoid concomitant use

### Boceprevir

- Alpha-blockers: boceprevir possibly increases plasma concentration of
  - **DOXAZOSIN** and **TAMSULOSIN**—manufacturer of boceprevir advises avoid concomitant use

**Boceprevir** (continued)

- Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with
  - **BUPRENORPHINE**; boceprevir possibly affects plasma concentration of **METHADONE**
- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with
  - **RIFAMPICIN** (plasma concentration of boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by manufacturer of
  - **APIXABAN**
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with
  - **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE** (plasma concentration of boceprevir possibly reduced)
- Antifungals: plasma concentration of boceprevir increased by
  - **KETOCONAZOLE**
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with
  - **ARTEMETHER WITH LUMEFANTRINE**
- Antipsychotics: boceprevir possibly increases plasma concentration of
  - **LURASIDONE**—avoid concomitant use; manufacturer of boceprevir advises avoid concomitant use with
    - **PIMOZIDE**; boceprevir possibly increases plasma concentration of
      - **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
  - Antivirals: boceprevir reduces plasma concentration of
    - **ATAZANAVIR**; boceprevir possibly increases the plasma concentration of
      - **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); avoid concomitant use of boceprevir with
        - **DARUNAVIR**; effects of both drugs possibly reduced when boceprevir given with **ETRAVIRINE**; avoidance of boceprevir advised by manufacturer of
          - **FOSAMPRENAVIR**, **NEVIRAPINE** and **TIPRANAVIR**; manufacturers advise avoid concomitant use of boceprevir with
            - **LOPINAVIR**; boceprevir increases plasma concentration of **MARAVIROC** (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with
              - **RITONAVIR**
      - Anxiolytics and Hypnotics: boceprevir increases plasma concentration of
        - **ORAL MIDAZOLAM**—manufacturer of boceprevir advises avoid concomitant use
      - Cardiac Glycosides: boceprevir possibly increases side-effects of
        - **DIGOXIN**
      - Ciclosporin: boceprevir increases plasma concentration of
        - **CICLOSPORIN**
      - Clostazol: boceprevir possibly increases plasma concentration of
        - **CLOSTAZOL** (see under Clostazol, p. 221)
      - Cobicistat: avoidance of boceprevir advised by manufacturer of
        - **COBICISTAT**
      - Cytotoxics: boceprevir possibly increases the plasma concentration of
        - **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with
          - **DASATINIB**, **ERLOTINIB**, **GEFITINIB**, **IMATINIB**, **LAPATINIB**, **NILOTINIB**, **PAZOPANIB**, **SORAFENIB** and **SUNITINIB**; manufacturer of ruxolitinib advises dose reduction when boceprevir given with
            - **RUXOLITINIB**—consult ruxolitinib product literature; boceprevir possibly increases plasma concentration of
              - **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
        - Domperidone: possible increased risk of ventricular arrhythmias when boceprevir given with
          - **DOMPERIDONE**—avoid concomitant use
        - Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with
          - **ERGOT ALKALOIDS**
        - Guanfacine: boceprevir possibly increases plasma concentration of
          - **GUANFACINE** (halve dose of guanfacine)
        - Lipid-regulating Drugs: boceprevir increases plasma concentration of
          - **ATORVASTATIN** (reduce dose of atorvastatin); boceprevir increases plasma concentration of **PRAVASTATIN**; manufacturers advise avoid concomitant use of boceprevir with
            - **SIMVASTATIN**
        - Progestogens: boceprevir increases plasma concentration of
          - **DROSPIRENONE** (increased risk of toxicity)
        - Sirolimus: boceprevir increases plasma concentration of
          - **SIROLIMUS** (increased risk of toxicity—reduce sirolimus dose)
        - Tacrolimus: boceprevir increases plasma concentration of
          - **TACROLIMUS** (reduce dose of tacrolimus)

**Bortezomib**

- Antibacterials: plasma concentration of bortezomib reduced by
  - **RIFAMPICIN**—manufacturer of bortezomib advises avoid concomitant use
- Antidepressants: plasma concentration of bortezomib possibly reduced by **ST JOHN'S WORT**—manufacturer of bortezomib advises avoid concomitant use
- Antiepileptics: plasma concentration of bortezomib possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**—manufacturer of bortezomib advises avoid concomitant use
- Antifungals: plasma concentration of bortezomib increased by **KETOCONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)

**Bosentan**

- Antibacterials: plasma concentration of bosentan reduced by
  - **RIFAMPICIN**—avoid concomitant use
- Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of **COUMARINS**
- Antidiabetics: increased risk of hepatotoxicity when bosentan given with
  - **GLIBENCLAMIDE**—avoid concomitant use
- Antifungals: plasma concentration of bosentan increased by **KETOCONAZOLE**; plasma concentration of bosentan possibly increased by
  - **FLUCONAZOLE**—avoid concomitant use; plasma concentration of bosentan possibly increased by **ITRACONAZOLE**
- Antivirals: avoidance of bosentan advised by manufacturer of **ELVITEGRAVIR** and **TIPRANAVIR**; bosentan possibly reduces plasma concentration of **INDINAVIR**; plasma concentration of bosentan increased by
  - **LOPINAVIR** and ● **RITONAVIR** (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of **TELAPREVIR**, also plasma concentration of bosentan possibly increased
- Avanafil: bosentan possibly reduces plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
- Ciclosporin: plasma concentration of bosentan increased by
  - **CYCLOSPORIN** (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Cobicistat: avoidance of bosentan advised by manufacturer of **COBICISTAT**
- Cytotoxics: bosentan possibly reduces plasma concentration of
  - **BOSUTINIB**—manufacturer of bosutinib advises avoid concomitant use
- Guanfacine: bosentan possibly reduces plasma concentration of
  - **GUANFACINE**—increase dose of guanfacine
- Lipid-regulating Drugs: bosentan reduces plasma concentration of **SIMVASTATIN**
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing
  - **OESTROGENS** (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing
  - **PROGESTOGENS** (alternative contraception recommended)
- Riociguat: bosentan reduces plasma concentration of **RIOCIQUAT**
- Sildenafil: bosentan reduces plasma concentration of **SILDENAFIL**, also plasma concentration of bosentan increased
- Tadalafil: bosentan reduces plasma concentration of **TADALAFIL**

**Bosutinib**

- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with
  - **METHADONE**
- Antacids: manufacturer of bosutinib advises separating administration with **ANTACIDS** by about 12 hours
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with
  - **AMIODARONE** and ● **DISOPYRAMIDE**; plasma concentration of bosutinib possibly increased by ● **DRONEDARONE**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antibacterials: plasma concentration of bosutinib possibly increased by
  - **CIPROFLOXACIN**, ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** and ● **TELITHROMYCIN**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with ● **MOXIFLOXACIN**; plasma concentration of bosutinib possibly reduced by ● **RIFABUTIN**—

**Bosutinib**

- Antibacterials (continued)
  - manufacturer of bosutinib advises avoid concomitant use; plasma concentration of bosutinib reduced by ● **RIFAMPICIN**—manufacturer of bosutinib advises avoid concomitant use
- Antidepressants: plasma concentration of bosutinib possibly reduced by ● **ST JOHN'S WORT**—manufacturer of bosutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of bosutinib possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of bosutinib advises avoid concomitant use
- Antifungals: plasma concentration of bosutinib increased by
  - **KETOCONAZOLE**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly increased by ● **FLUCONAZOLE**, ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antimalarials: possible increased risk of ventricular arrhythmias when bosutinib given with
  - **CHLOROQUINE** and ● **HYDROXYCHLOROQUINE**
- Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with ● **HALOPERIDOL**; avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of bosutinib possibly increased by
  - **ATAZANAVIR**, ● **BOCEPREVIR**, ● **DARUNAVIR**, ● **FOSAMPRENAVIR**, ● **INDINAVIR**, ● **RITONAVIR**, ● **SAQUINAVIR** and ● **TELAPREVIR**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by ● **EFAVIRENZ** and ● **ETRAVIRINE**—manufacturer of bosutinib advises avoid concomitant use
- Aprepitant: plasma concentration of bosutinib possibly increased by ● **APREPITANT**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with ● **SOTALOL**
- Bosentan: plasma concentration of bosutinib possibly reduced by ● **BOSENTAN**—manufacturer of bosutinib advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by ● **DILTIAZEM** and ● **VERAPAMIL**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Cytotoxics: plasma concentration of bosutinib possibly increased by ● **IMATINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Domperidone: manufacturer of bosutinib advises avoid concomitant use with ● **DOMPERIDONE** (risk of ventricular arrhythmias)
- Fosaprepitant: plasma concentration of bosutinib possibly increased by ● **FOSAPREPITANT**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Grapefruit Juice: plasma concentration of bosutinib possibly increased by ● **GRAPEFRUIT JUICE**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Modafinil: plasma concentration of bosutinib possibly reduced by ● **MODAFINIL**—manufacturer of bosutinib advises avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of bosutinib reduced by **LANSOPRAZOLE**

**Brentuximab vedotin**

- Antibacterials: effects of brentuximab vedotin possibly reduced by **RIFAMPICIN**
- Antifungals: possible increased risk of neutropenia when brentuximab vedotin given with ● **KETOCONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of pulmonary toxicity when brentuximab vedotin given with ● **BLEOMYCIN**—avoid concomitant use
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Brimonidine**

- Antidepressants: manufacturer of brimonidine advises avoid concomitant use with **MAOIs**, **TRICYCLIC-RELATED ANTIDEPRESSANTS** and **TRICYCLICS**

**Brinzolamide** see Diuretics

**Brivaracetam**

- Antibacterials: plasma concentration of brivaracetam reduced by ● **RIFAMPICIN**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs**; and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIs** and ● **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of brivaracetam reduced by **CARBAMAZEPINE**, also plasma concentration of active metabolite of carbamazepine increased; plasma concentration of brivaracetam reduced by **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**

**Bromocriptine**

- Alcohol: tolerance of bromocriptine reduced by **ALCOHOL**
- Antibacterials: plasma concentration of bromocriptine increased by **ERYTHROMYCIN** (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by **MACROLIDES** (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by **ANTIPSYCHOTICS**
- Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by **DOMPERIDONE**
- Hormone Antagonists: plasma concentration of bromocriptine increased by **OCTEOTIDE**
- Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**
- Methylidopa: antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by **METOCLOPRAMIDE**
- Sympathomimetics: risk of toxicity when bromocriptine given with ● **ISOMETHEPTENE**

**Bucilizine** see Antihistamines

**Budesonide** see Corticosteroids

**Bumetanide** see Diuretics

**Bupivacaine**

- Anti-arrhythmics: increased myocardial depression when bupivacaine given with **ANTI-ARRHYTHMICS**
- Beta-blockers: increased risk of bupivacaine toxicity when given with ● **PROPRANOLOL**

**Buprenorphine** see Opioid Analgesics

**Bupropion**

- Antidepressants: bupropion possibly increases plasma concentration of **CITALOPRAM**; manufacturer of bupropion advises avoid for 2 weeks after stopping ● **MAOIs**; manufacturer of bupropion advises avoid concomitant use with ● **MOCCLOBEMIDE**; bupropion possibly increases plasma concentration of **TRICYCLICS** (possible increased risk of convulsions); bupropion increases plasma concentration of **VORTIOXETINE** (consider reducing dose of vortioxetine)
- Antiepileptics: plasma concentration of bupropion reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN**; metabolism of bupropion inhibited by **SODIUM VALPROATE** and **VALPROIC ACID**
- Antivirals: metabolism of bupropion accelerated by **EFAVIRENZ** (reduced plasma concentration); plasma concentration of bupropion reduced by **RITONAVIR**
- Atomoxetine: possible increased risk of convulsions when bupropion given with **ATOMOXETINE**
- Dopaminergics: increased risk of side-effects when bupropion given with **AMANTADINE**, **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**
- Hormone Antagonists: bupropion possibly inhibits metabolism of ● **TAMOXIFEN** to active metabolite (avoid concomitant use)

**Bupropion** (continued)

- Methylthionium: possible risk of CNS toxicity when bupropion given with ● **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Buspirone** see Anxiolytics and Hypnotics

**Busulfan**

- Analgesics: metabolism of *intravenous* busulfan possibly inhibited by **PARACETAMOL** (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol)
- Antibacterials: plasma concentration of busulfan increased by ● **METRONIDAZOLE** (increased risk of toxicity)
- Antiepileptics: plasma concentration of busulfan possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**
- Antifungals: metabolism of busulfan inhibited by **ITRACONAZOLE** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with **TIOGUANINE**

**Butyrophenones** see Antipsychotics

**Cabazitaxel**

- Antibacterials: plasma concentration of cabazitaxel possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with ● **RIFABUTIN**; plasma concentration of cabazitaxel reduced by ● **RIFAMPICIN**—manufacturer of cabazitaxel advises avoid concomitant use
- Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with ● **ST JOHN'S WORT**
- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**
- Antifungals: manufacturer of cabazitaxel advises avoid concomitant use with ● **KETOCONAZOLE**; plasma concentration of cabazitaxel possibly increased by ● **ITRACONAZOLE** and ● **VORICONAZOLE**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: manufacturer of cabazitaxel advises avoid concomitant use with ● **ATAZANAVIR**; plasma concentration of cabazitaxel possibly increased by ● **INDINAVIR**, ● **RITONAVIR** and ● **SAQUINAVIR**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

**Cabergoline**

- Antibacterials: plasma concentration of cabergoline increased by **ERYTHROMYCIN** (increased risk of toxicity); plasma concentration of cabergoline possibly increased by **MACROLIDES** (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergoline antagonised by **ANTIPSYCHOTICS**
- Domperidone: hypoprolactinaemic effect of cabergoline possibly antagonised by **DOMPERIDONE**
- Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**
- Methylidopa: antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by **METOCLOPRAMIDE**

**Cabozantinib**

- Antibacterials: plasma concentration of cabozantinib possibly increased by **CLARITHROMYCIN** and **ERYTHROMYCIN**; plasma concentration of cabozantinib reduced by ● **RIFAMPICIN**—avoid concomitant use
- Antidepressants: plasma concentration of cabozantinib possibly reduced by **ST JOHN'S WORT**—manufacturer of cabozantinib advises avoid concomitant use
- Antiepileptics: plasma concentration of cabozantinib possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—avoid concomitant use

**Cabozantinib** (continued)

- ▶ Antifungals: plasma concentration of cabozantinib increased by **KETOCONAZOLE**; plasma concentration of cabozantinib possibly increased by **ITRACONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - ▶ **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ Antivirals: plasma concentration of cabozantinib possibly increased by **RITONAVIR**
- ▶ Corticosteroids: plasma concentration of cabozantinib possibly reduced by **DEXAMETHASONE**—manufacturer of cabozantinib advises avoid concomitant use
- ▶ Grapefruit Juice: plasma concentration of cabozantinib possibly increased by **GRAPEFRUIT JUICE**

**Caffeine citrate**

- ▶ Aminophylline: manufacturer of caffeine citrate advises avoid concomitant use with **AMINOPHYLLINE**
- ▶ Anti-arrhythmics: caffeine citrate antagonises anti-arrhythmic effect of **ADENOSINE**—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
- ▶ Antiepileptics: plasma concentration of caffeine citrate reduced by **FOSPHENYTOIN** and **PHENYTOIN**; caffeine citrate possibly antagonises effects of **PHENOBARBITAL** and **PRIMIDONE**
- ▶ Theophylline: manufacturer of caffeine citrate advises avoid concomitant use with **THEOPHYLLINE**
- ▶ Ulcer-healing Drugs: plasma concentration of caffeine citrate increased by **CIMETIDINE**

**Calcitriol** see Vitamins

**Calcium Salts**

**NOTE** see also Antacids

- ▶ Antibacterials: calcium salts reduce absorption of **CIPROFLOXACIN** (give at least 2 hours before or 4 hours after ciprofloxacin); calcium salts possibly reduce absorption of **TETRACYCLINES** (give at least 2 to 3 hours apart)
- ▶ Antivirals: calcium salts reduce absorption of **DOLUTEGRAVIR**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; separating administration from calcium salts by 4 hours advised by manufacturer of **LEDIPASVIR**; manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after **RILPIVIRINE**
- ▶ Bisphosphonates: calcium salts reduce absorption of **BISPHOSPHONATES**
- ▶ Cardiac glycosides: large *intravenous* doses of calcium salts can precipitate arrhythmias when given with **CARDIAC GLYCOSIDES**
- ▶ Corticosteroids: absorption of calcium salts reduced by **CORTICOSTEROIDS**
- ▶ Cytotoxics: calcium salts reduce absorption of **ESTRAMUSTINE** (manufacturer of estramustine advises avoid concomitant administration)
- ▶ Diuretics: increased risk of hypercalcaemia when calcium salts given with **THIAZIDES AND RELATED DIURETICS**
- ▶ Eltrombopag: calcium salts possibly reduce absorption of **ELTROMBOPAG** (give at least 4 hours apart)
- ▶ Fluorides: calcium salts reduce absorption of **FLUORIDES**
- ▶ Iron Salts: calcium salts reduce absorption of *oral* **IRON SALTS**
- ▶ Thyroid Hormones: calcium salts reduce absorption of **LEVOTHYROXINE**
- ▶ Zinc: calcium salts reduce absorption of **ZINC**

**Calcium-channel Blockers**

- NOTE** Dihydropyridine calcium-channel blockers include amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine
- ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with **ACE INHIBITORS**
  - ▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with **ADRENERGIC NEURONE BLOCKERS**
  - ▶ Alcohol: enhanced hypotensive effect when calcium-channel blockers given with **ALCOHOL**; verapamil possibly increases plasma concentration of **ALCOHOL**
  - ▶ Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with **ALDESLEUKIN**
  - ▶ Aliskiren: verapamil increases plasma concentration of **ALISKIREN**
  - Alpha-blockers: verapamil increases plasma concentration of **TAMSULOSIN**; enhanced hypotensive effect when calcium-

**Calcium-channel Blockers**

- Alpha-blockers (continued)
  - channel blockers given with ● **ALPHA-BLOCKERS**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Aminophylline: calcium-channel blockers possibly increase plasma concentration of ● **AMINOPHYLLINE** (enhanced effect); diltiazem increases plasma concentration of **AMINOPHYLLINE**; verapamil increases plasma concentration of ● **AMINOPHYLLINE** (enhanced effect)
- Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with **GENERAL ANAESTHETICS** or **ISOFLURANE**; hypotensive effect of verapamil enhanced by
  - **GENERAL ANAESTHETICS** (also AV delay)
- ▶ Analgesics: hypotensive effect of calcium-channel blockers antagonised by **NSAIDs**; diltiazem inhibits metabolism of **ALFENTANIL** (risk of prolonged or delayed respiratory depression)
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with
  - **AMIODARONE**; increased risk of myocardial depression and asystole when verapamil given with ● **DISOPYRAMIDE** or ● **FLECAINIDE**; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with
  - **DRONEDARONE**; nifedipine increases plasma concentration of **DRONEDARONE**
- Antibacterials: metabolism of calcium-channel blockers possibly inhibited by ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** and ● **TELITHROMYCIN** (increased risk of side-effects); manufacturer of lercanidipine advises avoid concomitant use with **ERYTHROMYCIN**; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by ● **RIFAMPICIN** (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by
  - **RIFAMPICIN** (possible significantly reduced plasma concentration); plasma concentration of felodipine possibly reduced by **RIFAMPICIN**; avoidance of verapamil advised by manufacturer of **FIDAXOMICIN**
- Anticoagulants: verapamil possibly increases plasma concentration of ● **DABIGATRAN** (see under Dabigatran Etxilate, p. 128); verapamil increases plasma concentration of **EDOXABAN**
- Antidepressants: metabolism of nifedipine possibly inhibited by **FLUOXETINE** (increased plasma concentration); diltiazem and verapamil increase plasma concentration of **IMIPRAMINE**; enhanced hypotensive effect when calcium-channel blockers given with **MAOIS**; plasma concentration of nifedipine reduced by **ST JOHN'S WORT**; plasma concentration of amlodipine and felodipine possibly reduced by **ST JOHN'S WORT**; plasma concentration of verapamil significantly reduced by ● **ST JOHN'S WORT**; diltiazem and verapamil possibly increase plasma concentration of **TRICYCLICS**
- ▶ Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with **INSULIN**
- Antiepileptics: effects of dihydropyridines, nicardipine and nifedipine probably reduced by **CARBAMAZEPINE**; diltiazem and verapamil enhance effects of ● **CARBAMAZEPINE**; manufacturer of nimodipine advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN** (plasma concentration of nimodipine possibly reduced); effects of felodipine and isradipine reduced by **CARBAMAZEPINE**; effects of felodipine and verapamil reduced by **FOSPHENYTOIN**; manufacturer of isradipine advises avoid concomitant use with **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**; diltiazem increases plasma concentration of ● **FOSPHENYTOIN** and ● **PHENYTOIN** but also effect of diltiazem reduced; effects of calcium-channel blockers probably reduced by ● **PHENOBARBITAL** and ● **PRIMIDONE**; manufacturer of nimodipine advises avoid concomitant use with
  - **PHENOBARBITAL** and ● **PRIMIDONE** (plasma concentration of nimodipine reduced); effects of felodipine and verapamil reduced by **PHENYTOIN**

**Calcium-channel Blockers** (continued)

- Antifungals: metabolism of dihydropyridines possibly inhibited by **ITRACONAZOLE** and **KETOCONAZOLE** (increased plasma concentration); metabolism of felodipine is inhibited by
  - **KETOCONAZOLE** (increased plasma concentration)—manufacturer of ketoconazole advises avoid concomitant use; manufacturer of lercanidipine advises avoid concomitant use with **ITRACONAZOLE** and **KETOCONAZOLE**; negative inotropic effect possibly increased when calcium-channel blockers given with **ITRACONAZOLE**; metabolism of felodipine inhibited by
    - **ITRACONAZOLE** (increased plasma concentration); plasma concentration of nifedipine increased by **MICAFUNGIN**
- ▶ Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with **MEFLOQUINE**
- ▶ Antimuscarinics: avoidance of verapamil advised by manufacturer of **DARIFENACIN**; verapamil increases plasma concentration of **SOLIFENACIN**
- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with **ANTIPSYCHOTICS**; verapamil possibly increases the plasma concentration of ● **LURASIDONE** (see under Lurasidone, p. 375); diltiazem increases the plasma concentration of ● **LURASIDONE** (see under Lurasidone, p. 375)
- Antivirals: plasma concentration of verapamil possibly increased by **ATAZANAVIR**; plasma concentration of diltiazem increased by ● **ATAZANAVIR** (reduce dose of diltiazem); plasma concentration of diltiazem reduced by **EFAVIRENZ**; plasma concentration of amlodipine increased by ● **RITONAVIR** (reduce dose of amlodipine); plasma concentration of calcium-channel blockers possibly increased by ● **RITONAVIR**; manufacturer of lercanidipine advises avoid concomitant use with **RITONAVIR**; caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer of **TELAPREVIR**; plasma concentration of amlodipine increased by **TELAPREVIR** (consider reducing dose of amlodipine)
- ▶ Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with **ANXIOLYTICS AND HYPNOTICS**; diltiazem and verapamil inhibit metabolism of **MIDAZOLAM** (increased plasma concentration with increased sedation); absorption of lercanidipine increased by **MIDAZOLAM**; diltiazem and verapamil increase plasma concentration of **BUSPIRONE** (reduce dose of buspirone)
- ▶ Aprepitant: plasma concentration of both drugs may increase when diltiazem given with **APREPITANT**
- Avanafil: diltiazem and verapamil possibly increase plasma concentration of ● **AVANAFIL**—see under Avanafil, p. 744
- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with **BETA-BLOCKERS**; increased risk of AV block and bradycardia when diltiazem given with ● **BETA-BLOCKERS**; asystole, severe hypotension and heart failure when verapamil given with ● **BETA-BLOCKERS** (see under Verapamil, p. 155); possible severe hypotension and heart failure when nifedipine given with ● **BETA-BLOCKERS**
- ▶ Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with **NIFEDIPINE**
- Cardiac Glycosides: nifedipine possibly increases plasma concentration of ● **DIGOXIN**; diltiazem, lercanidipine and nicardipine increase plasma concentration of ● **DIGOXIN**; verapamil increases plasma concentration of ● **DIGOXIN**, also increased risk of AV block and bradycardia
- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ● **CICLOSPORIN**; combination of lercanidipine with ● **CICLOSPORIN** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by **CICLOSPORIN** (increased risk of toxicity including gingival hyperplasia)
- ▶ Cilostazol: diltiazem increases plasma concentration of **CILOSTAZOL** (consider reducing dose of cilostazol)
- ▶ Clonidine: enhanced hypotensive effect when calcium-channel blockers given with **CLONIDINE**
- Colchicine: diltiazem and verapamil possibly increase risk of ● **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

**Calcium-channel Blockers** (continued)

- ▶ Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by **CORTICOSTEROIDS**; diltiazem increases plasma concentration of **METHYLPREDNISOLONE**
- Cytotoxics: verapamil possibly increases plasma concentration of **DOXORUBICIN**; verapamil possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of bradycardia when diltiazem or verapamil given with **CRIZOTINIB**; plasma concentration of both drugs may increase when verapamil given with ● **EVEROLIMUS** (consider reducing the dose of everolimus—consult everolimus product literature); diltiazem and verapamil possibly increase the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); diltiazem and verapamil possibly increase plasma concentration of ● **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881); nifedipine possibly inhibits metabolism of **VINCISTINE**
- ▶ Dapoxetine: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with **DAPOXETINE** (see under Dapoxetine, p. 751)
- ▶ Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with **DIAZOXIDE**
- ▶ Diuretics: diltiazem and verapamil increase plasma concentration of **EPLERENONE** (reduce dose of eplerenone); enhanced hypotensive effect when calcium-channel blockers given with **DIURETICS**
- ▶ Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**
- Fingolimod: possible increased risk of bradycardia when diltiazem or verapamil given with ● **FINGOLIMOD**
- ▶ Fosaprepitant: plasma concentration of both drugs may increase when diltiazem given with **FOSAPREPITANT**
- ▶ Grapefruit Juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by **GRAPEFRUIT JUICE**; plasma concentration of amlodipine possibly increased by **GRAPEFRUIT JUICE**
- ▶ Guanfacine: diltiazem and verapamil possibly increase the plasma concentration of **GUANFACINE** (halve dose of guanfacine)
- ▶ Hormone Antagonists: diltiazem and verapamil increase plasma concentration of **DUTASTERIDE**; possible increased risk of bradycardia when diltiazem or verapamil given with **PASIREOTIDE**
- Ivabradine: diltiazem and verapamil increase plasma concentration of ● **IVABRADINE**—avoid concomitant use
- Lenalidomide: verapamil possibly increases plasma concentration of ● **LENALIDOMIDE** (increased risk of toxicity)
- Lipid-regulating Drugs: diltiazem increases plasma concentration of **ATORVASTATIN**—possible increased risk of myopathy; plasma concentration of verapamil increased by ● **ATORVASTATIN**, also possible increased risk of myopathy (consider reducing dose of atorvastatin); possible increased risk of myopathy when amlodipine and diltiazem given with ● **SIMVASTATIN** (see under Simvastatin, p. 194); increased risk of myopathy when verapamil given with ● **SIMVASTATIN** (see under Simvastatin, p. 194); avoidance of diltiazem and verapamil advised by manufacturer of ● **LOMITAPIDE** (plasma concentration of lomitapide possibly increased); separating administration from amlodipine and lacidipine by 12 hours advised by manufacturer of **LOMITAPIDE**
- ▶ Lithium: neurotoxicity may occur when diltiazem or verapamil given with **LITHIUM** without increased plasma concentration of lithium
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and ● **PARENTERAL MAGNESIUM** in pre-eclampsia
- ▶ Methylidopa: enhanced hypotensive effect when calcium-channel blockers given with **METHYLDOPA**

**Calcium-channel Blockers** (continued)

- ▶ Moxisylyte: enhanced hypotensive effect when calcium-channel blockers given with **MOXISYLYTE**
- ▶ Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with **MOXONIDINE**
- ▶ Muscle Relaxants: verapamil enhances effects of **NON-DEPOLARISING MUSCLE RELAXANTS** and **SUXAMETHONIUM**; enhanced hypotensive effect when calcium-channel blockers given with **BACLOFEN** or **TIZANIDINE**; manufacturer of verapamil advises avoid concomitant use of *intravenous* **DANTROLENE**; possible increased risk of ventricular arrhythmias when diltiazem given with *intravenous* **DANTROLENE**—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of **NON-DEPOLARISING MUSCLE RELAXANTS**
- ▶ Naloxegol: diltiazem increases plasma concentration of **NALOXEGOL** (reduce dose of naloxegol—see under Naloxegol, p. 61); verapamil possibly increases plasma concentration of **NALOXEGOL** (reduce dose of naloxegol—see under Naloxegol, p. 61)
- ▶ Nitrates: enhanced hypotensive effect when calcium-channel blockers given with **NITRATES**
- ▶ Oestrogens: hypotensive effect of calcium-channel blockers antagonised by **OESTROGENS**
- ▶ Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with **ALPROSTADIL**
- ▶ Ranolazine: diltiazem and verapamil increase plasma concentration of **RANOLAZINE** (consider reducing dose of ranolazine)
- ▶ Sildenafil: enhanced hypotensive effect when amlodipine given with **SILDENAFIL**
- Sirolimus: diltiazem increases plasma concentration of ● **SIROLIMUS**; plasma concentration of both drugs increased when verapamil given with ● **SIROLIMUS**; nifedipine possibly increases plasma concentration of **SIROLIMUS**
- ▶ Sulfipyrazone: plasma concentration of verapamil reduced by **SULFINPYRAZONE**
- Tacrolimus: diltiazem, nifedipine and nifedipine increase plasma concentration of ● **TACROLIMUS**; felodipine and verapamil possibly increase plasma concentration of **TACROLIMUS**
- Theophylline: calcium-channel blockers possibly increase plasma concentration of ● **THEOPHYLLINE** (enhanced effect); diltiazem increases plasma concentration of **THEOPHYLLINE**; verapamil increases plasma concentration of ● **THEOPHYLLINE** (enhanced effect)
- ▶ Ticagrelor: diltiazem increases plasma concentration of **TICAGRELOR**
- ▶ Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by **CIMETIDINE** (increased plasma concentration); plasma concentration of isradipine increased by **CIMETIDINE** (halve dose of isradipine)
- ▶ Ulipristal: avoidance of verapamil advised by manufacturer of *low-dose* **ULIPRISTAL**
- ▶ Vardenafil: enhanced hypotensive effect when nifedipine given with **VARDENAFIL**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Calcium-channel Blockers (dihydropyridines)** see Calcium-channel Blockers

**Canagliflozin** see Antidiabetics

**Canakinumab**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Candesartan** see Angiotensin-II Receptor Antagonists

**Cannabis Extract**

- Antibacterials: plasma concentration of cannabis extract reduced by ● **RIFAMPICIN**—manufacturer of cannabis extract advises avoid concomitant use
- Antidepressants: plasma concentration of cannabis extract possibly reduced by ● **ST JOHN'S WORT**—manufacturer of cannabis extract advises avoid concomitant use; possible

**Cannabis Extract**

- Antidepressants (continued) increased risk of hypertension and tachycardia when cannabis extract given with **TRICYCLICS**
- Antiepileptics: plasma concentration of cannabis extract possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of cannabis extract advises avoid concomitant use
- ▶ Antifungals: plasma concentration of cannabis extract increased by **KETOCONAZOLE**

**Capecitabine**

- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with ● **ALLOPURINOL**
- ▶ Antibacterials: metabolism of capecitabine inhibited by **METRONIDAZOLE** (increased toxicity)
- Anticoagulants: capecitabine enhances anticoagulant effect of ● **COUMARINS**
- ▶ Antiepileptics: capecitabine possibly inhibits metabolism of **FOSPHENYTOIN** and **PHENYTOIN** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ Cytotoxics: capecitabine possibly increases plasma concentration of **ERLOTINIB**
- ▶ Filgrastim: neutropenia possibly exacerbated when capecitabine given with **FILGRASTIM**
- Folates: toxicity of capecitabine increased by ● **FOLIC ACID**—avoid concomitant use
- ▶ Lipetilgrastim: neutropenia possibly exacerbated when capecitabine given with **LIPEGFILGRASTIM**
- ▶ Pegfilgrastim: neutropenia possibly exacerbated when capecitabine given with **PEGFILGRASTIM**
- ▶ Ulcer-healing Drugs: metabolism of capecitabine inhibited by **CIMETIDINE** (increased plasma concentration)

**Capreomycin**

- ▶ Antibacterials: increased risk of nephrotoxicity when capreomycin given with **COLISTIMETHATE SODIUM** or **POLYMYXINS**; increased risk of nephrotoxicity and ototoxicity when capreomycin given with **AMINOGLYCOSIDES** or **VANCOMYCIN**
- ▶ Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with **PLATINUM COMPOUNDS**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNF C

**Captopril** see ACE Inhibitors

**Carbamazepine**

- ▶ Alcohol: CNS side-effects of carbamazepine possibly increased by **ALCOHOL**
- ▶ Aminophylline: carbamazepine accelerates metabolism of **AMINOPHYLLINE** (reduced effect)
- Analgesics: effects of carbamazepine enhanced by ● **DEXTROPROPOXYPHENE**; carbamazepine possibly accelerates metabolism of **FENTANYL** (reduced effect); carbamazepine reduces plasma concentration of **METHADONE**; carbamazepine reduces effects of **TRAMADOL**; carbamazepine possibly accelerates metabolism of **PARACETAMOL** (also isolated reports of hepatotoxicity)
- Anthelmintics: carbamazepine reduces plasma concentration of ● **ALBENDAZOLE** and ● **PRAZIQUANTEL**—consider increasing albendazole and praziquantel dose when given for systemic infections
- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of ● **DRONEDARONE**—avoid concomitant use
- Antibacterials: plasma concentration of carbamazepine increased by ● **CLARITHROMYCIN** (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by ● **ERYTHROMYCIN**; plasma concentration of carbamazepine reduced by ● **RIFABUTIN**; carbamazepine accelerates metabolism of **DOXYCYCLINE** (reduced effect); carbamazepine possibly reduces plasma concentration of ● **BEDAQUILINE**—manufacturer of bedaquiline advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of **DELAMANID**; plasma concentration of carbamazepine increased by ● **ISONIAZID** (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces

**Carbamazepine**

- **Antibacterials** (continued)
  - plasma concentration of ● **TELITHROMYCIN** (avoid during and for 2 weeks after carbamazepine)
- **Anticoagulants**: carbamazepine possibly reduces plasma concentration of ● **APIXABAN**—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; carbamazepine accelerates metabolism of ● **COUMARINS** (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of **DABIGATRAN**—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of ● **EDOXABAN**; carbamazepine possibly reduces plasma concentration of ● **RIVAROXABAN**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidepressants**: carbamazepine possibly reduces plasma concentration of **REBOXETINE**; plasma concentration of carbamazepine increased by ● **FLUOXETINE** and ● **FLUVOXAMINE**; carbamazepine reduces plasma concentration of ● **MIANSERIN**, **MIRTAZAPINE** and **TRAZODONE**; anticonvulsant effect of antiepileptics possibly antagonised by **MAOIS** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); manufacturer of carbamazepine advises avoid for 2 weeks after stopping ● **MAOIS**, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics antagonised by ● **SSRIS** and ● **TRICYCLICS** (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by **ST JOHN'S WORT**; carbamazepine accelerates metabolism of ● **TRICYCLICS** (reduced plasma concentration and reduced effect); carbamazepine possibly reduces plasma concentration of ● **VORTIOXETINE**—consider increasing dose of vortioxetine
- **Antiepileptics**: carbamazepine reduces plasma concentration of **BRIVARACETAM**, **SODIUM VALPROATE** and **VALPROIC ACID**, also plasma concentration of active metabolite of carbamazepine increased; carbamazepine possibly reduces plasma concentration of **ESLICARBAZEPINE** but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of **ETHOSUXIMIDE** and **RETIGABINE**; plasma concentration of both drugs often reduced when carbamazepine given with **FOSPHENYTOIN** or **PHENYTOIN**, also plasma concentration of fosphenytoin or phenytoin may be increased; carbamazepine often reduces plasma concentration of **LAMOTRIGINE**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with **LEVETIRACETAM**; plasma concentration of carbamazepine sometimes reduced by **OXCARBAZEPINE** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of ● **PERAMPANEL** (see under Perampanel, p. 301); carbamazepine possibly increases plasma concentration of **PHENOBARBITAL** and **PRIMIDONE**; plasma concentration of both drugs possibly reduced when carbamazepine given with **RUFINAMIDE**; plasma concentration of carbamazepine increased by ● **STIRIPENTOL**; carbamazepine reduces plasma concentration of **TIAGABINE** and **ZONISAMIDE**; carbamazepine often reduces plasma concentration of **TOPIRAMATE**
- **Antifungals**: plasma concentration of carbamazepine possibly increased by **KETOCONAZOLE**, also plasma concentration of ketoconazole possibly reduced; plasma concentration of carbamazepine possibly increased by **FLUCONAZOLE** and **MICONAZOLE**; carbamazepine possibly reduces plasma concentration of ● **ISAVUCONAZOLE** and ● **VORICONAZOLE**—avoid concomitant use; carbamazepine possibly reduces plasma concentration of **ITRACONAZOLE** and ● **POSACONAZOLE**; carbamazepine possibly reduces plasma concentration of **CASPOFUNGIN**—consider increasing dose of caspofungin
- **Antimalarials**: avoidance of carbamazepine advised by manufacturer of **ARTENIMOL WITH PIPERAQUINE**; anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- **Antimuscarinics**: carbamazepine possibly reduces plasma concentration of active metabolite of ● **FESOTERODINE**—manufacturer of fesoterodine advises avoid concomitant use

**Carbamazepine** (continued)

- **Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered); carbamazepine accelerates metabolism of **HALOPERIDOL**, **OLANZAPINE**, **QUETIAPINE** and **RISPERIDONE** (reduced plasma concentration); carbamazepine reduces plasma concentration of ● **ARIPIPRAZOLE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of ● **CLOZAPINE** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine possibly reduces plasma concentration of ● **LURASIDONE**—avoid concomitant use; carbamazepine reduces plasma concentration of **PALIPERIDONE**
- **Antivirals**: avoidance of carbamazepine advised by manufacturer of ● **BOCEPREVIR** and ● **RILPIVIRINE** (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of ● **DACLATASVIR** and ● **SIMEPREVIR**—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of **DARUNAVIR**, **FOSAMPRENAVIR**, **LOPINAVIR**, **SAQUINAVIR** and **TIPRANAVIR**; carbamazepine reduces plasma concentration of ● **DASABUVIR**, ● **OMBITASVIR** and ● **PARITAPREVIR**—avoid concomitant use; carbamazepine reduces the plasma concentration of ● **DOLUTEGRAVIR** (see under Dolutegravir, p. 592); plasma concentration of both drugs reduced when carbamazepine given with **EFAVIRENZ**; avoidance of carbamazepine advised by manufacturer of ● **ELVITEGRAVIR**, **ETRAVIRINE**, **LEDIPASVIR**, **SOFOSBUVIR** and ● **TELAPREVIR**; carbamazepine possibly reduces plasma concentration of ● **INDINAVIR**, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of **NEVIRAPINE**; plasma concentration of carbamazepine possibly increased by ● **RITONAVIR**
- ▶ **Anxiolytics and Hypnotics**: carbamazepine often reduces plasma concentration of **CLONAZEPAM**; carbamazepine reduces plasma concentration of **MIDAZOLAM**
- **Apremilast**: carbamazepine possibly reduces plasma concentration of ● **APREMILAST**—avoid concomitant use
- ▶ **Aprepitant**: carbamazepine possibly reduces plasma concentration of **APREPITANT**
- ▶ **Avanafil**: carbamazepine possibly reduces plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
- ▶ **Bupropion**: carbamazepine reduces plasma concentration of **BUPROPION**
- **Calcium-channel Blockers**: carbamazepine reduces effects of **FELODIPINE** and **ISRADIPINE**; carbamazepine probably reduces effects of **DIHYDROPYRIDINES**, **NICARDIPINE** and **NIFEDIPINE**; avoidance of carbamazepine advised by manufacturer of **NIMODIPINE** (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by ● **DILTIAZEM** and ● **VERAPAMIL**
- **Cannabis Extract**: carbamazepine possibly reduces plasma concentration of ● **CANNABIS EXTRACT**—manufacturer of cannabis extract advises avoid concomitant use
- **Ciclosporin**: carbamazepine accelerates metabolism of ● **CICLOSPORIN** (reduced plasma concentration)
- **Clopidogrel**: carbamazepine possibly reduces antiplatelet effect of ● **CLOPIDOGREL**
- **Cobicistat**: carbamazepine possibly reduces plasma concentration of ● **COBICISTAT**—manufacturer of cobicistat advises avoid concomitant use
- **Corticosteroids**: carbamazepine accelerates metabolism of ● **CORTICOSTEROIDS** (reduced effect)
- **Cytotoxics**: carbamazepine possibly decreases plasma concentration of **AXITINIB** (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of **BORTEZOMIB**, ● **BOSUTINIB**, **CRIZOTINIB**, ● **IBRUTINIB**, ● **IDELALISIB** and **PONATINIB**—manufacturer of bortezomib, bosutinib, crizotinib, ibrutinib, idelalisib and ponatinib advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of ● **CABOZANTINIB** and ● **CERITINIB**—avoid concomitant use; avoidance of

**Carbamazepine**

- Cytotoxics (continued)
  - carbamazepine advised by manufacturer of ● **CABAZITAXEL**, **DABRAFENIB**, **GEFITINIB**, ● **OLAPARIB** and **YEMURAFENIB**; avoidance of carbamazepine advised by manufacturer of **DASATINIB**, **VANDETANIB** and ● **VISMODEGIB** (plasma concentration of dasatinib, vandetanib and vismodegib possibly reduced); carbamazepine reduces plasma concentration of ● **IMATINIB** and ● **LAPATINIB**—avoid concomitant use; carbamazepine possibly reduces plasma concentration of **ERIBULIN**; carbamazepine reduces plasma concentration of **IRINOTECAN** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with **PROCARBAZINE**
- Diuretics: carbamazepine reduces plasma concentration of ● **EPLERENONE**—avoid concomitant use; increased risk of hyponatraemia when carbamazepine given with **DIURETICS**; plasma concentration of carbamazepine increased by ● **ACETAZOLAMIDE**
  - ▶ Fingolimod: carbamazepine reduces plasma concentration of **FINGOLIMOD**
  - ▶ Fosaprepitant: carbamazepine possibly reduces plasma concentration of **FOSAPREPITANT**
- Guanfacine: carbamazepine possibly reduces plasma concentration of ● **GUANFACINE**—increase dose of guanfacine
- Hormone Antagonists: carbamazepine possibly reduces plasma concentration of ● **ABIRATERONE**—manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by ● **DANAZOL** (increased risk of toxicity); carbamazepine possibly accelerates metabolism of **TOREMIFENE** (reduced plasma concentration)
  - ▶ 5HT<sub>2</sub>-receptor Antagonists: carbamazepine accelerates metabolism of **ONDANSETRON** (reduced effect)
- Ivacaftor: carbamazepine possibly reduces plasma concentration of ● **IVACAFTOR**—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of ● **SIMVASTATIN**—consider increasing dose of simvastatin
  - ▶ Lithium: neurotoxicity may occur when carbamazepine given with **LITHIUM** without increased plasma concentration of lithium
  - ▶ Lumacaftor: plasma concentration of carbamazepine possibly reduced by **LUMACAFTOR**—manufacturer of lumacaftor advises avoid concomitant use
  - ▶ Macitentan: avoidance of carbamazepine advised by manufacturer of **MACITENTAN**
  - ▶ Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of **NON-DEPOLARISING MUSCLE RELAXANTS** (accelerated recovery from neuromuscular blockade)
- Naloxegol: carbamazepine possibly reduces plasma concentration of ● **NALOXEGOL**—avoid concomitant use
- Oestrogens: carbamazepine accelerates metabolism of ● **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when anti-epileptics given with ● **ORLISTAT**
- Panobinostat: avoidance of carbamazepine advised by manufacturer of ● **PANOBINOSTAT**
- Progestogens: carbamazepine accelerates metabolism of ● **PROGESTOGENS** (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- ▶ Retinoids: plasma concentration of carbamazepine possibly reduced by **ISOTRETINOIN**
- ▶ Roflumilast: carbamazepine possibly inhibits effects of **ROFLUMILAST** (manufacturer of roflumilast advises avoid concomitant use)
- ▶ Theophylline: carbamazepine accelerates metabolism of **THEOPHYLLINE** (reduced effect)

**Carbamazepine** (continued)

- ▶ Thyroid Hormones: carbamazepine accelerates metabolism of **THYROID HORMONES** (may increase requirements for thyroid hormones in hypothyroidism)
- ▶ Tibolone: carbamazepine accelerates metabolism of **TIBOLONE** (reduced plasma concentration)
- ▶ Ticagrelor: carbamazepine possibly reduces plasma concentration of **TICAGRELOR**
- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by ● **CIMETIDINE** (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of ● **ULIPRISTAL** (contraceptive effect of ulipristal possibly reduced)
- ▶ Vitamins: carbamazepine possibly increases requirements for **ALFACALCIDOL**, **CALCIOTRIOL**, **COLECALCIFEROL**, **DIHYDROTACHYSTEROL**, **ERGOCALCIFEROL**, **PARICALCITOL** or **VITAMIN D**

**Carbapenems** see Ertapenem, Imipenem with Cilastatin, and Meropenem

**Carbimazole**

▶ Anticoagulants: carbimazole possibly enhances anticoagulant effect of **COUMARINS** see Diuretics

**Carbonic Anhydrase Inhibitors** see Diuretics

**Carboplatin** see Platinum Compounds

**Carboprost** see Prostaglandins

**Cardiac Glycosides**

- ▶ ACE Inhibitors: plasma concentration of digoxin possibly increased by **CAPTROPIL**
- ▶ Alpha-blockers: plasma concentration of digoxin increased by **PRazosin**
- ▶ Aminosaliclates: absorption of digoxin possibly reduced by **SULFASALAZINE**
- ▶ Analgesics: plasma concentration of cardiac glycosides possibly increased by **NSAIDs**, also possible exacerbation of heart failure and reduction of renal function
- ▶ Antacids: absorption of digoxin possibly reduced by **ANTACIDS**
- Anti-arrhythmics: plasma concentration of digoxin increased by ● **AMIODARONE**, ● **DRONEDARONE** and ● **PROPafenone** (halve dose of digoxin)
- ▶ Antibacterials: plasma concentration of digoxin possibly increased by **GENTAMICIN**, **TELITHROMYCIN** and **TRIMETHOPRIM**; absorption of digoxin reduced by **NEOMYCIN**; plasma concentration of digoxin possibly reduced by **RIFAMPICIN**; plasma concentration of digoxin increased by **MACROLIDES** (increased risk of toxicity)
- Antidepressants: plasma concentration of digoxin reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- ▶ Antidiabetics: plasma concentration of digoxin possibly reduced by **ACARBOSE**; plasma concentration of digoxin increased by **CANAGLIFLOZIN** and **SITAGLIPTIN**
- ▶ Anti-epileptics: plasma concentration of digoxin possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**
- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ● **AMPHOTERICIN**; plasma concentration of digoxin increased by **ISAVUCONAZOLE** and ● **ITRACONAZOLE**
- Antimalarials: plasma concentration of digoxin possibly increased by ● **CHLOROQUINE** and ● **HYDROXYCHLOROQUINE**; possible increased risk of bradycardia when digoxin given with **MEFLOQUINE**; plasma concentration of digoxin increased by ● **QUININE**
  - ▶ Antimuscarinics: plasma concentration of digoxin possibly increased by **DARIFENACIN**
- Antivirals: side-effects of digoxin possibly increased by **BOCEPREVIR**; plasma concentration of digoxin increased by ● **DACLATASVIR**, **ETRAVIRINE**, **SIMEPREVIR** and **TELAPREVIR**; plasma concentration of digoxin possibly increased by **PARITAPREVIR** (consider reducing dose of digoxin); plasma concentration of digoxin possibly increased by **RITONAVIR**
- ▶ Anxiolytics and Hypnotics: plasma concentration of digoxin increased by **ALPRAZOLAM** (increased risk of toxicity)
- ▶ Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with **BETA-BLOCKERS**
- ▶ Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large *intravenous* doses of **CALCIUM SALTS**

**Cardiac Glycosides** (continued)

- Calcium-channel Blockers: plasma concentration of digoxin increased by ● **DILTIAZEM**, ● **LERCANIDIPINE** and ● **NICARDIPINE**; plasma concentration of digoxin possibly increased by ● **NIFEDIPINE**; plasma concentration of digoxin increased by ● **VERAPAMIL**, also increased risk of AV block and bradycardia
- Cyclosporin: plasma concentration of digoxin increased by ● **CYCLOSPORIN** (increased risk of toxicity)
- ▶ Cobicistat: plasma concentration of digoxin possibly increased by **COBICISTAT**—reduce initial dose of digoxin
- Colchicine: possible increased risk of myopathy when digoxin given with ● **COLCHICINE**
- ▶ Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with **CORTICOSTEROIDS**
- ▶ Cytotoxics: absorption of digoxin *tablets* possibly reduced by **BLEOMYCIN**, **CARMUSTINE**, **CYCLOPHOSPHAMIDE**, **CYTARABINE**, **DOXORUBICIN**, **MELPHALAN**, **METHOTREXATE**, **PROCARBAZINE** and **VINCRIStINE**; possible increased risk of bradycardia when digoxin given with **CRIZOTINIB**; manufacturer of digoxin advises give **IBRUTINIB** at least 6 hours before or after ibrutinib; plasma concentration of digoxin increased by **VANDETANIB**—possible increased risk of bradycardia
- Diuretics: plasma concentration of digoxin possibly increased by **POTASSIUM CANRENOATE**; plasma concentration of digoxin increased by ● **SPIRONOLACTONE**; increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ● **ACETAZOLAMIDE**, ● **LOOP DIURETICS** or ● **THIAZIDES AND RELATED DIURETICS**
- ▶ Ivacaftor: plasma concentration of digoxin increased by **IVACAFTOR**
- ▶ Lenalidomide: plasma concentration of digoxin possibly increased by **LENALIDOMIDE**
- ▶ Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by **COLESTIPOL** and **COLESTYRAMINE**; plasma concentration of digoxin possibly increased by **ATORVASTATIN**
- ▶ Mirabegron: plasma concentration of digoxin increased by **MIRABEGRON**—reduce initial dose of digoxin
- ▶ Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with **SUXAMETHONIUM**; possible increased risk of bradycardia when cardiac glycosides given with **TIZANIDINE**
- ▶ Penicillamine: plasma concentration of digoxin possibly reduced by **PENICILLAMINE**
- ▶ Ranolazine: plasma concentration of digoxin increased by **RANOLAZINE**
- ▶ Sympathomimetics: avoidance of digoxin advised by manufacturer of **MIDODRINE**
- ▶ Sympathomimetics, Beta<sub>2</sub>: plasma concentration of digoxin possibly reduced by **SALBUTAMOL**
- Ticagrelor: plasma concentration of digoxin increased by ● **TICAGRELOR**
- Tolvaptan: plasma concentration of digoxin increased by **TOLVAPTAN** (increased risk of toxicity)
- ▶ Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by **PROTON PUMP INHIBITORS**; absorption of cardiac glycosides possibly reduced by **SUCRALFATE**
- ▶ Ulipristal: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after **ULIPRISTAL**

**Carmustine**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: carmustine possibly reduces absorption of **DIGOXIN tablets**
- ▶ Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by **CIMETIDINE**

**Carteolol** see Beta-blockers**Carvedilol** see Beta-blockers**Caspofungin**

- ▶ Antibacterials: plasma concentration of caspofungin initially increased and then reduced by **RIFAMPICIN** (consider increasing dose of caspofungin)
- ▶ Antiepileptics: plasma concentration of caspofungin possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN**—consider increasing dose of caspofungin
- ▶ Antivirals: plasma concentration of caspofungin possibly reduced by **EFAVIRENz** and **NEVIRAPINE**—consider increasing dose of caspofungin

**Caspofungin** (continued)

- Cyclosporin: plasma concentration of caspofungin increased by ● **CYCLOSPORIN** (manufacturer of caspofungin recommends monitoring liver enzymes)
- ▶ Corticosteroids: plasma concentration of caspofungin possibly reduced by **DEXAMETHASONE**—consider increasing dose of caspofungin
- Tacrolimus: caspofungin reduces plasma concentration of ● **TACROLIMUS**

**Catumaxomab**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
  - Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use
- Cefaclor** see Cephalosporins  
**Cefadroxil** see Cephalosporins  
**Cefalexin** see Cephalosporins  
**Cefixime** see Cephalosporins  
**Cefotaxime** see Cephalosporins  
**Cefradine** see Cephalosporins  
**Ceftaroline** see Cephalosporins  
**Ceftazidime** see Cephalosporins  
**Ceftobiprole** see Cephalosporins  
**Ceftolozane** see Cephalosporins  
**Ceftriaxone** see Cephalosporins  
**Cefuroxime** see Cephalosporins  
**Celecoxib** see NSAIDs  
**Celiprolol** see Beta-blockers

**Cephalosporins**

- ▶ Antacids: absorption of cefaclor reduced by **ANTACIDS**
- ▶ Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with **AMINOGLYCOSIDES**
- Anticoagulants: cephalosporins possibly enhance anticoagulant effect of ● **COUMARINS**
- ▶ Teriflunomide: plasma concentration of cefaclor increased by **TERIFLUNOMIDE**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Ceritinib**

- Analgesics: manufacturer of ceritinib advises avoid concomitant use with **ALFENTANIL** and **FENTANYL**; possible increased risk of ventricular arrhythmias when ceritinib given with ● **METHADONE**
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when ceritinib given with ● **AMIODARONE** and ● **DISOPYRAMIDE**
- Antibacterials: possible increased risk of ventricular arrhythmias when ceritinib given with ● **CLARITHROMYCIN** and ● **MOXIFLOXACIN**; plasma concentration of ceritinib possibly reduced by ● **RIFABUTIN**—avoid concomitant use; plasma concentration of ceritinib reduced by ● **RIFAMPICIN**—avoid concomitant use; plasma concentration of ceritinib possibly increased by ● **TELITHROMYCIN**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861)
- ▶ Anticoagulants: manufacturer of ceritinib advises avoid concomitant use with **WARFARIN**
- Antidepressants: plasma concentration of ceritinib possibly reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- Antiepileptics: plasma concentration of ceritinib possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—avoid concomitant use
- Antifungals: plasma concentration of ceritinib increased by ● **KETOCONAZOLE**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861); plasma concentration of ceritinib possibly increased by ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861)
- Antimalarials: possible increased risk of ventricular arrhythmias when ceritinib given with ● **CHLOROQUINE**
- Antipsychotics: possible increased risk of ventricular arrhythmias when ceritinib given with ● **DROPERIDOL** and ● **HALOPERIDOL**; avoid concomitant use of cytotoxics with

**Ceritinib**

- Antipsychotics (continued)
  - **CLOZAPINE** (increased risk of agranulocytosis); manufacturer of ceritinib advises avoid concomitant use with **PIMOZIDE**
- Antivirals: plasma concentration of ceritinib possibly increased by ● **RITONAVIR** and ● **SAQUINAVIR**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861)
- Beta-blockers: possible increased risk of ventricular arrhythmias when ceritinib given with ● **SOTALOL**
- ▶ Ciclosporin: manufacturer of ceritinib advises avoid concomitant use with **CICLOSPORIN**
- Domperidone: possible increased risk of ventricular arrhythmias when ceritinib given with ● **DOMPERIDONE**
- ▶ Ergot Alkaloids: manufacturer of ceritinib advises avoid concomitant use with **ERGOTAMINE**
- ▶ Grapefruit Juice: manufacturer of ceritinib advises avoid concomitant use with **GRAPEFRUIT JUICE**
- ▶ Sirolimus: manufacturer of ceritinib advises avoid concomitant use with **SIROLIMUS**
- ▶ Tacrolimus: manufacturer of ceritinib advises avoid concomitant use with **TACROLIMUS**

**Certolizumab pegol**

- Abatacept: avoid concomitant use of certolizumab pegol with
  - **ABATACEPT**
- Anakinra: avoid concomitant use of certolizumab pegol with
  - **ANAKINRA**
- Antipsychotics: avoid concomitant use of certolizumab pegol with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Cetirizine** see Antihistamines

**Cetuximab**

- Antipsychotics: avoid concomitant use of cetuximab with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Chenodeoxychoic Acid** see Bile Acids

**Chloral** see Anxiolytics and Hypnotics

**Chloramphenicol**

- ▶ Antibacterials: metabolism of chloramphenicol accelerated by **RIFAMPICIN** (reduced plasma concentration)
- Anticoagulants: chloramphenicol enhances anticoagulant effect of ● **COUMARINS**
- Antidiabetics: chloramphenicol enhances effects of
  - **SULFONYLUREAS**
- Antiepileptics: chloramphenicol increases plasma concentration of ● **FOSPHENYTOIN** and ● **PHENYTOIN** (increased risk of toxicity); metabolism of chloramphenicol possibly accelerated by ● **PHENOBARBITAL** and ● **PRIMIDONE** (reduced plasma concentration)
- Antipsychotics: avoid concomitant use of chloramphenicol with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Ciclosporin: chloramphenicol possibly increases plasma concentration of ● **CICLOSPORIN**
- Clopidogrel: chloramphenicol possibly reduces antiplatelet effect of ● **CLOPIDOGREL**
- ▶ Guanfacine: when given with chloramphenicol manufacturer of **GUANFACINE** advises halve dose
- ▶ Hydroxocobalamin: chloramphenicol reduces response to **HYDROXOCOBALAMIN**
- ▶ Iron Salts: chloramphenicol possibly inhibits effects of **IRON SALTS**
- Tacrolimus: chloramphenicol possibly increases plasma concentration of ● **TACROLIMUS**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Chlordiazepoxide** see Anxiolytics and Hypnotics

**Chlorprocaine**

- Antibacterials: chlorprocaine possibly inhibits effects of
  - **SULFONAMIDES** (manufacturer of chlorprocaine advises avoid concomitant use)

**Chloroquine**

- ▶ Adsorbents: absorption of chloroquine reduced by **KAOLIN**

**Chloroquine** (continued)

- ▶ Agalsidase Alfa and Beta: chloroquine possibly inhibits effects of **AGALSIDASE ALFA AND BETA** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- ▶ Antacids: absorption of chloroquine reduced by **ANTACIDS**
- Anthelmintics: chloroquine reduces plasma concentration of
  - **PRAZIQUANTEL**—consider increasing praziquantel dose when given for systemic infections
- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine given with ● **AMIODARONE**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when chloroquine given with ● **MOXIFLOXACIN**—avoid concomitant use
- Antidepressants: possible increased risk of ventricular arrhythmias when chloroquine given with ● **CITALOPRAM** and ● **ESCITALOPRAM**
- Antimalarials: avoidance of antimalarials advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; increased risk of convulsions when chloroquine given with ● **MEFLOQUINE**
- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine given with ● **DROPERIDOL**—avoid concomitant use
- Cardiac Glycosides: chloroquine possibly increases plasma concentration of ● **DIGOXIN**
- Ciclosporin: chloroquine increases plasma concentration of ● **CICLOSPORIN** (increased risk of toxicity)
- Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine given with ● **BOSUTINIB** and ● **CERTINIB**
- ▶ Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
- ▶ Lanthanum: absorption of chloroquine possibly reduced by **LANTHANUM** (give at least 2 hours apart)
- ▶ Laronidase: chloroquine possibly inhibits effects of **LARONIDASE** (manufacturer of laronidase advises avoid concomitant use)
- Panobinostat: possible increased risk of ventricular arrhythmias when chloroquine given with ● **PANOBINOSTAT**—avoid concomitant use
- ▶ Parasympathomimetics: chloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of **NEOSTIGMINE** and **PYRIDOSTIGMINE**
- ▶ Penicillamine: increased risk of haematological toxicity when antimalarials given with **PENICILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
- ▶ Ulcer-healing Drugs: metabolism of chloroquine inhibited by **CIMETIDINE** (increased plasma concentration)
- ▶ Vaccines: antimalarials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Chlorothiazide** see Diuretics

**Chlorphenamine** see Antihistamines

**Chlorpromazine** see Antipsychotics

**Chlortalidone** see Diuretics

**Cholera Vaccine** see Vaccines

**Cholic Acid** see Bile Acids

**Ciclesonide** see Corticosteroids

**Ciclosporin**

- ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with ● **ACE INHIBITORS**
- Aliskiren: ciclosporin increases plasma concentration of
  - **ALISKIREN**—avoid concomitant use
- ▶ Allopurinol: plasma concentration of ciclosporin possibly increased by **ALLOPURINOL** (risk of nephrotoxicity)
- Ambrisentan: ciclosporin increases plasma concentration of
  - **AMBRISENTAN** (see under Ambrisentan, p. 174)
- Analgesics: increased risk of nephrotoxicity when ciclosporin given with ● **NSAIDS**; ciclosporin increases plasma concentration of ● **DICLOFENAC** (halve dose of diclofenac)
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with ● **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Anti-arrhythmics: plasma concentration of ciclosporin possibly increased by **AMIODARONE** and **PROPAFENONE**
- Antibacterials: plasma concentration of ciclosporin increased by ● **AZITHROMYCIN**; metabolism of ciclosporin inhibited by
  - **CLARITHROMYCIN** and ● **ERYTHROMYCIN** (increased plasma concentration); metabolism of ciclosporin accelerated by ● **RIFAMPICIN** (reduced plasma concentration); plasma

## Ciclosporin

- **Antibacterials** (continued)
  - concentration of ciclosporin possibly reduced by
    - **SULFADIAZINE**; increased risk of nephrotoxicity when ciclosporin given with ● **AMINOGLYCOSIDES**, ● **POLYMYXINS**, ● **QUINOLONES**, ● **SULFONAMIDES** or ● **VANCOMYCIN**; plasma concentration of ciclosporin possibly increased by
    - **CHLORAMPHENICOL** and ● **TELITHROMYCIN**; increased risk of myopathy when ciclosporin given with ● **DAPTOMYCIN** (preferably avoid concomitant use); avoidance of ciclosporin advised by manufacturer of **FIDAXOMICIN**; metabolism of ciclosporin possibly inhibited by ● **MACROLIDES** (increased plasma concentration); ciclosporin increases plasma concentration of ● **RIFAXIMIN**; increased risk of nephrotoxicity when ciclosporin given with ● **TRIMETHOPRIM**, also plasma concentration of ciclosporin reduced by *intravenous* trimethoprim
- **Anticoagulants**: ciclosporin possibly increases plasma concentration of ● **DABIGATRAN**—manufacturer of dabigatran advises avoid concomitant use; ciclosporin increases plasma concentration of ● **EDOXABAN** (reduce dose of edoxaban—see under Edoxaban, p. 118)
- **Antidepressants**: plasma concentration of ciclosporin reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- ▶ **Antidiabetics**: ciclosporin possibly enhances hypoglycaemic effect of **REPAGLINIDE**
- **Antiepileptics**: metabolism of ciclosporin accelerated by
  - **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by **OXCARBAZEPINE**
- **Antifungals**: metabolism of ciclosporin inhibited by
  - **FLUCONAZOLE**, ● **ITRACONAZOLE**, ● **KETOCONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE** (increased plasma concentration); metabolism of ciclosporin possibly inhibited by ● **MICONAZOLE** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with
    - **AMPHOTERICIN**; plasma concentration of ciclosporin increased by **ISAVUCONAZOLE**; ciclosporin increases plasma concentration of ● **CASPOFUNGIN** (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by **GRISEOFULVIN** and **TERBINAFINE**; plasma concentration of ciclosporin possibly increased by **MICAFUNGIN**
- **Antimalarials**: plasma concentration of ciclosporin increased by ● **CHLOROQUINE** and ● **HYDROXYCHLOROQUINE** (increased risk of toxicity)
- ▶ **Antimuscarinics**: avoidance of ciclosporin advised by manufacturer of **DARIFENACIN**
- **Antivirals**: increased risk of nephrotoxicity when ciclosporin given with **ACICLOVIR** or **VALACICLOVIR**; plasma concentration of ciclosporin possibly increased by ● **ATAZANAVIR** and ● **RITONAVIR**; plasma concentration of ciclosporin increased by ● **BOCEPREVIR**, ● **FOSAMPRENAVIR** and ● **INDINAVIR**; plasma concentration of ciclosporin possibly reduced by ● **EFAVIRENZ**; plasma concentration of both drugs increased when ciclosporin given with ● **SAQUINAVIR**; plasma concentration of both drugs increased when ciclosporin given with
  - **TELAPREVIR** (reduce dose of ciclosporin)
- **Beta-blockers**: plasma concentration of ciclosporin increased by ● **CARVEDILOL**
- **Bile Acids**: avoidance of ciclosporin advised by manufacturer of **CHOLIC ACID**; absorption of ciclosporin increased by ● **URSODEOXYCHOLIC ACID**
- **Bosentan**: ciclosporin increases plasma concentration of ● **BOSENTAN** (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- **Calcium-channel Blockers**: combination of ciclosporin with ● **LERCANIDIPINE** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by ● **DILTIAZEM**, ● **NICARDIPINE** and ● **VERAPAMIL**; ciclosporin possibly increases plasma concentration of **NIFEDIPINE** (increased risk of toxicity including gingival hyperplasia)
- **Cardiac Glycosides**: ciclosporin increases plasma concentration of ● **DIGOXIN** (increased risk of toxicity)

## Ciclosporin (continued)

- **Colchicine**: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with ● **COLCHICINE**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- **Corticosteroids**: plasma concentration of ciclosporin increased by high-dose ● **METHYLPREDNISOLONE** (risk of convulsions); ciclosporin increases plasma concentration of **PREDNISOLONE**
- **Cytotoxics**: increased risk of nephrotoxicity when ciclosporin given with ● **MELPHALAN**; increased risk of neurotoxicity when ciclosporin given with ● **DOXORUBICIN**; ciclosporin increases plasma concentration of ● **EPIDRUBICIN** and ● **IDARUBICIN**; ciclosporin reduces excretion of **MITOXANTRONE** (increased plasma concentration); risk of toxicity when ciclosporin given with ● **METHOTREXATE**; ciclosporin possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours; avoidance of ciclosporin advised by manufacturer of **CERITINIB**; caution with ciclosporin advised by manufacturer of ● **CRIZOTINIB**; ciclosporin increases plasma concentration of ● **EVEROLIMUS** (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of ciclosporin possibly increased by **IMATINIB**; *in vitro* studies suggest a possible interaction between ciclosporin and **DOCETAXEL** (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of **ETOPOSIDE** (increased risk of toxicity)
  - ▶ **Dexrazoxane**: increased risk of immunosuppression with ciclosporin advised by manufacturer of **DEXRAZOXANE**
- **Diuretics**: plasma concentration of ciclosporin possibly increased by ● **ACETAZOLAMIDE**; increased risk of hyperkalaemia when ciclosporin given with ● **ALDOSTERONE ANTAGONISTS** or ● **POTASSIUM-SPARING DIURETICS**; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with **THIAZIDES AND RELATED DIURETICS**
- **Grapefruit Juice**: plasma concentration of ciclosporin increased by ● **GRAPEFRUIT JUICE** (increased risk of toxicity)
- **Hormone Antagonists**: metabolism of ciclosporin inhibited by ● **DANAZOL** (increased plasma concentration); plasma concentration of ciclosporin reduced by **LANREOTIDE** and ● **OCTREOTIDE**; plasma concentration of ciclosporin possibly reduced by ● **PASIREOTIDE**
- **Lenalidomide**: ciclosporin possibly increases plasma concentration of ● **LENALIDOMIDE** (increased risk of toxicity)
- **Lipid-regulating Drugs**: absorption of ciclosporin reduced by ● **COLESEVELAM**; increased risk of renal impairment when ciclosporin given with **BEZAFIBRATE** or **FENOFIBRATE**; increased risk of myopathy when ciclosporin given with ● **ATORVASTATIN** (see under Atorvastatin, p. 191); increased risk of myopathy when ciclosporin given with ● **FLUVASTATIN** or ● **PRAVASTATIN**; increased risk of myopathy when ciclosporin given with ● **ROSUVASTATIN** or ● **SIMVASTATIN** (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with ● **EZETIMIBE**; separating administration from ciclosporin by 12 hours advised by manufacturer of **LOMITAPIDE**
- ▶ **Lumacaftor**: avoidance of ciclosporin advised by manufacturer of **LUMACAFTOR**
- ▶ **Mannitol**: possible increased risk of nephrotoxicity when ciclosporin given with **MANNITOL**
- **Metoclopramide**: plasma concentration of ciclosporin increased by ● **METOCLOPRAMIDE**
- **Mifamurtide**: avoidance of ciclosporin advised by manufacturer of **MIFAMURTIDE**
- **Modafinil**: plasma concentration of ciclosporin reduced by ● **MODAFINIL**
- ▶ **Oestrogens**: plasma concentration of ciclosporin possibly increased by **OESTROGENS**
- **Orlistat**: absorption of ciclosporin possibly reduced by ● **ORLISTAT**
- **Potassium Salts**: increased risk of hyperkalaemia when ciclosporin given with ● **POTASSIUM SALTS**
- ▶ **Progestogens**: plasma concentration of ciclosporin possibly increased by **PROGESTOGENS**
- ▶ **Ranolazine**: plasma concentration of both drugs may increase when ciclosporin given with **RANOLAZINE**

**Cyclosporin** (continued)

- ▶ Sevelamer: plasma concentration of cyclosporin possibly reduced by **SEVELAMER**
- ▶ Sirolimus: cyclosporin increases plasma concentration of **SIROLIMUS**
- Sulfonpyrazone: plasma concentration of cyclosporin reduced by ● **SULFINPYRAZONE**
- Tacrolimus: plasma concentration of cyclosporin increased by ● **TACROLIMUS** (increased risk of nephrotoxicity)—avoid concomitant use
- ▶ Ticagrelor: cyclosporin increases plasma concentration of **TICAGRELOR**
- Ulcer-healing Drugs: plasma concentration of cyclosporin possibly increased by ● **CIMETIDINE**; plasma concentration of cyclosporin possibly affected by **OMEPRAZOLE**
- ▶ Vitamins: plasma concentration of cyclosporin possibly affected by **VITAMIN E**

**Cilostazol**

- Anagrelide: avoidance of cilostazol advised by manufacturer of ● **ANAGRELIDE**
- Antibacterials: plasma concentration of cilostazol possibly increased by ● **CLARITHROMYCIN** (see under Cilostazol, p. 221); plasma concentration of cilostazol increased by ● **ERYTHROMYCIN** (see under Cilostazol, p. 221)
- Antifungals: plasma concentration of cilostazol increased by ● **KETOCONAZOLE** (see under Cilostazol, p. 221); plasma concentration of cilostazol possibly increased by ● **ITRACONAZOLE** (see under Cilostazol, p. 221)
- Antivirals: plasma concentration of cilostazol possibly increased by ● **BOCEPREVIR**, ● **RITONAVIR** and ● **TELAPREVIR** (see under Cilostazol, p. 221)
- ▶ Calcium-channel Blockers: plasma concentration of cilostazol increased by **DILTIAZEM** (consider reducing dose of cilostazol)
- ▶ Lipid-regulating Drugs: separating administration from cilostazol by 12 hours advised by manufacturer of **LOMITAPIDE**
- Ulcer-healing Drugs: plasma concentration of cilostazol increased by ● **OMEPRAZOLE** (see under Cilostazol, p. 221)

**Cimetidine** see Histamine H<sub>2</sub>-antagonists

**Cinacalcet**

- ▶ Antifungals: metabolism of cinacalcet inhibited by **KETOCONAZOLE** (increased plasma concentration)
- Hormone Antagonists: cinacalcet possibly inhibits metabolism of ● **TAMOXIFEN** to active metabolite (avoid concomitant use)

**Cinnarizine** see Antihistamines

**Ciprofibrate** see Fibrates

**Ciprofloxacin** see Quinolones

**Cisatracurium** see Muscle Relaxants

**Cisplatin** see Platinum Compounds

**Citalopram** see Antidepressants, SSRI

**Cladribine**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: avoidance of cladribine advised by manufacturer of ● **LAMIVUDINE**

**Clarithromycin** see Macrolides

**Clemastine** see Antihistamines

**Clindamycin**

- Muscle Relaxants: clindamycin enhances effects of ● **NON-DEPOLARISING MUSCLE RELAXANTS** and ● **SUXAMETHONIUM**
- ▶ Parasympathomimetics: clindamycin antagonises effects of **NEOSTIGMINE** and **PYRIDOSTIGMINE**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Clobazam** see Anxiolytics and Hypnotics

**Clofazimine**

- Antibacterials: possible increased risk of ventricular arrhythmias when clofazimine given with ● **BEDAQUILINE**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Clomethiazole** see Anxiolytics and Hypnotics

**Clo mipramine** see Antidepressants, Tricyclic

**Clozapepam** see Anxiolytics and Hypnotics

**Clonidine**

- ▶ ACE Inhibitors: enhanced hypotensive effect when clonidine given with **ACE INHIBITORS**; previous treatment with clonidine possibly delays antihypertensive effect of **CAPTOPRIL**

**Clonidine** (continued)

- ▶ Adrenergic Neuron Blockers: enhanced hypotensive effect when clonidine given with **ADRENERGIC NEURONE BLOCKERS**
  - ▶ Alcohol: enhanced hypotensive effect when clonidine given with **ALCOHOL**
  - Aldesleukin: enhanced hypotensive effect when clonidine given with **ALDESLEUKIN**
  - Alpha-blockers: enhanced hypotensive effect when clonidine given with **ALPHA-BLOCKERS**
  - Anaesthetics, General: enhanced hypotensive effect when clonidine given with **GENERAL ANAESTHETICS**
  - ▶ Analgesics: hypotensive effect of clonidine antagonised by **NSAIDS**
  - ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
  - Antidepressants: enhanced hypotensive effect when clonidine given with **MAOIS**; hypotensive effect of clonidine possibly antagonised by **MIRTAZAPINE**; hypotensive effect of clonidine antagonised by ● **TRICYCLICS**, also increased risk of hypertension on clonidine withdrawal
  - ▶ Antipsychotics: enhanced hypotensive effect when clonidine given with **PHENOTHIAZINES**
  - ▶ Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with **ANXIOLYTICS AND HYPNOTICS**
  - Beta-blockers: increased risk of withdrawal hypertension when clonidine given with ● **BETA-BLOCKERS** (withdraw beta-blockers several days before slowly withdrawing clonidine)
  - ▶ Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with **CALCIUM-CHANNEL BLOCKERS**
  - ▶ Corticosteroids: hypotensive effect of clonidine antagonised by **CORTICOSTEROIDS**
  - ▶ Cytotoxics: possible increased risk of bradycardia when clonidine given with **CRIZOTINIB**
  - ▶ Diazoxide: enhanced hypotensive effect when clonidine given with **DIAZOXIDE**
  - ▶ Diuretics: enhanced hypotensive effect when clonidine given with **DIURETICS**
  - ▶ Dopaminergics: enhanced hypotensive effect when clonidine given with **CO-BENEDOPA**, **CO-CARELDOPA** or **LEVODOPA**
  - ▶ Histamine: avoidance of clonidine advised by manufacturer of **HISTAMINE**
  - ▶ Methyldopa: enhanced hypotensive effect when clonidine given with **METHYLDOPA**
  - ▶ Moxislyte: enhanced hypotensive effect when clonidine given with **MOXISLYTE**
  - ▶ Moxonidine: enhanced hypotensive effect when clonidine given with **MOXONIDINE**
  - ▶ Muscle Relaxants: enhanced hypotensive effect when clonidine given with **BACLOFEN** or **TIZANIDINE**
  - ▶ Nitrates: enhanced hypotensive effect when clonidine given with **NITRATES**
  - ▶ Oestrogens: hypotensive effect of clonidine antagonised by **OESTROGENS**
  - ▶ Prostaglandins: enhanced hypotensive effect when clonidine given with **ALPROSTADIL**
  - Sympathomimetics: possible risk of hypertension when clonidine given with **ADRENALINE (EPINEPHRINE)** or **NORADRENALINE (NOREPINEPHRINE)**; serious adverse events reported with concomitant use of clonidine and ● **METHYLPHENIDATE** (causality not established)
  - ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- Clopidamide** see Diuretics
- Clopidogrel**
- ▶ Analgesics: increased risk of bleeding when clopidogrel given with **NSAIDS** or **ASPIRIN**
  - Antibacterials: antiplatelet effect of clopidogrel possibly reduced by ● **CHLORAMPHENICOL**, ● **CIPROFLOXACIN** and ● **ERYTHROMYCIN**
  - Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with ● **WARFARIN**; antiplatelet action of clopidogrel enhances anticoagulant effect of ● **COUMARINS** and ● **PHENINDIONE**; increased risk of bleeding when clopidogrel given with **HEPARINS**

**Clopidogrel** (continued)

- Antidepressants: antiplatelet effect of clopidogrel possibly reduced by ● **FLUOXETINE**, ● **FLUVOXAMINE** and ● **MOCLOBEMIDE**
- Antiepileptics: antiplatelet effect of clopidogrel possibly reduced by ● **CARBAMAZEPINE** and ● **OXCARBAZEPINE**
- Antifungals: antiplatelet effect of clopidogrel possibly reduced by ● **FLUCONAZOLE**, ● **ITRACONAZOLE**, ● **KETOCONAZOLE** and ● **VORICONAZOLE**
- Antivirals: antiplatelet effect of clopidogrel possibly reduced by ● **ETRAVIRINE**
- Dipyridamole: increased risk of bleeding when clopidogrel given with **DIPYRIDAMOLE**
- ▶ Iloprost: increased risk of bleeding when clopidogrel given with **ILOPROST**
- Lipid-regulating Drugs: clopidogrel increases plasma concentration of ● **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature)
- ▶ Prasugrel: possible increased risk of bleeding when clopidogrel given with **PRASUGREL**
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by ● **CIMETIDINE**, **LANSOPRAZOLE**, **PANTOPRAZOLE** and **RABEPRAZOLE**; antiplatelet effect of clopidogrel reduced by ● **ESOMEPRAZOLE** and ● **OMEPRAZOLE**

**Clotrimazole** see Antifungals, Imidazole

**Clozapine** see Antipsychotics

**Co-amoxiclav** see Penicillins

**Co-beneldopa**

- ▶ ACE Inhibitors: enhanced hypotensive effect when co-beneldopa given with **ACE INHIBITORS**
  - ▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when co-beneldopa given with **ADRENERGIC NEURONE BLOCKERS**
  - ▶ Alpha-blockers: enhanced hypotensive effect when co-beneldopa given with **ALPHA-BLOCKERS**
  - Anaesthetics, General: increased risk of arrhythmias when co-beneldopa given with ● **VOLATILE LIQUID GENERAL ANAESTHETICS**
  - ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-beneldopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
  - ▶ Antibacterials: effects of co-beneldopa possibly reduced by **ISONIAZID**
  - Antidepressants: risk of hypertensive crisis when co-beneldopa given with ● **MAOIS**, avoid co-beneldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when co-beneldopa given with **MOCLOBEMIDE**
  - Antiepileptics: effects of co-beneldopa possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**
  - ▶ Antimuscarinics: absorption of co-beneldopa possibly reduced by **ANTIMUSCARINICS**
  - ▶ Antipsychotics: effects of co-beneldopa antagonised by **ANTIPSYCHOTICS**; avoidance of co-beneldopa advised by manufacturer of **AMISULPRIDE** (antagonism of effect)
  - ▶ Anxiolytics and Hypnotics: effects of co-beneldopa possibly antagonised by **BENZODIAZEPINES**
  - ▶ Beta-blockers: enhanced hypotensive effect when co-beneldopa given with **BETA-BLOCKERS**
  - ▶ Bupropion: increased risk of side-effects when co-beneldopa given with **BUPROPION**
  - ▶ Calcium-channel Blockers: enhanced hypotensive effect when co-beneldopa given with **CALCIUM-CHANNEL BLOCKERS**
  - ▶ Clonidine: enhanced hypotensive effect when co-beneldopa given with **CLONIDINE**
  - ▶ Diazoxide: enhanced hypotensive effect when co-beneldopa given with **DIAZOXIDE**
  - ▶ Diuretics: enhanced hypotensive effect when co-beneldopa given with **DIURETICS**
  - ▶ Dopaminergics: enhanced effects and increased toxicity of co-beneldopa when given with **SELEGLINE** (reduce dose of co-beneldopa)
  - ▶ Iron Salts: absorption of co-beneldopa possibly reduced by **oral IRON SALTS**
  - ▶ Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**
  - ▶ Methylodopa: enhanced hypotensive effect when co-beneldopa given with **METHYLDOPA**; antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- Co-beneldopa** (continued)
- ▶ Moxonidine: enhanced hypotensive effect when co-beneldopa given with **MOXONIDINE**
  - ▶ Muscle Relaxants: possible agitation, confusion and hallucinations when co-beneldopa given with **BACLOFEN**
  - ▶ Nitrates: enhanced hypotensive effect when co-beneldopa given with **NITRATES**
  - ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when co-beneldopa given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- Cobicistat**
- Alpha-blockers: cobicistat possibly increases plasma concentration of ● **ALFUZOSIN**—manufacturer of cobicistat advises avoid concomitant use
  - Anti-arrhythmics: cobicistat possibly increases plasma concentration of ● **AMIODARONE**—manufacturer of cobicistat advises avoid concomitant use
  - Antibacterials: plasma concentration of cobicistat reduced by ● **RIFABUTIN** (adjust dose—consult product literature); plasma concentration of cobicistat possibly reduced by ● **RIFAMPICIN**—manufacturer of cobicistat advises avoid concomitant use
  - Anticoagulants: avoidance of cobicistat advised by manufacturer of **APIXABAN**; cobicistat possibly enhances anticoagulant effect of ● **RIVAROXABAN**—avoid concomitant use
  - Antidepressants: plasma concentration of cobicistat possibly reduced by ● **ST JOHN'S WORT**—manufacturer of cobicistat advises avoid concomitant use
  - Antiepileptics: plasma concentration of cobicistat possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of cobicistat advises avoid concomitant use
  - ▶ Antifungals: cobicistat possibly increases plasma concentration of **ITRACONAZOLE** and **KETOCONAZOLE**—manufacturer of cobicistat advises reduce dose of itraconazole and ketoconazole
  - Antipsychotics: cobicistat possibly increases plasma concentration of ● **LURASIDONE**—avoid concomitant use; cobicistat possibly increases plasma concentration of ● **PIMOZIDE**—manufacturer of cobicistat advises avoid concomitant use
  - Antivirals: manufacturer of cobicistat advises avoid concomitant use with **BOCEPREVIR** and **RITONAVIR**; cobicistat possibly increases the plasma concentration of ● **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); avoidance of cobicistat advised by manufacturer of **DASABUVIR**, **NEVIRAPINE**, **OMBITASVIR** and **PARITAPREVIR**; cobicistat possibly increases plasma concentration of ● **MARAVIROC** (reduce dose of maraviroc); cobicistat possibly increases plasma concentration of ● **SIMEPREVIR**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs reduced when cobicistat given with ● **TIPRANAVIR** (avoid concomitant use)
  - Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with **oral MIDAZOLAM**
  - Avanafil: cobicistat possibly increases plasma concentration of ● **AVANAFIL**—avoid concomitant use
  - ▶ Bosentan: manufacturer of cobicistat advises avoid concomitant use with **BOSENTAN**
  - ▶ Cardiac Glycosides: cobicistat possibly increases plasma concentration of **DIGOXIN**—reduce initial dose of digoxin
  - Cytotoxics: cobicistat possibly increases the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); cobicistat possibly increases plasma concentration of ● **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
  - Domperidone: possible increased risk of ventricular arrhythmias when cobicistat given with ● **DOMPERIDONE**—avoid concomitant use
  - Ergot Alkaloids: cobicistat possibly increases plasma concentration of ● **ERGOT ALKALOIDS**—manufacturer of cobicistat advises avoid concomitant use
  - Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of **ATORVASTATIN**—manufacturer of cobicistat

**Cobicistat**

- Lipid-regulating Drugs (continued) advises reduce dose of atorvastatin; manufacturer of cobicistat advises avoid concomitant use with ● **SIMVASTATIN**
- Oestrogens: cobicistat accelerates metabolism of ● **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- ▶ Progestogens: cobicistat increases plasma concentration of **NORGESTIMATE**
- Sildenafil: cobicistat possibly increases plasma concentration of ● **SILDENAFIL**—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
- ▶ Sympathomimetics, Beta<sub>2</sub>: manufacturer of cobicistat advises avoid concomitant use with **SALMETEROL**
- Tadalafil: cobicistat possibly increases plasma concentration of ● **TADALAFIL**—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Vardenafil: cobicistat possibly increases plasma concentration of ● **VARDENAFIL**—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)

**Co-careldopa**

- ▶ ACE Inhibitors: enhanced hypotensive effect when co-careldopa given with **ACE INHIBITORS**
- ▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when co-careldopa given with **ADRENERGIC NEURONE BLOCKERS**
- ▶ Alpha-blockers: enhanced hypotensive effect when co-careldopa given with **ALPHA-BLOCKERS**
- Anaesthetics, General: increased risk of arrhythmias when co-careldopa given with ● **VOLATILE LIQUID GENERAL ANAESTHETICS**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-careldopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Antibacterials: effects of co-careldopa possibly reduced by **ISONIAZID**
- Antidepressants: risk of hypertensive crisis when co-careldopa given with ● **MAOIS**, avoid co-careldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when co-careldopa given with **MOCLOBEMIDE**
- ▶ Antiepileptics: effects of co-careldopa possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**
- ▶ Antimuscarinics: absorption of co-careldopa possibly reduced by **ANTIMUSCARINICS**
- ▶ Antipsychotics: effects of co-careldopa antagonised by **ANTIPSYCHOTICS**; avoidance of co-careldopa advised by manufacturer of **AMISULPRIDE** (antagonism of effect)
- ▶ Anxiolytics and Hypnotics: effects of co-careldopa possibly antagonised by **BENZODIAZEPINES**
- ▶ Beta-blockers: enhanced hypotensive effect when co-careldopa given with **BETA-BLOCKERS**
- ▶ Bupropion: increased risk of side-effects when co-careldopa given with **BUPROPION**
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when co-careldopa given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when co-careldopa given with **CLONIDINE**
- ▶ Diazoxide: enhanced hypotensive effect when co-careldopa given with **DIAZOXIDE**
- ▶ Diuretics: enhanced hypotensive effect when co-careldopa given with **DIURETICS**
- ▶ Dopaminergics: enhanced effects and increased toxicity of co-careldopa when given with **SELEGILINE** (reduce dose of co-careldopa)
- ▶ Iron Salts: absorption of co-careldopa possibly reduced by *oral* **IRON SALTS**
- ▶ Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**
- ▶ Methyl dopa: enhanced hypotensive effect when co-careldopa given with **METHYLDOPA**; antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- ▶ Moxonidine: enhanced hypotensive effect when co-careldopa given with **MOXONIDINE**
- ▶ Muscle Relaxants: possible agitation, confusion and hallucinations when co-careldopa given with **BACLOFEN**

**Co-careldopa** (continued)

- ▶ Nitrates: enhanced hypotensive effect when co-careldopa given with **NITRATES**
  - ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when co-careldopa given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- Codeine** see Opioid Analgesics
- Co-fluampicil** see Penicillins
- Colchicine**
- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with ● **AMIODARONE**
  - Antibacterials: possible increased risk of colchicine toxicity when given with ● **AZITHROMYCIN**, ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** and ● **TELITHROMYCIN**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Antifungals: possible increased risk of colchicine toxicity when given with ● **ITRACONAZOLE** and ● **KETOCONAZOLE**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Antivirals: possible increased risk of colchicine toxicity when given with ● **ATAZANAVIR**, ● **INDINAVIR**, ● **RITONAVIR** and ● **TELAPREVIR**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with ● **DILTIAZEM** and ● **VERAPAMIL**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Cardiac Glycosides: possible increased risk of myopathy when colchicine given with ● **DIGOXIN**
  - Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ● **CICLOSPORIN**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Grapefruit Juice: possible increased risk of colchicine toxicity when given with ● **GRAPEFRUIT JUICE**
  - Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with ● **FIBRATES** or ● **STATINS**
  - ▶ Netupitant: caution with colchicine advised by manufacturer of **NETUPITANT**

**Colecalciferol** see Vitamins**Colesevelam**

- NOTE** Other drugs should be taken at least 4 hours before or after colestevlam to reduce possible interference with absorption
- ▶ Antidiabetics: colestevlam reduces absorption of **GLIBENCLAMIDE** and **GLIPIZIDE**; colestevlam reduces absorption of **GLIMEPIRIDE**—manufacturer of glimepiride advises give at least 4 hours before colestevlam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **CANAGLILOZIN**
  - ▶ Antiepileptics: colestevlam possibly reduces absorption of **FOSPHENYTOIN** and **PHENYTOIN**
  - ▶ Bile Acids: colestevlam probably reduces effects of **CHOLIC ACID** (manufacturer of cholic acid advises give at least 5 hours apart)
  - Ciclosporin: colestevlam reduces absorption of ● **CICLOSPORIN**
  - ▶ Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **LOMITAPIDE** (give at least 4 hours apart)
  - ▶ Oestrogens: colestevlam reduces absorption of **ETHINYLESTRADIOL**
  - ▶ Thyroid Hormones: colestevlam reduces absorption of **LEVOTHYROXINE**

**Colestipol**

- NOTE** Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption
- ▶ Antibacterials: colestipol possibly reduces absorption of **TETRACYCLINE**
  - ▶ Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **CANAGLILOZIN**
  - ▶ Bile Acids: colestipol possibly reduces absorption of **BILE ACIDS**; colestipol probably reduces effects of **CHOLIC ACID** (manufacturer of cholic acid advises give at least 5 hours apart)

**Colestipol** (continued)

- ▶ Cardiac Glycosides: colestipol possibly reduces absorption of **CARDIAC GLYCOSIDES**
- ▶ Diuretics: colestipol reduces absorption of **THIAZIDES AND RELATED DIURETICS** (give at least 2 hours apart)
- ▶ Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **LOMITAPIDE** (give at least 4 hours apart)
- ▶ Thyroid Hormones: colestipol reduces absorption of **THYROID HORMONES**

**Colestyramine**

**NOTE** Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

- ▶ Analgesics: colestyramine increases the excretion of **MELOXICAM**; colestyramine reduces absorption of **PARACETAMOL**
- ▶ Antibacterials: colestyramine possibly reduces absorption of **TETRACYCLINE**; colestyramine antagonises effects of *oral* **VANCOMYCIN**
- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of ● **COUMARINS** and ● **PHENINDIONE**
- ▶ Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of **ACARBOSE**; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **CANAGLIFLOZIN**
- ▶ Antiepileptics: colestyramine possibly reduces absorption of **SODIUM VALPROATE** and **VALPROIC ACID**
- ▶ Bile Acids: colestyramine possibly reduces absorption of **BILE ACIDS**; colestyramine probably reduces effects of **CHOLIC ACID** (manufacturer of cholic acid advises give at least 5 hours apart)
- ▶ Cardiac Glycosides: colestyramine possibly reduces absorption of **CARDIAC GLYCOSIDES**
- ▶ Diuretics: colestyramine reduces absorption of **THIAZIDES AND RELATED DIURETICS** (give at least 2 hours apart)
- ▶ Leflunomide: colestyramine significantly decreases effect of **LEFLUNOMIDE** (enhanced elimination)—avoid unless drug elimination desired
- ▶ Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **LOMITAPIDE** (give at least 4 hours apart)
- ▶ Mycophenolate: colestyramine reduces absorption of **MYCOPHENOLATE**
- ▶ Raloxifene: colestyramine reduces absorption of **RALOXIFENE** (manufacturer of raloxifene advises avoid concomitant administration)
- ▶ Teriflunomide: colestyramine significantly decreases effect of **TERIFLUNOMIDE** (enhanced elimination)—avoid unless drug elimination desired
- ▶ Thyroid Hormones: colestyramine reduces absorption of **THYROID HORMONES**
- ▶ Vitamins: colestyramine possibly reduces absorption of **CALCIOTRIOL** (give at least 1 hour before or 4 to 6 hours after colestyramine)

**Colistimethate Sodium** see Polymyxins

**Contraceptives, oral** see Oestrogens and Progestogens

**Corticosteroids**

**NOTE** Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified

- ▶ ACE Inhibitors: corticosteroids antagonise hypotensive effect of **ACE INHIBITORS**
- ▶ Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**
- Aldesleukin: avoidance of corticosteroids advised by manufacturer of ● **ALDESLEUKIN**
- ▶ Alpha-blockers: corticosteroids antagonise hypotensive effect of **ALPHA-BLOCKERS**
- ▶ Aminophylline: increased risk of hypokalaemia when corticosteroids given with **AMINOPHYLLINE**
- ▶ Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with **NSAIDS**; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with **ASPIRIN**, also corticosteroids reduce plasma concentration of salicylate
- ▶ Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Antacids: absorption of deflazacort reduced by **ANTACIDS**

**Corticosteroids** (continued)

- ▶ Anthelmintics: dexamethasone increases plasma concentration of active metabolite of **ALBENDAZOLE**; continuous use of dexamethasone possibly reduces plasma concentration of **PRAZIQUANTEL**
- Antibacterials: plasma concentration of methylprednisolone possibly increased by **CLARITHROMYCIN**; metabolism of corticosteroids possibly inhibited by **ERYTHROMYCIN**; metabolism of methylprednisolone inhibited by **ERYTHROMYCIN**; corticosteroids possibly reduce plasma concentration of **ISONIAZID**; metabolism of corticosteroids accelerated by ● **RIFAMYCINS** (reduced effect)
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of ● **COUMARINS** (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of **PHENINDIONE**
- ▶ Antidiabetics: corticosteroids antagonise hypoglycaemic effect of **ANTIIDIABETICS**
- Antiepileptics: metabolism of corticosteroids accelerated by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE** (reduced effect)
- Antifungals: metabolism of corticosteroids possibly inhibited by **ITRACONAZOLE** and **KETOCONAZOLE**; plasma concentration of active metabolite of ciclolesonol increased by ● **KETOCONAZOLE**; plasma concentration of *inhaled* mometasone increased by **KETOCONAZOLE**; plasma concentration of *inhaled* and *oral* (and possibly also *intranasal* and *rectal*) budesonide increased by ● **ITRACONAZOLE** and ● **KETOCONAZOLE**; *inhaled* fluticasone plasma concentration is possibly increased by **KETOCONAZOLE**; metabolism of methylprednisolone inhibited by **KETOCONAZOLE**; increased risk of hypokalaemia when corticosteroids given with ● **AMPHOTERICIN**—avoid concomitant use unless corticosteroids needed to control reactions; plasma concentration of *inhaled* fluticasone increased by **ITRACONAZOLE**; metabolism of methylprednisolone possibly inhibited by **ITRACONAZOLE**; dexamethasone possibly reduces plasma concentration of **CASPOFUNGIN**—consider increasing dose of caspofungin
- Antivirals: dexamethasone possibly reduces plasma concentration of **DACLATASVIR** and **SIMEPREVIR**—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; dexamethasone possibly reduces plasma concentration of **INDINAVIR**, **LOPINAVIR**, **SAQUINAVIR** and **TELAPREVIR**; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of ● **RILPIVIRINE**; plasma concentration of budesonide (including *inhaled*, *intranasal*, and *rectal* budesonide) possibly increased by ● **RITONAVIR**—increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by ● **RITONAVIR**—increased risk of adrenal suppression; plasma concentration of triamcinolone *injection* increased by ● **RITONAVIR**—increased risk of adrenal suppression; plasma concentration of *inhaled* and *intranasal* fluticasone increased by ● **RITONAVIR**—increased risk of adrenal suppression; plasma concentration of *inhaled* and *intranasal* budesonide and fluticasone possibly increased by **TELAPREVIR**
- ▶ Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by **APREPITANT** (reduce dose of dexamethasone and methylprednisolone)
- ▶ Beta-blockers: corticosteroids antagonise hypotensive effect of **BETA-BLOCKERS**
- ▶ Calcium Salts: corticosteroids reduce absorption of **CALCIUM SALTS**
- ▶ Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of **CALCIUM-CHANNEL BLOCKERS**; plasma concentration of methylprednisolone increased by **DILTIAZEM**
- ▶ Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with **CARDIAC GLYCOSIDES**
- Ciclosporin: high-dose methylprednisolone increases plasma concentration of ● **CICLOSPORIN** (risk of convulsions); plasma concentration of prednisolone increased by **CICLOSPORIN**
- ▶ Clonidine: corticosteroids antagonise hypotensive effect of **CLONIDINE**
- ▶ Cytotoxics: possible increased risk of hepatotoxicity when dexamethasone given with *high-dose* **METHOTREXATE**; dexamethasone possibly decreases plasma concentration of

**Corticosteroids**

Cytotoxics (continued)

- AXITINIB (increase dose of axitinib—consult axitinib product literature); dexamethasone possibly reduces plasma concentration of **CABOZANTINIB**—manufacturer of cabozantinib advises avoid concomitant use
- ▶ Diazoxide: corticosteroids antagonise hypotensive effect of  **DIAZOXIDE**
- ▶ Diuretics: corticosteroids antagonise diuretic effect of **DIURETICS**; increased risk of hypokalaemia when corticosteroids given with **ACETAZOLAMIDE**, **LOOP DIURETICS** or **THIAZIDES AND RELATED DIURETICS**
- ▶ Fosaprepitant: metabolism of dexamethasone and methylprednisolone inhibited by **FOSAPREPITANT** (reduce dose of dexamethasone and methylprednisolone)
- Grapefruit Juice: plasma concentration of *oral* budesonide increased by ● **GRAPEFRUIT JUICE**—avoid concurrent use or separate administration by as much as possible and consider reducing *oral* budesonide dose
- ▶ Histamine: avoidance of corticosteroids advised by manufacturer of **HISTAMINE**
- ▶ Methyldopa: corticosteroids antagonise hypotensive effect of **METHYLDOPA**
- ▶ Mifamurtide: avoidance of corticosteroids advised by manufacturer of **MIFAMURTIDE**
- ▶ Mifepristone: effect of corticosteroids (including *inhaled* corticosteroids) may be reduced for 3–4 days after **MIFEPRISTONE**
- ▶ Moxonidine: corticosteroids antagonise hypotensive effect of **MOXONIDINE**
- ▶ Muscle Relaxants: corticosteroids possibly antagonise effects of **PANCURONIUM** and **VECURONIUM**
- Netupitant: plasma concentration of dexamethasone increased by ● **NETUPITANT** (halve dose of dexamethasone)
- ▶ Nicorandil: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with **NICORANDIL**
- ▶ Nitrates: corticosteroids antagonise hypotensive effect of **NITRATES**
- ▶ Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing **OESTROGENS**
- ▶ Panobinostat: dexamethasone reduces plasma concentration of **PANOBINOSTAT**
- ▶ Sodium Benzoate: corticosteroids possibly reduce effects of **SODIUM BENZOATE**
- ▶ Sodium Phenylbutyrate: corticosteroids possibly reduce effects of **SODIUM PHENYLBUTYRATE**
- ▶ Somatropin: corticosteroids may inhibit growth-promoting effect of **SOMATROPIN**
- ▶ Sympathomimetics: metabolism of dexamethasone accelerated by **EPHEDRINE**; possible risk of hypertension when corticosteroids given with **MIDODRINE**
- ▶ Sympathomimetics, Beta<sub>2</sub>: increased risk of hypokalaemia when corticosteroids given with high doses of **BETA<sub>2</sub> SYMPATHOMIMETICS**
- ▶ Theophylline: increased risk of hypokalaemia when corticosteroids given with **THEOPHYLLINE**
- Vaccines: high doses of corticosteroids impair immune response to ● **VACCINES**—avoid concomitant use with live vaccines
- ▶ Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of **HYDRALAZINE**, **MINOXIDIL** and **SODIUM NITROPRUSSIDE**

**Co-trimoxazole** see Trimethoprim and Sulfamethoxazole**Coumarins**

- NOTE** Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control
- Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of ● **ALCOHOL**
  - ▶ Allopurinol: anticoagulant effect of coumarins possibly enhanced by **ALLOPURINOL**
  - Anabolic Steroids: anticoagulant effect of coumarins enhanced by ● **ANABOLIC STEROIDS**

**Coumarins** (continued)

- Analgesics: anticoagulant effect of coumarins possibly enhanced by ● **NSAIDS**; increased risk of haemorrhage when anticoagulants given with *intravenous* ● **DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **KETOROLAC** (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by ● **TRAMADOL**; increased risk of bleeding when coumarins given with ● **ASPIRIN** (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of **PARACETAMOL**
- Anthelmintics: anticoagulant effect of coumarins possibly enhanced by **IVERMECTIN**; anticoagulant effect of warfarin possibly enhanced by ● **LEVAMISOLE**
- Anti-arrhythmics: metabolism of coumarins inhibited by ● **AMIODARONE** (enhanced anticoagulant effect); anticoagulant effect of warfarin may be enhanced or reduced by **DISOPYRAMIDE**; anticoagulant effect of coumarins possibly enhanced by ● **DRONEDARONE**; anticoagulant effect of coumarins enhanced by ● **PROPafenone**
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with ● **NEOMYCIN** (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by ● **AZITHROMYCIN**, ● **AZTREONAM**, ● **CEPHALOSPORINS**, **CIPROFLOXACIN**, **LEVOFLOXACIN**, ● **TETRACYCLINES**, **TIGECYCLINE** and **TRIMETHOPRIM**; anticoagulant effect of coumarins enhanced by ● **CHLORAMPHENICOL**, ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN**, ● **METRONIDAZOLE**, ● **NALIDIXIC ACID**, ● **NORFLOXACIN**, ● **OFLOXACIN** and ● **SULFONAMIDES**; plasma concentration of warfarin possibly increased by **ORITAVANCIN**; an interaction between coumarins and broad-spectrum **PENICILLINS** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of coumarins accelerated by ● **RIFAMYCINS** (reduced anticoagulant effect); anticoagulant effect of warfarin possibly reduced by **RIFAXIMIN**
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● **APIXABAN**, ● **DABIGATRAN**, ● **EDOXABAN** and ● **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: anticoagulant effect of warfarin possibly enhanced by ● **VENLAFAXINE**; anticoagulant effect of warfarin may be enhanced or reduced by **TRAZODONE**; anticoagulant effect of coumarins possibly enhanced by ● **SSRIS**; anticoagulant effect of coumarins reduced by ● **ST JOHN'S WORT** (avoid concomitant use); anticoagulant effect of warfarin enhanced by **MIRTAZAPINE**; anticoagulant effect of coumarins may be enhanced or reduced by ● **TRICYCLICS**
- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by **EXENATIDE**; coumarins possibly enhance hypoglycaemic effect of ● **SULFONYLUREAS**, also possible changes to anticoagulant effect
- Antiepileptics: metabolism of coumarins accelerated by ● **CARBAMAZEPINE**, ● **PHENOBARBITAL** and ● **PRIMIDONE** (reduced anticoagulant effect); plasma concentration of warfarin reduced by **ESLICARBZEPINE**; metabolism of coumarins accelerated by ● **FOSPHENYTOIN** and ● **PHENYTOIN** (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by **SODIUM VALPROATE** and **VALPROIC ACID**
- Antifungals: anticoagulant effect of coumarins enhanced by ● **FLUCONAZOLE**, ● **ITRACONAZOLE**, ● **KETOCONAZOLE** and ● **VORICONAZOLE**; anticoagulant effect of coumarins greatly enhanced by ● **MICONAZOLE** (including oral gel and possibly vaginal and topical formulations)—avoid concomitant use if possible; anticoagulant effect of coumarins reduced by ● **GRISEOFULVIN**
- ▶ Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by **PROGUANIL**; plasma concentration of both drugs increased when warfarin given with **QUININE**
- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by **ATAZANAVIR**, ● **NEVIRAPINE** and ● **RITONAVIR**; plasma

## Coumarins

- Antivirals (continued)
  - concentration of coumarins possibly affected by ● **EFAVIRENZ**; anticoagulant effect of coumarins may be enhanced or reduced by ● **FOSAMPRENAVIR**; anticoagulant effect of coumarins possibly enhanced by ● **RITONAVIR**; anticoagulant effect of warfarin possibly enhanced by ● **SAQUINAVIR**; plasma concentration of warfarin possibly affected by ● **TELAPREVIR**
- ▶ Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by ● **CHLORAL**
- ▶ Aprepitant: anticoagulant effect of warfarin possibly reduced by ● **APREPITANT**
- Azathioprine: anticoagulant effect of acenocoumarol possibly reduced by ● **AZATHIOPRINE**; anticoagulant effect of warfarin reduced by ● **AZATHIOPRINE**
- ▶ Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of ● **BOSENTAN**
- ▶ Carbimazole: anticoagulant effect of coumarins possibly enhanced by ● **CARBIMAZOLE**
- Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of ● **CLOPIDOGREL**; avoidance of warfarin advised by manufacturer of ● **CLOPIDOGREL**
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by ● **CORTICOSTEROIDS** (high-dose corticosteroids enhance anticoagulant effect)
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by ● **CRANBERRY JUICE**—avoid concomitant use
- Cytotoxics: anticoagulant effect of coumarins possibly enhanced by ● **ETOPOSIDE**, ● **IFOSFAMIDE** and ● **SORAFENIB**; anticoagulant effect of coumarins enhanced by ● **CAPECITABINE**, ● **FLUOROURACIL** and ● **TEGAFUR**; anticoagulant effect of warfarin possibly enhanced by ● **GEFITINIB**, ● **GEMCITABINE** and ● **VEMURAFENIB**; anticoagulant effect of coumarins possibly reduced by ● **MERCAPTOPYRINE** and ● **MITOTANE**; avoidance of warfarin advised by manufacturer of ● **CERITINIB**; plasma concentration of warfarin reduced by ● **DABRAFENIB**; increased risk of bleeding when coumarins given with ● **ERLOTINIB**; avoidance of coumarins advised by manufacturer of ● **IBRUTINIB**; replacement of warfarin with a heparin advised by manufacturer of ● **IMATINIB** (possibility of enhanced warfarin effect); increased risk of bleeding when warfarin given with ● **REGORAFENIB**
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of ● **DIPYRIDAMOLE**
- Disulfiram: anticoagulant effect of coumarins enhanced by ● **DISULFIRAM**
- Dopaminergics: anticoagulant effect of warfarin enhanced by ● **ENTACAPONE**
- Enteral Feeds: anticoagulant effect of coumarins antagonised by vitamin K (present in some ● **ENTERAL FEEDS**)
- ▶ Fosaprepitant: anticoagulant effect of warfarin possibly reduced by ● **FOSAPREPITANT**
- Glucosamine: anticoagulant effect of warfarin enhanced by ● **GLUCOSAMINE** (avoid concomitant use)
- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by ● **BICALUTAMIDE** and ● **TOREMIFENE**; metabolism of coumarins inhibited by ● **DANAZOL** (enhanced anticoagulant effect); plasma concentration of coumarins possibly reduced by ● **ENZALUTAMIDE**; anticoagulant effect of coumarins enhanced by ● **FLUTAMIDE** and ● **TAMOXIFEN**
- ▶ Iloprost: anticoagulant effect of coumarins possibly enhanced by ● **ILOPROST**
- ▶ Lactulose: anticoagulant effect of coumarins possibly enhanced by ● **LACTULOSE**
- ▶ Leflunomide: anticoagulant effect of warfarin possibly enhanced by ● **LEFLUNOMIDE**
- ▶ Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by ● **ZAFIRLUKAST**
- ▶ Levocarnitine: anticoagulant effect of coumarins possibly enhanced by ● **LEVOCARNITINE**
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by ● **COLESTYRAMINE**; anticoagulant effect of warfarin may be transiently reduced by ● **ATORVASTATIN**; anticoagulant effect of coumarins enhanced by ● **FIBRATES** and ● **FLUVASTATIN**; anticoagulant effect of coumarins possibly enhanced by ● **EZETIMIBE** and

## Coumarins

- Lipid-regulating Drugs (continued)
  - **ROSUVASTATIN**; anticoagulant effect of coumarins can be enhanced by ● **SIMVASTATIN**; anticoagulant effect of warfarin possibly enhanced by ● **LOMITAPIDE**
- ▶ Memantine: anticoagulant effect of warfarin possibly enhanced by ● **MEMANTINE**
- ▶ Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by ● **OESTROGENS**
- ▶ Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of ● **ORLISTAT**
- ▶ Prasugrel: possible increased risk of bleeding when coumarins given with ● **PRASUGREL**
- ▶ Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by ● **PROGESTOGENS**
- ▶ Raloxifene: anticoagulant effect of coumarins antagonised by ● **RALOXIFENE**
- Retinoids: anticoagulant effect of coumarins possibly reduced by ● **ACITRETIN**
- Sulfipyrazone: anticoagulant effect of coumarins enhanced by ● **SULFINPYRAZONE**
- Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by ● **METHYLPHENIDATE**
- Testolactone: anticoagulant effect of coumarins enhanced by ● **TESTOLACTONE**
- Testosterone: anticoagulant effect of coumarins enhanced by ● **TESTOSTERONE**
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by ● **THYROID HORMONES**
- ▶ Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by ● **UBIDECARENONE**
- Ulcer-healing Drugs: metabolism of coumarins inhibited by ● **CIMETIDINE** (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by ● **ESOMEPRAZOLE** and ● **OMEPRAZOLE**; anticoagulant effect of coumarins might be enhanced by ● **PANTOPRAZOLE**; absorption of coumarins possibly reduced by ● **SUCRALFATE** (reduced anticoagulant effect)
- ▶ Vaccines: anticoagulant effect of warfarin possibly enhanced by ● **INFLUENZA VACCINE**
- Vitamins: anticoagulant effect of coumarins possibly enhanced by ● **VITAMIN E**; anticoagulant effect of coumarins antagonised by ● **VITAMIN K**

## Cranberry Juice

- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of ● **COUMARINS**—avoid concomitant use

## Crizotinib

- Analgesics: manufacturer of crizotinib advises caution with ● **ALFENTANIL** and ● **FENTANYL**
- Antibacterials: plasma concentration of crizotinib possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by ● **RIFABUTIN**—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by ● **RIFAMPICIN**—manufacturer of crizotinib advises avoid concomitant use
- ▶ Antidepressants: plasma concentration of crizotinib possibly reduced by ● **ST JOHN'S WORT**—manufacturer of crizotinib advises avoid concomitant use
- ▶ Antiepileptics: plasma concentration of crizotinib possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of crizotinib advises avoid concomitant use
- Antifungals: plasma concentration of crizotinib increased by ● **KETOCONAZOLE**—avoid concomitant use; plasma concentration of crizotinib possibly increased by ● **ITRACONAZOLE** and ● **VORICONAZOLE**—manufacturer of crizotinib advises avoid concomitant use
- ▶ Antimalarials: possible increased risk of bradycardia when crizotinib given with ● **MFLOQUINE**
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with ● **PIMOZIDE**
- Antivirals: plasma concentration of crizotinib possibly increased by ● **ATAZANAVIR**, ● **INDINAVIR**, ● **RITONAVIR** and

**Crizotinib**

- Antivirals (continued)
  - **SAQUINAVIR**—manufacturer of crizotinib advises avoid concomitant use
- Anxiolytics and Hypnotics: crizotinib increases plasma concentration of • **MIDAZOLAM**
  - ▶ Beta-blockers: possible increased risk of bradycardia when crizotinib given with **BETA-BLOCKERS**
  - ▶ Calcium-channel Blockers: possible increased risk of bradycardia when crizotinib given with **DILTIAZEM** or **VERAPAMIL**
  - ▶ Cardiac glycosides: possible increased risk of bradycardia when crizotinib given with **DIGOXIN**
- Cyclosporin: manufacturer of crizotinib advises caution with • **CYCLOSPORIN**
  - ▶ Clonidine: possible increased risk of bradycardia when crizotinib given with **CLONIDINE**
- Cytotoxics: crizotinib possibly increases the plasma concentration of • **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
- Ergot Alkaloids: manufacturer of crizotinib advises caution with • **ERGOT ALKALOIDS**
- Grapefruit Juice: plasma concentration of crizotinib possibly increased by • **GRAPEFRUIT JUICE**—manufacturer of crizotinib advises avoid concomitant use
- ▶ Guanfacine: crizotinib possibly increases plasma concentration of **GUANFACINE** (halve dose of guanfacine)
- Oestrogens: manufacturer of crizotinib advises contraceptive effect of • **OESTROGENS** possibly reduced
- ▶ Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with **PILOCARPINE**
- Progestogens: manufacturer of crizotinib advises contraceptive effect of • **PROGESTOGENS** possibly reduced
- Sirolimus: manufacturer of crizotinib advises caution with • **SIROLIMUS**
- Tacrolimus: manufacturer of crizotinib advises caution with • **TACROLIMUS**

**Cyclizine** see Antihistamines

**Cyclopenthiamide** see Diuretics

**Cyclopentolate** see Antimuscarinics

**Cyclophosphamide**

- Antifungals: side-effects of cyclophosphamide possibly increased by **FLUCONAZOLE** and **ITRACONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with • **CLOZAPINE** (increased risk of agranulocytosis)
  - ▶ Cardiac glycosides: cyclophosphamide possibly reduces absorption of **DIGOXIN tablets**
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with • **PENTOSTATIN**—avoid concomitant use
  - ▶ Muscle Relaxants: cyclophosphamide enhances effects of **SUXAMETHONIUM**

**Cycloserine**

- Alcohol: increased risk of convulsions when cycloserine given with • **ALCOHOL**
- ▶ Antibacterials: increased risk of CNS toxicity when cycloserine given with **ISONIAZID**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNF C

**Cyproheptadine** see Antihistamines

**Cytarabine**

- Antifungals: cytarabine possibly reduces plasma concentration of **FLUCYTOSINE**
- Antipsychotics: avoid concomitant use of cytotoxics with • **CLOZAPINE** (increased risk of agranulocytosis)
  - ▶ Cardiac glycosides: cytarabine possibly reduces absorption of **DIGOXIN tablets**
- ▶ Cytotoxics: intracellular concentration of cytarabine increased by **FLUDARABINE**

**Cytotoxics** see individual drugs

**Dabigatran**

- Analgesics: possible increased risk of bleeding when dabigatran given with • **NSAIDS**; increased risk of haemorrhage when anticoagulants given with **INTRAVENOUS • DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • **KETOROLAC** (avoid concomitant use, including low-dose heparins)

**Dabigatran** (continued)

- Anti-arrhythmics: plasma concentration of dabigatran increased by • **AMIODARONE** (see under Dabigatran Etexilate, p. 128); plasma concentration of dabigatran increased by • **DRONEDARONE**—avoid concomitant use
- Antibacterials: possible increased risk of bleeding when dabigatran given with **CLARITHROMYCIN**; plasma concentration of dabigatran reduced by • **RIFAMPICIN**—manufacturer of dabigatran advises avoid concomitant use
- Anticoagulants: increased risk of haemorrhage when dabigatran given with other • **ANTICOAGULANTS** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with • **APIXABAN**, • **EDOxabAN** and • **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: possible increased risk of bleeding when dabigatran given with • **SSRI-RELATED ANTIDEPRESSANTS** or • **SSRIS**; plasma concentration of dabigatran possibly reduced by **ST JOHN'S WORT**—manufacturer of dabigatran advises avoid concomitant use
  - ▶ Antiepileptics: plasma concentration of dabigatran possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN**—manufacturer of dabigatran advises avoid concomitant use
- Antifungals: plasma concentration of dabigatran increased by • **KETOCONAZOLE**—avoid concomitant use; manufacturer of dabigatran advises avoid concomitant use with **ITRACONAZOLE**
- ▶ Antivirals: manufacturers advise avoid concomitant use of dabigatran with **DARUNAVIR**; plasma concentration of dabigatran possibly increased by **RILPIVIRINE** and **TELAPREVIR**
- Calcium-channel Blockers: plasma concentration of dabigatran possibly increased by • **VERAPAMIL** (see under Dabigatran Etexilate, p. 128)
- Cyclosporin: plasma concentration of dabigatran possibly increased by • **CYCLOSPORIN**—manufacturer of dabigatran advises avoid concomitant use
- ▶ Nupituptan: caution with dabigatran advised by manufacturer of **NETUPITANT**
- Sulfipyrazole: possible increased risk of bleeding when dabigatran given with • **SULFINPYRAZOLE**
- Tacrolimus: plasma concentration of dabigatran possibly increased by • **TACROLIMUS**—manufacturer of dabigatran advises avoid concomitant use
- Ticagrelor: plasma concentration of dabigatran increased by • **TICAGRELOR**
- ▶ Ulipristal: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after **ULIPRISTAL**

**Dabrafenib**

- ▶ Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with **RIFAMPICIN**
- ▶ Anticoagulants: dabrafenib reduces plasma concentration of **WARFARIN**
- ▶ Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with **ST JOHN'S WORT**
- ▶ Antiepileptics: manufacturer of dabrafenib advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ Antifungals: plasma concentration of dabrafenib increased by **KETOCONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with • **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ Lipid-regulating Drugs: plasma concentration of dabrafenib increased by **GEMFIBROZIL**
- Oestrogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing • **OESTROGENS** possibly reduced (alternative contraceptive recommended)
- Progestogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing • **PROGESTOGENS** possibly reduced (alternative contraceptive recommended)
- ▶ Ulcer-healing Drugs: manufacturer of dabrafenib advises avoid concomitant use with **PROTON PUMP INHIBITORS** (plasma concentration of dabrafenib possibly reduced)

**Dacarbazine**

- Aldesleukin: avoidance of dacarbazine advised by manufacturer of ● **ALDESLEUKIN**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)

**Daclatasvir**

- Anti-arrhythmics: possible increased risk of bradycardia when daclatasvir (with sofosbuvir) given with ● **AMIODARONE**—see under Amiodarone, p. 99
- Antibacterials: plasma concentration of daclatasvir possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); plasma concentration of daclatasvir possibly reduced by ● **RIFABUTIN**—manufacturer of daclatasvir advises avoid concomitant use; plasma concentration of daclatasvir reduced by ● **RIFAMPICIN**—avoid concomitant use
- ▶ Antidepressants: plasma concentration of daclatasvir possibly reduced by **ST JOHN'S WORT**—manufacturer of daclatasvir advises avoid concomitant use
- Antiepileptics: plasma concentration of daclatasvir possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **OXCARBAZEPINE**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of daclatasvir advises avoid concomitant use
- Antifungals: plasma concentration of daclatasvir increased by ● **KETOCONAZOLE**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); plasma concentration of daclatasvir possibly increased by ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**—reduce dose of daclatasvir (see under Daclatasvir, p. 577)
- Antivirals: plasma concentration of daclatasvir increased by ● **ATAZANAVIR** and ● **TELAPREVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); plasma concentration of daclatasvir possibly increased by ● **BOCEPREVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); manufacturer of daclatasvir advises avoid concomitant use with **DARUNAVIR** (plasma concentration of daclatasvir possibly increased); plasma concentration of daclatasvir reduced by ● **EFAVIRENZ**—increase dose of daclatasvir (see under Daclatasvir, p. 577); manufacturer of daclatasvir advises avoid concomitant use with **ETRAVIRINE** and **NEVIRAPINE** (plasma concentration of daclatasvir possibly reduced)
- Cardiac Glycosides: daclatasvir increases plasma concentration of ● **DIGOXIN**
- Cobicistat: plasma concentration of daclatasvir possibly increased by ● **COBICISTAT**—reduce dose of daclatasvir (see under Daclatasvir, p. 577)
- ▶ Corticosteroids: plasma concentration of daclatasvir possibly reduced by **DEXAMETHASONE**—manufacturer of daclatasvir advises avoid concomitant use
- ▶ Lipid-regulating Drugs: daclatasvir increases plasma concentration of **ROSUVASTATIN**

**Dactinomycin**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when dactinomycin given with ● **VINCRIStINE**
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live ● **VACCINES**—avoid concomitant use
- ▶ Vitamins: dactinomycin possibly reduces effects of **ALFACALCIDOL**, **CALCITRIOL**, **COLECALCIFEROL**, **DIHYDROTACHYSTEROL**, **ERGOCALCIFEROL**, **PARICALCITOL** and **VITAMIN D**

**Dairy Products**

- ▶ Antibacterials: dairy products reduce absorption of **CIPROFLOXACIN** (give at least 2 hours apart); dairy products reduce absorption of **NORFLOXACIN**; dairy products reduce absorption of **TETRACYCLINES** (except doxycycline and minocycline)
- ▶ Cytotoxics: dairy products possibly reduce plasma concentration of **MERCAPTOPURINE**—manufacturer of mercaptopurine advises give at least 1 hour before or 3 hours after dairy products
- ▶ Eltrombopag: dairy products possibly reduce absorption of **ELTROMBOPAG** (give at least 4 hours apart)

**Dalteparin** see Heparins

**Danaparoid**

- Analgesics: increased risk of haemorrhage when anticoagulants given with *intravenous* ● **DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **KETOROLAC** (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● **APIXABAN**, ● **DABIGATRAN**, ● **EDOXABAN** and ● **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

**Danazol**

- Anticoagulants: danazol inhibits metabolism of ● **COUMARINS** (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of ● **CARBAMAZEPINE** (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of ● **CICLOSPORIN** (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with ● **SIMVASTATIN**—avoid concomitant use
- ▶ Tacrolimus: danazol possibly increases plasma concentration of **TACROLIMUS**

**Dantrolene** see Muscle Relaxants

**Dapagliflozin** see Antidiabetics

**Dapoxetine**

- Alcohol: increased sedative effect when dapoxetine given with ● **ALCOHOL**
- Analgesics: possible increased risk of serotonergic effects when dapoxetine given with ● **TRAMADOL** (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **CLARITHROMYCIN** and **ERYTHROMYCIN** (see under Dapoxetine, p. 751); manufacturer of dapoxetine advises avoid concomitant use with ● **TELITHROMYCIN** (increased risk of toxicity)
- Antidepressants: possible increased risk of serotonergic effects when dapoxetine given with ● **SSRIS**, ● **ST JOHN'S WORT**, ● **DULOXETINE**, ● **TRICYCLICS** and ● **VENLAFAXINE** (manufacturer of dapoxetine advises SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine); increased risk of serotonergic effects when dapoxetine given with ● **MAOIS** (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Antifungals: plasma concentration of dapoxetine increased by ● **KETOCONAZOLE**—manufacturer of dapoxetine advises avoid concomitant use; manufacturer of dapoxetine advises dose reduction when dapoxetine given with **FLUCONAZOLE** (see under Dapoxetine, p. 751); manufacturer of dapoxetine advises avoid concomitant use with ● **ITRACONAZOLE** (increased risk of toxicity)
- Antivirals: manufacturer of dapoxetine advises avoid concomitant use with ● **ATAZANAVIR**, ● **RITONAVIR** and ● **SAQUINAVIR** (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with **FOSAMPRENAVIR** (see under Dapoxetine, p. 751)
- ▶ Aprepitant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **APREPITANT** (see under Dapoxetine, p. 751)
- ▶ Calcium-channel Blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with **DILTIAZEM** and **VERAPAMIL** (see under Dapoxetine, p. 751)
- 5HT<sub>1</sub>-receptor Agonists: possible increased risk of serotonergic effects when dapoxetine given with ● **5HT<sub>1</sub> AGONISTS** (manufacturer of dapoxetine advises 5HT<sub>1</sub> agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT<sub>1</sub> agonists)
- Lithium: possible increased risk of serotonergic effects when dapoxetine given with ● **LITHIUM** (manufacturer of dapoxetine advises lithium should not be started until 1 week after

**Dapoxetine**

- Lithium (continued) stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- ▶ Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with **SILDENAFIL**
- ▶ Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with **TADALAFIL**
- ▶ Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with **VARDENAFIL**

**Dapsone**

- ▶ Antibacterials: plasma concentration of dapsone reduced by **RIFAMYCINS**; plasma concentration of both drugs may increase when dapsone given with **TRIMETHOPRIM**
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with ● **SAQUINAVIR**—avoid concomitant use
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Daptomycin**

- Cyclosporin: increased risk of myopathy when daptomycin given with ● **CYCLOSPORIN** (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with ● **FIBRATES** or ● **STATINS** (preferably avoid concomitant use)
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Darifenacin** see Antimuscarinics

**Darunavir**

- ▶ Anti-arrhythmics: darunavir possibly increases plasma concentration of **LIDOCAINE**—avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of ● **RIFABUTIN** (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by ● **RIFAMPICIN**—avoid concomitant use
- ▶ Anticoagulants: avoidance of darunavir advised by manufacturer of **APIXABAN** and **RIVAROXABAN**; manufacturers advise avoid concomitant use of darunavir with **DABIGATRAN**
- Antidepressants: darunavir possibly reduces plasma concentration of **PAROXETINE** and **SERTRALINE**; plasma concentration of darunavir reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- ▶ Antiepileptics: plasma concentration of darunavir possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ Antifungals: plasma concentration of both drugs increased when darunavir given with **KETOCONAZOLE**; darunavir possibly affects plasma concentration of **VORICONAZOLE**
- Antimalarials: plasma concentration of lumefantrine increased when darunavir given with **ARTEMETHER WITH LUMEFANTRINE**; darunavir possibly increases plasma concentration of ● **QUININE** (increased risk of toxicity)
- Antipsychotics: darunavir possibly increases plasma concentration of ● **ARIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); darunavir possibly increases plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of darunavir with ● **BOCEPREVIR** or ● **TELAPREVIR**; avoidance of darunavir advised by manufacturer of **DACLATASVIR** (plasma concentration of daclatasvir possibly increased); manufacturer of darunavir advises take **DIDANOSINE** 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by ● **EFAVIRENZ** (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with **INDINAVIR**; plasma concentration of darunavir reduced by ● **LOPINAVIR** and **SAQUINAVIR**—avoid concomitant use; darunavir increases plasma concentration of ● **MARAVIROC** (consider reducing dose of maraviroc); darunavir increases plasma concentration of ● **PARITAPREVIR** and plasma concentration of darunavir decreased; increased risk of rash when darunavir given with **RALTEGRAVIR**; plasma concentration of both drugs increased when darunavir given with ● **SIMEPREVIR**—manufacturer of simeprevir advises avoid concomitant use

**Darunavir** (continued)

- Cytotoxics: darunavir possibly increases the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of ● **EVEROLIMUS**—manufacturer of everolimus advises avoid concomitant use; darunavir possibly increases the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
- Ergot Alkaloids: increased risk of ergotism when darunavir given with ● **ERGOT ALKALOIDS**—manufacturer of darunavir advises avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when darunavir given with **ATORVASTATIN**; darunavir possibly increases plasma concentration of **PRAVASTATIN** (use lowest possible dose of pravastatin); darunavir increases plasma concentration of ● **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); avoidance of darunavir advised by manufacturer of ● **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of darunavir possibly reduced by ● **ORLISTAT**
- Ranolazine: darunavir possibly increases plasma concentration of ● **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use

**Dasabuvir**

- Antibacterials: manufacturer of dasabuvir advises avoid concomitant use with **CLARITHROMYCIN** and **TELITHROMYCIN**; plasma concentration of dasabuvir possibly reduced by ● **RIFAMPICIN**—avoid concomitant use
- Antidepressants: plasma concentration of dasabuvir possibly reduced by ● **ST JOHN'S WORT**—manufacturer of dasabuvir advises avoid concomitant use
- Antiepileptics: plasma concentration of dasabuvir reduced by ● **CARBAMAZEPINE**—avoid concomitant use; plasma concentration of dasabuvir possibly reduced by ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—avoid concomitant use
- Antifungals: plasma concentration of both drugs increased when dasabuvir given with ● **KETOCONAZOLE**—avoid concomitant use; plasma concentration of both drugs possibly increased when dasabuvir given with ● **ITRACONAZOLE** and ● **POSACONAZOLE**—avoid concomitant use
- ▶ Antivirals: manufacturer of dasabuvir advises avoid concomitant use with **EFAVIRENZ**, **ETRAVIRINE** and **NEVIRAPINE**
- ▶ Cobiscat: manufacturer of dasabuvir advises avoid concomitant use with **COBICISTAT**
- Cytotoxics: manufacturer of dasabuvir advises avoid concomitant use with **MITOTANE**
- Diuretics: dasabuvir increases plasma concentration of ● **FUROSEMIDE** (reduce dose of furosemide)
- ▶ Hormone Antagonists: manufacturer of dasabuvir advises avoid concomitant use with **ENZALUTAMIDE**
- Lipid-regulating Drugs: manufacturer of dasabuvir advises avoid concomitant use with ● **ATORVASTATIN**, **GEMFIBROZIL** and ● **SIMVASTATIN**; dasabuvir increases plasma concentration of ● **ROSUVASTATIN** (reduce dose of rosuvastatin—see under Rosuvastatin, p. 193)
- Oestrogens: manufacturer of dasabuvir advises avoid concomitant use of ● **ETHINYLESTRADIOL**—use alternative form of contraception

**Dasatinib**

- Antacids: absorption of dasatinib possibly reduced by ● **ANTACIDS** (give at least 2 hours apart)
- Antibacterials: manufacturer of dasatinib advises avoid concomitant use with **CLARITHROMYCIN**, **ERYTHROMYCIN** and **TELITHROMYCIN** (plasma concentration of dasatinib possibly increased); metabolism of dasatinib accelerated by ● **RIFAMPICIN** (reduced plasma concentration—avoid concomitant use)
- ▶ Antiepileptics: manufacturer of dasatinib advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE** (plasma concentration of dasatinib possibly reduced)
- ▶ Antifungals: plasma concentration of dasatinib possibly increased by **KETOCONAZOLE**; manufacturer of dasatinib

**Dasatinib**

- Antifungals (continued)
  - advises avoid concomitant use with **ITRACONAZOLE** (plasma concentration of dasatinib possibly increased)
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: avoidance of dasatinib advised by manufacturer of
  - **BOCEPREVIR**; manufacturer of dasatinib advises avoid concomitant use with **RITONAVIR** (plasma concentration of dasatinib possibly increased)
- Grapefruit Juice: manufacturer of dasatinib advises avoid concomitant use with **GRAPEFRUIT JUICE** (plasma concentration of dasatinib possibly increased)
- Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of **SIMVASTATIN**
- Ulcer-healing Drugs: plasma concentration of dasatinib reduced by
  - **FAMOTIDINE** and ● **OMEPRAZOLE**—consider using an antacid as an alternative; manufacturer of dasatinib advises avoid concomitant use with ● **HISTAMINE H<sub>2</sub>-ANTAGONISTS** and ● **PROTON PUMP INHIBITORS**—consider using an antacid as an alternative

**Daurorubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: possible increased risk of cardiotoxicity when daurorubicin given with ● **TRASTUZUMAB**—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live ● **VACCINES**—avoid concomitant use

**Decitabine**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)

**Deferasirox**

- Aminophylline: deferasirox increases plasma concentration of
  - **AMINOPHYLLINE** (consider reducing dose of aminophylline)
- Antacids: absorption of deferasirox possibly reduced by **ANTACIDS** containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
- Antibacterials: plasma concentration of deferasirox reduced by **RIFAMPICIN**
- Antidiabetics: deferasirox increases plasma concentration of **REPAGLINIDE**
- Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with **CLOZAPINE**
- Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of **MIDAZOLAM**
- Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with **TIZANIDINE**
- Theophylline: deferasirox increases plasma concentration of
  - **THEOPHYLLINE** (consider reducing dose of theophylline)

**Deferiprone**

- Antacids: absorption of deferiprone possibly reduced by **ANTACIDS** containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

**Deflazacort** see Corticosteroids**Delamanid**

- Analgesics: increased risk of ventricular arrhythmias when delamanid given with ● **METHADONE**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when delamanid given with ● **AMIODARONE** or ● **DISOPYRAMIDE**
- Antibacterials: possible increased risk of ventricular arrhythmias when delamanid given with ● **CLARITHROMYCIN** and ● **ERYTHROMYCIN**; increased risk of ventricular arrhythmias when delamanid given with ● **MOXIFLOXACIN**; plasma concentration of delamanid reduced by ● **RIFAMPICIN**; delamanid increases plasma concentration of **ETHAMBUTOL**
- Antidepressants: possible increased risk of ventricular arrhythmias when delamanid given with ● **TRICYCLICS** that prolong the QT interval
- Antiepileptics: manufacturer of delamanid advises avoid concomitant use with **CARBAMAZEPINE**
- Antipsychotics: increased risk of ventricular arrhythmias when delamanid given with ● **DROPERIDOL**, ● **HALOPERIDOL** or ● **PIMOZIDE**; increased risk of ventricular arrhythmias when delamanid given with ● **PHENOTHIAZINES** that prolong the QT interval

**Delamanid** (continued)

- Antivirals: plasma concentration of delamanid increased by **LOPINAVIR** and **RITONAVIR**; increased risk of ventricular arrhythmias when delamanid given with ● **SAQUINAVIR**
- Beta-blockers: increased risk of ventricular arrhythmias when delamanid given with ● **SOTALOL**
- Cytotoxics: increased risk of ventricular arrhythmias when delamanid given with ● **ARSENIC TRIOXIDE** or ● **VINFLUNINE**; possible increased risk of ventricular arrhythmias when delamanid given with ● **VINBLASTINE**, ● **VINCRIStINE**, ● **VINDESINE** and ● **VINORELBINE**
- Domperidone: possible increased risk of ventricular arrhythmias when delamanid given with ● **DOMPERIDONE**
- Pentamidine Isetonate: increased risk of ventricular arrhythmias when delamanid given with ● **PENTAMIDINE ISETONATE**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Demeclocycline** see Tetracyclines**Desferrioxamine**

- Antipsychotics: avoidance of desferrioxamine advised by manufacturer of **LEVOMEPROMAZINE**; manufacturer of desferrioxamine advises avoid concomitant use with **PROCHLORPERAZINE**

**Desflurane** see Anaesthetics, General**Desloratadine** see Antihistamines**Desmopressin**

- Analgesics: effects of desmopressin enhanced by **INDOMETACIN**
- Loperamide: plasma concentration of *oral* desmopressin increased by **LOPERAMIDE**

**Desogestrel** see Progestogens**Dexamethasone** see Corticosteroids**Dexamfetamine** see Sympathomimetics**Dexibuprofen** see NSAIDs**Dexketoprofen** see NSAIDs**Dexrazoxane**

- Antiepileptics: dexrazoxane possibly reduces absorption of
  - **FOSPHENYTOIN** and ● **PHENYTOIN**
- Ciclosporin: manufacturer of dexrazoxane advises increased risk of immunosuppression with **CICLOSPORIN**
- Tacrolimus: manufacturer of dexrazoxane advises increased risk of immunosuppression with **TACROLIMUS**
- Vaccines: risk of generalised infections when dexrazoxane given with live ● **VACCINES**—avoid concomitant use

**Dextromethorphan** see Opioid Analgesics**Dextropropoxyphene** see Opioid Analgesics**Diamorphine** see Opioid Analgesics**Diazepam** see Anxiolytics and Hypnotics**Diazoxide**

- ACE Inhibitors: enhanced hypotensive effect when diazoxide given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with **ADRENERGIC NEURONE BLOCKERS**
- Alcohol: enhanced hypotensive effect when diazoxide given with **ALCOHOL**
- Aldesleukin: enhanced hypotensive effect when diazoxide given with **ALDESLEUKIN**
- Alpha-blockers: enhanced hypotensive effect when diazoxide given with **ALPHA-BLOCKERS**
- Anaesthetics, General: enhanced hypotensive effect when diazoxide given with **GENERAL ANAESTHETICS**
- Analgesics: hypotensive effect of diazoxide antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Antidepressants: enhanced hypotensive effect when diazoxide given with **MAOIS** or **TRICYCLIC-RELATED ANTIDEPRESSANTS**
- Antidiabetics: diazoxide antagonises hypoglycaemic effect of **ANTIDIABETICS**
- Antiepileptics: diazoxide reduces plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**, also effect of diazoxide may be reduced
- Antipsychotics: enhanced hypotensive effect when diazoxide given with **PHENOTHIAZINES**

**Diazoxide** (continued)

- ▶ Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with **ANXIOLYTICS AND HYPNOTICS**
- ▶ Beta-blockers: enhanced hypotensive effect when diazoxide given with **BETA-BLOCKERS**
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when diazoxide given with **CLONIDINE**
- ▶ Corticosteroids: hypotensive effect of diazoxide antagonised by **CORTICOSTEROIDS**
- ▶ Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with **DIURETICS**
- ▶ Dopaminergics: enhanced hypotensive effect when diazoxide given with **CO-BENELDOPA, CO-CARELDOPA** or **LEVODOPA**
- ▶ Methyldopa: enhanced hypotensive effect when diazoxide given with **METHYLDOPA**
- ▶ Moxisylyle: enhanced hypotensive effect when diazoxide given with **MOXISYLYLE**
- ▶ Moxonidine: enhanced hypotensive effect when diazoxide given with **MOXONIDINE**
- ▶ Muscle Relaxants: enhanced hypotensive effect when diazoxide given with **BACLOFEN** or **TIZANIDINE**
- ▶ Nitrates: enhanced hypotensive effect when diazoxide given with **NITRATES**
- ▶ Prostaglandins: enhanced hypotensive effect when diazoxide given with **ALPROSTADIL**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with **HYDRALAZINE, MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Diclofenac** see NSAIDs**Dicycloverine** see Antimuscarinics**Didanosine**

**NOTE** Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart

- Allopurinol: plasma concentration of didanosine increased by ● **ALLOPURINOL** (risk of toxicity)—avoid concomitant use
- ▶ Analgesics: plasma concentration of didanosine possibly reduced by **METHADONE**
- ▶ Antibacterials: didanosine *tablets* reduce absorption of **CIPROFLOXACIN** (give at least 2 hours before or 4 hours after ciprofloxacin); manufacturer of levofloxacin advises give didanosine *tablets* at least 2 hours before or after **LEVOFLOXACIN**; manufacturer of moxifloxacin advises give didanosine *tablets* at least 6 hours before or after **MOXIFLOXACIN**; manufacturer of norfloxacin advises give didanosine at least 2 hours before or after **NORFLOXACIN**
- Antivirals: didanosine *tablets* reduce absorption of **ATAZANAVIR** (give at least 2 hours before or 1 hour after didanosine *tablets*); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after **DARUNAVIR**; plasma concentration of didanosine possibly increased by **GANCICLOVIR** and **VALGANCICLOVIR**; didanosine *tablets* reduce absorption of **INDINAVIR** (give at least 1 hour apart); increased risk of side-effects when didanosine given with ● **RIBAVIRIN**—avoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after **RILPIVIRINE**; manufacturer of ritonavir advises didanosine and **RITONAVIR** should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with ● **STAVUDINE**; plasma concentration of didanosine increased by ● **TENOFOVIR** (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by **TIPRANAVIR**—manufacturer of tipranavir advises tipranavir and didanosine *capsules* should be taken at least 2 hours apart
- Cytotoxics: increased risk of toxicity when didanosine given with ● **HYDROXYCARBAMIDE**—avoid concomitant use
- Orlistat: absorption of didanosine possibly reduced by ● **ORLISTAT**

**Dieneogest** see Progestogens**Diethylcarbamazine**

- ▶ Antacids: excretion of diethylcarbamazine reduced by **SODIUM BICARBONATE**

**Digoxin** see Cardiac Glycosides**Dihydrocodeine** see Opioid Analgesics**Dihydrotychsterol** see Vitamins**Diltiazem** see Calcium-channel Blockers**Dimethyl sulfoxide**

- Analgesics: avoid concomitant use of dimethyl sulfoxide with ● **SULINDAC**

**Dinoprostone** see Prostaglandins**Diphenoxylate** see Opioid Analgesics**Diphtheria Vaccines** see Vaccines**Dipipanone** see Opioid Analgesics**Dipyridamole**

- ▶ Antacids: absorption of dipyridamole possibly reduced by **ANTACIDS**
- Anti-arrhythmics: dipyridamole enhances and extends effect of ● **ADENOSINE** (important risk of toxicity)—reduce dose of adenosine, see p. 101
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of ● **COUMARINS** and ● **PHENINDIONE**; dipyridamole enhances anticoagulant effect of **HEPARINS**
- ▶ Clopidogrel: increased risk of bleeding when dipyridamole given with **CLOPIDOGREL**
- ▶ Cytotoxics: dipyridamole possibly reduces effects of **FLUDARABINE**

**Disopyramide**

- ▶ Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE** or **ROPIVACAINE**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ● **ANTI-ARRHYTHMICS**; increased risk of ventricular arrhythmias when disopyramide given with ● **AMIODARONE** or ● **DRONEDARONE**—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by ● **AZITHROMYCIN** (increased risk of toxicity); plasma concentration of disopyramide possibly increased by ● **CLARITHROMYCIN** (increased risk of ventricular arrhythmias); plasma concentration of disopyramide increased by ● **ERYTHROMYCIN** (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with ● **MOXIFLOXACIN**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with ● **DELANIDIN**; metabolism of disopyramide accelerated by ● **RIFAMYCINS** (reduced plasma concentration); possible increased risk of ventricular arrhythmias when disopyramide given with ● **TELITHROMYCIN**
- ▶ Anticoagulants: disopyramide may enhance or reduce anticoagulant effect of **WARFARIN**
- Antidepressants: avoidance of disopyramide advised by manufacturer of ● **CITALOPRAM** and ● **ESCITALOPRAM** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with ● **TRICYCLICS**
- ▶ Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of **GLICLAZIDE, INSULIN** and **METFORMIN**
- ▶ Antiepileptics: plasma concentration of disopyramide reduced by **FOSPHENYTOIN** and **PHENYTOIN**; metabolism of disopyramide accelerated by **PHENOBARBITAL** and **PRIMIDONE** (reduced plasma concentration)
- Antifungals: increased risk of ventricular arrhythmias when disopyramide given with ● **KETOCONAZOLE**—avoid concomitant use; avoidance of disopyramide advised by manufacturer of ● **ITRACONAZOLE**
- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with ● **MIZOLASTINE**—avoid concomitant use
- Antimalarials: avoidance of disopyramide advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** (risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of ● **ARTEMNOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with **ANTIMUSCARINICS**; increased risk of ventricular arrhythmias when disopyramide given with ● **TOLTERODINE**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ● **ANTI-ARRHYTHMICS** that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with ● **AMISULPRIDE**, ● **DROPERIDOL**, ● **PIMOZIDE** or ● **ZUCLOPENTHIXOL**—avoid concomitant use; possible increased

### Disopyramide

- Antipsychotics (continued)
  - risk of ventricular arrhythmias when disopyramide given with
    - HALOPERIDOL—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with
      - PHENOTHIAZINES or ● SULPIRIDE
- Antivirals: plasma concentration of disopyramide possibly increased by ● RITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with
  - SAQUINAVIR—avoid concomitant use; avoidance of disopyramide advised by manufacturer of ● TELAPREVIR (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with ● ATOMOXETINE
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ● BETA-BLOCKERS; increased risk of ventricular arrhythmias when disopyramide given with
  - SOTALOL—avoid concomitant use
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with
  - VERAPAMIL
- Cytotoxics: possible increased risk of ventricular arrhythmias when disopyramide given with ● BOSUTINIB and ● CERITINIB; possible increased risk of ventricular arrhythmias when disopyramide given with ● VANDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with ● ARSENIC TRIOXIDE
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with ● ACETAZOLAMIDE, ● LOOP DIURETICS or ● THIAZIDES AND RELATED DIURETICS
- Fingolimod: possible increased risk of bradycardia when disopyramide given with ● FINGOLIMOD
- Ivabradine: increased risk of ventricular arrhythmias when disopyramide given with ● IVABRADINE
- Nitrates: disopyramide reduces effects of sublingual tablets of ● NITRATES (failure to dissolve under tongue owing to dry mouth)
- Panobinostat: possible increased risk of ventricular arrhythmias when disopyramide given with ● PANOBINOSTAT—avoid concomitant use
- Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when disopyramide given with ● PENTAMIDINE ISETIONATE
- Ranolazine: avoidance of disopyramide advised by manufacturer of ● RANOLAZINE
- Sildenafil: manufacturer of disopyramide advises avoid concomitant use with ● SILDENAFIL (risk of ventricular arrhythmias)
- Tadalafil: manufacturer of disopyramide advises avoid concomitant use with ● TADALAFIL (risk of ventricular arrhythmias)
- Vardenafil: manufacturer of disopyramide advises avoid concomitant use with ● VARDENAFIL (risk of ventricular arrhythmias)

### Disulfiram

- Alcohol: disulfiram reaction when disulfiram given with ● ALCOHOL
- Aminophylline: disulfiram inhibits metabolism of ● AMINOPHYLLINE (increased risk of toxicity)
- Antibacterials: psychotic reaction reported when disulfiram given with ● METRONIDAZOLE; CNS effects of disulfiram possibly increased by ● ISONIAZID
- Anticoagulants: disulfiram enhances anticoagulant effect of
  - COUMARINS
- Antidepressants: increased disulfiram reaction with alcohol reported with concomitant ● AMITRIPTYLINE; disulfiram inhibits metabolism of ● TRICYCLICS (increased plasma concentration)
- Antiepileptics: disulfiram inhibits metabolism of
  - FOSPHENYTOIN and ● PHENYTOIN (increased risk of toxicity)
- Anxiolytics and Hypnotics: disulfiram increases risk of ● TEMAZEPAM toxicity; disulfiram inhibits metabolism of ● BENZODIAZEPINES (increased sedative effects)
- Paraldehyde: risk of toxicity when disulfiram given with
  - PARALDEHYDE
- Theophylline: disulfiram inhibits metabolism of ● THEOPHYLLINE (increased risk of toxicity)

### Diuretics

- NOTE Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind
- NOTE Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind
- ACE Inhibitors: enhanced hypotensive effect when diuretics given with ● ACE INHIBITORS; increased risk of severe hyperkalaemia when eplerenone and spironolactone given with ● ACE INHIBITORS—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when amiloride, potassium canrenoate or triamterene given with ● ACE INHIBITORS
  - Adrenergic Neuropeptide Blockers: enhanced hypotensive effect when diuretics given with ● ADRENERGIC NEURONE BLOCKERS
  - Alcohol: enhanced hypotensive effect when diuretics given with ● ALCOHOL
  - Aldesleukin: enhanced hypotensive effect when diuretics given with ● ALDESLEUKIN
  - Aliskiren: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with ● ALISKIREN; plasma concentration of furosemide reduced by ● ALISKIREN
  - Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with ● ALLOPURINOL especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when diuretics given with ● ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
  - Aminophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with ● AMINOPHYLLINE
  - Anaesthetics, General: enhanced hypotensive effect when diuretics given with ● GENERAL ANAESTHETICS
- Analgesics: possible increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with ● NSAIDS; diuretics increase risk of nephrotoxicity of ● NSAIDS, also antagonism of diuretic effect; diuretic effect of potassium canrenoate possibly antagonised by ● NSAIDS; furosemide possibly increases the excretion of ● ACETEMETACIN; effects of diuretics antagonised by ● INDOMETACIN and ● KETOROLAC; increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with ● INDOMETACIN; occasional reports of reduced renal function when triamterene given with ● INDOMETACIN—avoid concomitant use; diuretic effect of spironolactone antagonised by ● ASPIRIN; increased risk of toxicity when acetazolamide given with high-dose ● ASPIRIN; possible increased risk of toxicity when loop diuretics given with high-dose ● ASPIRIN (also possible reduced effect of loop diuretics)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with ● ANGIOTENSIN-II RECEPTOR ANTAGONISTS; increased risk of severe hyperkalaemia when eplerenone and spironolactone given with ● ANGIOTENSIN-II RECEPTOR ANTAGONISTS—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when amiloride, potassium canrenoate or triamterene given with ● ANGIOTENSIN-II RECEPTOR ANTAGONISTS; plasma concentration of furosemide reduced by ● VALSARTAN
- Anti-arrhythmics: plasma concentration of eplerenone increased by ● AMIODARONE (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ● AMIODARONE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ● DISOPYRAMIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ● FLECAINIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of
  - LIDOCAINE
- Antibacterials: plasma concentration of eplerenone increased by ● CLARITHROMYCIN and ● TELITHROMYCIN—avoid

## Diuretics

- **Antibacterials** (continued)
  - concomitant use; plasma concentration of eplerenone increased by **ERYTHROMYCIN** (reduce dose of eplerenone); plasma concentration of eplerenone reduced by
    - **RIFAMPICIN**—avoid concomitant use; avoidance of diuretics advised by manufacturer of **LYMECYCLINE**; increased risk of ototoxicity when loop diuretics given with
      - **AMINOGLYCOSIDES**,
      - **POLYMYXINS** or • **VANCOMYCIN**; acetazolamide antagonises effects of • **METHANAMINE**; possible increased risk of hyperkalaemia when spironolactone given with **TRIMETHOPRIM**; increased risk of hyperkalaemia when eplerenone given with **TRIMETHOPRIM**
  - **Antidepressants**: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **REBOXETINE**; enhanced hypotensive effect when diuretics given with **MAOIS**; plasma concentration of eplerenone reduced by • **ST JOHN'S WORT**—avoid concomitant use; increased risk of postural hypotension when diuretics given with **TRICYCLICS**
  - ▶ **Antidiabetics**: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of **ANTIIDIABETICS**; avoidance of loop diuretics advised by manufacturer of **CANAGLIFLOZIN**; diuretic effect of diuretics possibly enhanced by **CANAGLIFLOZIN**; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by **DAPAGLIFLOZIN**
  - **Antiepileptics**: acetazolamide increases plasma concentration of • **CARBAMAZEPINE**; plasma concentration of eplerenone reduced by • **CARBAMAZEPINE**, • **FOSPHENYTOIN**, • **PHENOBARBITAL**, • **PHENYTOIN** and • **PRIMIDONE**—avoid concomitant use; increased risk of hyponatraemia when diuretics given with **CARBAMAZEPINE**; increased risk of osteomalacia when carbonic anhydrase inhibitors given with **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** or **PRIMIDONE**; effects of furosemide antagonised by **FOSPHENYTOIN** and **PHENYTOIN**; acetazolamide possibly increases plasma concentration of • **FOSPHENYTOIN** and • **PHENYTOIN**; hydrochlorothiazide possibly increases plasma concentration of **TOPIRAMATE**; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of **ZONISAMIDE**
  - **Antifungals**: plasma concentration of eplerenone increased by • **ITRACONAZOLE** and • **KETOCONAZOLE**—avoid concomitant use; increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **AMPHOTERICIN**; plasma concentration of eplerenone increased by **FLUCONAZOLE** (reduce dose of eplerenone); hydrochlorothiazide increases plasma concentration of **FLUCONAZOLE**
  - **Antipsychotics**: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with • **AMISULPRIDE**; enhanced hypotensive effect when diuretics given with **PHENOTHIAZINES**; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with • **PIMOZIDE** (avoid concomitant use)
  - **Antivirals**: plasma concentration of furosemide increased by • **DASABUVIR**, • **OMBITASVIR** and • **PARITAPREVIR** (reduce dose of furosemide); plasma concentration of eplerenone increased by • **RITONAVIR**—avoid concomitant use; plasma concentration of eplerenone increased by **SAQUINAVIR** (reduce dose of eplerenone)
  - ▶ **Anxiolytics and Hypnotics**: enhanced hypotensive effect when diuretics given with **ANXIOLYTICS AND HYPNOTICS**; administration of **parenteral** furosemide with **CHLORAL** may displace thyroid hormone from binding sites
  - **Atomoxetine**: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with • **ATOMOXETINE**
  - **Beta-blockers**: enhanced hypotensive effect when diuretics given with **BETA-BLOCKERS**; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with • **SOTALOL**
  - ▶ **Calcium Salts**: increased risk of hypercalcaemia when thiazides and related diuretics given with **CALCIUM SALTS**
  - ▶ **Calcium-channel Blockers**: enhanced hypotensive effect when diuretics given with **CALCIUM-CHANNEL BLOCKERS**; plasma concentration of eplerenone increased by **DILTIAZEM** and **VERAPAMIL** (reduce dose of eplerenone)

## Diuretics (continued)

- **Cardiac Glycosides**: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with • **CARDIAC GLYCOSIDES**; potassium canrenoate possibly increases plasma concentration of **DIGOXIN**; spironolactone increases plasma concentration of • **DIGOXIN**
- **Ciclosporin**: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with • **CICLOSPORIN**; increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with **CICLOSPORIN**; acetazolamide possibly increases plasma concentration of • **CICLOSPORIN**
- ▶ **Clonidine**: enhanced hypotensive effect when diuretics given with **CLONIDINE**
- ▶ **Corticosteroids**: diuretic effect of diuretics antagonised by **CORTICOSTEROIDS**; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **CORTICOSTEROIDS**
- **Cytotoxics**: alkaline urine due to acetazolamide increases excretion of **METHOTREXATE**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with • **ARSENIC TRIOXIDE**; avoidance of spironolactone advised by manufacturer of **MITOTANE** (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with **PLATINUM COMPOUNDS**
- ▶ **Diazoxide**: enhanced hypotensive and hyperglycaemic effects when diuretics given with **DIAZOXIDE**
- ▶ **Diuretics**: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **ACETAZOLAMIDE**; profound diuresis possible when metolazone given with **FUROSEMIDE**; increased risk of hypokalaemia when thiazides and related diuretics given with **LOOP DIURETICS**
- ▶ **Dopaminergics**: enhanced hypotensive effect when diuretics given with **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**
- ▶ **Hormone Antagonists**: avoidance of spironolactone advised by manufacturer of **ABIRATERONE**; increased risk of hypercalcaemia when thiazides and related diuretics given with **TOREMIFENE**
- ▶ **Lipid-regulating Drugs**: absorption of thiazides and related diuretics reduced by **COLESTIPOL** and **COLESTYRAMINE** (give at least 2 hours apart)
- **Lithium**: aldosterone antagonists and potassium-sparing diuretics reduce excretion of • **LITHIUM** (increased plasma concentration and risk of toxicity); loop diuretics and thiazides and related diuretics reduce excretion of • **LITHIUM** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; acetazolamide increases the excretion of • **LITHIUM**
- ▶ **Methyldopa**: enhanced hypotensive effect when diuretics given with **METHYLDOPA**
- ▶ **Moxisylyte**: enhanced hypotensive effect when diuretics given with **MOXISYLYTE**
- ▶ **Moxonidine**: enhanced hypotensive effect when diuretics given with **MOXONIDINE**
- ▶ **Muscle Relaxants**: enhanced hypotensive effect when diuretics given with **BACLOFEN** or **TIZANIDINE**
- ▶ **Nitrates**: enhanced hypotensive effect when diuretics given with **NITRATES**
- ▶ **Oestrogens**: diuretic effect of diuretics antagonised by **OESTROGENS**
- **Potassium Salts**: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with • **POTASSIUM SALTS**
- ▶ **Progestogens**: risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with **DROSPIRENONE** (monitor serum potassium during first cycle)
- ▶ **Prostaglandins**: enhanced hypotensive effect when diuretics given with **ALPROSTADIL**
- ▶ **Sacubitril**: plasma concentration of furosemide reduced by **SACUBITRIL**
- ▶ **Sympathomimetics, Beta<sub>2</sub>**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of **BETA<sub>2</sub> SYMPATHOMIMETICS**

**Diuretics** (continued)

- Tacrolimus: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with ● **TACROLIMUS**
- ▶ Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **THEOPHYLLINE**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- ▶ Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with **ALFACALCIDOL**, **CALCITRIOL**, **COLECALCIFEROL**, **DIHYDROTACHYSTEROL**, **ERGOCALCIFEROL**, **PARICALCITOL** or **VITAMIN D**

**Diuretics, Loop** see Diuretics**Diuretics, Potassium-sparing** see Diuretics**Diuretics, Thiazide and related** see Diuretics**Dobutamine** see Sympathomimetics**Docetaxel**

- Antibacterials: plasma concentration of docetaxel possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Antifungals: *in vitro* studies suggest a possible interaction between docetaxel and **KETOCONAZOLE** (consult docetaxel product literature); plasma concentration of docetaxel possibly increased by ● **ITRACONAZOLE** and ● **VORICONAZOLE**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of docetaxel possibly increased by ● **INDINAVIR**, ● **RITONAVIR** and ● **SAQUINAVIR**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- ▶ Ciclosporin: *in vitro* studies suggest a possible interaction between docetaxel and **CICLOSPORIN** (consult docetaxel product literature)
- ▶ Cytotoxics: possible increased risk of neutropenia when docetaxel given with **LAPATINIB**; plasma concentration of docetaxel increased by **SORAFENIB**
- ▶ Netupitant: plasma concentration of docetaxel increased by **NETUPITANT**

**Dolutegravir**

- ▶ Antacids: absorption of dolutegravir reduced by **ALUMINIUM HYDROXIDE** and **ORAL MAGNESIUM SALTS**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts
- Antibacterials: plasma concentration of dolutegravir reduced by ● **RIFAMPICIN** (see under Dolutegravir, p. 592)
- Antidepressants: plasma concentration of dolutegravir possibly reduced by ● **ST JOHN'S WORT** (see under Dolutegravir, p. 592)
- ▶ Antidiabetics: dolutegravir increases the plasma concentration of **METFORMIN**—consider reducing dose of metformin
- Antiepileptics: plasma concentration of dolutegravir reduced by ● **CARBAMAZEPINE** (see under Dolutegravir, p. 592); plasma concentration of dolutegravir possibly reduced by ● **FENPHENYTOIN**, ● **OXCARBAZEPINE**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE** (see under Dolutegravir, p. 592)
- Antivirals: plasma concentration of dolutegravir reduced by ● **EFAVIRENZ**, ● **ETRAVIRINE** and ● **TIPRANAVIR** (see under Dolutegravir, p. 592); plasma concentration of dolutegravir reduced by ● **FOSAMPRENAVIR**; plasma concentration of dolutegravir possibly reduced by ● **NEVIRAPINE** (see under Dolutegravir, p. 592)
- ▶ Calcium Salts: absorption of dolutegravir reduced by **CALCIUM SALTS**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts
- ▶ Iron Salts: absorption of dolutegravir reduced by *oral* **IRON SALTS**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after *oral* iron salts

**Domperidone**

- ▶ Analgesics: effects of domperidone on gastro-intestinal activity antagonised by **OPIOID ANALGESICS**
- Antibacterials: possible increased risk of ventricular arrhythmias when domperidone given with

**Domperidone****Antibacterials** (continued)

- **CLARITHROMYCIN** or ● **TELITHROMYCIN**—avoid concomitant use; plasma concentration of domperidone increased by ● **ERYTHROMYCIN** (increased risk of ventricular arrhythmias—avoid concomitant use); possible increased risk of ventricular arrhythmias when domperidone given with ● **DELAMANID**
- Antifungals: avoidance of domperidone advised by manufacturer of ● **KETOCONAZOLE** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when domperidone given with ● **ITRACONAZOLE** or ● **VORICONAZOLE**—avoid concomitant use
- Antimalarials: avoidance of domperidone advised by manufacturer of ● **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias)
- ▶ Antimuscarinics: effects of domperidone on gastro-intestinal activity antagonised by **ANTIMUSCARINICS**
- Antivirals: possible increased risk of ventricular arrhythmias when domperidone given with ● **BOCEPREVIR**, ● **RITONAVIR**, ● **SAQUINAVIR** or ● **TELAPREVIR**—avoid concomitant use
- Cobistat: possible increased risk of ventricular arrhythmias when domperidone given with ● **COBICISTAT**—avoid concomitant use
- Cytotoxics: avoidance of domperidone advised by manufacturer of ● **BOSUTINIB** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when domperidone given with ● **CERTINIB**
- Dopaminergics: possible increased risk of ventricular arrhythmias when domperidone given with ● **APOMORPHINE**; domperidone possibly antagonises hypoprolactinaemic effects of **BROMOCRIPTINE** and **CABERGOLINE**

**Donepezil** see Parasympathomimetics**Dopamine** see Sympathomimetics**Dopaminergics** see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolid, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone**Dopexamine** see Sympathomimetics**Dorzolamide** see Diuretics**Dosulepin** see Antidepressants, Tricyclic**Doxapram**

- ▶ Aminophylline: increased CNS stimulation when doxapram given with **AMINOPHYLLINE**
- Anaesthetics, General: increased risk of arrhythmias when doxapram given with ● **VOLATILE LIQUID GENERAL ANAESTHETICS** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
- ▶ Antidepressants: effects of doxapram enhanced by **MAOIS**
- ▶ Sympathomimetics: increased risk of hypertension when doxapram given with **SYMPATHOMIMETICS**
- ▶ Theophylline: increased CNS stimulation when doxapram given with **THEOPHYLLINE**

**Doxazosin** see Alpha-blockers**Doxepin** see Antidepressants, Tricyclic**Doxorubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ Antivirals: doxorubicin possibly inhibits effects of **STAVUDINE**
- ▶ Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by **VERAPAMIL**
- ▶ Cardiac Glycosides: doxorubicin possibly reduces absorption of **DIGOXIN tablets**
- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with ● **CICLOSPORIN**
- Cytotoxics: possible increased risk of cardiotoxicity when doxorubicin given with ● **TRASTUZUMAB**—avoid concomitant use for up to 28 weeks after stopping trastuzumab; plasma concentration of doxorubicin increased by **SORAFENIB**
- ▶ Ulcer-healing Drugs: plasma concentration of doxorubicin reduced by **CIMETIDINE**
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live ● **VACCINES**—avoid concomitant use

**Doxycycline** see Tetracyclines

**Dronedaronne**

- ▶ Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE**, **LEVOBUPIVACAINE**, **PRILIOCAINE** or **ROPIVACAINE**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other • **ANTI-ARRHYTHMICS**; increased risk of ventricular arrhythmias when dronedaronne given with • **AMIODARONE** or • **DISOPYRAMIDE**—avoid concomitant use
- Antibacterials: manufacturer of dronedaronne advises avoid concomitant use with • **CLARITHROMYCIN** (risk of ventricular arrhythmias); plasma concentration of dronedaronne increased by • **ERYTHROMYCIN** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedaronne reduced by • **RIFAMPICIN**—avoid concomitant use; avoidance of dronedaronne advised by manufacturer of **FIDAXOMICIN**; increased risk of ventricular arrhythmias when dronedaronne given with • **TELITHROMYCIN**—avoid concomitant use
- Anticoagulants: dronedaronne possibly enhances anticoagulant effect of • **COUMARINS** and • **PHENINDIONE**; dronedaronne increases plasma concentration of • **DABIGATRAN**—avoid concomitant use; dronedaronne increases plasma concentration of • **EDOXABAN** (reduce dose of edoxaban—see under Edoxaban, p. 118); avoidance of dronedaronne advised by manufacturer of **RIVAROXABAN**
- Antidepressants: avoidance of dronedaronne advised by manufacturer of • **CITALOPRAM** and • **ESCITALOPRAM** (risk of ventricular arrhythmias); plasma concentration of dronedaronne possibly reduced by • **ST JOHN'S WORT**—avoid concomitant use; manufacturer of dronedaronne advises avoid concomitant use with • **TRICYCLICS** (risk of ventricular arrhythmias)
- Antiepileptics: plasma concentration of dronedaronne possibly reduced by • **CARBAMAZEPINE**, • **FOSPHENYTOIN**, • **PHENOBARBITAL**, • **PHENYTOIN** and • **PRIMIDONE**—avoid concomitant use
- Antifungals: plasma concentration of dronedaronne increased by • **KETOCONAZOLE**—avoid concomitant use; manufacturer of dronedaronne advises avoid concomitant use with • **ITRACONAZOLE**, • **POSACONAZOLE** and • **VORICONAZOLE**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with • **ANTI-PSYCHOTICS** that prolong the QT interval; manufacturer of dronedaronne advises avoid concomitant use with • **PHENOTHIAZINES** (risk of ventricular arrhythmias)
- Antivirals: manufacturer of dronedaronne advises avoid concomitant use with • **RITONAVIR**; increased risk of ventricular arrhythmias when dronedaronne given with • **SAQUINAVIR**—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with • **BETA-BLOCKERS**; dronedaronne possibly increases plasma concentration of **METOPROLOL** and **PROPRANOLOL**; increased risk of ventricular arrhythmias when dronedaronne given with • **SOTALOL**—avoid concomitant use
- Calcium-channel Blockers: plasma concentration of dronedaronne increased by • **NIFEDIPINE**; increased risk of bradycardia and myocardial depression when dronedaronne given with • **DILTIAZEM** and • **VERAPAMIL**
- Cardiac Glycosides: dronedaronne increases plasma concentration of • **DIGOXIN** (halve dose of digoxin)
- Cytotoxics: dronedaronne possibly increases the plasma concentration of • **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; dronedaronne possibly increases the plasma concentration of • **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
- Fingolimod: possible increased risk of bradycardia when dronedaronne given with • **FINGOLIMOD**
- Grapefruit Juice: plasma concentration of dronedaronne increased by • **GRAPEFRUIT JUICE**—avoid concomitant use
- Lipid-regulating Drugs: dronedaronne possibly increases plasma concentration of **ATORVASTATIN**; dronedaronne increases plasma concentration of • **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dronedaronne given with • **SIMVASTATIN**; avoidance of

**Dronedaronne**

- Lipid-regulating Drugs (continued)
  - dronedaronne advised by manufacturer of • **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- ▶ Sirolimus: manufacturer of dronedaronne advises caution with **SIROLIMUS**
- ▶ Tacrolimus: manufacturer of dronedaronne advises caution with **TACROLIMUS**

**Droperidol** see Antipsychotics**Drosiprone** see Progestogens**Dulaglutide** see Antidiabetics**Duloxetine**

- ▶ Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with **FENTANYL**; possible increased serotonergic effects when duloxetine given with **PETHIDINE** or **TRAMADOL**
- Antibacterials: metabolism of duloxetine inhibited by
  - **CIPROFLOXACIN**—avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with • **DABIGATRAN**
- Antidepressants: metabolism of duloxetine inhibited by
  - **FLUVOXAMINE**—avoid concomitant use; possible increased serotonergic effects when duloxetine given with **SSRIs**, **ST JOHN'S WORT**, **AMITRIPTYLINE**, **CLOMIPRAMINE**, • **MOCLOBEMIDE** or **VENLAFAXINE**; duloxetine should not be started until 2 weeks after stopping • **MAOIs**, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start • **MOCLOBEMIDE** for at least 1 week; possible increased risk of convulsions when SSRI-related antidepressants given with • **VORTIOXETINE**
- Antimalarials: avoidance of antidepressants advised by manufacturer of • **ARTEMETHER WITH LUMEFANTRINE** and • **ARTENIMOL WITH PIPERAQUINE**
- ▶ Atomoxetine: possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**
- Dapoxetine: possible increased risk of serotonergic effects when duloxetine given with • **DAPOXETINE** (manufacturer of dapoxetine advises duloxetine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping duloxetine)
- 5HT<sub>1</sub>-receptor Agonists: possible increased serotonergic effects when duloxetine given with **5HT<sub>1</sub> AGONISTS**
- 5HT<sub>2</sub>-receptor Antagonists: possible increased serotonergic effects when SSRI-related antidepressants given with **5HT<sub>2</sub> ANTAGONISTS**
- Methylthionium: risk of CNS toxicity when SSRI-related antidepressants given with • **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Dutasteride**

- ▶ Calcium-channel Blockers: plasma concentration of dutasteride increased by **DILTIAZEM** and **VERAPAMIL**

**Dydrogesterone** see Progestogens**Edoxaban**

- Analgesics: increased risk of bleeding when edoxaban given with • **NSAIDS** (manufacturer of edoxaban advises avoid long-term NSAIDs); increased risk of haemorrhage when anticoagulants given with **INTRAVENOUS** • **DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • **KETOROLAC** (avoid concomitant use, including low-dose heparins); increased risk of bleeding when edoxaban given with high-dose • **ASPIRIN** (avoid concomitant use)
- Anti-arrhythmics: plasma concentration of edoxaban increased by • **DRONEDARONE** (reduce dose of edoxaban—see under Edoxaban, p. 118)
- Antibacterials: plasma concentration of edoxaban increased by • **ERYTHROMYCIN** (reduce dose of edoxaban—see under Edoxaban, p. 118); plasma concentration of edoxaban reduced by • **RIFAMPICIN**
- Anticoagulants: increased risk of haemorrhage when edoxaban given with other • **ANTICOAGULANTS** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with

**Edoxaban**

- Anticoagulants (continued)
  - **APIXABAN**, ● **DABIGATRAN** and ● **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of edoxaban possibly reduced by ● **ST JOHN'S WORT**
- Antiepileptics: plasma concentration of edoxaban possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**
- Antifungals: plasma concentration of edoxaban increased by ● **KETOCONAZOLE** (reduce dose of edoxaban—see under Edoxaban, p. 118)
- ▶ Calcium-channel Blockers: plasma concentration of edoxaban increased by ● **VERAPAMIL**
- Ciclosporin: plasma concentration of edoxaban increased by ● **CICLOSPORIN** (reduce dose of edoxaban—see under Edoxaban, p. 118)

**Efavirenz**

- ▶ Analgesics: efavirenz reduces plasma concentration of ● **METHADONE**
- ▶ Antibacterials: efavirenz reduces plasma concentration of ● **CLARITHROMYCIN**, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of ● **RIFABUTIN**—increase dose of rifabutin; plasma concentration of efavirenz reduced by ● **RIFAMPICIN**—increase dose of efavirenz; efavirenz possibly reduces plasma concentration of ● **BEDAQUILINE**—manufacturer of bedaquiline advises avoid concomitant use
- Anticoagulants: efavirenz possibly affects plasma concentration of ● **COUMARINS**
- Antidepressants: plasma concentration of efavirenz reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- ▶ Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with ● **CARBAMAZEPINE**
- Antifungals: efavirenz reduces plasma concentration of ● **ITRACONAZOLE**, ● **KETOCONAZOLE** and ● **POSACONAZOLE**; avoidance of efavirenz advised by manufacturer of ● **ISAVUCONAZOLE**; efavirenz reduces plasma concentration of ● **VORICONAZOLE**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of ● **CASPOFUNGIN**—consider increasing dose of caspofungin
- Antimalarials: efavirenz reduces plasma concentration of ● **ARTEMETHER WITH LUMEFANTRINE**; efavirenz possibly affects plasma concentration of ● **PROGUANIL**
- Antipsychotics: efavirenz possibly reduces plasma concentration of ● **ARIPIPRAZOLE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of ● **PIMOZIDE** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of ● **ATAZANAVIR** (plasma concentration of atazanavir reduced); efavirenz reduces the plasma concentration of ● **DACLATASVIR**—increase dose of daclatasvir (see under Daclatasvir, p. 577); efavirenz reduces plasma concentration of ● **DARUNAVIR** (adjust dose—consult product literature); avoidance of efavirenz advised by manufacturer of ● **DASABUVIR**, ● **ELVITEGRAVIR**, ● **OMBITASVIR** and ● **PARITAPREVIR**; efavirenz reduces the plasma concentration of ● **DOLUTEGRAVIR** (see under Dolutegravir, p. 592); efavirenz possibly reduces plasma concentration of ● **ETRAVIRINE**—avoid concomitant use; efavirenz reduces plasma concentration of ● **INDINAVIR** and ● **SIMEPREVIR**; efavirenz reduces plasma concentration of ● **LOPINAVIR**—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of ● **MARAVIROC**—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by ● **NEVIRAPINE**—avoid concomitant use; toxicity of efavirenz increased by ● **RITONAVIR**, monitor liver function tests—manufacturer of *Atripla*<sup>®</sup> advises avoid concomitant use with *high-dose* ritonavir; efavirenz significantly reduces plasma concentration of ● **SAQUINAVIR**; efavirenz reduces plasma concentration of ● **TELAPREVIR**—increase dose of telaprevir

**Efavirenz** (continued)

- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with ● **MIDAZOLAM**—avoid concomitant use
- Atovaquone: efavirenz reduces plasma concentration of ● **ATOVAQUONE**—avoid concomitant use
- ▶ Avanafil: efavirenz possibly reduces plasma concentration of ● **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
- ▶ Bupropion: efavirenz accelerates metabolism of ● **BUPROPION** (reduced plasma concentration)
- ▶ Calcium-channel Blockers: efavirenz reduces plasma concentration of ● **DILTIAZEM**
- Ciclosporin: efavirenz possibly reduces plasma concentration of ● **CICLOSPORIN**
- Cytotoxics: efavirenz possibly reduces plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with ● **ERGOT ALKALOIDS**—avoid concomitant use
- ▶ Grapefruit Juice: plasma concentration of efavirenz possibly increased by ● **GRAPEFRUIT JUICE**
- Guanfacine: efavirenz possibly reduces plasma concentration of ● **GUANFACINE**—increase dose of guanfacine
- ▶ Lipid-regulating Drugs: efavirenz reduces plasma concentration of ● **ATORVASTATIN**, ● **PRAVASTATIN** and ● **SIMVASTATIN**
- Orlistat: absorption of efavirenz possibly reduced by ● **ORLISTAT**
- Progestogens: efavirenz possibly reduces contraceptive effect of ● **PROGESTOGENS**
- Tacrolimus: efavirenz possibly affects plasma concentration of ● **TACROLIMUS**

**Eletriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)

**Eltrombopag**

- ▶ Antacids: absorption of eltrombopag reduced by ● **ANTACIDS** (give at least 4 hours apart)
- ▶ Antivirals: plasma concentration of eltrombopag possibly reduced by ● **LOPINAVIR**
- ▶ Calcium Salts: absorption of eltrombopag possibly reduced by ● **CALCIUM SALTS** (give at least 4 hours apart)
- ▶ Dairy Products: absorption of eltrombopag possibly reduced by ● **DAIRY PRODUCTS** (give at least 4 hours apart)
- ▶ Iron Salts: absorption of eltrombopag possibly reduced by ● **ORAL IRON SALTS** (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of ● **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature)
- ▶ Selenium: absorption of eltrombopag possibly reduced by ● **SELENIUM** (give at least 4 hours apart)
- ▶ Zinc: absorption of eltrombopag possibly reduced by ● **ZINC** (give at least 4 hours apart)

**Elvitegravir**

- ▶ Antacids: absorption of elvitegravir reduced by ● **ALUMINIUM HYDROXIDE** and ● **ORAL MAGNESIUM SALTS** (give at least 4 hours apart)
- Antibacterials: plasma concentration of elvitegravir reduced by ● **RIFABUTIN** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with ● **RIFAMPICIN**
- Antidepressants: manufacturer of elvitegravir advises avoid concomitant use with ● **ST JOHN'S WORT**
- Antiepileptics: manufacturer of elvitegravir advises avoid concomitant use with ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**
- Antivirals: plasma concentration of elvitegravir increased by ● **ATAZANAVIR** and ● **LOPINAVIR** boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with ● **EFAVIRENZ** and ● **NEVIRAPINE**
- ▶ Bosentan: manufacturer of elvitegravir advises avoid concomitant use with ● **BOSENTAN**
- Orlistat: absorption of elvitegravir possibly reduced by ● **ORLISTAT**
- ▶ Progestogens: elvitegravir increases plasma concentration of ● **NORGESTIMATE**

**Empagliflozin** see Antidiabetics

**Emtricitabine**

- ▶ Antivirals: manufacturer of emtricitabine advises avoid concomitant use with **LAMIVUDINE**
- Orlistat: absorption of emtricitabine possibly reduced by ● **ORLISTAT**

**Enalapril** see ACE Inhibitors

**Enfuvirtide**

- Orlistat: absorption of enfuvirtide possibly reduced by ● **ORLISTAT**

**Enoxaparin** see Heparins

**Enoximone** see Phosphodiesterase Inhibitors

**Entacapone**

- Anticoagulants: entacapone enhances anticoagulant effect of ● **WARFARIN**
- Antidepressants: manufacturer of entacapone advises caution with **MOCLOBEMIDE**, **TRICYCLICS** and **VENLAFAXINE**; avoid concomitant use of entacapone with non-selective ● **MAOIS**
- ▶ Dopaminergics: entacapone possibly enhances effects of **ADOPAMPHINE**; entacapone possibly reduces plasma concentration of **RASAGILINE**; manufacturer of entacapone advises max. dose of 10 mg **SELEGILINE** if used concomitantly
- ▶ Iron Salts: absorption of entacapone reduced by oral **IRON SALTS**
- ▶ Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**
- ▶ Methyl dopa: entacapone possibly enhances effects of **METHYLDOPA**; antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- ▶ Sympathomimetics: entacapone possibly enhances effects of **ADRENALINE (EPINEPHRINE)**, **DOBUTAMINE**, **DOPAMINE** and **NORADRENALINE (NOREPINEPHRINE)**

**Enteral Feeds**

- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of ● **COUMARINS** and ● **PHENINDIONE**
- ▶ Antiepileptics: enteral feeds possibly reduce absorption of **FOSPHENYTOIN** and **PHENYTOIN**

**Enzalutamide**

- Anticoagulants: enzalutamide possibly reduces plasma concentration of ● **COUMARINS**
- ▶ Antivirals: avoidance of enzalutamide advised by manufacturer of **DASABUVIR**, **OMBITASVIR** and **PARITAPREVIR**
- Anxiolytics and Hypnotics: enzalutamide reduces plasma concentration of ● **MIDAZOLAM**
- Lipid-regulating Drugs: plasma concentration of enzalutamide increased by ● **GEMFIBROZIL**—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- ▶ Ulcer-healing Drugs: enzalutamide reduces plasma concentration of **OMEPRAZOLE**

**Ephedrine** see Sympathomimetics

**Epinephrine**

**NOTE** Epinephrine interactions as for adrenaline, see under sympathomimetics

**Epirubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of epirubicin increased by ● **CICLOSPORIN**
- Cytotoxics: possible increased risk of cardiotoxicity when epirubicin given with ● **TRASTUZUMAB**—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by ● **CIMETIDINE**
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live ● **VACCINES**—avoid concomitant use

**Eplerenone** see Diuretics

**Eprosartan** see Angiotensin-II Receptor Antagonists

**Eptifibatid**

- ▶ Iloprost: increased risk of bleeding when eptifibatid given with **ILOPROST**

**Ergocalciferol** see Vitamins

**Ergometrine** see Ergot Alkaloids

**Ergot Alkaloids**

- Antibacterials: increased risk of ergotism when ergot alkaloids given with ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** or ● **TELITHROMYCIN**—avoid concomitant use; increased risk of ergotism when ergotamine given with **TETRACYCLINES**

**Ergot Alkaloids (continued)**

- ▶ Antidepressants: possible risk of hypertension when ergotamine given with **REBOXETINE**
- Antifungals: avoidance of ergot alkaloids advised by manufacturer of ● **KETOCONAZOLE**; avoidance of ergometrine advised by manufacturer of ● **ITRACONAZOLE** (increased risk of ergotism); increased risk of ergotism when ergometrine given with ● **VORICONAZOLE**—avoid concomitant use; increased risk of ergotism when ergotamine given with ● **IMIDAZOLES** or ● **TRIAZOLES**—avoid concomitant use
- ▶ Antipsychotics: plasma concentration of ergot alkaloids possibly increased by **LURASIDONE** (increased risk of toxicity)
- Antivirals: plasma concentration of ergot alkaloids possibly increased by ● **ATAZANAVIR**—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of ● **BOCEPREVIR** and ● **TELAPREVIR**; increased risk of ergotism when ergot alkaloids given with ● **DARUNAVIR**—manufacturer of darunavir advises avoid concomitant use; increased risk of ergotism when ergot alkaloids given with ● **EFAVIRENZ** or ● **RITONAVIR**—avoid concomitant use; increased risk of ergotism when ergotamine given with ● **FOSAMPRENAVIR**, ● **INDINAVIR** or ● **SAQUINAVIR**—avoid concomitant use; increased risk of ergotism when ergometrine given with ● **INDINAVIR**—avoid concomitant use
- ▶ Beta-blockers: increased peripheral vasoconstriction when ergot alkaloids given with **BETA-BLOCKERS**
- Cobicistat: plasma concentration of ergot alkaloids possibly increased by ● **COBICISTAT**—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: avoidance of ergotamine advised by manufacturer of **CERITINIB** and **IDELALISIB**; caution with ergot alkaloids advised by manufacturer of ● **CRIZOTINIB**
- 5HT<sub>2</sub>-receptor Agonists: increased risk of vasospasm when ergotamine given with ● **ALMOTRIPTAN**, ● **RIZATRIPTAN**, ● **SUMATRIPTAN** or ● **ZOLMITRIPTAN** (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with ● **ELETRIPTAN**, ● **FROVATRIPTAN** or ● **NARATRIPTAN** (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)
- ▶ Sympathomimetics: increased risk of ergotism when ergot alkaloids given with **SYMPATHOMIMETICS**
- Ticagrelor: plasma concentration of ergot alkaloids possibly increased by ● **TICAGRELOR**
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with ● **CIMETIDINE**—avoid concomitant use

**Ergotamine** see Ergot Alkaloids

**Eribulin**

- ▶ Antibacterials: plasma concentration of eribulin possibly reduced by **RIFAMPICIN**
- ▶ Antidepressants: plasma concentration of eribulin possibly reduced by **ST JOHN'S WORT**
- ▶ Antiepileptics: plasma concentration of eribulin possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN**
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)

**Erolotinib**

- Analgesics: increased risk of bleeding when erlotinib given with ● **NSAIDS**
- Antacids: plasma concentration of erlotinib possibly reduced by ● **ANTACIDS**—give antacids at least 4 hours before or 2 hours after erlotinib
- ▶ Antibacterials: plasma concentration of erlotinib increased by **CIPROFLOXACIN**; metabolism of erlotinib accelerated by **RIFAMPICIN** (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with ● **COUMARINS**
- ▶ Antifungals: metabolism of erlotinib inhibited by **KETOCONAZOLE** (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: avoidance of erlotinib advised by manufacturer of ● **BOCEPREVIR**

**Erlotinib** (continued)

- ▶ Cytotoxics: plasma concentration of erlotinib possibly increased by **CAPECITABINE**
- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with ● **CIMETIDINE**, ● **ESOMEPRAZOLE**, ● **FAMOTIDINE**, ● **LANSOPRAZOLE**, ● **NIZATIDINE**, ● **PANTOPRAZOLE** and ● **RABEPRAZOLE**; plasma concentration of erlotinib reduced by ● **RANITIDINE**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by ● **OMEPRAZOLE**—manufacturer of erlotinib advises avoid concomitant use

**Ertapenem**

- Antiepileptics: carbapenems reduce plasma concentration of ● **SODIUM VALPROATE** and ● **VALPROIC ACID**—avoid concomitant use
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Erythromycin** see Macrolides**Escitalopram** see Antidepressants, SSRI**Eslicarbazepine**

- ▶ Anticoagulants: eslicarbazepine reduces plasma concentration of **WARFARIN**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIS** and ● **TRICYCLICS** (convulsive threshold lowered)
- ▶ Antiepileptics: plasma concentration of eslicarbazepine possibly reduced by **CARBAMAZEPINE** but risk of side-effects increased; plasma concentration of eslicarbazepine reduced by **FOSPHENYTOIN** and **PHENYTOIN**, also plasma concentration of fosphenytoin and phenytoin increased; manufacturer of eslicarbazepine advises avoid concomitant use with **OXCARBAZEPINE**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- ▶ Lipid-regulating Drugs: eslicarbazepine reduces plasma concentration of **ROSUVASTATIN**; eslicarbazepine reduces plasma concentration of **SIMVASTATIN**—consider increasing dose of simvastatin
- Oestrogens: eslicarbazepine accelerates metabolism of ● **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**
- Progestogens: eslicarbazepine accelerates metabolism of ● **PROGESTOGENS** (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)

**Esmolol** see Beta-blockers**Esomeprazole** see Proton Pump Inhibitors**Estradiol** see Oestrogens**Estramustine**

- ▶ Antacids: absorption of estramustine possibly reduced by **ALUMINIUM HYDROXIDE** and **ORAL MAGNESIUM SALTS**—manufacturer of estramustine advises avoid concomitant administration
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by ● **SODIUM CLODRONATE**
- ▶ Calcium Salts: absorption of estramustine reduced by **CALCIUM SALTS** (manufacturer of estramustine advises avoid concomitant administration)

**Estriol** see Oestrogens**Estrone** see Oestrogens**Etanercept**

- Abatacept: avoid concomitant use of etanercept with ● **ABATACEPT**

**Etanercept** (continued)

- Anakinra: avoid concomitant use of etanercept with ● **ANAKINRA**
- Vaccines: risk of generalised infections when etanercept given with live ● **VACCINES**—avoid concomitant use

**Ethambutol**

- ▶ Antibacterials: plasma concentration of ethambutol increased by **DELAMANID**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Ethinylestradiol** see Oestrogens**Ethosuximide**

- Antibacterials: metabolism of ethosuximide inhibited by ● **ISONIAZID** (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIS** and ● **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by **CARBAMAZEPINE**, **PHENOBARBITAL** and **PRIMIDONE**; plasma concentration of ethosuximide possibly reduced by ● **FOSPHENYTOIN** and ● **PHENYTOIN**, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by **SODIUM VALPROATE** and **VALPROIC ACID**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**

**Etodolac** see NSAIDs**Etomidate** see Anaesthetics, General**Etonogestrel** see Progestogens**Etoposide**

- Anticoagulants: etoposide possibly enhances anticoagulant effect of ● **COUMARINS**
- ▶ Antiepileptics: plasma concentration of etoposide possibly reduced by **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ Antifungals: plasma concentration of etoposide increased by **KETOCONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ Atovaquone: plasma concentration of etoposide possibly increased by **ATOVAQUONE**
- ▶ Cyclosporin: plasma concentration of etoposide possibly increased by **CYCLOSPORIN** (increased risk of toxicity)
- ▶ Netupitant: plasma concentration of etoposide increased by **NETUPITANT**

**Etoricoxib** see NSAIDs**Etravirine**

- Antibacterials: etravirine reduces plasma concentration of ● **CLARITHROMYCIN** (but concentration of an active metabolite increased), also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with ● **RIFABUTIN**; manufacturer of etravirine advises avoid concomitant use with **RIFAMPICIN**; etravirine possibly reduces plasma concentration of **BEDAQUILINE**—manufacturer of bedaquiline advises avoid concomitant use
- ▶ Antidepressants: manufacturer of etravirine advises avoid concomitant use with **ST JOHN'S WORT**
- ▶ Antiepileptics: manufacturer of etravirine advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ Antifungals: avoidance of etravirine advised by manufacturer of **ISAVUCONAZOLE**
- ▶ Antimalarials: etravirine reduces plasma concentration of **ARTEMETHER WITH LUMEFANTRINE**
- Antivirals: effects of both drugs possibly reduced when etravirine given with **BOCEPREVIR**; avoidance of etravirine advised by manufacturer of **DACLATASVIR** (plasma concentration of daclatasvir possibly reduced); avoidance of

**Etravirine**

- Antivirals (continued)
  - etravirine advised by manufacturer of **DASABUVIR**, **OMBITASVIR**, **PARITAPREVIR** and **SIMEPREVIR**; etravirine reduces the plasma concentration of ● **DOLUTEGRAVIR** (see under Dolutegravir, p. 592); plasma concentration of etravirine possibly reduced by ● **EFAVIRENZ** and ● **NEVIRAPINE**—avoid concomitant use; etravirine increases plasma concentration of ● **FOSAMPRENAVIR** (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of ● **INDINAVIR**—avoid concomitant use; etravirine possibly reduces plasma concentration of **MARAVIROC**; plasma concentration of etravirine reduced by ● **TIPRANAVIR**, also plasma concentration of tipranavir increased (avoid concomitant use)
- ▶ Cardiac Glycosides: etravirine increases plasma concentration of **DIGOXIN**
- Clopidogrel: etravirine possibly reduces antiplatelet effect of ● **CLOPIDOGREL**
- Cytotoxics: etravirine possibly reduces plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid concomitant use
- Guanfacine: etravirine possibly reduces plasma concentration of ● **GUANFACINE**—increase dose of guanfacine
- ▶ Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of **ATORVASTATIN**
- Orlistat: absorption of etravirine possibly reduced by ● **ORLISTAT**
- ▶ Sildenafil: etravirine reduces plasma concentration of **SILDENAFIL**

**Everolimus**

- ACE Inhibitors: increased risk of angioedema when everolimus given with ● **ACE INHIBITORS**
- Antibacterials: plasma concentration of everolimus possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by ● **ERYTHROMYCIN** (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of everolimus reduced by ● **RIFAMPICIN** (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature)
- ▶ Antidepressants: plasma concentration of everolimus possibly reduced by **ST JOHN'S WORT**—manufacturer of everolimus advises avoid concomitant use
- Antifungals: plasma concentration of everolimus increased by ● **KETOCONAZOLE**—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of everolimus possibly increased by ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by ● **ATAZANAVIR**, ● **DARUNAVIR**, ● **INDINAVIR**, ● **RITONAVIR** and ● **SAQUINAVIR**—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with ● **VERAPAMIL** (consider reducing the dose of everolimus—consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by ● **CYCLOSPORIN** (consider reducing the dose of everolimus—consult everolimus product literature)
- Cytotoxics: plasma concentration of everolimus increased by ● **IMATINIB** (consider reducing the dose of everolimus—consult everolimus product literature)
- ▶ Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with **GRAPEFRUIT JUICE**
- ▶ Lumacaftor: avoidance of everolimus advised by manufacturer of **LUMACAFTOR**

**Evolocumab**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Exemestane**

- ▶ Antibacterials: plasma concentration of exemestane possibly reduced by **RIFAMPICIN**

**Enatenide** see Antidiabetics**Ezetimibe**

- ▶ Anticoagulants: ezetimibe possibly enhances anticoagulant effect of **COUMARINS**
- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with ● **CYCLOSPORIN**
- Lipid-regulating Drugs: ezetimibe increases plasma concentration of ● **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); increased risk of cholelithiasis and gallbladder disease when ezetimibe given with **FIBRATES**—discontinue if suspected

**Famotidine** see Histamine H<sub>2</sub>-antagonists**Fampridine**

- Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with ● **CIMETIDINE**

**Febuxostat**

- Azathioprine: manufacturer of febuxostat advises avoid concomitant use with ● **AZATHIOPRINE**
- Cytotoxics: manufacturer of febuxostat advises avoid concomitant use with ● **MERCAPTOPURINE**

**Felodipine** see Calcium-channel Blockers**Fenofibrate** see Fibrates**Fenopropfen** see NSAIDs**Fentanyl** see Opioid Analgesics**Ferrous Fumarate** see Iron salts**Ferrous Gluconate** see Iron salts**Ferrous Sulfate** see Iron salts**Fesoterodine** see Antimuscarinics**Fexofenadine** see Antihistamines**Fibrates**

- Antibacterials: increased risk of myopathy when fibrates given with ● **DAPTOMYCIN** (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of ● **COUMARINS** and ● **PHENINDIONE**
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with **INSULIN** or **SULFONYLUREAS**; gemfibrozil possibly enhances hypoglycaemic effect of **NATEGLINIDE**; increased risk of severe hypoglycaemia when gemfibrozil given with ● **REPAGLINIDE**—avoid concomitant use
- Antivirals: avoidance of gemfibrozil advised by manufacturer of **DASABUVIR**; gemfibrozil increases plasma concentration of ● **PARITAPREVIR**—manufacturer of paritaprevir advises avoid concomitant use
- ▶ Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with **CYCLOSPORIN**
- Colchicine: possible increased risk of myopathy when fibrates given with ● **COLCHICINE**
- Cytotoxics: gemfibrozil increases plasma concentration of **DABRAFENIB**; gemfibrozil increases plasma concentration of ● **BEXAROTENE**—avoid concomitant use
- Hormone Antagonists: gemfibrozil increases plasma concentration of ● **ENZALUTAMIDE**—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- ▶ Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of **MONTELUKAST**
- Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with ● **ATORVASTATIN**, ● **FLUVASTATIN** or ● **PRAVASTATIN** (preferably avoid concomitant use); increased risk of myopathy when fibrates given with ● **ROSUVASTATIN** (see under Rosuvastatin, p. 193); possible increased risk of myopathy when bezafibrate given with ● **SIMVASTATIN** (see under Simvastatin, p. 194); possible increased risk of myopathy when ciprofibrate given with ● **SIMVASTATIN** (see under Simvastatin, p. 194); increased risk of myopathy when gemfibrozil given with ● **SIMVASTATIN** (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with **EZETIMIBE**—discontinue if suspected; increased risk of myopathy when fibrates given with ● **STATINS**; reduce maximum dose of fenofibrate when given with **STATINS**—see under Fenofibrate, p. 188

**Fidaxomicin**

- ▶ Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with **AMIODARONE** and **DRONEDARONE**
- ▶ Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with **CLARITHROMYCIN** and **ERYTHROMYCIN**
- ▶ Antifungals: manufacturer of fidaxomicin advises avoid concomitant use with **KETOCONAZOLE**
- ▶ Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with **VERAPAMIL**
- ▶ Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with **CICLOSPORIN**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Filgrastim**

- ▶ Cytotoxics: neutropenia possibly exacerbated when filgrastim given with **CAPECITABINE**, **FLUOROURACIL** or **TEGAFUR**

**Fingolimod**

- Anti-arrhythmics: possible increased risk of bradycardia when fingolimod given with ● **AMIODARONE**, ● **DISOPYRAMIDE** or ● **DRONEDARONE**
- ▶ Antidepressants: plasma concentration of fingolimod possibly reduced by **ST JOHN'S WORT**—manufacturer of fingolimod advises avoid concomitant use
- ▶ Antiepileptics: plasma concentration of fingolimod reduced by **CARBAMAZEPINE**
- Antifungals: plasma concentration of fingolimod increased by ● **KETOCONAZOLE**
- Beta-blockers: possible increased risk of bradycardia when fingolimod given with ● **BETA-BLOCKERS**
- Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with ● **DILTIAZEM** or ● **VERAPAMIL**

**Flavoxate** see Antimuscarinics

**Flecainide**

- ▶ Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE**, **LEVOBUPIVACAINE**, **PRILCAGINE** or **ROPIVACAINE**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ● **ANTI-ARRHYTHMICS**; plasma concentration of flecainide increased by ● **AMIODARONE** (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by **FLUOXETINE**; increased risk of ventricular arrhythmias when flecainide given with ● **TRICYCLICS**
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with ● **MIZOLASTINE**—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** (risk of ventricular arrhythmias); plasma concentration of flecainide increased by ● **QUININE**
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with ● **TOLTERODINE**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ● **ANTIPSYCHOTICS** that prolong the QT interval; increased risk of arrhythmias when flecainide given with ● **CLOZAPINE**
- Antivirals: plasma concentration of flecainide possibly increased by ● **FOSAMPRENAVIR**, ● **INDINAVIR**, ● **LOPINAVIR** and ● **RITONAVIR** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with ● **SAQUINAVIR**—avoid concomitant use; caution with flecainide advised by manufacturer of ● **TELAPREVIR** (risk of ventricular arrhythmias)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with ● **BETA-BLOCKERS**; increased myocardial depression when anti-arrhythmics given with ● **BETA-BLOCKERS**
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with ● **VERAPAMIL**
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with ● **ACETAZOLAMIDE**, ● **LOOP DIURETICS** or ● **THIAZIDES AND RELATED DIURETICS**
- ▶ Ulcer-healing Drugs: metabolism of flecainide inhibited by **CIMETIDINE** (increased plasma concentration)

**Flucloxacillin** see Penicillins

**Fluconazole** see Antifungals, Triazoles

**Flucytosine**

- ▶ Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by **AMPHOTERICIN** (toxicity possibly increased)
- ▶ Cytotoxics: plasma concentration of flucytosine possibly reduced by **CYTARABINE**

**Fludarabine**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: fludarabine increases intracellular concentration of **CYTARABINE**; increased pulmonary toxicity when fludarabine given with ● **PENTOSTATIN** (unacceptably high incidence of fatalities)
- ▶ Dipyradamole: effects of fludarabine possibly reduced by **DIPYRIDAMOLE**

**Fludrocortisone** see Corticosteroids

**Fluorides**

- ▶ Calcium Salts: absorption of fluorides reduced by **CALCIUM SALTS**

**Fluorouracil**

- ▶ Antibacterials: metabolism of fluorouracil inhibited by **METRONIDAZOLE** (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of ● **COUMARINS**
- ▶ Antiepileptics: fluorouracil possibly inhibits metabolism of **FOSPHENYTOIN** and **PHENYTOIN** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: avoidance of fluorouracil advised by manufacturer of ● **PANITUMUMAB**
- ▶ Filgrastim: neutropenia possibly exacerbated when fluorouracil given with **FILGRASTIM**
- Folate: toxicity of fluorouracil increased by ● **FOLIC ACID**—avoid concomitant use
- ▶ Lipegfilgrastim: neutropenia possibly exacerbated when fluorouracil given with **LIPEGFILGRASTIM**
- ▶ Pegfilgrastim: neutropenia possibly exacerbated when fluorouracil given with **PEGFILGRASTIM**
- Temoporfin: increased skin photosensitivity when *topical* fluorouracil used with ● **TEMOPORFIN**
- ▶ Ulcer-healing Drugs: metabolism of fluorouracil inhibited by **CIMETIDINE** (increased plasma concentration)

**Fluoxetine** see Antidepressants, SSRI

**Flupentixol** see Antipsychotics

**Fluphenazine** see Antipsychotics

**Flurazepam** see Anxiolytics and Hypnotics

**Flurbiprofen** see NSAIDs

**Flutamide**

- Anticoagulants: flutamide enhances anticoagulant effect of ● **COUMARINS**

**Fluticasone** see Corticosteroids

**Fluvastatin** see Statins

**Fluvoxamine** see Antidepressants, SSRI

**Folates**

- ▶ Aminosalicylates: absorption of folic acid possibly reduced by **SULFASALAZINE**
- ▶ Antacids: absorption of folic acid possibly reduced by **ANTACIDS** (manufacturer of folic acid advises give at least 2 hours apart)
- ▶ Antiepileptics: folates possibly reduce plasma concentration of **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- Cytotoxics: folic acid increases toxicity of ● **CAPECITABINE**, ● **FLUOROURACIL** and ● **TEGAFUR**—avoid concomitant use; avoidance of folates advised by manufacturer of ● **RALTITREXED**; avoidance of folic acid advised by manufacturer of ● **PANITUMUMAB**

**Folic Acid** see Folate

**Folinic Acid** see Folate

**Fondaparinux**

- Analgesics: increased risk of haemorrhage when anticoagulants given with *intravenous* ● **DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **KETOROLAC** (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● **APIXABAN**, ● **DABIGATRAN**, ● **EDOXYBAN** and ● **RIVAROXABAN** (avoid concomitant use except

**Fondaparinux**

- Anticoagulants (continued)
  - when switching with other anticoagulants or using heparin to maintain catheter patency)

**Formoterol** see Sympathomimetics, Beta<sub>2</sub>

**Fosamprenavir**

- NOTE** Fosamprenavir is a prodrug of amprenavir
- ▶ Analgesics: fosamprenavir reduces plasma concentration of **METHADONE**
  - Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of • **AMIODARONE**, • **FLECAINIDE** and • **PROPAFENONE** (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of • **LIDOCAINE**—avoid concomitant use
  - Antibacterials: fosamprenavir increases plasma concentration of • **RIFABUTIN** (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by • **RIFAMPICIN**—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of • **TELITHROMYCIN**
  - ▶ Anticoagulants: avoidance of fosamprenavir advised by manufacturer of **APIXABAN** and **RIVAROXABAN**; fosamprenavir may enhance or reduce anticoagulant effect of **COUMARINS**
  - Antidepressants: plasma concentration of fosamprenavir reduced by • **ST JOHN'S WORT**—avoid concomitant use
  - ▶ Antiepileptics: plasma concentration of fosamprenavir possibly reduced by **CARBAMAZEPINE**, **PHENOBARBITAL** and **PRIMIDONE**
  - ▶ Antifungals: fosamprenavir increases plasma concentration of **KETOCONAZOLE** (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with **ITRACONAZOLE**; fosamprenavir possibly reduces plasma concentration of **POSACONAZOLE**
  - Antimalarials: caution with fosamprenavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; fosamprenavir possibly increases plasma concentration of • **QUININE** (increased risk of toxicity)
  - ▶ Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of **DARIFENACIN** and **TOLTERODINE**
  - Antipsychotics: fosamprenavir possibly increases plasma concentration of • **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); fosamprenavir increases plasma concentration of • **PIMOZIDE** (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of • **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
  - Antivirals: manufacturer of fosamprenavir advises avoid concomitant use with • **BOCEPREVIR** and • **RALTEGRAVIR**; fosamprenavir reduces plasma concentration of • **DOLUTEGRAVIR**; plasma concentration of fosamprenavir increased by • **ETRAVIRINE** (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by **LOPINAVIR**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir reduced by • **MARAVIROC**—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by **NEVIRAPINE**—avoid unboosted fosamprenavir; manufacturers advise avoid concomitant use of fosamprenavir with • **TELAPREVIR**; plasma concentration of fosamprenavir reduced by • **TIPRANAVIR**
  - Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of • **MIDAZOLAM** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
  - Avanafil: fosamprenavir possibly increases plasma concentration of • **AVANAFIL**—see under Avanafil, p. 744
  - Cyclosporin: fosamprenavir increases plasma concentration of • **CYCLOSPORIN**
  - Cytotoxics: fosamprenavir possibly increases the plasma concentration of • **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosamprenavir possibly increases the plasma concentration of • **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)

**Fosamprenavir** (continued)

- ▶ Dapoxetine: manufacturer of dapoxetine advises dose reduction when fosamprenavir given with **DAPOXETINE** (see under Dapoxetine, p. 751)
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with • **ERGOTAMINE**—avoid concomitant use
- ▶ Guanfacine: fosamprenavir possibly increases plasma concentration of **GUANFACINE** (halve dose of guanfacine)
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with **ATORVASTATIN**; possible increased risk of myopathy when fosamprenavir given with • **ROSUVASTATIN**—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with • **SIMVASTATIN**—avoid concomitant use; avoidance of fosamprenavir advised by manufacturer of • **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of fosamprenavir possibly reduced by • **ORLISTAT**
- Ranolazine: fosamprenavir possibly increases plasma concentration of • **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- ▶ Sildenafil: fosamprenavir possibly increases plasma concentration of **SILDENAFIL**
- Tacrolimus: fosamprenavir increases plasma concentration of • **TACROLIMUS**
- ▶ Tadalafil: fosamprenavir possibly increases plasma concentration of **TADALAFIL**
- ▶ Vardenafil: fosamprenavir possibly increases plasma concentration of **VARDENAFIL**

**Fosaprepitant**

- ▶ Antibacterials: plasma concentration of fosaprepitant possibly increased by **CLARITHROMYCIN** and **TELITHROMYCIN**; plasma concentration of fosaprepitant reduced by **RIFAMPICIN**
- ▶ Anticoagulants: fosaprepitant possibly reduces anticoagulant effect of **WARFARIN**
- Antidepressants: manufacturer of fosaprepitant advises avoid concomitant use with • **ST JOHN'S WORT**
- ▶ Antidiabetics: fosaprepitant reduces plasma concentration of **TOLBUTAMIDE**
- ▶ Antiepileptics: plasma concentration of fosaprepitant possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ Antifungals: plasma concentration of fosaprepitant increased by **KETOCONAZOLE**
- Antipsychotics: manufacturer of fosaprepitant advises avoid concomitant use with • **PIMOZIDE**
- ▶ Antivirals: plasma concentration of fosaprepitant possibly increased by **RITONAVIR**
- ▶ Anxiolytics and Hypnotics: fosaprepitant increases plasma concentration of **MIDAZOLAM** (risk of prolonged sedation)
- ▶ Avanafil: fosaprepitant possibly increases plasma concentration of **AVANAFIL**
- ▶ Calcium-channel Blockers: plasma concentration of both drugs may increase when fosaprepitant given with **DILTIAZEM**
- ▶ Corticosteroids: fosaprepitant inhibits metabolism of **DEXAMETHASONE** and **METHYLPREDNISOLONE** (reduce dose of dexamethasone and methylprednisolone)
- Cytotoxics: fosaprepitant possibly increases the plasma concentration of • **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosaprepitant possibly increases plasma concentration of **IBRUTINIB**
- ▶ Guanfacine: fosaprepitant possibly increases plasma concentration of **GUANFACINE** (halve dose of guanfacine)
- ▶ Lipid-regulating Drugs: separating administration from fosaprepitant by 12 hours advised by manufacturer of **LOMITAPIDE**
- Oestrogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing • **OESTROGENS** (alternative contraception recommended)
- Progestogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing • **PROGESTOGENS** (alternative contraception recommended)

**Foscarnet**

- Pentamidine Isetionate: increased risk of hypocalcaemia when foscarnet given with *parenteral* ● **PENTAMIDINE ISETIONATE**

**Fosfomycin**

- Metoclopramide: plasma concentration of fosfomycin reduced by **METOCLOPRAMIDE**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Fosinopril** see ACE Inhibitors**Fosphenytoin**

- Alcohol: plasma concentration of fosphenytoin possibly reduced by chronic heavy consumption of **ALCOHOL**
- Aminophylline: plasma concentration of both drugs reduced when fosphenytoin given with ● **AMINOPHYLLINE**
- Analgesics: excretion of fosphenytoin possibly reduced by **ACEMETACIN** (increased risk of toxicity); fosphenytoin possibly accelerates metabolism of **FENTANYL** (reduced effect); fosphenytoin accelerates metabolism of **METHADONE** (reduced effect and risk of withdrawal effects); fosphenytoin possibly increases risk of ● **PETHIDINE** toxicity; effects of fosphenytoin enhanced by **ASPIRIN**; fosphenytoin possibly accelerates metabolism of **PARACETAMOL** (also isolated reports of hepatotoxicity)
- Antacids: absorption of fosphenytoin reduced by **ANTACIDS**
- Anthelmintics: fosphenytoin reduces plasma concentration of ● **ALBENDAZOLE** and ● **PRAZIQUANTEL**—consider increasing albendazole and praziquantel dose when given for systemic infections; plasma concentration of fosphenytoin possibly increased by **LEVAMISOLE**
- Anti-arrhythmics: metabolism of fosphenytoin inhibited by ● **AMIODARONE** (increased plasma concentration); fosphenytoin reduces plasma concentration of **DISOPYRAMIDE**; fosphenytoin possibly reduces plasma concentration of ● **DRONEDARONE**—avoid concomitant use
- Antibacterials: metabolism of fosphenytoin inhibited by **CLARITHROMYCIN** (increased plasma concentration); metabolism of fosphenytoin possibly inhibited by **METRONIDAZOLE** (increased plasma concentration); plasma concentration of fosphenytoin increased or decreased by **CIPROFLOXACIN**; fosphenytoin accelerates metabolism of **DOXYCYCLINE** (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of ● **BEDAQUILINE**—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of fosphenytoin increased by ● **CHLORAMPHENICOL** (increased risk of toxicity); metabolism of fosphenytoin possibly inhibited by **ISONIAZID** (increased risk of toxicity); metabolism of fosphenytoin accelerated by ● **RIFAMYCINS** (reduced plasma concentration); plasma concentration of fosphenytoin possibly increased by **SULFONAMIDES**; fosphenytoin reduces plasma concentration of ● **TELITHROMYCIN** (avoid during and for 2 weeks after fosphenytoin); plasma concentration of fosphenytoin increased by ● **TRIMETHOPRIM** (also increased antifolate effect)
- Anticoagulants: fosphenytoin possibly reduces plasma concentration of ● **APIXABAN** and ● **EDOXABAN**; fosphenytoin accelerates metabolism of ● **COUMARINS** (possibility of reduced anticoagulant effect, but enhancement also reported); fosphenytoin possibly reduces plasma concentration of **DABIGATRAN**—manufacturer of dabigatran advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of ● **RIVAROXABAN**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: plasma concentration of fosphenytoin increased by ● **FLUOXETINE** and ● **FLUVOXAMINE**; fosphenytoin reduces plasma concentration of ● **MIANSERIN**, **MIRTAZAPINE** and **PAROXETINE**; plasma concentration of fosphenytoin possibly increased by **SERTRALINE**, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIs** and ● **TRICYCLICS** (convulsive threshold lowered); plasma concentration of fosphenytoin possibly reduced by ● **ST JOHN'S WORT**—avoid concomitant use; fosphenytoin possibly reduces plasma concentration of ● **TRICYCLICS**; fosphenytoin possibly

**Fosphenytoin**

- Antidepressants (continued) reduces plasma concentration of ● **VORTIOXETINE**—consider increasing dose of vortioxetine
- Antidiabetics: plasma concentration of fosphenytoin transiently increased by **TOLBUTAMIDE** (possibility of toxicity)
- Antiepileptics: fosphenytoin reduces plasma concentration of **BRIVARACETAM**, **LAMOTRIGINE**, **TIAGABINE** and **ZONISAMIDE**; plasma concentration of both drugs often reduced when fosphenytoin given with **CARBAMAZEPINE**, also plasma concentration of fosphenytoin may be increased; fosphenytoin reduces plasma concentration of **ESLICARBAZEPINE**, also plasma concentration of fosphenytoin increased; plasma concentration of fosphenytoin possibly increased by ● **ETHOSUXIMIDE**, also plasma concentration of ethosuximide possibly reduced; plasma concentration of fosphenytoin increased by **OXCARBAZEPINE**, also plasma concentration of an active metabolite of oxcarbazepine reduced; fosphenytoin reduces plasma concentration of ● **PERAMPANEL** (see under Perampanel, p. 301); fosphenytoin often increases plasma concentration of **PHENOBARBITAL** and **PRIMIDONE**, plasma concentration of fosphenytoin often reduced but may be increased; fosphenytoin possibly reduces plasma concentration of **RETIGABINE**; fosphenytoin possibly reduces plasma concentration of **RUFINAMIDE**, also plasma concentration of fosphenytoin possibly increased; plasma concentration of fosphenytoin increased or possibly reduced when given with **SODIUM VALPROATE** and **VALPROIC ACID**, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of fosphenytoin increased by ● **STIRIPENTOL**; plasma concentration of fosphenytoin increased by ● **TOPIRAMATE** (also plasma concentration of topiramate reduced); plasma concentration of fosphenytoin reduced by **VIGABATRIN**
- Antifungals: fosphenytoin reduces plasma concentration of ● **KETOCONAZOLE** and ● **POSACONAZOLE**; anticonvulsant effect of fosphenytoin enhanced by ● **MICONAZOLE** (plasma concentration of fosphenytoin increased); plasma concentration of fosphenytoin increased by ● **FLUCONAZOLE** (consider reducing dose of fosphenytoin); fosphenytoin possibly reduces plasma concentration of ● **ISAVUCONAZOLE**—avoid concomitant use; fosphenytoin reduces plasma concentration of ● **ITRACONAZOLE**—avoid concomitant use; plasma concentration of fosphenytoin increased by ● **VORICONAZOLE**, also fosphenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for fosphenytoin toxicity); fosphenytoin possibly reduces plasma concentration of **CASPOFUNGIN**—consider increasing dose of caspofungin
- Antimalarials: avoidance of fosphenytoin advised by manufacturer of **ARTENIMOL WITH PIPERAQUINE**; anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**; anticonvulsant effect of fosphenytoin antagonised by ● **PYRIMETHAMINE**, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered); fosphenytoin reduces plasma concentration of **HALOPERIDOL**; plasma concentration of fosphenytoin possibly increased or decreased by **CHLORPROMAZINE**; fosphenytoin possibly reduces plasma concentration of ● **ARIPIPRAZOLE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); fosphenytoin accelerates metabolism of **CLOZAPINE** and **QUETIAPINE** (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of ● **LURASIDONE**—avoid concomitant use
- Antivirals: fosphenytoin possibly reduces plasma concentration of **ABACAVIR**, **DARUNAVIR**, **LOPINAVIR** and **SAQUINAVIR**; avoidance of fosphenytoin advised by manufacturer of ● **BOCEPREVIR** and ● **RILPIVIRINE** (plasma concentration of boceprevir and rilpivirine possibly reduced); fosphenytoin possibly reduces plasma concentration of ● **DACLATASVIR** and ● **SIMEPREVIR**—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of ● **DASABUVIR**, ● **OMBITASVIR** and ● **PARITAPREVIR**—avoid concomitant use;

## Fosphenytoin

- Antivirals (continued)
  - fosphenytoin possibly reduces the plasma concentration of
    - **DOLUTEGRAVIR** (see under Dolutegravir, p. 592); avoidance of fosphenytoin advised by manufacturer of
      - **ELVITEGRAVIR**, **ETRAVIRINE**, **LEDIPASVIR**, **SOFOSBUVIR** and **TELAPREVIR**;
    - fosphenytoin possibly reduces plasma concentration of
      - **INDINAVIR**, also plasma concentration of fosphenytoin possibly increased; fosphenytoin possibly reduces plasma concentration of **RITONAVIR**, also plasma concentration of fosphenytoin possibly affected; plasma concentration of fosphenytoin increased or decreased by **ZIDOVUDINE**
  - ▶ Anxiolytics and Hypnotics: fosphenytoin often reduces plasma concentration of **CLONAZEPAM**; plasma concentration of fosphenytoin increased or decreased by **DIAZEPAM**; plasma concentration of fosphenytoin possibly increased or decreased by **BENZODIAZEPINES**
  - ▶ Aprepitant: fosphenytoin possibly reduces plasma concentration of **APREPITANT**
  - ▶ Bupropion: fosphenytoin reduces plasma concentration of **BUPROPION**
  - ▶ Caffeine citrate: fosphenytoin reduces plasma concentration of **CAFFEINE CITRATE**
- Calcium-channel Blockers: fosphenytoin reduces effects of **FELODIPINE** and **VERAPAMIL**; avoidance of fosphenytoin advised by manufacturer of **ISRADIPINE**; avoidance of fosphenytoin advised by manufacturer of **NIMODIPINE** (plasma concentration of nimodipine possibly reduced); plasma concentration of fosphenytoin increased by ● **DILTIAZEM** but also effect of diltiazem reduced
- Cannabis Extract: fosphenytoin possibly reduces plasma concentration of ● **CANNABIS EXTRACT**—manufacturer of cannabis extract advises avoid concomitant use
- ▶ Cardiac Glycosides: fosphenytoin possibly reduces plasma concentration of **DIGOXIN**
- Ciclosporin: fosphenytoin accelerates metabolism of ● **CICLOSPORIN** (reduced plasma concentration)
- Cobicistat: fosphenytoin possibly reduces plasma concentration of ● **COBICISTAT**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: fosphenytoin accelerates metabolism of ● **CORTICOSTEROIDS** (reduced effect)
- Cytotoxics: fosphenytoin possibly reduces plasma concentration of **BUSULFAN**, **ERIBULIN** and **ETOPOSIDE**; metabolism of fosphenytoin possibly inhibited by **CAPECITABINE**, **FLUOROURACIL** and **TEGAFUR** (increased risk of toxicity); fosphenytoin increases antifolate effect of **METHOTREXATE**; plasma concentration of fosphenytoin possibly reduced by **CISPLATIN**; fosphenytoin possibly decreases plasma concentration of **AXITINIB** (increase dose of axitinib—consult axitinib product literature); fosphenytoin possibly reduces plasma concentration of **BORTEZOMIB**, ● **BOSUTINIB**, **CRIZOTINIB**, ● **IBRUTINIB**, ● **IDELALISIB** and **PONATINIB**—manufacturer of bortezomib, bosutinib, crizotinib, ibrutinib, idelalisib and ponatinib advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of ● **CABOZANTINIB** and ● **CERITINIB**—avoid concomitant use; avoidance of fosphenytoin advised by manufacturer of ● **CABAZITAXEL**, **DABRAFENIB**, **GEFITINIB**, ● **LAPATINIB** and **VEMURAFENIB**; avoidance of fosphenytoin advised by manufacturer of **DASATINIB** and ● **VISMODEGIB** (plasma concentration of dasatinib and vismodegib possibly reduced); fosphenytoin reduces plasma concentration of ● **IMATINIB**—avoid concomitant use; fosphenytoin reduces plasma concentration of **IRINOTECAN** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when fosphenytoin given with **PROCARBAZINE**
- Dextrazoxane: absorption of fosphenytoin possibly reduced by ● **DEXRAZOXANE**
- ▶ Diazoxide: plasma concentration of fosphenytoin reduced by **DIAZOXIDE**, also effect of diazoxide may be reduced
- Disulfiram: metabolism of fosphenytoin inhibited by ● **DISULFIRAM** (increased risk of toxicity)
- Diuretics: fosphenytoin reduces plasma concentration of ● **EPLERENONE**—avoid concomitant use; plasma concentration

## Fosphenytoin

- Diuretics (continued)
  - of fosphenytoin possibly increased by ● **ACETAZOLAMIDE**; fosphenytoin antagonises effects of **FUROSEMIDE**; increased risk of osteomalacia when fosphenytoin given with **CARBONIC ANHYDRASE INHIBITORS**
- ▶ Dopaminergics: fosphenytoin possibly reduces effects of **CO-BENELDOPA**, **CO-CARELDOPA** and **LEVODOPA**
- ▶ Enteral Feeds: absorption of fosphenytoin possibly reduced by **ENTERAL FEEDS**
- ▶ Folate: plasma concentration of fosphenytoin possibly reduced by **FOLATES**
- ▶ Fosaprepitant: fosphenytoin possibly reduces plasma concentration of **FOSAPREPITANT**
- Hormone Antagonists: fosphenytoin possibly reduces plasma concentration of ● **ABIRATERONE**—manufacturer of abiraterone advises avoid concomitant use; fosphenytoin possibly accelerates metabolism of **TORSEMIFENE**
- ▶ 5HT<sub>2</sub>-receptor Antagonists: fosphenytoin accelerates metabolism of **ONDANSETRON** (reduced effect)
- Ivacaftor: fosphenytoin possibly reduces plasma concentration of ● **IVACAFTOR**—manufacturer of ivacaftor advises avoid concomitant use
- ▶ Leflunomide: plasma concentration of fosphenytoin possibly increased by **LEFLUNOMIDE**
- ▶ Lipid-regulating Drugs: absorption of fosphenytoin possibly reduced by **COLESEVELAM**; combination of fosphenytoin with **FLUVASTATIN** may increase plasma concentration of either drug (or both)
- ▶ Lithium: neurotoxicity may occur when fosphenytoin given with **LITHIUM** without increased plasma concentration of lithium
- ▶ Lumacaftor: plasma concentration of fosphenytoin possibly reduced by **LUMACAFTOR**—manufacturer of lumacaftor advises avoid concomitant use
- ▶ Macitentan: avoidance of fosphenytoin advised by manufacturer of **MACITENTAN**
- ▶ Modafinil: plasma concentration of fosphenytoin possibly increased by **MODAFINIL**
- Muscle Relaxants: *long-term use* of fosphenytoin reduces effects of ● **NON-DEPOLARISING MUSCLE RELAXANTS** (but *acute use* of fosphenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: fosphenytoin accelerates metabolism of ● **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**
- Panobinostat: avoidance of fosphenytoin advised by manufacturer of ● **PANOBINOSTAT**
- Progestogens: fosphenytoin accelerates metabolism of ● **PROGESTOGENS** (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- ▶ Roflumilast: fosphenytoin possibly inhibits effects of **ROFLUMILAST** (manufacturer of roflumilast advises avoid concomitant use)
- Sulfipyrazone: plasma concentration of fosphenytoin increased by ● **SULFINPYRAZONE**
- ▶ Sympathomimetics: plasma concentration of fosphenytoin increased by **METHYLPHENIDATE**
- ▶ Tacrolimus: fosphenytoin reduces plasma concentration of **TACROLIMUS**, also plasma concentration of fosphenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when fosphenytoin given with ● **THEOPHYLLINE**
- ▶ Thyroid Hormones: fosphenytoin accelerates metabolism of **THYROID HORMONES** (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin possibly increased
- ▶ Tibolone: fosphenytoin accelerates metabolism of **TIBOLONE**
- ▶ Ticagrelor: fosphenytoin possibly reduces plasma concentration of **TICAGRELOR**

**Fosphenytoin** (continued)

- Ulcer-healing Drugs: metabolism of fosphenytoin inhibited by
  - **CIMETIDINE** (increased plasma concentration); effects of fosphenytoin enhanced by ● **ESOMEPRAZOLE**; effects of fosphenytoin possibly enhanced by **OMEPRAZOLE**; absorption of fosphenytoin reduced by ● **SUCRALFATE**
- Ulipristal: avoidance of fosphenytoin advised by manufacturer of ● **ULIPRISTAL** (contraceptive effect of ulipristal possibly reduced)
- ▶ Vaccines: effects of fosphenytoin enhanced by **INFLUENZA VACCINE**
- ▶ Vitamins: fosphenytoin possibly increases requirements for **ALFACALCIDOL**, **CALCITRIOL**, **COLECALCIFEROL**, **DIHYDROTACHYSTEROL**, **ERGOCALCIFEROL**, **PARICALCITOL** or **VITAMIN D**

**Frovatriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)

**Furosemide** see Diuretics

**Fusidic Acid**

- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ● **RITONAVIR**—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given with **SAQUINAVER**
- Lipid-regulating Drugs: risk of myopathy and rhabdomyolysis when fusidic acid given with ● **STATINS**—avoid concomitant use and for 7 days after last fusidic acid dose
- ▶ Sugammadex: fusidic acid possibly reduces response to **SUGAMMADEX**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Gabapentin**

- ▶ Analgesics: bioavailability of gabapentin increased by **MORPHINE**
- ▶ Antacids: absorption of gabapentin reduced by **ANTACIDS**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIs** and ● **TRICYCLICS** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**

**Galantamine** see Parasympathomimetics

**Ganciclovir**

- NOTE** Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Antibacterials: increased risk of convulsions when ganciclovir given with ● **IMIPENEM WITH CILASTATIN**
  - Antivirals: ganciclovir possibly increases plasma concentration of **DIDANOSINE**; profound myelosuppression when ganciclovir given with ● **ZIDOVUDINE** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
  - ▶ Mycophenolate: plasma concentration of ganciclovir possibly increased by **MYCOPHENOLATE**, also plasma concentration of inactive metabolite of mycophenolate possibly increased
  - ▶ Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with **TACROLIMUS**

**Gefitinib**

- Antibacterials: plasma concentration of gefitinib reduced by ● **RIFAMPICIN**—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of ● **WARFARIN**
- ▶ Antidepressants: manufacturer of gefitinib advises avoid concomitant use with **ST JOHN'S WORT**
- ▶ Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- ▶ Antifungals: plasma concentration of gefitinib increased by **ITRACONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Antivirals: avoidance of gefitinib advised by manufacturer of ● **BOCEPREVIR**

**Gefitinib** (continued)

- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by ● **RANITIDINE**
- Gemcitabine**
- ▶ Anticoagulants: gemcitabine possibly enhances anticoagulant effect of **WARFARIN**
  - Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Gemprost** see Prostaglandins
- Gemfibrozil** see Fibrates
- Gentamicin** see Aminoglycosides
- Gestodene** see Progestogens
- Glibenclamide** see Antidiabetics
- Gliclazide** see Antidiabetics
- Glimepiride** see Antidiabetics
- Glipizide** see Antidiabetics
- Glucosamine**
- Anticoagulants: glucosamine enhances anticoagulant effect of ● **WARFARIN** (avoid concomitant use)
- Glycerol Trinitrate** see Nitrates
- Glycopyrronium** see Antimuscarinics
- Gold**
- NOTE** see Sodium Aurothiomalate
- Golimumab**
- Abatacept: avoid concomitant use of golimumab with ● **ABATACEPT**
  - Anakinra: avoid concomitant use of golimumab with ● **ANAKINRA**
  - Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
  - Vaccines: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use
- Granisetron** see 5HT<sub>3</sub>-receptor Antagonists (under HT)
- Grapefruit Juice**
- Aliskiren: grapefruit juice reduces plasma concentration of ● **ALISKIREN**—avoid concomitant use
  - ▶ Anthelmintics: grapefruit juice increases plasma concentration of active metabolite of **ALBENDAZOLE**; grapefruit juice increases plasma concentration of **PRAZIQUANTEL**
  - Anti-arrhythmics: grapefruit juice increases plasma concentration of **AMIODARONE**; grapefruit juice increases plasma concentration of ● **DRONEDARONE**—avoid concomitant use
  - ▶ Antidepressants: grapefruit juice possibly increases plasma concentration of **SERTRALINE**
  - ▶ Antihistamines: grapefruit juice reduces plasma concentration of **BILASTINE**
  - ▶ Antimalarials: grapefruit juice possibly increases plasma concentration of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of grapefruit juice advised by manufacturer of **ARTENIMOL WITH PIPERAQUINE**
  - Antipsychotics: avoidance of grapefruit juice advised by manufacturer of **LURASIDONE** and **PIMOZIDE**; grapefruit juice possibly increases plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
  - ▶ Antivirals: grapefruit juice possibly increases plasma concentration of **EFAVIRENZ**
  - ▶ Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of **oral MIDAZOLAM**; grapefruit juice increases plasma concentration of **BUSPIRONE**
  - ▶ Avanafl: grapefruit juice possibly increases plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
  - ▶ Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of **AMLODIPINE**; grapefruit juice increases plasma concentration of **FELODIPINE**, **ISRADIPINE**, **LACIDIPINE**, **LERCANIDIPINE**, **NICARDIPINE**, **NIFEDIPINE**, **NIMODIPINE** and **VERAPAMIL**
  - Ciclosporin: grapefruit juice increases plasma concentration of ● **CYCLOSPORIN** (increased risk of toxicity)
  - Colchicine: grapefruit juice possibly increases risk of ● **COLCHICINE** toxicity
  - Corticosteroids: grapefruit juice increases plasma concentration of **oral** ● **BUDESONIDE**—avoid concurrent use or separate administration by as much as possible and consider reducing **oral** budesonide dose

**Grapefruit Juice** (continued)

- Cytotoxics: grapefruit juice possibly increases plasma concentration of **AXITINIB**, **CABOZANTINIB** and **PONATINIB**; grapefruit juice possibly increases the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; avoidance of grapefruit juice advised by manufacturer of **CERITINIB**, **EVEROLIMUS**, **IBRUTINIB**, ● **LAPATINIB**, ● **NILOTINIB**, **OLAPARIB** and ● **PAZOPANIB**; grapefruit juice possibly increases plasma concentration of ● **CRIZOTINIB** and **VINFLUNINE**—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of **DASATINIB** (plasma concentration of dasatinib possibly increased)
- ▶ Guanfacine: avoidance of grapefruit juice advised by manufacturer of **GUANFACINE**
- ▶ Ivabradine: grapefruit juice increases plasma concentration of **IVABRADINE**
- ▶ Ivacaftor: grapefruit juice possibly increases plasma concentration of **IVACAFTOR**—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of **ATORVASTATIN**; grapefruit juice increases plasma concentration of ● **SIMVASTATIN**—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of **LOMITAPIDE**
- Naloxegol: grapefruit juice possibly increases plasma concentration of ● **NALOXEGOL**—avoid concomitant use
- ▶ Panobinostat: avoidance of grapefruit juice advised by manufacturer of **PANOBINOSTAT**
- ▶ Pirfenidone: avoidance of grapefruit juice advised by manufacturer of **PIRFENIDONE**
- Ranolazine: grapefruit juice possibly increases plasma concentration of ● **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- ▶ Sildenafil: grapefruit juice possibly increases plasma concentration of **SILDENAFIL**
- Sirolimus: grapefruit juice increases plasma concentration of ● **SIROLIMUS**—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of ● **TACROLIMUS**
- ▶ Tadalafil: grapefruit juice possibly increases plasma concentration of **TADALAFIL**
- Tolvaptan: grapefruit juice increases plasma concentration of ● **TOLVAPTAN**—avoid concomitant use
- ▶ Ulipristal: avoidance of grapefruit juice advised by manufacturer of *low-dose* **ULIPRISTAL**
- Vardenafil: grapefruit juice possibly increases plasma concentration of ● **VARDENAFIL**—avoid concomitant use

**Griseofulvin**

- ▶ Alcohol: griseofulvin possibly enhances effects of **ALCOHOL**
- Anticoagulants: griseofulvin reduces anticoagulant effect of ● **COUMARINS**
- ▶ Antiepileptics: absorption of griseofulvin reduced by **PHENOBARBITAL** and **PRIMIDONE** (reduced effect)
- ▶ Ciclosporin: griseofulvin possibly reduces plasma concentration of **CYCLOSPORIN**
- ▶ Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with **OESTROGENS**
- ▶ Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with **PROGESTOGENS**

**Guanethidine** see Adrenergic Neurone Blockers**Guanfacine**

- ▶ Alcohol: sedative effects possibly increased when guanfacine given with **ALCOHOL**
- Antibacterials: plasma concentration of guanfacine possibly increased by ● **CLARITHROMYCIN**, **ERYTHROMYCIN** and ● **TELITHROMYCIN** (halve dose of guanfacine); plasma concentration of guanfacine possibly reduced by ● **RIFABUTIN**—increase dose of guanfacine; plasma concentration of guanfacine reduced by ● **RIFAMPICIN**—increase dose of guanfacine; manufacturer of guanfacine advises halve dose when given with **CHLORAMPHENICOL**
- Antidepressants: plasma concentration of guanfacine possibly reduced by ● **ST JOHN'S WORT**—increase dose of guanfacine

**Guanfacine** (continued)

- Antiepileptics: plasma concentration of guanfacine possibly reduced by ● **CARBAMAZEPINE**, ● **OXCARBAZEPINE**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—increase dose of guanfacine; guanfacine increases plasma concentration of **SODIUM VALPROATE** and **VALPROIC ACID**
- Antifungals: plasma concentration of guanfacine increased by ● **KETOCONAZOLE** (halve dose of guanfacine); plasma concentration of guanfacine possibly increased by **FLUCONAZOLE**, ● **ITRACONAZOLE** and ● **POSACONAZOLE** (halve dose of guanfacine)
- ▶ Antipsychotics: sedative effects possibly increased when guanfacine given with **ANTIpsychotics**
- Antivirals: plasma concentration of guanfacine possibly increased by **ATAZANAVIR**, ● **BOCEPREVIR**, **FOSAMPRENAVIR**, ● **INDINAVIR**, ● **RITONAVIR**, ● **SAQUINAVIR** and ● **TELAPREVIR** (halve dose of guanfacine); plasma concentration of guanfacine possibly reduced by ● **EFAVIRENZ**, ● **ETRAVIRINE** and ● **NEVIRAPINE**—increase dose of guanfacine
- ▶ Anxiolytics and Hypnotics: sedative effects possibly increased when guanfacine given with **ANxiolytics AND Hypnotics**
- ▶ Aprepitant: plasma concentration of guanfacine possibly increased by **APREPITANT** (halve dose of guanfacine)
- Bosentan: plasma concentration of guanfacine possibly reduced by ● **BOSENTAN**—increase dose of guanfacine
- ▶ Calcium-channel Blockers: plasma concentration of guanfacine possibly increased by **DILTIAZEM** and **VERAPAMIL** (halve dose of guanfacine)
- ▶ Cytotoxics: plasma concentration of guanfacine possibly increased by **CRIZOTINIB** and **IMATINIB** (halve dose of guanfacine)
- ▶ Fosaprepitant: plasma concentration of guanfacine possibly increased by **FOSAPREPITANT** (halve dose of guanfacine)
- ▶ Grapefruit Juice: manufacturer of guanfacine advises avoid concomitant use with **GRAPEFRUIT JUICE**
- Modafinil: plasma concentration of guanfacine possibly reduced by ● **MODAFINIL**—increase dose of guanfacine

**Haemophilus Vaccine** see Vaccines**Haloperidol** see Antipsychotics**Heparin** see Heparins**Heparins**

- ▶ ACE Inhibitors: increased risk of hyperkalaemia when heparins given with **ACE INHIBITORS**
- ▶ Aliskiren: increased risk of hyperkalaemia when heparins given with **ALISKIREN**
- Analgesics: possible increased risk of bleeding when heparins given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with *intravenous* ● **DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **KETOROLAC** (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by ● **ASPIRIN**
- ▶ Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● **APIXABAN**, ● **DABIGATRAN**, ● **EDOXABAN** and ● **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- ▶ Clopidogrel: increased risk of bleeding when heparins given with **CLOPIDOGREL**
- ▶ Dipyridamole: anticoagulant effect of heparins enhanced by **DIPYRIDAMOLE**
- ▶ Iloprost: anticoagulant effect of heparins possibly enhanced by **ILOPROST**
- Nitrates: anticoagulant effect of heparins reduced by *infusion* of ● **GLYCERYL TRINITRATE**

**Hepatitis Vaccines** see Vaccines**Histamine**

- ▶ Antidepressants: manufacturer of histamine advises avoid concomitant use with **MAOIs**; effects of histamine theoretically antagonised by **TRICYCLICS**—manufacturer of histamine advises avoid concomitant use

**Histamine** (continued)

- ▶ Antihistamines: effects of histamine theoretically antagonised by **ANTIHISTAMINES**—manufacturer of histamine advises avoid concomitant use
- ▶ Antimalarials: manufacturer of histamine advises avoid concomitant use with **ANTIMALARIALS**
- ▶ Antipsychotics: effects of histamine theoretically antagonised by **ANTI-PSYCHOTICS**—manufacturer of histamine advises avoid concomitant use
- ▶ Atovaquone: manufacturer of histamine advises avoid concomitant use with **ATOVAQUONE**
- ▶ Clonidine: manufacturer of histamine advises avoid concomitant use with **CLONIDINE**
- ▶ Corticosteroids: manufacturer of histamine advises avoid concomitant use with **CORTICOSTEROIDS**
- ▶ Ulcer-healing Drugs: effects of histamine theoretically antagonised by **HISTAMINE H<sub>2</sub>-ANTAGONISTS**—manufacturer of histamine advises avoid concomitant use

**Histamine H<sub>2</sub>-antagonists**

- Alpha-blockers: cimetidine and ranitidine antagonise effects of
  - **TOLAZOLINE**
- Aminophylline: cimetidine inhibits metabolism of
  - **AMINOPHYLLINE** (increased plasma concentration)
- ▶ Analgesics: cimetidine inhibits metabolism of **OPIOID ANALGESICS** (increased plasma concentration)
- ▶ Antelmintics: cimetidine possibly enhances effects of **ALBENDAZOLE**; cimetidine possibly inhibits metabolism of **MEBENDAZOLE** (increased plasma concentration); cimetidine increases plasma concentration of **PRAZIQUANTEL**
- Anti-arrhythmics: cimetidine increases plasma concentration of **AMIODARONE** and **PROPAFENONE**; cimetidine inhibits metabolism of **FLECAINIDE** (increased plasma concentration); cimetidine increases plasma concentration of **LIDOCAINE** (increased risk of toxicity)
- ▶ Antibacterials: cimetidine increases plasma concentration of **ERYTHROMYCIN** (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of **METRONIDAZOLE** (increased plasma concentration); metabolism of cimetidine accelerated by **RIFAMPICIN** (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of ● **COUMARINS** (enhanced anticoagulant effect)
- ▶ Antidepressants: cimetidine increases plasma concentration of **CITALOPRAM**, **ESCITALOPRAM**, **MIRTAZAPINE** and **SERTRALINE**; cimetidine inhibits metabolism of **AMITRIPTYLINE**, **DOXEPIN**, **IMIPRAMINE** and **NORTRIPTYLINE** (increased plasma concentration); cimetidine increases plasma concentration of **MOCLOBEMIDE** (halve dose of moclobemide); cimetidine possibly increases plasma concentration of **TRICYCLICS**
- ▶ Antidiabetics: cimetidine reduces excretion of **METFORMIN** (increased plasma concentration); cimetidine enhances hypoglycaemic effect of **SULFONYLUREAS**
- Antiepileptics: cimetidine inhibits metabolism of
  - **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENYTOIN**, ● **SODIUM VALPROATE** and ● **VALPROIC ACID** (increased plasma concentration)
- Antifungals: histamine H<sub>2</sub>-antagonists reduce absorption of **ITRACONAZOLE** and **KETOCONAZOLE**; cimetidine reduces plasma concentration of ● **POSACONAZOLE**—manufacturer of posaconazole *suspension* advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of ● **POSACONAZOLE**—manufacturer of posaconazole *suspension* advises avoid concomitant use; cimetidine increases plasma concentration of **TERBINAFINE**
- ▶ Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of **LORATADINE**; cimetidine increases plasma concentration of **HYDROXYZINE**
- Antimalarials: avoidance of cimetidine advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; cimetidine inhibits metabolism of **CHLOROQUINE**, **HYDROXYCHLOROQUINE** and **QUININE** (increased plasma concentration)
- ▶ Antipsychotics: cimetidine possibly enhances effects of **ANTI-PSYCHOTICS**, **CHLORPROMAZINE** and **CLOZAPINE**
- Antivirals: manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with **ATAZANAVIR**—consult atazanavir product literature; famotidine and ranitidine reduce the plasma concentration of

**Histamine H<sub>2</sub>-antagonists**

- Antivirals (continued)
  - **ATAZANAVIR** (adjust doses of both drugs—consult atazanavir product literature); famotidine reduces plasma concentration of **LEDIPASVIR**; famotidine increases plasma concentration of **RALTEGRAVIR**; avoidance of histamine H<sub>2</sub>-antagonists for 12 hours before or 4 hours after **RILPIVIRINE** advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of **SAQUINAVIR**
  - ▶ Anxiolytics and Hypnotics: cimetidine inhibits metabolism of **BENZODIAZEPINES**, **CLOMETHAZOLE** and **ZALEPLON** (increased plasma concentration); cimetidine increases plasma concentration of **MELATONIN**
  - ▶ Azathioprine: manufacturer of azathioprine advises possible increased risk of myelosuppression when cimetidine given with **AZATHIOPRINE**
  - ▶ Beta-blockers: cimetidine increases plasma concentration of **LABETALOL**, **METOPROLOL** and **PROPRANOLOL**; cimetidine possibly increases plasma concentration of *oral* **TIMOLOL**
  - ▶ Caffeine citrate: cimetidine increases plasma concentration of **CAFFEINE CITRATE**
  - ▶ Calcium-channel Blockers: cimetidine possibly inhibits metabolism of **CALCIUM-CHANNEL BLOCKERS** (increased plasma concentration); cimetidine increases plasma concentration of **ISRADIPINE** (halve dose of isradipine)
  - Ciclosporin: cimetidine possibly increases plasma concentration of ● **CYCLOSPORIN**
  - Clopidogrel: cimetidine possibly reduces antiplatelet effect of ● **CLOPIDOGREL**
  - Cytotoxics: cimetidine possibly enhances myelosuppressive effects of **CARMUSTINE** and **LOMUSTINE**; cimetidine reduces plasma concentration of **DOXORUBICIN**; cimetidine increases plasma concentration of ● **EPIRUBICIN**; cimetidine inhibits metabolism of **CAPECITABINE**, **FLUOROURACIL** and **TEGAFUR** (increased plasma concentration); avoidance of histamine H<sub>2</sub>-antagonists advised by manufacturer of ● **DASATINIB**—consider using an antacid as an alternative; famotidine reduces plasma concentration of ● **DASATINIB**—consider using an antacid as an alternative; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of ● **ERLOTINIB**; ranitidine reduces plasma concentration of ● **ERLOTINIB**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of ● **GEFITINIB**; histamine H<sub>2</sub>-antagonists possibly reduce absorption of **LAPATINIB**; histamine H<sub>2</sub>-antagonists possibly reduce absorption of **PAZOPANIB**—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H<sub>2</sub>-antagonists
  - ▶ Dopaminergics: cimetidine reduces excretion of **PRAMIPEXOLE** (increased plasma concentration)
  - Ergot Alkaloids: increased risk of ergotism when cimetidine given with ● **ERGOTAMINE**—avoid concomitant use
  - Fampridine: avoidance of cimetidine advised by manufacturer of ● **FAMPRIDINE**
  - ▶ Histamine: histamine H<sub>2</sub>-antagonists theoretically antagonise effects of **HISTAMINE**—manufacturer of histamine advises avoid concomitant use
  - ▶ Hormone Antagonists: absorption of cimetidine possibly delayed by **OCTREOTIDE**
  - ▶ 5HT<sub>2</sub>-receptor Agonists: cimetidine inhibits metabolism of **ZOLMITRIPTAN** (reduce dose of zolmitriptan)
  - ▶ Lipid-regulating Drugs: separating administration from cimetidine and ranitidine by 12 hours advised by manufacturer of **LOMITAPIDE**
  - ▶ Roflumilast: cimetidine inhibits the metabolism of **ROFLUMILAST**
  - ▶ Sildenafil: cimetidine increases plasma concentration of **SILDENAFIL**—consider reducing dose of sildenafil for erectile dysfunction
  - ▶ Sympathomimetics: cimetidine possibly inhibits metabolism of **DOBUTAMINE**
  - Theophylline: cimetidine inhibits metabolism of ● **THEOPHYLLINE** (increased plasma concentration)
  - ▶ Thyroid Hormones: cimetidine reduces absorption of **LEVOTHYROXINE**

**Homatropine** see Antimuscarinics

**Hormone Antagonists** see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Lanreotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

### 5HT<sub>1</sub>-receptor Agonists

- Antibacterials: plasma concentration of eletriptan increased by ● **CLARITHROMYCIN** and ● **ERYTHROMYCIN** (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by **QUINOLONES** (reduce dose of zolmitriptan)
- Antidepressants: increased risk of CNS toxicity when 5HT<sub>1</sub> agonists given with ● **CITALOPRAM** (manufacturer of citalopram advises avoid concomitant use); increased risk of CNS toxicity when sumatriptan given with ● **CITALOPRAM**, ● **ESCITALOPRAM**, ● **FLUOXETINE**, ● **FLUOXAMINE** or ● **PAROXETINE**; metabolism of frovatriptan inhibited by **FLUOXAMINE**; metabolism of zolmitriptan possibly inhibited by **FLUOXAMINE** (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with **SERTRALINE**; possible increased serotonergic effects when 5HT<sub>1</sub> agonists given with **DULOXETINE**, **VENLAFAXINE** or **VORTIOXETINE**; risk of CNS toxicity when rizatriptan or sumatriptan given with ● **MAOIS** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when zolmitriptan given with ● **MAOIS** or ● **MOCLOBEMIDE** (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with ● **MOCLOBEMIDE** (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotonergic effects when naratriptan given with **SSRIs**; increased serotonergic effects when 5HT<sub>1</sub> agonists given with ● **ST JOHN'S WORT**—avoid concomitant use
- Antifungals: plasma concentration of eletriptan increased by ● **ITRACONAZOLE** and ● **KETOCONAZOLE** (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by **KETOCONAZOLE** (increased risk of toxicity)
- Antivirals: plasma concentration of eletriptan increased by ● **INDINAVIR** and ● **RITONAVIR** (risk of toxicity)—avoid concomitant use
  - ▶ Beta-blockers: plasma concentration of rizatriptan increased by **PROPRANOLOL** (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Dapoxetine: possible increased risk of serotonergic effects when 5HT<sub>1</sub> agonists given with ● **DAPOXETINE** (manufacturer of dapoxetine advises 5HT<sub>1</sub> agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT<sub>1</sub> agonists)
- ▶ Dopaminergics: avoidance of 5HT<sub>1</sub> agonists advised by manufacturer of **SELEGILINE**
- Ergot Alkaloids: increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with ● **ERGOTAMINE** (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine); increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ● **ERGOTAMINE** (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine)
- ▶ Lithium: possible risk of toxicity when sumatriptan given with **LITHIUM**
- ▶ Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by **CIMETIDINE** (reduce dose of zolmitriptan)

### 5HT<sub>2</sub>-receptor Antagonists

- ▶ Analgesics: ondansetron possibly antagonises effects of **TRAMADOL**
- ▶ Antibacterials: metabolism of ondansetron accelerated by **RIFAMPICIN** (reduced effect)
- ▶ Antidepressants: possible increased serotonergic effects when 5HT<sub>2</sub> antagonists given with **SSRI-RELATED ANTIDEPRESSANTS** or **SSRIs**
- ▶ Antiepileptics: metabolism of ondansetron accelerated by **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN** (reduced effect)
- Cytotoxics: increased risk of ventricular arrhythmias when ondansetron given with ● **VANDETANIB**—avoid concomitant use
- Dopaminergics: possible increased hypotensive effect when ondansetron given with ● **APOMORPHINE**—avoid concomitant use

### 5HT<sub>2</sub>-receptor Antagonists (continued)

- Panobinostat: possible increased risk of ventricular arrhythmias when granisetron and ondansetron given with ● **PANOBINOSTAT**
- Human papillomavirus Vaccine** see Vaccines
- Hydralazine** see Vasodilator Antihypertensives
- Hydrochlorothiazide** see Diuretics
- Hydrocortisone** see Corticosteroids
- Hydroflumethiazide** see Diuretics
- Hydromorphone** see Opioid Analgesics
- Hydroxalcite** see Antacids
- Hydroxocobalamin**
  - ▶ Antibacterials: response to hydroxocobalamin reduced by **CHLORAMPHENICOL**
- Hydroxycarbamide**
  - Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
  - Antivirals: increased risk of toxicity when hydroxycarbamide given with ● **DIDANOSINE** and ● **STAVUDINE**—avoid concomitant use
  - Vaccines: risk of generalised infections when hydroxycarbamide given with live ● **VACCINES**—avoid concomitant use
- Hydroxychloroquine**
  - ▶ Adsorbents: absorption of hydroxychloroquine reduced by **KAOLIN**
  - ▶ Agalsidase Alfa and Beta: hydroxychloroquine possibly inhibits effects of **AGALSIDASE ALFA AND BETA** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
  - ▶ Antacids: absorption of hydroxychloroquine reduced by **ANTACIDS**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when hydroxychloroquine given with ● **AMIODARONE**—avoid concomitant use
  - Antibacterials: increased risk of ventricular arrhythmias when hydroxychloroquine given with ● **MOXIFLOXACIN**—avoid concomitant use
  - Antimalarials: avoidance of antimalarials advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; increased risk of convulsions when hydroxychloroquine given with ● **MEFLOQUINE**
  - Antipsychotics: increased risk of ventricular arrhythmias when hydroxychloroquine given with ● **DROPERIDOL**—avoid concomitant use
  - Cardiac Glycosides: hydroxychloroquine possibly increases plasma concentration of ● **DIGOXIN**
  - Ciclosporin: hydroxychloroquine increases plasma concentration of ● **CICLOSPORIN** (increased risk of toxicity)
  - Cytotoxics: possible increased risk of ventricular arrhythmias when hydroxychloroquine given with ● **BOSUTINIB**
  - ▶ Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
  - ▶ Lanthanum: absorption of hydroxychloroquine possibly reduced by **LANTHANUM** (give at least 2 hours apart)
  - ▶ Laronidase: hydroxychloroquine possibly inhibits effects of **LARONIDASE** (manufacturer of laronidase advises avoid concomitant use)
  - ▶ Parasympathomimetics: hydroxychloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of **NEOSTIGMINE** and **PYRIDOSTIGMINE**
  - ▶ Penicillamine: increased risk of haematological toxicity when antimalarials given with **PENICILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
  - ▶ Ulcer-healing Drugs: metabolism of hydroxychloroquine inhibited by **CIMETIDINE** (increased plasma concentration)
  - ▶ Vaccines: antimalarials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC
- Hydroxyzine** see Antihistamines
- Hyoscine** see Antimuscarinics
- Ibandronic Acid** see Bisphosphonates
- Ibrutinib**
  - Anti-arrhythmics: plasma concentration of ibrutinib possibly increased by ● **AMIODARONE** and ● **DRONEDARONE**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - Antibacterials: plasma concentration of ibrutinib possibly increased by ● **CIPROFLOXACIN**, ● **CLARITHROMYCIN**,

**Ibrutinib**

- **Antibacterials** (continued)
    - **ERYTHROMYCIN** and ● **TELITHROMYCIN**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); plasma concentration of ibrutinib reduced by ● **RIFAMPICIN**—avoid concomitant use
  - **Anticoagulants**: manufacturer of ibrutinib advises avoid concomitant use with ● **COUMARINS** and ● **PHENINDIONE**
  - **Antidepressants**: plasma concentration of ibrutinib possibly reduced by ● **ST JOHN'S WORT**—manufacturer of ibrutinib advises avoid concomitant use
  - **Antiepileptics**: plasma concentration of ibrutinib possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN** and ● **PHENYTOIN**—manufacturer of ibrutinib advises avoid concomitant use
  - **Antifungals**: plasma concentration of ibrutinib increased by ● **KETOCONAZOLE**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); plasma concentration of ibrutinib possibly increased by ● **FLUCONAZOLE**, ● **ITRACONAZOLE** and ● **VORICONAZOLE**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
  - **Antivirals**: plasma concentration of ibrutinib possibly increased by ● **ATAZANAVIR**, ● **DARUNAVIR**, ● **FOSAMPRENAVIR**, ● **INDINAVIR**, ● **RITONAVIR** and ● **SAQUINAVIR**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - **Aprepitant**: plasma concentration of ibrutinib possibly increased by ● **APREPITANT**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - **Calcium-channel Blockers**: plasma concentration of ibrutinib possibly increased by ● **DILTIAZEM** and ● **VERAPAMIL**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - **Cardiac Glycosides**: manufacturer of ibrutinib advises give ● **DIGOXIN** at least 6 hours before or after ibrutinib
  - **Cobicistat**: plasma concentration of ibrutinib possibly increased by ● **COBICISTAT**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - **Cytotoxics**: plasma concentration of ibrutinib possibly increased by ● **CRIZOTINIB** and ● **IMATINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
  - **Fosaprepitant**: plasma concentration of ibrutinib possibly increased by ● **FOSAPREPITANT**
  - **Grapefruit Juice**: manufacturer of ibrutinib advises avoid concomitant use with ● **GRAPEFRUIT JUICE**
  - **Vitamins**: manufacturer of ibrutinib advises avoid concomitant use with ● **VITAMIN E**
- Ibuprofen** see NSAIDs

**Idarubicin**

- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- **Ciclosporin**: plasma concentration of idarubicin increased by ● **CICLOSPORIN**
- **Cytotoxics**: possible increased risk of cardiotoxicity when idarubicin given with ● **TRASTUZUMAB**—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- **Vaccines**: risk of generalised infections when cytotoxic antibiotics given with live ● **VACCINES**—avoid concomitant use

**Idelalisib**

- **Alpha-blockers**: manufacturer of idelalisib advises avoid concomitant use with ● **ALFUZOSIN**
- **Anti-arrhythmics**: manufacturer of idelalisib advises avoid concomitant use with ● **AMIODARONE**
- **Antibacterials**: plasma concentration of idelalisib reduced by ● **RIFAMPICIN**—avoid concomitant use
- **Antidepressants**: plasma concentration of idelalisib possibly reduced by ● **ST JOHN'S WORT**—manufacturer of idelalisib advises avoid concomitant use
- **Antiepileptics**: plasma concentration of idelalisib possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN** and ● **PHENYTOIN**—manufacturer of idelalisib advises avoid concomitant use
- **Antifungals**: plasma concentration of idelalisib increased by ● **KETOCONAZOLE**
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis); manufacturer

**Idelalisib**

- **Antipsychotics** (continued)
  - of idelalisib advises avoid concomitant use with ● **PIMOZIDE** and ● **QUETIAPINE**
- **Anxiolytics and Hypnotics**: manufacturer of idelalisib advises avoid concomitant use of ● **oral MIDAZOLAM**
- **Ergot Alkaloids**: manufacturer of idelalisib advises avoid concomitant use with ● **ERGOTAMINE**
- **Lipid-regulating Drugs**: manufacturer of idelalisib advises avoid concomitant use with ● **SIMVASTATIN**
- **Sildenafil**: manufacturer of idelalisib advises avoid concomitant use of ● **SILDENAFIL** for pulmonary arterial hypertension
- **Sympathomimetics, Beta<sub>2</sub>**: manufacturer of idelalisib advises avoid concomitant use with ● **SALMETEROL**

**Ifosfamide**

- **Anticoagulants**: ifosfamide possibly enhances anticoagulant effect of ● **COUMARINS**
- **Antifungals**: metabolism of ifosfamide inhibited by ● **KETOCONAZOLE**
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- **Cytotoxics**: increased risk of toxicity when ifosfamide given with ● **CISPLATIN**

**Iloprost**

- **Analgesics**: increased risk of bleeding when iloprost given with ● **NSAIDs** or ● **ASPIRIN**
- **Anticoagulants**: iloprost possibly enhances anticoagulant effect of ● **COUMARINS** and ● **HEPARINS**; increased risk of bleeding when iloprost given with ● **PHENINDIONE**
- **Clopidogrel**: increased risk of bleeding when iloprost given with ● **CLOPIDOGREL**
- **Eptifibatid**: increased risk of bleeding when iloprost given with ● **EPTIFIBATIDE**
- **Tirofiban**: increased risk of bleeding when iloprost given with ● **TIROFIBAN**

**Imatinib**

- **Analgesics**: manufacturer of imatinib advises caution with ● **PARACETAMOL**
- **Antibacterials**: plasma concentration of imatinib reduced by ● **RIFAMPICIN**—avoid concomitant use
- **Anticoagulants**: manufacturer of imatinib advises replacement of ● **WARFARIN** with a heparin (possibility of enhanced warfarin effect)
- **Antidepressants**: plasma concentration of imatinib reduced by ● **ST JOHN'S WORT**—avoid concomitant use
- **Antiepileptics**: plasma concentration of imatinib reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **OXCARBAZEPINE** and ● **PHENYTOIN**—avoid concomitant use
- **Antifungals**: plasma concentration of imatinib increased by ● **KETOCONAZOLE**
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- **Antivirals**: avoidance of imatinib advised by manufacturer of ● **BOCEPREVIR**
- **Ciclosporin**: imatinib possibly increases plasma concentration of ● **CICLOSPORIN**
- **Cytotoxics**: imatinib possibly increases the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; imatinib increases plasma concentration of ● **EVEROLIMUS** (consider reducing the dose of everolimus—consult everolimus product literature); imatinib possibly increases the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867)
- **Guanfacine**: imatinib possibly increases plasma concentration of ● **GUANFACINE** (halve dose of guanfacine)
- **Lipid-regulating Drugs**: imatinib increases plasma concentration of ● **SIMVASTATIN**
- **Tacrolimus**: imatinib increases plasma concentration of ● **TACROLIMUS**
- **Thyroid Hormones**: imatinib possibly reduces plasma concentration of ● **LEVOTHYROXINE**

**Imidapril** see ACE Inhibitors

**Imipenem with Cilastatin**

- Antiepileptics: carbapenems reduce plasma concentration of
  - **SODIUM VALPROATE** and • **VALPROIC ACID**—avoid concomitant use
- Antivirals: increased risk of convulsions when imipenem with cilastatin given with
  - **GANCICLOVIR** or • **VALGANCICLOVIR**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Imipramine** see Antidepressants, Tricyclic

**Immunoglobulins**

- Vaccines: anti-d immunoglobulins and normal immunoglobulin might impair immune response to
  - **BCG VACCINE**—give BCG vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to live
    - **INFLUENZA VACCINE**—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
      - **ORAL TYPHOID VACCINE**—give oral typhoid vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
        - **POLIOMYELITIS VACCINE**—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
          - **ROTAVIRUS VACCINE**—give rotavirus vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
            - **SMALLPOX VACCINE**—give smallpox vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
              - **VARICELLA-ZOSTER VACCINE**—give varicella-zoster vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to
                - **YELLOW FEVER VACCINE**—give yellow fever vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin

**Indacaterol** see Sympathomimetics, Beta<sub>2</sub>

**Indapamide** see Diuretics

**Indinavir**

- ▶ Aldesleukin: plasma concentration of indinavir possibly increased by **ALDESLEUKIN**
- Anti-arrhythmics: indinavir possibly increases plasma concentration of
  - **AMIODARONE**—avoid concomitant use; indinavir possibly increases plasma concentration of
  - **FLECAINIDE** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of
  - **RIFABUTIN**, also plasma concentration of indinavir decreased (reduce dose of rifabutin and increase dose of indinavir); metabolism of indinavir accelerated by • **RIFAMPICIN** (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of • **TELITHROMYCIN**
- ▶ Anticoagulants: avoidance of indinavir advised by manufacturer of **APIXABAN** and **RIVAROXABAN**
- Antidepressants: plasma concentration of indinavir reduced by
  - **ST JOHN'S WORT**—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by
  - **CARBAMAZEPINE**, • **FOSPHENYTOIN** and
  - **PHENYTOIN**, also plasma concentration of carbamazepine, fosphenytoin and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by
  - **PHENOBARBITAL** and • **PRIMIDONE**
- Antifungals: plasma concentration of indinavir increased by
  - **ITRACONAZOLE** and • **KETOCONAZOLE** (consider reducing dose

**Indinavir**

- Antifungals (continued)
  - of indinavir); plasma concentration of indinavir reduced by **ISAVUCONAZOLE**
- Antimalarials: caution with indinavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; indinavir possibly increases plasma concentration of • **QUININE** (increased risk of toxicity)
- ▶ Antimuscarinics: avoidance of indinavir advised by manufacturer of **DARIFENACIN** and **TOLTERODINE**; manufacturer of fesoterodine advises dose reduction when indinavir given with **FESOTERODINE**—consult fesoterodine product literature
- Antipsychotics: indinavir possibly increases plasma concentration of • **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); indinavir possibly increases plasma concentration of
  - **LURASIDONE**—avoid concomitant use; indinavir possibly increases plasma concentration of • **PIMOZIDE** (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir possibly increases plasma concentration of • **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of indinavir with
  - **ATAZANAVIR**; plasma concentration of both drugs increased when indinavir given with **DARUNAVIR**; absorption of indinavir reduced by **DIDANOSINE tablets** (give at least 1 hour apart); plasma concentration of indinavir reduced by **EFAVIRENZ** and **NEVIRAPINE**; plasma concentration of indinavir possibly reduced by • **ETRAVIRINE**—avoid concomitant use; indinavir increases plasma concentration of • **MARAVIROC** (consider reducing dose of maraviroc); avoidance of indinavir advised by manufacturer of **PARITAPREVRIL**; plasma concentration of indinavir increased by **RITONAVIR**; indinavir increases plasma concentration of **SAQUINAVIR**
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with • **ALPRAZOLAM**—avoid concomitant use; indinavir possibly increases plasma concentration of
  - **MIDAZOLAM** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- ▶ Atovaquone: plasma concentration of indinavir possibly reduced by **ATOVAQUONE**
- Avanafil: indinavir possibly increases plasma concentration of
  - **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
- ▶ Bosentan: plasma concentration of indinavir possibly reduced by **BOSENTAN**
- Ciclosporin: indinavir increases plasma concentration of
  - **CICLOSPORIN**
- Colchicine: indinavir possibly increases risk of • **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- ▶ Corticosteroids: plasma concentration of indinavir possibly reduced by **DEXAMETHASONE**
- Cytotoxics: indinavir possibly increases plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of • **BOSUTINIB** and • **CABAZITAXEL**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of • **CRIZOTINIB** and • **EVEROLIMUS**—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases the plasma concentration of • **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); indinavir possibly increases plasma concentration of • **PAZOPANIB** (reduce dose of pazopanib); indinavir possibly increases plasma concentration of **PONATINIB**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when indinavir given with
  - **RUXOLITINIB**—consult ruxolitinib product literature; indinavir possibly increases plasma concentration of
  - **DOCETAXEL**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Ergot Alkaloids: increased risk of ergotism when indinavir given with
  - **ERGOMETRINE** or • **ERGOTAMINE**—avoid concomitant use
- Guanfacine: indinavir possibly increases plasma concentration of • **GUANFACINE** (halve dose of guanfacine)

**Indinavir** (continued)

- **5HT<sub>1</sub>-receptor Agonists**: indinavir increases plasma concentration of ● **ELETRIPATAN** (risk of toxicity)—avoid concomitant use
- **Lipid-regulating Drugs**: possible increased risk of myopathy when indinavir given with **ATORVASTATIN**; possible increased risk of myopathy when indinavir given with ● **ROSUVASTATIN**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with ● **SIMVASTATIN** (avoid concomitant use); avoidance of indinavir advised by manufacturer of ● **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- **Naloxone**: indinavir possibly increases plasma concentration of ● **NALOXEGOL**—avoid concomitant use
- **Orlista**: absorption of indinavir possibly reduced by ● **ORLISTAT**
- **Ranolazine**: indinavir possibly increases plasma concentration of ● **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- **Sildenafil**: indinavir increases plasma concentration of ● **SILDENAFIL**—reduce initial dose of sildenafil
- ▶ **Tadalafil**: indinavir possibly increases plasma concentration of **TADALAFIL**
- **Vardenafil**: indinavir increases plasma concentration of ● **VARDENAFIL**—avoid concomitant use

**Indometacin** see NSAIDs**Indoramin** see Alpha-blockers**Infliximab**

- **Abatacept**: avoid concomitant use of infliximab with ● **ABATACEPT**
- **Anakinra**: avoid concomitant use of infliximab with ● **ANAKINRA**
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- **Vaccines**: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Influenza Vaccine** see Vaccines**Insulin** see Antidiabetics**Interferon Alfa** see Interferons**Interferon Gamma** see Interferons**Interferons**

- **Aminophylline**: interferon alfa and peginterferon alfa inhibit metabolism of ● **AMINOPHYLLINE** (consider reducing dose of aminophylline)
- **Antivirals**: caution with peginterferon alfa advised by manufacturer of **ADEFОВIR**; increased risk of peripheral neuropathy when interferon alfa and peginterferon alfa given with ● **TELБIVUDINE**
- **Theophylline**: interferon alfa and peginterferon alfa inhibit metabolism of ● **THEOPHYLLINE** (consider reducing dose of theophylline)
- ▶ **Vaccines**: manufacturer of interferon gamma advises avoid concomitant use with **VACCINES**

**Ipilimumab**

- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- ▶ **Cytotoxics**: manufacturer of ipilimumab advises avoid concomitant use with **VEМURAFENIB**
- **Vaccines**: risk of generalised infections when monoclonal antibodies given with live ● **VACCINES**—avoid concomitant use

**Ipratropium** see Antimuscarinics**Irbesartan** see Angiotensin-II Receptor Antagonists**Irinotecan**

- **Antidepressants**: metabolism of irinotecan accelerated by ● **ST JOHN'S WORT** (reduced plasma concentration)—avoid concomitant use)
- ▶ **Antiepileptics**: plasma concentration of irinotecan and its active metabolite reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- **Antifungals**: plasma concentration of irinotecan reduced by ● **KETOCONAZOLE** (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; increased risk of toxicity when irinotecan given with ● **ITRACONAZOLE**—avoid concomitant use
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- **Antivirals**: metabolism of irinotecan possibly inhibited by ● **ATAZANAVIR** (increased risk of toxicity)

**Irinotecan** (continued)

- **Cytotoxics**: avoidance of irinotecan advised by manufacturer of ● **PANITUMUMAB**; plasma concentration of active metabolite of irinotecan increased by ● **LAPATINIB**—consider reducing dose of irinotecan; plasma concentration of irinotecan increased by **REGORAFENIB**; plasma concentration of irinotecan possibly increased by **SORAFENIB**

**Iron Salts**

- ▶ **Antacids**: absorption of *oral* iron salts reduced by **ORAL MAGNESIUM SALTS** (as magnesium trisilicate)
- ▶ **Antibacterials**: *oral* iron salts reduce absorption of **CIPROFLOXACIN** (give at least 2 hours before or 4 hours after ciprofloxacin); *oral* iron salts reduce absorption of **LEVOFLOXACIN**, **NORFLOXACIN** and **OFLOXACIN** (give at least 2 hours apart); *oral* iron salts reduce absorption of **MOXIFLOXACIN** (give at least 6 hours apart); effects of iron salts possibly inhibited by **CHLORAMPHENICOL**; *oral* iron salts reduce absorption of tetracyclines, also absorption of *oral* iron salts reduced by **TETRACYCLINES** (give at least 2 to 3 hours apart)
- ▶ **Antivirals**: *oral* iron salts reduce absorption of **DOLUTEGRAVIR**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after *oral* iron salts
- ▶ **Bisphosphonates**: *oral* iron salts reduce absorption of **BISPHOSPHONATES**
- ▶ **Calcium Salts**: absorption of *oral* iron salts reduced by **CALCIUM SALTS**
- ▶ **Dopaminergics**: *oral* iron salts possibly reduce absorption of **CO-BENELDOPA**, **CO-CARELDOPA** and **LEVODOPA**; *oral* iron salts reduce absorption of **ENTACAPONE**
- ▶ **Eltrombopag**: *oral* iron salts possibly reduce absorption of **ELTROMBOPAG** (give at least 4 hours apart)
- ▶ **Methyldopa**: *oral* iron salts antagonise hypotensive effect of **METHYLDOPA**
- ▶ **Mycophenolate**: *oral* iron salts reduce absorption of **MYCOPHENOLATE**
- ▶ **Penicillamine**: *oral* iron salts reduce absorption of **PENICILLAMINE**
- ▶ **Thyroid Hormones**: *oral* iron salts reduce absorption of **LEVOTHYROXINE** (give at least 2 hours apart)
- ▶ **Trientine**: absorption of *oral* iron salts reduced by **TRIENTINE**
- ▶ **Zinc**: *oral* iron salts reduce absorption of **ZINC**, also absorption of *oral* iron salts reduced by zinc

**Isavuconazole** see Antifungals, Imidazole**Isocarboxazid** see MAOIs**Isoflurane** see Anaesthetics, General**Isometheptene** see Sympathomimetics**Isoniazid**

- ▶ **Aminophylline**: isoniazid possibly increases plasma concentration of **AMINOPHYLLINE**
- ▶ **Anaesthetics, General**: increased risk of hepatotoxicity when isoniazid given with **ISOFLURANE**
- ▶ **Analgesics**: avoidance of isoniazid advised by manufacturer of **PETHIDINE**
- ▶ **Antacids**: absorption of isoniazid reduced by **ANTACIDS**
- **Antibacterials**: increased risk of hepatotoxicity when isoniazid given with ● **RIFAMPICIN**; increased risk of CNS toxicity when isoniazid given with **CYCLOSERINE**
- **Antiepileptics**: isoniazid increases plasma concentration of ● **CARBAMAZEPINE** (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of ● **ETHOSUXIMIDE** (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of **FOSPHENYTOIN** and **PHENYTOIN** (increased risk of toxicity)
- ▶ **Antifungals**: isoniazid possibly reduces plasma concentration of **KETOCONAZOLE**
- ▶ **Anxiolytics and Hypnotics**: isoniazid inhibits the metabolism of **DIAZEPAM**
- ▶ **Corticosteroids**: plasma concentration of isoniazid possibly reduced by **CORTICOSTEROIDS**
- ▶ **Disulfiram**: isoniazid possibly increases CNS effects of **DISULFIRAM**
- ▶ **Dopaminergics**: isoniazid possibly reduces effects of **CO-BENELDOPA**, **CO-CARELDOPA** and **LEVODOPA**
- ▶ **Lipid-regulating Drugs**: separating administration from isoniazid by 12 hours advised by manufacturer of **LOMITAPIDE**

**Isoniazid** (continued)

- ▶ Theophylline: isoniazid possibly increases plasma concentration of **THEOPHYLLINE**
- ▶ Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Isosorbide Dinitrate** see Nitrates

**Isosorbide Mononitrate** see Nitrates

**Isotretinoin** see Retinoids

**Istradipine** see Calcium-channel Blockers

**Itraconazole** see Antifungals, Triazole

**Ivabradine**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with ● **AMIODARONE** or ● **DISOPYRAMIDE**
- Antibacterials: plasma concentration of ivabradine possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with ● **ERYTHROMYCIN**—avoid concomitant use
- ▶ Antidepressants: plasma concentration of ivabradine reduced by **ST JOHN'S WORT**—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by ● **KETOCONAZOLE**—avoid concomitant use; plasma concentration of ivabradine increased by **FLUCONAZOLE**—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by ● **ITRACONAZOLE**—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with ● **MEFLOQUINE**
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with ● **PIMOZIDE**
- Antivirals: plasma concentration of ivabradine possibly increased by ● **RITONAVIR**—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with ● **SOTALOL**
- Calcium-channel Blockers: plasma concentration of ivabradine increased by ● **DILTIAZEM** and ● **VERAPAMIL**—avoid concomitant use
- ▶ Grapefruit Juice: plasma concentration of ivabradine increased by **GRAPEFRUIT JUICE**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when ivabradine given with ● **PENTAMIDINE ISETIONATE**

**Ivacaftor**

- Antibacterials: plasma concentration of ivacaftor possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC); plasma concentration of ivacaftor possibly increased by ● **ERYTHROMYCIN**—reduce dose of ivacaftor (see under Ivacaftor, p. 275); plasma concentration of ivacaftor possibly reduced by ● **RIFABUTIN**—manufacturer of ivacaftor advises avoid concomitant use; plasma concentration of ivacaftor reduced by ● **RIFAMPICIN**—manufacturer of ivacaftor advises avoid concomitant use
- Antidepressants: plasma concentration of ivacaftor possibly reduced by ● **ST JOHN'S WORT**—manufacturer of ivacaftor advises avoid concomitant use
- Antiepileptics: plasma concentration of ivacaftor possibly reduced by ● **CARBAMAZEPINE**, ● **FOSPHENYTOIN**, ● **PHENOBARBITAL**, ● **PHENYTOIN** and ● **PRIMIDONE**—manufacturer of ivacaftor advises avoid concomitant use
- Antifungals: plasma concentration of ivacaftor increased by ● **KETOCONAZOLE**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC); plasma concentration of ivacaftor increased by ● **FLUCONAZOLE**—reduce dose of ivacaftor (see under Ivacaftor, p. 275); plasma concentration of ivacaftor possibly increased by ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC)
- ▶ Anxiolytics and Hypnotics: ivacaftor increases plasma concentration of **MIDAZOLAM**
- ▶ Cardiac Glycosides: ivacaftor increases plasma concentration of **DIGOXIN**

**Ivacaftor** (continued)

- ▶ Grapefruit Juice: plasma concentration of ivacaftor possibly increased by **GRAPEFRUIT JUICE**—manufacturer of ivacaftor advises avoid concomitant use
- ▶ Lipid-regulating Drugs: separating administration from ivacaftor by 12 hours advised by manufacturer of **LOMITAPIDE**

**Ivermectin**

- ▶ Anthelmintics: plasma concentration of ivermectin possibly increased by **LEVAMISOLE**
- ▶ Anticoagulants: ivermectin possibly enhances anticoagulant effect of **COUMARINS**

**Japanese Encephalitis Vaccine** see Vaccines

**Kaolin**

- ▶ Analgesics: kaolin possibly reduces absorption of **ASPIRIN**
- ▶ Antibacterials: kaolin possibly reduces absorption of **TETRACYCLINES**
- ▶ Antimalarials: kaolin reduces absorption of **CHLOROQUINE** and **HYDROXYCHLOROQUINE**
- ▶ Antipsychotics: kaolin possibly reduces absorption of **PHENOTHIAZINES**

**Ketamine** see Anaesthetics, General

**Ketoprofen** see NSAIDs

**Ketorolac** see NSAIDs

**Ketotifen** see Antihistamines

**Labetalol** see Beta-blockers

**Lacidipine** see Calcium-channel Blockers

**Lacosamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIs** and ● **TRICYCLICS** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**

**Lactulose**

- ▶ Anticoagulants: lactulose possibly enhances anticoagulant effect of **COUMARINS**

**Lamivudine**

- ▶ Antibacterials: plasma concentration of lamivudine increased by **TRIMETHOPRIM** (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- ▶ Antivirals: avoidance of lamivudine advised by manufacturer of **ENTRICITABINE**
- Cytotoxics: manufacturer of lamivudine advises avoid concomitant use with ● **CLADRIBINE**
- Orlistat: absorption of lamivudine possibly reduced by ● **ORLISTAT**

**Lamotrigine**

- Antibacterials: plasma concentration of lamotrigine reduced by ● **RIFAMPICIN**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIs** and ● **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of lamotrigine often reduced by **CARBAMAZEPINE**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**; plasma concentration of lamotrigine increased by ● **SODIUM VALPROATE** and ● **VALPROIC ACID** (increased risk of toxicity—reduce lamotrigine dose)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- ▶ Antivirals: plasma concentration of lamotrigine possibly reduced by **RITONAVIR**

**Lamotrigine** (continued)

- Oestrogens: plasma concentration of lamotrigine reduced by
  - **OESTROGENS**—consider increasing dose of lamotrigine
  - Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**
- Progestogens: plasma concentration of lamotrigine possibly increased by ● **DESOGESTREL**

**Lanreotide**

- Antidiabetics: lanreotide possibly reduces requirements for **ANTIDIABETICS**
- Ciclosporin: lanreotide reduces plasma concentration of **CYCLOSPORIN**

**Lansoprazole** see Proton Pump Inhibitors**Lanthanum**

- Antibacterials: lanthanum possibly reduces absorption of **QUINOLONES** (give at least 2 hours before or 4 hours after lanthanum)
- Antifungals: lanthanum possibly reduces absorption of **KETOCONAZOLE** (give at least 2 hours apart)
- Antimalarials: lanthanum possibly reduces absorption of **CHLOROQUINE** and **HYDROXYCHLOROQUINE** (give at least 2 hours apart)
- Thyroid Hormones: lanthanum reduces absorption of **LEVOTHYROXINE** (give at least 2 hours apart)

**Lapatinib**

- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with ● **RIFABUTIN**, ● **RIFAMPICIN** and ● **TELITHROMYCIN**
- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with ● **ST JOHN'S WORT**
- Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with ● **REPAGLINIDE**
- Antiepileptics: plasma concentration of lapatinib reduced by ● **CARBAMAZEPINE**—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ● **FOSPHENYTOIN** and ● **PHENYTOIN**
- Antifungals: plasma concentration of lapatinib increased by ● **KETOCONAZOLE**—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ● **ITRACONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with ● **PIMOZIDE**
- Antivirals: avoidance of lapatinib advised by manufacturer of ● **BOCEPREVIR**; manufacturer of lapatinib advises avoid concomitant use with ● **RITONAVIR** and ● **SAQUINAVIR**
- Cytotoxics: lapatinib increases plasma concentration of **PAZOPANIB**; possible increased risk of neutropenia when lapatinib given with **DOCETAXEL**; increased risk of neutropenia when lapatinib given with ● **PACLITAXEL**; lapatinib increases plasma concentration of active metabolite of ● **IRINOTECAN**—consider reducing dose of irinotecan
- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with ● **GRAPEFRUIT JUICE**
- Lipid-regulating Drugs: separating administration from lapatinib by 12 hours advised by manufacturer of **LOMITAPIDE**
- Ulcer-healing Drugs: absorption of lapatinib possibly reduced by **HISTAMINE H<sub>2</sub>-ANTAGONISTS** and **PROTON PUMP INHIBITORS**

**Laronidase**

- Antimalarials: effects of laronidase possibly inhibited by **CHLOROQUINE** and **HYDROXYCHLOROQUINE** (manufacturer of laronidase advises avoid concomitant use)

**Ledipasvir**

- Antacids: manufacturer of ledipasvir advises separating administration from **ANTACIDS** by 4 hours
- Anti-arrhythmics: possible increased risk of bradycardia when ledipasvir (with sofosbuvir) given with ● **AMIODARONE**—see under Amiodarone, p. 99
- Antibacterials: manufacturer of ledipasvir advises avoid concomitant use with **RIFABUTIN** and **RIFAMPICIN**
- Antidepressants: manufacturer of ledipasvir advises avoid concomitant use with **ST JOHN'S WORT**
- Antiepileptics: manufacturer of ledipasvir advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN**, **OXCARBAZEPINE**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**

**Ledipasvir** (continued)

- Antivirals: plasma concentration of both drugs increased when ledipasvir given with **SIMEPREVIR**—manufacturer of ledipasvir advises avoid concomitant use
- Calcium Salts: manufacturer of ledipasvir advises separating administration from **CALCIUM SALTS** by 4 hours
- Lipid-regulating Drugs: possible increased risk of myopathy when ledipasvir given with ● **ATORVASTATIN**, ● **FLUVASTATIN** and ● **SIMVASTATIN**—manufacturer of ledipasvir advises consider reducing dose of atorvastatin, fluvastatin and simvastatin; manufacturer of ledipasvir advises avoid concomitant use with ● **ROSUVASTATIN**
- Ulcer-healing Drugs: plasma concentration of ledipasvir reduced by **FAMOTIDINE** and **OMEPRAZOLE**; manufacturer of ledipasvir advises do not take **PROTON PUMP INHIBITORS** before ledipasvir

**Leflunomide**

- NOTE** Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
- Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by **RIFAMPICIN**
- Anticoagulants: leflunomide possibly enhances anticoagulant effect of **WARFARIN**
- Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of **TOLBUTAMIDE**
- Antiepileptics: leflunomide possibly increases plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**
- Cytotoxics: risk of toxicity when leflunomide given with ● **METHOTREXATE**
- Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by **COLESTYRAMINE** (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: risk of generalised infections when leflunomide given with live ● **VACCINES**—avoid concomitant use

**Lenalidomide**

- Antibacterials: plasma concentration of lenalidomide possibly increased by ● **CLARITHROMYCIN** (increased risk of toxicity)
- Antifungals: plasma concentration of lenalidomide possibly increased by ● **ITRACONAZOLE** and ● **KETOCONAZOLE** (increased risk of toxicity)
- Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by ● **VERAPAMIL** (increased risk of toxicity)
- Cardiac Glycosides: lenalidomide possibly increases plasma concentration of **DIGOXIN**
- Ciclosporin: plasma concentration of lenalidomide possibly increased by ● **CYCLOSPORIN** (increased risk of toxicity)

**Lenvatinib**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)

**Lercanidipine** see Calcium-channel Blockers**Leukotriene Receptor Antagonists**

- Aminophylline: zafirlukast possibly increases plasma concentration of **AMINOPHYLLINE**, also plasma concentration of zafirlukast reduced
- Analgesics: plasma concentration of zafirlukast increased by **ASPIRIN**
- Antibacterials: plasma concentration of zafirlukast reduced by **ERYTHROMYCIN**
- Anticoagulants: zafirlukast enhances anticoagulant effect of **WARFARIN**
- Antiepileptics: plasma concentration of montelukast reduced by **PHENOBARBITAL** and **PRIMIDONE**
- Antifungals: plasma concentration of zafirlukast increased by **FLUCONAZOLE**
- Lipid-regulating Drugs: plasma concentration of montelukast increased by **GEMFIBROZIL**
- Theophylline: zafirlukast possibly increases plasma concentration of **THEOPHYLLINE**, also plasma concentration of zafirlukast reduced

**Levamisole**

- Alcohol: possibility of disulfiram-like reaction when levamisole given with **ALCOHOL**
- Anthelmintics: plasma concentration of both drugs possibly reduced when levamisole given with **ALBENDAZOLE**; levamisole possibly increases plasma concentration of **IVERMECTIN**

**Levamisole** (continued)

- Anticoagulants: levamisole possibly enhances anticoagulant effect of ● **WARFARIN**
- ▶ Antiepileptics: levamisole possibly increases plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**

**Levetiracetam**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ● **MAOIS** and ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● **SSRIS** and ● **TRICYCLICS** (convulsive threshold lowered)
- ▶ Antiepileptics: levetiracetam possibly increases risk of **CARBAMAZEPINE** toxicity
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Cytotoxics: levetiracetam possibly increases plasma concentration of ● **METHOTREXATE**
- Orlistat: possible increased risk of convulsions when antiepileptics given with ● **ORLISTAT**

**Levobunolol** see Beta-blockers

**Levobupivacaine**

- ▶ Anti-arrhythmics: increased myocardial depression when levobupivacaine given with **ANTI-ARRHYTHMICS**

**Levocarnitine**

- ▶ Anticoagulants: levocarnitine possibly enhances anticoagulant effect of **COUMARINS**

**Levocetirizine** see Antihistamines

**Levodopa**

- ACE Inhibitors: enhanced hypotensive effect when levodopa given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with **ADRENERGIC NEURONE BLOCKERS**
- ▶ Alpha-blockers: enhanced hypotensive effect when levodopa given with **ALPHA-BLOCKERS**
- Anaesthetics, General: increased risk of arrhythmias when levodopa given with ● **VOLATILE LIQUID GENERAL ANAESTHETICS**
- ▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- ▶ Antibacterials: effects of levodopa possibly reduced by **ISONIAZID**
- Antidepressants: risk of hypertensive crisis when levodopa given with ● **MAOIS**, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with **MOCLOBEMIDE**
- ▶ Antiepileptics: effects of levodopa possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**
- ▶ Antimuscarinics: absorption of levodopa possibly reduced by **ANTIMUSCARINICS**
- ▶ Antipsychotics: effects of levodopa antagonised by **ANTIPSYCHOTICS**; avoidance of levodopa advised by manufacturer of **AMISULPRIDE** (antagonism of effect)
- ▶ Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by **BENZODIAZEPINES**
- ▶ Beta-blockers: enhanced hypotensive effect when levodopa given with **BETA-BLOCKERS**
- ▶ Bupropion: increased risk of side-effects when levodopa given with **BUPROPION**
- ▶ Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when levodopa given with **CLONIDINE**
- ▶ Diazoxide: enhanced hypotensive effect when levodopa given with **DIAZOXIDE**
- Diuretics: enhanced hypotensive effect when levodopa given with **DIURETICS**
- ▶ Dopaminergics: enhanced effects and increased toxicity of levodopa when given with **SELEGILINE** (reduce dose of levodopa)
- ▶ Iron Salts: absorption of levodopa possibly reduced by **oral IRON SALTS**
- ▶ Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**

**Levodopa** (continued)

- ▶ Methyldopa: enhanced hypotensive effect when levodopa given with **METHYLDOPA**; antiparkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- ▶ Moxonidine: enhanced hypotensive effect when levodopa given with **MOXONIDINE**
- ▶ Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with **BACLOFEN**
- ▶ Nitrates: enhanced hypotensive effect when levodopa given with **NITRATES**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**
- ▶ Vitamins: effects of levodopa reduced by **PYRIDOXINE** when given without dopa-decarboxylase inhibitor

**Levofloxacin** see Quinolones

**Levofolinic Acid** see Folates

**Levomoprogeline** see Antipsychotics

**Levonorgestrel** see Progestogens

**Levosimendan**

- Nitrates: possible severe postural hypotension when levosimendan given with ● **ISOSORBIDE MONONITRATE**

**Levothyroxine** see Thyroid Hormones

**Lidocaine**

**NOTE** Interactions less likely when lidocaine used topically

- ▶ Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE**, **LEVOBUPIVACAINE**, **PRILOCAINE** or **ROPIVACAINE**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ● **ANTI-ARRHYTHMICS**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ● **ANTIPSYCHOTICS** that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by ● **ATAZANAVIR** and **LOPINAVIR**; plasma concentration of lidocaine possibly increased by **DARUNAVIR** and ● **FOSAMPRENAVIR**—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with ● **SAQUINAVIR**—avoid concomitant use; caution with *intravenous* lidocaine advised by manufacturer of **TELAPREVIR**
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ● **BETA-BLOCKERS**; possible increased risk of lidocaine toxicity when given with **NADOLOL**; increased risk of lidocaine toxicity when given with ● **PROPRANOLOL**
- Diuretics: action of lidocaine antagonised by hypokalaemia caused by ● **ACETAZOLAMIDE**, ● **LOOP DIURETICS** or ● **THIAZIDES AND RELATED DIURETICS**
- ▶ Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with **SUXAMETHONIUM**
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by ● **CIMETIDINE** (increased risk of toxicity)

**Linagliptin** see Antidiabetics

**Linezolid** see MAOIs

**Liothyronine** see Thyroid Hormones

**Lipefigilgrastim**

- ▶ Cytotoxics: neutropenia possibly exacerbated when lipefigilgrastim given with **CAPECITABINE**, **FLUOROURACIL** or **TEGAFUR**

**Lipid-regulating Drugs** see Colesevelam, Colestipol,

Colestyramine, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins

**Liraglutide** see Antidiabetics

**Lisdexamfetamine** see Sympathomimetics

**Lisinopril** see ACE Inhibitors

**Lithium**

- ACE Inhibitors: excretion of lithium reduced by ● **ACE INHIBITORS** (increased plasma concentration)
- Aminophylline: excretion of lithium increased by **AMINOPHYLLINE** (reduced plasma concentration)
- Analgesics: excretion of lithium reduced by ● **NSAIDS** (increased risk of toxicity); excretion of lithium reduced by ● **KETOROLAC** (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by ● **ANGIOTENSIN-II RECEPTOR ANTAGONISTS** (increased plasma concentration)

**Lithium** (continued)

- Antacids: excretion of lithium increased by **SODIUM BICARBONATE** (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of ● **AMIODARONE** (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with **METRONIDAZOLE**
- Antidepressants: possible increased serotonergic effects when lithium given with **VENLAFAXINE**; increased risk of CNS effects when lithium given with ● **SSRIS** (lithium toxicity reported); risk of toxicity when lithium given with **TRICYCLICS**
- Antiepileptics: neurotoxicity may occur when lithium given with **CARBAMAZEPINE**, **FOSPHENYTOIN** or **PHENYTOIN** without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by **TOPIRAMATE**
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with **CLOZAPINE**, **FLUPENTIXOL**, **HALOPERIDOL**, **PHENOTHIAZINES**, ● **RISPERIDONE** or **ZUCLOPENTHIXOL**; possible risk of toxicity when lithium given with **OLANZAPINE**; lithium possibly increases extrapyramidal side-effects of **QUETIAPINE**; increased risk of extrapyramidal side-effects when lithium given with **SULPRIDE**
- Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with **CLONAZEPAM**
- Calcium-channel Blockers: neurotoxicity may occur when lithium given with **DILTIAZEM** or **VERAPAMIL** without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with ● **ARSENIC TRIOXIDE**
- Dapoxetine: possible increased risk of serotonergic effects when lithium given with ● **DAPOXETINE** (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Diuretics: excretion of lithium increased by ● **ACETAZOLAMIDE**; excretion of lithium reduced by ● **ALDOSTERONE ANTAGONISTS** and ● **POTASSIUM-SPARING DIURETICS** (increased plasma concentration and risk of toxicity); excretion of lithium reduced by ● **LOOP DIURETICS** and ● **THIAZIDES AND RELATED DIURETICS** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides
- 5HT<sub>1</sub>-receptor Agonists: possible risk of toxicity when lithium given with **SUMATRIPTAN**
- Methyl dopa: neurotoxicity may occur when lithium given with ● **METHYLDOPA** without increased plasma concentration of lithium
- Muscle Relaxants: lithium enhances effects of **MUSCLE RELAXANTS**; hyperkinesia caused by lithium possibly aggravated by **BACLOFEN**
- Parasympathomimetics: lithium antagonises effects of **NEOSTIGMINE**
- Theophylline: excretion of lithium increased by **THEOPHYLLINE** (reduced plasma concentration)

**Lixisenatide** see Antidiabetics

**Lofepramine** see Antidepressants, Tricyclic

**Lofexidine**

- Alcohol: increased sedative effect when lofexidine given with **ALCOHOL**
- Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with **ANXIOLYTICS AND HYPNOTICS**

**Lomitapide**

- Alcohol: manufacturer of lomitapide advises avoid concomitant use with **ALCOHOL**
- Anti-arrhythmics: manufacturer of lomitapide advises separating administration from **AMIODARONE** by 12 hours; manufacturer of lomitapide advises avoid concomitant use with ● **DRONEDARONE** (plasma concentration of lomitapide possibly increased)
- Antibacterials: manufacturer of lomitapide advises separating administration from **AZITHROMYCIN** and **ISONIAZID** by 12 hours; manufacturer of lomitapide advises avoid concomitant use with ● **CLARITHROMYCIN**, ● **ERYTHROMYCIN** and ● **TELITHROMYCIN** (plasma concentration of lomitapide possibly increased)

**Lomitapide** (continued)

- Anticoagulants: lomitapide possibly enhances anticoagulant effect of **WARFARIN**
- Antidepressants: manufacturer of lomitapide advises separating administration from **FLUOXETINE** and **FLUVOXAMINE** by 12 hours
- Antidiabetics: manufacturer of lomitapide advises separating administration from **LINAGLIPTIN** by 12 hours
- Antifungals: plasma concentration of lomitapide increased by ● **KETOCONAZOLE**—avoid concomitant use; manufacturer of lomitapide advises avoid concomitant use with ● **TRIAZOLES** (plasma concentration of lomitapide possibly increased)
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with ● **DARUNAVIR**, ● **FOSAMPRENAVIR**, ● **INDINAVIR**, ● **LOPINAVIR**, ● **RITONAVIR**, ● **SAQUINAVIR**, ● **TELAPREVIR** and ● **TIPRANAVIR** (plasma concentration of lomitapide possibly increased)
- Anxiolytics and Hypnotics: manufacturer of lomitapide advises separating administration from **ALPRAZOLAM** by 12 hours
- Calcium-channel Blockers: manufacturer of lomitapide advises separating administration from **AMLODIPINE** and **LACIDIPINE** by 12 hours; manufacturer of lomitapide advises avoid concomitant use with ● **DILTIAZEM** and ● **VERAPAMIL** (plasma concentration of lomitapide possibly increased)
- Ciclosporin: manufacturer of lomitapide advises separating administration from **CICLOSPORIN** by 12 hours
- Clofazone: manufacturer of lomitapide advises separating administration from **CLOTAZOL** by 12 hours
- Cytotoxics: manufacturer of lomitapide advises separating administration from **LAPATINIB**, **NILOTINIB** and **PAZOPANIB** by 12 hours
- Fosaprepitant: manufacturer of lomitapide advises separating administration from **FOSAPREPITANT** by 12 hours
- Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with **GRAPEFRUIT JUICE**
- Hormone Antagonists: manufacturer of lomitapide advises separating administration from **BICALUTAMIDE** by 12 hours
- Ivacaftor: manufacturer of lomitapide advises separating administration from **IVACAFTOR** by 12 hours
- Lipid-regulating Drugs: lomitapide increases plasma concentration of **ATORVASTATIN**—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; lomitapide increases plasma concentration of ● **SIMVASTATIN** (see under Simvastatin, p. 194); absorption of lomitapide possibly reduced by **BILE ACID SEQUESTRANTS** (give at least 4 hours apart)
- Oestrogens: manufacturer of lomitapide advises separating administration from **ESTROGENS** by 12 hours
- Ranolazine: manufacturer of lomitapide advises separating administration from **RANOLAZINE** by 12 hours
- Tacrolimus: manufacturer of lomitapide advises separating administration from **TACROLIMUS** by 12 hours
- Ticagrelor: manufacturer of lomitapide advises separating administration from **TICAGRELOR** by 12 hours
- Tolvaptan: manufacturer of lomitapide advises separating administration from **TOLVAPTAN** by 12 hours
- Ulcer-healing Drugs: manufacturer of lomitapide advises separating administration from **CIMETIDINE** and **RANITIDINE** by 12 hours

**Lomustine**

- Antipsychotics: avoid concomitant use of cytotoxics with ● **CLOZAPINE** (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by **CIMETIDINE**

**Loperamide**

- Desmopressin: loperamide increases plasma concentration of oral **DESMOPRESSIN**

**Lopinavir**

- NOTE** In combination with ritonavir as **Kaletra**<sup>®</sup> (ritonavir is present to inhibit lopinavir metabolism and increase plasma lopinavir concentration)—see also Ritonavir
- Anti-arrhythmics: lopinavir possibly increases plasma concentration of ● **FLECAINIDE** (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of **LIDOCAINE**

**Lopinavir** (continued)

- **Antibacterials:** plasma concentration of lopinavir reduced by
  - **RIFAMPICIN**—avoid concomitant use; lopinavir increases plasma concentration of **DELAMANID**; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of ● **TELITHROMYCIN**
- ▶ **Anticoagulants:** avoidance of lopinavir advised by manufacturer of **APIXABAN**; manufacturers advise avoid concomitant use of lopinavir with **RIVAROXABAN**
- **Antidepressants:** plasma concentration of lopinavir reduced by
  - **ST JOHN'S WORT**—avoid concomitant use
- **Antiepileptics:** plasma concentration of lopinavir possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, ● **PHENOBARBITAL**, **PHENYTOIN** and ● **PRIMIDONE**
- ▶ **Antifungals:** lopinavir increases plasma concentration of **ISAVUCONAZOLE** (also plasma concentration of lopinavir reduced)
- ▶ **Antihistamines:** lopinavir possibly increases plasma concentration of **CHLORPHENAMINE**
- ▶ **Antimalarials:** caution with lopinavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**
- ▶ **Antimuscarinics:** avoidance of lopinavir advised by manufacturer of **DARIFENACIN** and **TOLTERODINE**
- **Antipsychotics:** lopinavir possibly increases plasma concentration of ● **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- **Antivirals:** manufacturers advise avoid concomitant use of lopinavir with ● **BOCEPREVIR** and ● **TELAPREVIR**; lopinavir reduces plasma concentration of ● **DARUNAVIR**—avoid concomitant use; plasma concentration of lopinavir reduced by ● **EFAVIRENZ**—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of ● **ELVITEGRAVIR** (reduce dose of elvitegravir); lopinavir reduces plasma concentration of **FOSAMPRENAVIR**; effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of ● **MARAVIROC** (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by ● **NEVIRAPINE**—consider increasing dose of lopinavir; lopinavir increases plasma concentration of ● **PARITAPREVIR**—manufacturer of paritaprevir advises avoid concomitant use; increased risk of ventricular arrhythmias when lopinavir given with ● **SAQUINAVIR**—avoid concomitant use; lopinavir increases plasma concentration of **TENOFOVIR**; plasma concentration of lopinavir reduced by ● **TIPRANAVIR**
- **Bosentan:** lopinavir increases plasma concentration of ● **BOSENTAN** (consider reducing dose of bosentan)
- ▶ **Corticosteroids:** plasma concentration of lopinavir possibly reduced by **DEXAMETHASONE**
- **Cytotoxics:** manufacturer of ruxolitinib advises dose reduction when lopinavir given with ● **RUXOLITINIB**—consult ruxolitinib product literature
- ▶ **Eltrombopag:** lopinavir possibly reduces plasma concentration of **ELTROMBOPAG**
- **Lipid-regulating Drugs:** possible increased risk of myopathy when lopinavir given with **ATORVASTATIN**; lopinavir increases plasma concentration of ● **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with ● **SIMVASTATIN**—avoid concomitant use; avoidance of lopinavir advised by manufacturer of ● **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of lopinavir possibly reduced by ● **ORLISTAT**
- **Ranolazine:** lopinavir possibly increases plasma concentration of ● **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- ▶ **Sirolimus:** lopinavir possibly increases plasma concentration of **SIROLIMUS**
- ▶ **Sympathomimetics, Beta<sub>2</sub>:** manufacturer of lopinavir advises avoid concomitant use with **SALMETEROL**

**Loprazolam** see Anxiolytics and Hypnotics

**Loratadine** see Antihistamines

**Lorazepam** see Anxiolytics and Hypnotics

**Lormetazepam** see Anxiolytics and Hypnotics

**Losartan** see Angiotensin-II Receptor Antagonists

**Lumacaftor**

- **Antibacterials:** lumacaftor possibly reduces plasma concentration of ● **CLARITHROMYCIN** and ● **TELITHROMYCIN**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFc); lumacaftor possibly reduces plasma concentration of **RIFABUTIN**—avoid concomitant use
- ▶ **Antidepressants:** manufacturer of lumacaftor advises avoid concomitant use with **ST JOHN'S WORT**
- ▶ **Antiepileptics:** lumacaftor possibly reduces plasma concentration of **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**—manufacturer of lumacaftor advises avoid concomitant use
- **Antifungals:** lumacaftor possibly reduces plasma concentration of ● **KETOCONAZOLE**, ● **POSACONAZOLE** and ● **VORICONAZOLE**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFc); lumacaftor reduces plasma concentration of ● **ITRACONAZOLE**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFc)
- ▶ **Anxiolytics and Hypnotics:** lumacaftor possibly reduces plasma concentration of **MIDAZOLAM**—manufacturer of lumacaftor advises avoid concomitant use
- **Ciclosporin:** manufacturer of lumacaftor advises avoid concomitant use with **CYCLOSPORIN**
- ▶ **Cytotoxics:** manufacturer of lumacaftor advises avoid concomitant use with **EVEROLIMUS**
- **Oestrogens:** lumacaftor possibly causes contraceptive failure of hormonal contraceptives containing ● **ETHINYLESTRADIOL** (alternative contraception recommended)
- **Progestogens:** lumacaftor possibly causes contraceptive failure of hormonal contraceptives containing ● **PROGESTOGENS** (alternative contraception recommended)
- ▶ **Sirolimus:** manufacturer of lumacaftor advises avoid concomitant use with **SIROLIMUS**
- ▶ **Tacrolimus:** manufacturer of lumacaftor advises avoid concomitant use with **TACROLIMUS**

**Lurasidone** see Antipsychotics

**Lymecycline** see Tetracyclines

**Macitentan**

- **Antibacterials:** plasma concentration of macitentan reduced by
  - **RIFAMPICIN**—avoid concomitant use
- ▶ **Antidepressants:** manufacturer of macitentan advises avoid concomitant use with **ST JOHN'S WORT**
- ▶ **Antiepileptics:** manufacturer of macitentan advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN** and **PHENYTOIN**
- ▶ **Antifungals:** plasma concentration of macitentan increased by **KETOCONAZOLE**

**Macrogols**

**NOTE** Some manufacturers suggest taking their oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

**Macrolides**

**NOTE** See also Telithromycin

**NOTE** Interactions do not apply to small amounts of erythromycin used topically

- **Aminophylline:** clarithromycin possibly increases plasma concentration of **AMINOPHYLLINE**; erythromycin increases plasma concentration of ● **AMINOPHYLLINE** (also aminophylline may reduce absorption of oral erythromycin)
- ▶ **Analgesics:** erythromycin increases plasma concentration of **ALFENTANIL**; clarithromycin possibly increases plasma concentration of **FENTANYL**
- ▶ **Antacids:** absorption of azithromycin reduced by **ANTACIDS** (give at least 2 hours before or 1 hour after antacids)
- **Anti-arrhythmics:** increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **AMIODARONE**—avoid concomitant use; clarithromycin possibly increases plasma concentration of ● **DISOPYRAMIDE** (increased risk of ventricular arrhythmias); azithromycin possibly increases plasma concentration of ● **DISOPYRAMIDE** (increased risk of toxicity); erythromycin increases plasma concentration of ● **DISOPYRAMIDE** (increased risk of toxicity); avoidance of

## Macrolides

- **Anti-arrhythmics** (continued)
  - clarithromycin advised by manufacturer of ● **DRONEDARONE** (risk of ventricular arrhythmias); erythromycin increases plasma concentration of ● **DRONEDARONE** (increased risk of ventricular arrhythmias—avoid concomitant use)
- **Antibacterials**: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **MOXIFLOXACIN**—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with ● **RIFABUTIN**; clarithromycin increases plasma concentration of ● **RIFABUTIN** (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of ● **RIFABUTIN** (increased risk of toxicity—reduce rifabutin dose); clarithromycin and erythromycin possibly increase plasma concentration of ● **BEDAQUILINE**—avoid concomitant use if clarithromycin and erythromycin given for more than 14 days; possible increased risk of ventricular arrhythmias when clarithromycin and erythromycin given with ● **DELAMANID**; avoidance of clarithromycin and erythromycin advised by manufacturer of ● **FIDAXOMICIN**; plasma concentration of clarithromycin reduced by ● **RIFAMYCINS**
- **Anticoagulants**: avoidance of clarithromycin advised by manufacturer of ● **APIXABAN**; azithromycin possibly enhances anticoagulant effect of ● **COUMARINS**; clarithromycin and erythromycin enhance anticoagulant effect of ● **COUMARINS**; possible increased risk of bleeding when clarithromycin given with ● **DABIGATRAN**; erythromycin increases plasma concentration of ● **EDOXABAN** (reduce dose of edoxaban—see under Edoxaban, p. 118)
- **Antidepressants**: avoidance of macrolides advised by manufacturer of ● **REBOXETINE**; avoidance of *intravenous* erythromycin advised by manufacturer of ● **CITALOPRAM** and ● **ESCITALOPRAM** (risk of ventricular arrhythmias); avoidance of erythromycin advised by manufacturer of ● **VENLAFAXINE** (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of ● **TRAZODONE**
- ▶ **Antidiabetics**: clarithromycin enhances effects of ● **REPAGLINIDE**
- **Antiepileptics**: erythromycin increases plasma concentration of ● **CARBAMAZEPINE**; clarithromycin increases plasma concentration of ● **CARBAMAZEPINE** (consider reducing dose of carbamazepine); clarithromycin inhibits metabolism of ● **FOSPHENYTOIN** and ● **PHENYTOIN** (increased plasma concentration); erythromycin possibly inhibits metabolism of ● **SODIUM VALPROATE** and ● **VALPROIC ACID** (increased plasma concentration)
- **Antifungals**: avoidance of concomitant clarithromycin in severe renal impairment advised by manufacturer of ● **KETOCONAZOLE**; avoidance of erythromycin advised by manufacturer of ● **FLUCONAZOLE**; clarithromycin increases plasma concentration of ● **ITRACONAZOLE**
- **Antihistamines**: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of ● **LORATADINE**; macrolides possibly inhibit metabolism of ● **MIZOLASTINE** (avoid concomitant use); erythromycin inhibits metabolism of ● **MIZOLASTINE**—avoid concomitant use
- **Antimalarials**: avoidance of macrolides advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; avoidance of macrolides advised by manufacturer of ● **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias)
- ▶ **Antimuscarinics**: erythromycin possibly increases plasma concentration of ● **DARIFENACIN**; manufacturer of fesoterodine advises dose reduction when clarithromycin given with ● **FESOTERODINE**—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of ● **TOLTERODINE**
- **Antipsychotics**: avoidance of macrolides advised by manufacturer of ● **DROPERIDOL** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **ZUCLOPENTHIXOL**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ● **AMISULPRIDE**—avoid concomitant use; erythromycin possibly increases plasma concentration of ● **CLOZAPINE** (possible increased risk of convulsions); clarithromycin possibly increases plasma concentration of ● **LURASIDONE**—avoid concomitant use;

## Macrolides

- **Antipsychotics** (continued)
  - erythromycin possibly increases the plasma concentration of ● **LURASIDONE** (see under Lurasidone, p. 373); possible increased risk of ventricular arrhythmias when erythromycin given with ● **PIMOZIDE**—avoid concomitant use; increased risk of ventricular arrhythmias when clarithromycin given with ● **PIMOZIDE**—avoid concomitant use; erythromycin increases plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use; clarithromycin possibly increases plasma concentration of ● **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **SULPIRIDE**
- **Antivirals**: plasma concentration of both drugs increased when clarithromycin given with ● **ATAZANAVIR**; clarithromycin possibly increases the plasma concentration of
  - **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, p. 577); avoidance of clarithromycin advised by manufacturer of ● **DASABUVIR** and ● **PARITAPREVRIR**; plasma concentration of clarithromycin reduced by ● **EFAVIREN**, also plasma concentration of active metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by ● **ETRAVIRINE** and ● **NEVIRAPINE** (but concentration of an active metabolite increased), also plasma concentration of etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of ● **MARAVIROC** (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of ● **RILPIVIRINE** (plasma concentration of rilpivirine possibly increased); plasma concentration of azithromycin and erythromycin possibly increased by ● **RITONAVIR**; plasma concentration of clarithromycin increased by ● **RITONAVIR** (reduce dose of clarithromycin in renal impairment); plasma concentration of both drugs possibly increased when clarithromycin given with ● **SAQUINAVIR** and ● **TELAPREVRIR** (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when erythromycin given with ● **SAQUINAVIR**—avoid concomitant use; clarithromycin possibly increases plasma concentration of ● **SIMEPREVRIR**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with ● **SIMEPREVRIR**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs possibly increased when erythromycin given with ● **TELAPREVRIR** (increased risk of ventricular arrhythmias); plasma concentration of clarithromycin increased by ● **TIPRANAVIR** (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of ● **ZIDOVUDINE** (give at least 2 hours apart)
- **Anxiolytics and Hypnotics**: clarithromycin and erythromycin inhibit metabolism of ● **MIDAZOLAM** (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of ● **BUSPIRONE** (reduce dose of buspirone); erythromycin inhibits the metabolism of ● **ZOPICLONE**
- ▶ **Appetitant**: clarithromycin possibly increases plasma concentration of ● **APREPITANT**
- **Atomoxetine**: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **ATOMOXETINE**
- **Avanafil**: clarithromycin possibly increases plasma concentration of ● **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use; erythromycin increases plasma concentration of ● **AVANAFIL**—see under Avanafil, p. 744
- **Calcium-channel Blockers**: clarithromycin and erythromycin possibly inhibit metabolism of ● **CALCIUM-CHANNEL BLOCKERS** (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of ● **LERCANIDIPINE**
- ▶ **Cardiac Glycosides**: macrolides increase plasma concentration of ● **DIGOXIN** (increased risk of toxicity)
- **Ciclosporin**: macrolides possibly inhibit metabolism of
  - **CICLOSPORIN** (increased plasma concentration); azithromycin increases plasma concentration of ● **CICLOSPORIN**; clarithromycin and erythromycin inhibit metabolism of ● **CICLOSPORIN** (increased plasma concentration)

**Macrolides** (continued)

- Clostrazol: clarithromycin possibly increases plasma concentration of ● **CLOSTAZOL** (see under Clostrazol, p. 221); erythromycin increases plasma concentration of ● **CLOSTAZOL** (see under Clostrazol, p. 221)
- Clopidogrel: erythromycin possibly reduces antiplatelet effect of ● **CLOPIDOGREL**
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of ● **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- ▶ Corticosteroids: erythromycin possibly inhibits metabolism of **CORTICOSTEROIDS**; erythromycin inhibits the metabolism of **METHYLPREDNISOLONE**; clarithromycin possibly increases plasma concentration of **METHYLPREDNISOLONE**
- Cytotoxics: erythromycin possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; clarithromycin and erythromycin possibly increase plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of ● **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin and erythromycin possibly increase plasma concentration of **CABOZANTINIB**; possible increased risk of ventricular arrhythmias when clarithromycin given with ● **CERITINIB**; clarithromycin possibly increases plasma concentration of ● **CRIZOTINIB** and ● **EVEROLIMUS**—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of clarithromycin and erythromycin advised by manufacturer of **DASATINIB** (plasma concentration of dasatinib possibly increased); erythromycin increases plasma concentration of ● **EVEROLIMUS** (consider reducing the dose of everolimus—consult everolimus product literature); clarithromycin and erythromycin possibly increase the plasma concentration of ● **IBRUTINIB**—reduce dose of ibrutinib (see under Ibrutinib, p. 867); avoidance of clarithromycin advised by manufacturer of ● **NILOTINIB**; clarithromycin possibly increases plasma concentration of ● **PAZOPANIB** (reduce dose of pazopanib); clarithromycin possibly increases plasma concentration of **PONATINIB**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with ● **RUXOLITINIB**—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **VANDETANIB**—avoid concomitant use; clarithromycin possibly increases the plasma concentration of ● **CABAZITAXEL**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; clarithromycin possibly increases plasma concentration of ● **DOCETAXEL**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of ventricular arrhythmias when erythromycin given with ● **ARSENIC TRIOXIDE**; clarithromycin and erythromycin possibly increase plasma concentration of ● **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881); erythromycin increases toxicity of ● **WINBLASTINE**—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with ● **VINOORELBINE**
- ▶ Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with **DAPOXETINE** (see under Dapoxetine, p. 751)
- Diuretics: clarithromycin increases plasma concentration of ● **EPLERENONE**—avoid concomitant use; erythromycin increases plasma concentration of **EPLERENONE** (reduce dose of eplerenone)
- Domperidone: possible increased risk of ventricular arrhythmias when clarithromycin given with ● **DOMPERIDONE**—avoid concomitant use; erythromycin increases plasma concentration of ● **DOMPERIDONE** (increased risk of ventricular arrhythmias—avoid concomitant use)
- ▶ Dopaminergics: macrolides possibly increase plasma concentration of **BROMOCRIPTINE** and **CABERGOLINE** (increased risk of toxicity); erythromycin increases plasma concentration of **BROMOCRIPTINE** and **CABERGOLINE** (increased risk of toxicity)

**Macrolides** (continued)

- Ergot Alkaloids: increased risk of ergotism when clarithromycin or erythromycin given with ● **ERGOT ALKALOIDS**—avoid concomitant use
- ▶ Fosaprepitant: clarithromycin possibly increases plasma concentration of **FOSAPREPITANT**
- Guanfacine: clarithromycin and erythromycin possibly increase the plasma concentration of ● **GUANFACINE** (halve dose of guanfacine)
- 5HT<sub>2</sub>-receptor Agonists: clarithromycin and erythromycin increase plasma concentration of ● **ELETRIPTAN** (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of ● **IVABRADINE**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ● **IVABRADINE**—avoid concomitant use
- Ivacaftor: clarithromycin possibly increases plasma concentration of ● **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNF), and Lumacaftor with Ivacaftor in BNF or BNF); erythromycin possibly increases plasma concentration of ● **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor, p. 275)
- Lenalidomide: clarithromycin possibly increases plasma concentration of ● **LENALIDOMIDE** (increased risk of toxicity)
- ▶ Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of **ZAFIRLUKAST**
- Lipid-regulating Drugs: possible increased risk of myopathy when azithromycin or erythromycin given with ● **ATORVASTATIN**; clarithromycin increases plasma concentration of ● **ATORVASTATIN** and **PRAVASTATIN**; erythromycin increases plasma concentration of **PRAVASTATIN**; erythromycin reduces plasma concentration of **ROSUVASTATIN**; possible increased risk of myopathy when azithromycin given with ● **SIMVASTATIN**; increased risk of myopathy when clarithromycin or erythromycin given with ● **SIMVASTATIN** (avoid concomitant use); separating administration from azithromycin by 12 hours advised by manufacturer of **LOMITAPIDE**; avoidance of clarithromycin and erythromycin advised by manufacturer of ● **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- Lumacaftor: plasma concentration of clarithromycin possibly reduced by ● **LUMACAFTOR**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNF)
- ▶ Mirabegron: when given with clarithromycin avoid or reduce dose of **MIRABEGRON** in hepatic or renal impairment—see Mirabegron, p. 715
- Naloxegol: clarithromycin possibly increases plasma concentration of ● **NALOXEGOL**—avoid concomitant use
- ▶ Netupitant: plasma concentration of erythromycin increased by **NETUPITANT**
- ▶ Oestrogens: erythromycin increases plasma concentration of **ESTRADIOL**
- Panobinostat: increased risk of ventricular arrhythmias when clarithromycin given with ● **PANOBINOSTAT**—avoid concomitant use
- ▶ Parasympathomimetics: erythromycin increases plasma concentration of **GALANTAMINE**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ● **PENTAMIDINE ISETIONATE**
- ▶ Progestogens: erythromycin increases plasma concentration of **DIENOGEST**
- Ranolazine: clarithromycin possibly increases plasma concentration of ● **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: clarithromycin increases the plasma concentration of ● **SILDENAFIL**—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; erythromycin increases plasma concentration of **SILDENAFIL**—reduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension
- Sirolimus: clarithromycin increases plasma concentration of ● **SIROLIMUS**—avoid concomitant use; plasma concentration of

**Macrolides**

- **Sirolimus** (continued)
  - both drugs increased when erythromycin given with ● **SIROLIMUS**
- **Tacrolimus**: clarithromycin and erythromycin increase plasma concentration of ● **TACROLIMUS**
- **Tadalafil**: clarithromycin and erythromycin possibly increase plasma concentration of **TADALAFIL**
- **Theophylline**: clarithromycin possibly increases plasma concentration of **THEOPHYLLINE**; erythromycin increases plasma concentration of ● **THEOPHYLLINE** (also theophylline may reduce absorption of *oral* erythromycin)
- **Ticagrelor**: clarithromycin possibly increases plasma concentration of ● **TICAGRELOR**—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of **TICAGRELOR**
- **Ulcer-healing Drugs**: plasma concentration of erythromycin increased by **CIMETIDINE** (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with **OMEPRAZOLE**
- **Ulipristal**: avoidance of clarithromycin advised by manufacturer of *low-dose* **ULIPRISTAL**; erythromycin increases plasma concentration of *low-dose* **ULIPRISTAL**—manufacturer of *low-dose* ulipristal advises avoid concomitant use
- **Vaccines**: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC
- **Vardenafil**: clarithromycin possibly increases plasma concentration of **VARDENAFIL** (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of **VARDENAFIL** (reduce dose of vardenafil)

**Magnesium (parenteral)**

- **Calcium-channel Blockers**: profound hypotension reported with concomitant use of parenteral magnesium and ● **NIFEDIPINE** in pre-eclampsia
- **Muscle Relaxants**: parenteral magnesium enhances effects of **NON-DEPOLARISING MUSCLE RELAXANTS** and **SUXAMETHONIUM**

**Magnesium Salts (oral)** see Antacids**Mannitol**

- **Antibacterials**: avoidance of mannitol advised by manufacturer of **TOBRAMYCIN**
- **Ciclosporin**: possible increased risk of nephrotoxicity when mannitol given with **CICLOSPORIN**

**MAOIs**

**NOTE** For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline

**NOTE** Tedizolid is a reversible, non-selective MAO inhibitor and an antibacterial

**NOTE** Linezolid is a reversible, non-selective MAO inhibitor and an antibacterial

- **ACE Inhibitors**: MAOIs possibly enhance hypotensive effect of **ACE INHIBITORS**
  - **Adrenergic Neurone Blockers**: enhanced hypotensive effect when MAOIs given with **ADRENERGIC NEURONE BLOCKERS**
  - **Alcohol**: MAOIs interact with tyramine found in some beverages containing ● **ALCOHOL** and some de-alcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect
  - **Alpha<sub>2</sub>-adrenoceptor Stimulants**: avoidance of MAOIs advised by manufacturer of **APRACLONIDINE** and **BRIMONIDINE**
  - **Alpha-blockers**: avoidance of MAOIs advised by manufacturer of ● **INDORAMIN**; enhanced hypotensive effect when MAOIs given with **ALPHA-BLOCKERS**
  - **Analgesics**: possible increased serotonergic effects when MAOIs given with **FENTANYL**; CNS excitation or depression (hypertension or hypotension) when MAOIs given with ● **PETHIDINE**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with
    - **TRAMADOL**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of ● **NEFOPAM**; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with ● **OPIOID ANALGESICS**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs
- MAOIs** (continued)
- **Angiotensin-II Receptor Antagonists**: MAOIs possibly enhance hypotensive effect of **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
  - **Antibacterials**: plasma concentration of linezolid reduced by **RIFAMPICIN** (possible therapeutic failure of linezolid)
  - **Antidepressants**: increased risk of hypertension and CNS excitation when MAOIs given with ● **REBOXETINE** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start ● **CITALOPRAM**, ● **ESCITALOPRAM**, ● **FLUVOXAMINE**, ● **PAROXETINE** or ● **SERTRALINE** for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start ● **FLOXETINE** for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start ● **DULOXETINE** for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with ● **VENLAFAXINE** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other ● **MAOIs** (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start ● **MOCLOBEMIDE** for at least 1 week; MAOIs increase CNS effects of ● **SSRIS** (risk of serious toxicity); after stopping MAOIs do not start ● **MIRTAZAPINE** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start ● **TRICYCLIC-RELATED ANTIDEPRESSANTS** for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with ● **TRICYCLICS**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); avoidance of linezolid advised by manufacturer of ● **VORTIOXETINE**; increased risk of hypertension and CNS excitation when MAOIs given with ● **VORTIOXETINE** (vortioxetine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 2 weeks after stopping vortioxetine)
  - **Antidiabetics**: MAOIs possibly enhance hypoglycaemic effect of **ANTIDIABETICS**; MAOIs enhance hypoglycaemic effect of **INSULIN**, **METFORMIN** and **SULFONYLUREAS**
  - **Antiepileptics**: MAOIs possibly antagonise anticonvulsant effect of **ANTIEPILEPTICS** (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of ● **CARBAMAZEPINE**, also antagonism of anticonvulsant effect
  - **Antihistamines**: avoidance of MAOIs advised by manufacturer of **HYDROXYZINE**; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of **PROMETHAZINE**; increased antimuscarinic and sedative effects when MAOIs given with **ANTIHISTAMINES**
  - **Antimalarials**: avoidance of antidepressants advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** and ● **ARTENIMOL WITH PIPERAQUINE**
  - **Antimuscarinics**: increased risk of antimuscarinic side-effects when MAOIs given with **ANTIMUSCARINICS**
  - **Antipsychotics**: CNS effects of MAOIs possibly increased by ● **CLOZAPINE**
  - **Anxiolytics and Hypnotics**: manufacturer of tranlycypromine advises avoid ● **BUSPIRONE** for 14 days after stopping tranlycypromine; avoidance of MAOIs advised by manufacturer of **BUSPIRONE**
  - **Atomoxetine**: after stopping MAOIs do not start ● **ATOMOXETINE** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**
  - **Beta-blockers**: enhanced hypotensive effect when MAOIs given with **BETA-BLOCKERS**
  - **Bupropion**: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of ● **BUPROPION**

## MAOIs (continued)

- ▶ Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when MAOIs given with **CLONIDINE**
- Dopamine: increased risk of serotonergic effects when MAOIs given with ● **DAPOXETINE** (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- ▶ Diazoxide: enhanced hypotensive effect when MAOIs given with **DIAZOXIDE**
- ▶ Diuretics: enhanced hypotensive effect when MAOIs given with **DIURETICS**
- Dopaminergics: risk of hypertensive crisis when MAOIs given with ● **CO-BENELDOPA**, ● **CO-CARELDOPA** or ● **LEVODOPA**, avoid co-beneldopa, co-careldopa or levodopa for at least 2 weeks after stopping MAOIs; avoid concomitant use of non-selective MAOIs with ● **ENTACAPONE**; risk of hypertensive crisis when MAOIs given with ● **RASAGILINE**, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with ● **SELEGILINE**—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with **TOLCAPONE**
- ▶ Doxapram: MAOIs enhance effects of **DOXAPRAM**
- ▶ Histamine: avoidance of MAOIs advised by manufacturer of **HISTAMINE**
- 5HT<sub>2</sub>-receptor Agonists: risk of CNS toxicity when MAOIs given with ● **RIZATRIPTAN** or ● **SUMATRIPTAN** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with ● **ZOLMITRIPTAN** (reduce dose of zolmitriptan)
- Methylidopa: avoidance of MAOIs advised by manufacturer of ● **METHYLDOPA**
- ▶ Moxonidine: enhanced hypotensive effect when MAOIs given with **MOXONIDINE**
- ▶ Muscle Relaxants: phenelzine enhances effects of **SUXAMETHONIUM**
- ▶ Nicorandil: enhanced hypotensive effect when MAOIs given with **NICORANDIL**
- ▶ Nitrates: enhanced hypotensive effect when MAOIs given with **NITRATES**
- ▶ Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of **PHOLCODINE**
- Sympathomimetics: risk of hypertensive crisis when MAOIs given with ● **ADRENALINE (EPINEPHRINE)**, ● **DOBUTAMINE**, ● **DOPAMINE**, ● **NORADRENALINE (NOREPINEPHRINE)** or ● **XYLOMETAZOLINE**; risk of hypertensive crisis when MAOIs given with ● **DEXAMFETAMINE**, ● **EPHEDRINE**, ● **ISOMETHEPTENE**, ● **LISDEXAMFETAMINE**, ● **METARAMINOL**, ● **METHYLPHENIDATE**, ● **PHENYLEPHRINE** or ● **PSEUDOEPHEDRINE**, avoid dexamfetamine, ephedrine, isometheptene, lisdexametamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of **MIDODRINE**; risk of hypertensive crisis when MAOIs given with ● **OXYMETAZOLINE**, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs
- Tetrabenazine: risk of CNS toxicity when MAOIs given with ● **TETRABENAZINE** (avoid tetrabenazine for 2 weeks after MAOIs)
- ▶ Vaccines: antibacterials including linezolid and tedizolid inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**MAOIs, reversible** see Moclobemide

**Maraviroc**

- Antibacterials: plasma concentration of maraviroc possibly increased by ● **CLARITHROMYCIN** and ● **TELITHROMYCIN** (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by ● **RIFAMPICIN**—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by ● **ST JOHN'S WORT**—avoid concomitant use

**Maraviroc** (continued)

- Antifungals: plasma concentration of maraviroc increased by ● **KETOCONAZOLE** (consider reducing dose of maraviroc)
- Antivirals: plasma concentration of maraviroc increased by ● **ATAZANAVIR**, ● **BOCEPREVIR**, ● **DARUNAVIR**, ● **INDINAVIR**, ● **LOPINAVIR**, ● **SAQUINAVIR** and ● **TELAPREVIR** (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by ● **EFAVIRENZ**—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by ● **ETRAVIRINE**; maraviroc reduces plasma concentration of ● **FOSAMPRENAVIR**—avoid concomitant use; plasma concentration of maraviroc increased by **RITONAVIR**
- Cobicistat: plasma concentration of maraviroc possibly increased by ● **COBICISTAT** (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by ● **ORLISTAT**

**Mebendazole**

- ▶ Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by **CIMETIDINE** (increased plasma concentration)

**Medroxyprogesterone** see Progestogens

**Mefenamic Acid** see NSAIDs

**Mefloquine**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with ● **AMIODARONE**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with ● **MOXIFLOXACIN**—avoid concomitant use; plasma concentration of mefloquine reduced by ● **RIFAMPICIN**—avoid concomitant use
- Antidepressants: possible increased risk of convulsions when mefloquine given with ● **VORTIOXETINE**
- Antiepileptics: mefloquine antagonises anticonvulsant effect of ● **ANTIEPILEPTICS**
- ▶ Antifungals: plasma concentration of mefloquine increased by **KETOCONAZOLE**
- Antimalarials: avoidance of antimalarials advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE**; increased risk of convulsions when mefloquine given with ● **CHLOROQUINE** or ● **HYDROXYCHLOROQUINE**; increased risk of convulsions when mefloquine given with ● **QUININE** (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with ● **HALOPERIDOL**—avoid concomitant use; avoidance of mefloquine advised by manufacturer of **AMISULPRIDE**; increased risk of ventricular arrhythmias when mefloquine given with ● **PIMOZIDE**—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with ● **RISPERIDONE**
- ▶ Antivirals: mefloquine possibly reduces plasma concentration of **RITONAVIR**
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with ● **ATOMOXETINE**
- Beta-blockers: increased risk of bradycardia when mefloquine given with **BETA-BLOCKERS**
- ▶ Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with **DIGOXIN**
- ▶ Cytotoxics: possible increased risk of bradycardia when mefloquine given with **CRIZOTINIB**
- ▶ Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
- Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with ● **IVABRADINE**
- ▶ Penicillamine: increased risk of haematological toxicity when antimalarials given with **PENICILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
- ▶ Vaccines: antimalarials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Megestrol** see Progestogens

**Melatonin** see Anxiolytics and Hypnotics

**Meloxicam** see NSAIDs

**Melphalan**

- Antibacterials: increased risk of melphalan toxicity when given with **NALIDIXIC ACID**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: melphalan possibly reduces absorption of **DIGOXIN tablets**
- Ciclosporin: increased risk of nephrotoxicity when melphalan given with ● **CICLOSPORIN**

**Memantine**

- Anaesthetics, General: increased risk of CNS toxicity when memantine given with ● **KETAMINE** (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with ● **DEXTROMETHORPHAN** (manufacturer of memantine advises avoid concomitant use)
- Anticoagulants: memantine possibly enhances anticoagulant effect of **WARFARIN**
- Antimuscarinics: memantine possibly enhances effects of **ANTIMUSCARINICS**
- Antipsychotics: memantine possibly reduces effects of **ANTI-PSYCHOTICS**
- Dopaminergics: memantine possibly enhances effects of **DOPAMINERGICS** and **SELEGILINE**; increased risk of CNS toxicity when memantine given with ● **AMANTADINE** (manufacturer of memantine advises avoid concomitant use)
- Muscle Relaxants: memantine possibly modifies effects of **BACLOFEN** and **DANTROLENE**

**Meningococcal Vaccines** see Vaccines**Mepacrine**

- Antimalarials: mepacrine increases plasma concentration of **PRIMAQUINE** (increased risk of toxicity)

**Meprobamate** see Anxiolytics and Hypnotics**Mepztalinol** see Opioid Analgesics**Mercaptopurine**

- Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with ● **ALLOPURINOL** (reduce dose of mercaptopurine to one quarter of usual dose)
- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with ● **SULFAMETHOXAZOLE** (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with ● **TRIMETHOPRIM** (also with co-trimoxazole)
- Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of ● **COUMARINS**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Dairy Products: plasma concentration of mercaptopurine possibly reduced by **DAIRY PRODUCTS**—manufacturer of mercaptopurine advises give at least 1 hour before or 3 hours after dairy products
- Febuxostat: avoidance of mercaptopurine advised by manufacturer of ● **FEBUXOSTAT**

**Meropelem**

- Antiepileptics: carbapenems reduce plasma concentration of ● **SODIUM VALPROATE** and ● **VALPROIC ACID**—avoid concomitant use
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Mestranol** see Oestrogens**Metaraminol** see Sympathomimetics**Metformin** see Antidiabetics**Methadone** see Opioid Analgesics**Methenamine**

- Antacids: avoid concomitant use of methenamine with **ANTACIDS**
- Antibacterials: increased risk of crystalluria when methenamine given with ● **SULFONAMIDES**
- Diuretics: effects of methenamine antagonised by
  - **ACETAZOLAMIDE**
- Potassium Salts: avoid concomitant use of methenamine with **POTASSIUM CITRATE**
- Sodium Citrate: avoid concomitant use of methenamine with **SODIUM CITRATE**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

**Methocarbamol** see Muscle Relaxants**Methotrexate**

- Aminophylline: methotrexate possibly increases plasma concentration of **AMINOPHYLLINE**
- Anaesthetics, General: antifolate effect of methotrexate increased by ● **NITROUS OXIDE**—avoid concomitant use
- Analgesics: excretion of methotrexate probably reduced by ● **NSAIDS** (increased risk of toxicity); excretion of methotrexate reduced by ● **ASPIRIN**, ● **DICLOFENAC**, ● **IBUPROFEN**, ● **INDOMETACIN**, ● **KETOPROFEN**, ● **MELOXICAM** and ● **NAPROXEN** (increased risk of toxicity)
- Antibacterials: absorption of methotrexate possibly reduced by **NEOMYCIN**; excretion of methotrexate possibly reduced by **CIPROFLOXACIN** (increased risk of toxicity); increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when methotrexate given with
  - **SULFAMETHOXAZOLE** (as co-trimoxazole); increased risk of methotrexate toxicity when given with **DOXYCYCLINE**, **SULFONAMIDES** or **TETRACYCLINE**; excretion of methotrexate reduced by **PENICILLINS** (increased risk of toxicity); increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when methotrexate given with ● **TRIMETHOPRIM** (also with co-trimoxazole)
- Antiepileptics: antifolate effect of methotrexate increased by **FOSPHENYTOIN** and **PHENYTOIN**; plasma concentration of methotrexate possibly increased by ● **LEVETIRACETAM**
- Antimalarials: antifolate effect of methotrexate increased by
  - **PYRIMETHAMINE**
- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of **DIGOXIN tablets**
- Ciclosporin: risk of toxicity when methotrexate given with ● **CICLOSPORIN**
- Corticosteroids: possible increased risk of hepatotoxicity when *high-dose* methotrexate given with **DEXAMETHASONE**
- Cytotoxics: increased pulmonary toxicity when methotrexate given with ● **CISPLATIN**
- Diuretics: excretion of methotrexate increased by alkaline urine due to **ACETAZOLAMIDE**
- Leflunomide: risk of toxicity when methotrexate given with ● **LEFLUNOMIDE**
- Retinoids: plasma concentration of methotrexate increased by ● **ACITRETIN** (also increased risk of hepatotoxicity)—avoid concomitant use
- Theophylline: methotrexate possibly increases plasma concentration of **THEOPHYLLINE**
- Ulcer-healing Drugs: excretion of methotrexate possibly reduced by **PROTON PUMP INHIBITORS** (increased risk of toxicity)

**Methyldopa**

- ACE Inhibitors: enhanced hypotensive effect when methyldopa given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with **ADRENERGIC NEURONE BLOCKERS**
- Alcohol: enhanced hypotensive effect when methyldopa given with **ALCOHOL**
- Aldesleukin: enhanced hypotensive effect when methyldopa given with **ALDESLEUKIN**
- Alpha-blockers: enhanced hypotensive effect when methyldopa given with **ALPHA-BLOCKERS**
- Anaesthetics, General: enhanced hypotensive effect when methyldopa given with **GENERAL ANAESTHETICS**
- Analgesics: hypotensive effect of methyldopa antagonised by **NSAIDS**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with ● **MAOIS**
- Antipsychotics: enhanced hypotensive effect when methyldopa given with **ANTI-PSYCHOTICS** (also increased risk of extrapyramidal effects)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with **ANXIOLYTICS AND HYPNOTICS**
- Beta-blockers: enhanced hypotensive effect when methyldopa given with **BETA-BLOCKERS**

**Methyldopa** (continued)

- ▶ Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with **CALCIUM-CHANNEL BLOCKERS**
- ▶ Clonidine: enhanced hypotensive effect when methyldopa given with **CLONIDINE**
- ▶ Corticosteroids: hypotensive effect of methyldopa antagonised by **CORTICOSTEROIDS**
- ▶ Diazoxide: enhanced hypotensive effect when methyldopa given with **DIAZOXIDE**
- ▶ Diuretics: enhanced hypotensive effect when methyldopa given with **DIURETICS**
- ▶ Dopaminergics: methyldopa antagonises antiparkinsonian effect of **DOPAMINERGICS**; increased risk of extrapyramidal side-effects when methyldopa given with **AMANTADINE**; enhanced hypotensive effect when methyldopa given with **CO-BENELDOPA**, **CO-CARELDOPA** or **LEVODOPA**; effects of methyldopa possibly enhanced by **ENTACAPONE**
- ▶ Iron Salts: hypotensive effect of methyldopa antagonised by oral **IRON SALTS**
- Lithium: neurotoxicity may occur when methyldopa given with ● **LITHIUM** without increased plasma concentration of lithium
- ▶ Moxisylyte: enhanced hypotensive effect when methyldopa given with **MOXISYLYTE**
- ▶ Moxonidine: enhanced hypotensive effect when methyldopa given with **MOXONIDINE**
- ▶ Muscle Relaxants: enhanced hypotensive effect when methyldopa given with **BACLOFEN** or **TIZANIDINE**
- ▶ Nitrates: enhanced hypotensive effect when methyldopa given with **NITRATES**
- ▶ Oestrogens: hypotensive effect of methyldopa antagonised by **OESTROGENS**
- ▶ Prostaglandins: enhanced hypotensive effect when methyldopa given with **ALPROSTADIL**
- Sympathomimetics, Beta<sub>2</sub>: acute hypotension reported when methyldopa given with *infusion* of ● **SALBUTAMOL**
- ▶ Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with **HYDRALAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

**Methylphenidate** see Sympathomimetics

**Methylprednisolone** see Corticosteroids

**Methylthioninium**

- Antidepressants: risk of CNS toxicity when methylthioninium given with ● **SSRI-RELATED ANTIDEPRESSANTS**, ● **SSRIS** and ● **CLOMIPRAMINE**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration); possible risk of CNS toxicity when methylthioninium given with ● **MIRTAZAPINE**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methylthioninium given with ● **BUSPIRONE**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methylthioninium given with ● **BUPROPION**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

**Metoclopramide**

- ▶ Alcohol: metoclopramide possibly increases absorption of **ALCOHOL**
- ▶ Anaesthetics, General: metoclopramide enhances effects of **THIOPENTAL**
- ▶ Analgesics: metoclopramide increases rate of absorption of **ASPIRIN** (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by **OPIOID ANALGESICS**; metoclopramide increases rate of absorption of **PARACETAMOL**
- ▶ Antibacterials: metoclopramide reduces plasma concentration of **FOSFOMYCIN**
- ▶ Antidepressants: CNS toxicity reported when metoclopramide given with **SSRIS**
- ▶ Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by **ANTIMUSCARINICS**

**Metoclopramide** (continued)

- ▶ Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with **ANTIPSYCHOTICS**
