## Oxazepam

### ● INDICATIONS AND DOSE

#### Anxiety (short-term use)

- ▶ BY MOUTH
- ▶ Adult: 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose
- ▶ Elderly: 10–20 mg 3–4 times a day

#### Insomnia associated with anxiety

- ▶ BY MOUTH
- ▶ Adult: 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression

- **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives are safer.

Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2

#### ▶ Oxazepam (Non-proprietary)

**Oxazepam 10 mg** Oxazepam 10mg tablets | 28 tablet (PoM) £7.97  
DT price = £1.13 (C04-1)

**Oxazepam 15 mg** Oxazepam 15mg tablets | 28 tablet (PoM) £7.97  
DT price = £1.17 (C04-1)

## HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

## Meprobamate

### ● INDICATIONS AND DOSE

#### Short-term use in anxiety—not recommended

- ▶ BY MOUTH
- ▶ Adult: 400 mg 3–4 times a day
- ▶ Elderly: Up to 200 mg 3–4 times a day

### IMPORTANT SAFETY INFORMATION

The European Medicines Agency has recommended (January 2012) the suspension of all marketing authorisations for meprobamate because the risks, particularly of serious CNS side-effects, outweigh the benefits.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · acute pulmonary insufficiency · respiratory depression
- **CAUTIONS** Abrupt withdrawal (may precipitate convulsions) · avoid prolonged use · debilitated · elderly · epilepsy (may induce seizures) · history of alcohol abuse · history of drug abuse · marked personality disorder · muscle weakness · respiratory disease
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
  - ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
  - ▶ **Rare** Agranulocytosis · apnoea · blood disorders · jaundice · rashes · respiratory depression · skin reactions
  - ▶ **Frequency not known** CNS effects · paradoxical excitement · paraesthesia · weakness
- **PREGNANCY** Avoid if possible.
- **BREAST FEEDING** Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment. Increased cerebral sensitivity.
- **PATIENT AND CARER ADVICE**

#### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Meprobamate is less suitable for prescribing.

**• MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

▶ **Meprobamate (Non-proprietary)**

**Meprobamate 400 mg** Meprobamate 400mg tablets | 84 tablet [PoM] £197.63 DT price = £197.63 [C03]

## 3.2 Attention deficit hyperactivity disorder

### Attention deficit hyperactivity disorder

**Management**

Central nervous system stimulants include the **amfetamines** (dexamfetamine sulfate p. 328 and lisdexamfetamine mesilate p. 329) **and related drugs** (e.g. methylphenidate hydrochloride p. 326). They have very few indications and in particular, should **not** be used to treat depression, obesity, senility, debility, or for relief of fatigue.

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependence; and preferences of the patient and carers. Methylphenidate hydrochloride and atomoxetine below are used for the management of ADHD; dexamfetamine sulfate and lisdexamfetamine mesilate are an alternative in children who do not respond to these drugs. Guanfacine p. 329, a non-stimulant  $\alpha_2$ -adrenoceptor agonist, can be used in children for whom stimulants are not suitable, not tolerated, or ineffective. Therapeutic response to guanfacine should be evaluated every 3 months for the first year and then at least yearly, when prescribed for extended periods.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

### CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS

#### Atomoxetine

28-Sep-2016

**• INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder (initiated by a specialist)**

▶ **BY MOUTH**

- ▶ **Child 6–17 years (body-weight up to 70 kg):** Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given

under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day

- ▶ **Child 6–17 years (body-weight 70 kg and above):** Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day
- ▶ **Adult (body-weight up to 70 kg):** Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- ▶ **Adult (body-weight 70 kg and above):** Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80–100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

- **UNLICENSED USE** Atomoxetine doses in BNF may differ from those in product literature.
- ▶ **In children** Doses above 100 mg daily not licensed.
- ▶ **In adults** Dose maximum of 120 mg not licensed.
- **CONTRA-INDICATIONS** Pheochromocytoma · severe cardiovascular disease · severe cerebrovascular disease
- **CAUTIONS** QT-interval prolongation · aggressive behaviour · cardiovascular disease · cerebrovascular disease · emotional lability · history of seizures · hostility · hypertension · mania · psychosis · structural cardiac abnormalities · susceptibility to angle-closure glaucoma · tachycardia
- **INTERACTIONS** → Appendix 1 (atomoxetine). Avoid concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anorexia · anxiety · chills · constipation · depression · dermatitis · dizziness · drowsiness · dry mouth · dyspepsia · flatulence · flushing · headache · increased blood pressure · irritability · lethargy · malaise · mydriasis · nausea · palpitation · paraesthesia · prostatitis · rash · sexual dysfunction · sleep disturbances · sweating · tachycardia · taste disturbances · tremor · urinary dysfunction · vomiting
  - ▶ **Uncommon** Aggression · cold extremities · emotional lability · hostility · hypoaesthesia · menstrual disturbances · muscle spasms · pruritus · psychosis · QT-interval prolongation · suicidal ideation · syncope · tics
  - ▶ **Rare** Raynaud's phenomenon · seizures
  - ▶ **Very rare** Angle-closure glaucoma · hepatic disorders
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid-present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Halve dose in moderate impairment. Quarter dose in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for appearance or worsening of anxiety, depression or tics.
  - ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) [www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd](http://www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd)

**Suicidal ideation** Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.

**Hepatic impairment** Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006)** NICE TA98

Atomoxetine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.

[www.nice.org.uk/TA98](http://www.nice.org.uk/TA98)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2015) that atomoxetine oral solution (*Strattera*®) is accepted for restricted use, within its licensed indications, for treating patients who are unable to swallow capsules.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Methylphenidate hydrochloride

#### ● INDICATIONS AND DOSE

##### Attention deficit hyperactivity disorder (initiated under specialist supervision)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 6–17 years: Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound

hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

- ▶ Adult: Initially 5 mg 2–3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2–3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

##### Narcolepsy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 10–60 mg daily in divided doses; usual dose 20–30 mg daily in divided doses, dose to be taken before meals

##### CONCERTA® XL

##### Attention deficit hyperactivity disorder

- ▶ BY MOUTH

- ▶ Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day
- ▶ Adult: Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Concerta*® XL 18 mg once daily.

##### EQUASYM® XL

##### Attention deficit hyperactivity disorder

- ▶ BY MOUTH

- ▶ Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- ▶ Adult: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; maximum 100 mg per day

##### MEDIKINET® XL

##### Attention deficit hyperactivity disorder

- ▶ BY MOUTH

- ▶ Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- ▶ Adult: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day

- **UNLICENSED USE** Doses over 60 mg daily not licensed; doses of *Concerta XL* over 54 mg daily not licensed.
- ▶ In children Not licensed for use in children under 6 years.
- ▶ In adults Not licensed for use in narcolepsy. Not licensed for use in adults for attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Anorexia nervosa · arrhythmias · cardiomyopathy · cardiovascular disease · cerebrovascular disorders · heart failure · hyperthyroidism · phaeochromocytoma · psychosis · severe depression ·

severe hypertension · structural cardiac abnormalities · suicidal ideation · uncontrolled bipolar disorder · vasculitis

- **CAUTIONS** Agitation · alcohol dependence · anxiety · drug dependence · epilepsy (discontinue if increased seizure frequency) · family history of Tourette syndrome · susceptibility to angle-closure glaucoma · tics

**CONCERTA® XL** Dysphagia (dose form not appropriate) · restricted gastro-intestinal lumen (dose form not appropriate)

- **INTERACTIONS** → Appendix 1 (sympathomimetics).

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · aggression · alopecia · anorexia · arrhythmias · arthralgia · asthenia · changes in blood pressure · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · fever · growth restriction · headache · insomnia · irritability · movement disorders · nasopharyngitis · nausea · nervousness · palpitation · pruritus · rash · reduced weight gain · tachycardia · tics · vomiting
- ▶ **Uncommon** Abnormal dreams · confusion · constipation · dyspnoea · epistaxis · haematuria · muscle cramps · suicidal ideation · urinary frequency
- ▶ **Rare** Angina · sweating · visual disturbances;
- ▶ **Very rare** Angle-closure glaucoma · blood disorders · cerebral arteritis · dependence · erythema multiforme · exfoliative dermatitis · hepatic dysfunction · leucopenia · myocardial infarction · neuroleptic malignant syndrome · psychosis · seizures · thrombocytopenia · tolerance · Tourette syndrome

- ▶ **Frequency not known** Bradycardia · convulsions · supraventricular tachycardia

- **PREGNANCY** Limited experience—avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Limited information available—avoid.

- **MONITORING REQUIREMENTS**

- ▶ Monitor for psychiatric disorders.
- ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION**

**MEDIKINET® XL** Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

**EQUASYM® XL** Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

**CONCERTA® XL** Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

**MEDIKINET® XL** Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

**EQUASYM® XL** Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

**Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased

by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see *Drugs and driving* under Guidance on prescribing p. 1.

**CONCERTA® XL** Tablet membrane may pass through gastro-intestinal tract unchanged.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

## CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS > AMFETAMINES

### Dexamfetamine sulfate

(Dexamphetamine sulfate)

#### ● INDICATIONS AND DOSE

##### Narcolepsy

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 10 mg daily in divided doses, increased in steps of 10 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day
- ▶ **Elderly:** Initially 5 mg daily in divided doses, increased in steps of 5 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

##### Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

###### ▶ BY MOUTH

- ▶ **Child 6–17 years:** Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)
- ▶ **Adult:** Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

- **UNLICENSED USE** Not licensed for use in adults for refractory attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Advanced arteriosclerosis (in adults) · agitated states · cardiovascular disease · history of alcohol abuse · history of drug abuse · hyperexcitability · hyperthyroidism · moderate hypertension · severe hypertension · structural cardiac abnormalities
- **CAUTIONS** Anorexia · bipolar disorder · history of epilepsy (discontinue if seizures occur) · mild hypertension · psychosis · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

#### CAUTIONS, FURTHER INFORMATION

- ▶ Tics and Tourette syndrome Discontinue use if tics occur.
- ▶ Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

- **INTERACTIONS** → Appendix 1 (sympathomimetics).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal cramps · acidosis · aggression · alopecia · anhedonia · anorexia · anxiety · ataxia · cardiomyopathy · cardiovascular collapse · cerebral vasculitis · chest pain · confusion · depression · diarrhoea · dizziness · dry mouth · dysphoria · euphoria · growth restriction in children · headache · hyperactivity · hyperpyrexia (in children) · hyperreflexia · hypertension · hypotension · impaired concentration · irritability · ischaemic colitis · malaise · mydriasis · myocardial infarction · nausea · nervousness · neuroleptic malignant syndrome · obsessive-compulsive behaviour · palpitations · panic attack · paranoia · psychosis · pyrexia (in adults) · rash · renal impairment · restlessness · rhabdomyolysis · seizures · sexual dysfunction · sleep disturbances · stroke · sweating · tachycardia · taste disturbance · Tourette

syndrome (in predisposed individuals) · tremor · urticaria · visual disturbances · weight loss

- ▶ **Very rare** Angle-closure glaucoma
- ▶ **Frequency not known** Choreoathetoid movements (in predisposed individuals) · dyskinesia (in predisposed individuals) · increased appetite · tics (in predisposed individuals)

#### Overdose

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).
- **BREAST FEEDING** Significant amount in milk—avoid.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor growth in children.
  - ▶ Monitor for aggressive behaviour or hostility during initial treatment.
- ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ In children Tablets can be halved.
- **PRESCRIBING AND DISPENSING INFORMATION** Data on safety and efficacy of long-term use not complete.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

**Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98

Dexamfetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.

[www.nice.org.uk/TA98](http://www.nice.org.uk/TA98)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release capsule, oral suspension, oral solution

##### Tablet

###### ▶ Dexamfetamine sulfate (Non-proprietary)

**Dexamfetamine sulfate 5 mg** Dexamfetamine 5mg tablets | 28 tablet [PoM] £24.75 DT price = £24.75 [CD2]

###### ▶ Amfexa (Flynn Pharma Ltd)

**Dexamfetamine sulfate 5 mg** Amfexa 5mg tablets | 30 tablet [PoM] £19.89 [CD2]

**Dexamfetamine sulfate 10 mg** Amfexa 10mg tablets | 30 tablet [PoM] £38.78 [CD2]

**Dexamfetamine sulfate 20 mg** Amfexa 20mg tablets | 30 tablet [PoM] £59.67 [CD2]

**Lisdexamfetamine mesilate**

- **DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

● **INDICATIONS AND DOSE****Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)**▶ **BY MOUTH**

- ▶ Child 6–17 years: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
- ▶ Adult: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

- **UNLICENSED USE** Not licensed for use in adults for attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Advanced arteriosclerosis · agitated states · hyperexcitability · hyperthyroidism · moderate hypertension · severe hypertension · symptomatic cardiovascular disease

- **CAUTIONS** Anorexia · bipolar disorder · history of alcohol abuse · history of cardiac abnormalities · history of cardiovascular disease · history of drug abuse · may lower seizure threshold (discontinue if seizures occur) · psychosis · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

**CAUTIONS, FURTHER INFORMATION**

- ▶ Tics and Tourette syndrome Discontinue use if tics occur.
- ▶ Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

- **INTERACTIONS** → Appendix 1 (sympathomimetics).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal cramps · aggression · decreased appetite · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · growth restriction in children · headache · labile mood · malaise · mydriasis · nausea · pyrexia · sleep disturbances · tics · vomiting · weight loss
- ▶ **Uncommon** Anorexia · anxiety · depression · dermatillomania · dysphoria · hallucination · hypertension · logorrhoea · mania · palpitation · paranoia · rash · restlessness · sexual dysfunction · sweating · tachycardia · tremor · visual disturbances

- ▶ **Very rare** Angle-closure glaucoma

- ▶ **Frequency not known** Cardiomyopathy · choreoathetoid movements (in predisposed individuals) · dyskinesia (in predisposed individuals) · euphoria · seizures · Tourette syndrome (in predisposed individuals)

**Overdose**

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in human milk.

- **RENAL IMPAIRMENT** Max. dose 50 mg daily in severe impairment.

● **MONITORING REQUIREMENTS**

- ▶ Monitor for aggressive behaviour or hostility during initial treatment.
- ▶ Monitor growth in children.
- ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION** Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

● **PATIENT AND CARER ADVICE**

Patients and carers should be counselled on the administration of capsules.

**Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

**SYMPATHOMIMETICS > ALPHA<sub>2</sub>-ADRENOCEPTOR AGONISTS****Guanfacine**

26-May-2016

● **INDICATIONS AND DOSE****Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)**▶ **BY MOUTH**

- ▶ Child 6–12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature

continued →

- ▶ Child 13–17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

● **CAUTIONS** Bradycardia (risk of torsade de pointes) · heart block (risk of torsade de pointes) · history of cardiovascular disease · history of QT-interval prolongation · hypokalaemia (risk of torsade de pointes)

● **INTERACTIONS** → Appendix 1 (guanfacine). Caution with concomitant use of drugs that prolong QT-interval.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anxiety · bradycardia · constipation · decreased appetite · depression · diarrhoea · dizziness · dry mouth · enuresis · headache · hypotension · irritability · malaise · mood lability · nausea · rash · sleep disturbance · somnolence · vomiting · weight increase
- ▶ **Uncommon** Agitation · chest pain · convulsion · dyspepsia · first-degree AV block · hallucination · pallor · pollakiuria · pruritus · sinus arrhythmia · syncope · tachycardia
- ▶ **Rare** Hypertension
- ▶ **Frequency not known** Suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Somnolence and sedation** Somnolence and sedation may occur, predominantly during the first 2–3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

**Overdose**

Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in females of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment and end-stage renal disease.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.
- ▶ Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.

● **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid administration with high fat meals (may increase absorption).

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of guanfacine modified-release tablets.

**Missed doses**

Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.

**Driving and skilled tasks**

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

## 3.3 Bipolar disorder and mania

### Drugs for mania and hypomania

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

**Benzodiazepines**

Use of benzodiazepines (such as lorazepam p. 317) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

**Antipsychotic drugs**

Antipsychotic drugs (normally olanzapine p. 373, quetiapine p. 375, or risperidone p. 377) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An

antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 332, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

#### Carbamazepine

Carbamazepine p. 291 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

#### Valproate

Valproate (valproic acid below (as the semisodium salt) and sodium valproate p. 306) is used for the treatment of manic episodes associated with bipolar disorder. It must be started and supervised by a specialist experienced in managing bipolar disorder. Valproate (valproic acid and sodium valproate) is also used for the prophylaxis of bipolar disorder. Valproic acid and sodium valproate should not be used in female children, in females of childbearing potential and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefit and risk of valproate therapy should be carefully reconsidered at regular treatment reviews. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

#### Lithium

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

#### Other drugs used for Bipolar disorder and mania

Aripiprazole, p. 370 · Chlorpromazine hydrochloride, p. 361 · Haloperidol, p. 363 · Lamotrigine, p. 297 · Paliperidone, p. 374 · Perphenazine, p. 364 · Prochlorperazine, p. 365 · Zuclophenthixol acetate, p. 367

## ANTIEPILEPTICS

### Valproic acid

09-Jun-2016

#### ● INDICATIONS AND DOSE

##### Treatment of manic episodes associated with bipolar disorder

- ▶ BY MOUTH
- ▶ Adult: Initially 750 mg daily in 2–3 divided doses, then increased to 1–2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring

##### Migraine prophylaxis

- ▶ BY MOUTH
- ▶ Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid.

#### CONVULEX®

##### Epilepsy

- ▶ BY MOUTH
- ▶ Adult: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ *Convulex*® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

- UNLICENSED USE Not licensed for migraine prophylaxis.

#### IMPORTANT SAFETY INFORMATION

##### MHRA/CHM ADVICE: VALPROATE AND RISK OF ABNORMAL PREGNANCY OUTCOMES

Infants exposed to valproate in utero are at a high risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 11% risk). Valproate should not be used in female children, females of childbearing potential or during pregnancy unless alternative treatments are ineffective or not tolerated.

- CONTRA-INDICATIONS Acute porphyrias p. 930 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction
- CAUTIONS Systemic lupus erythematosus
- CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- ▶ Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged

prothrombin time (particularly in association with other relevant abnormalities).

- **INTERACTIONS** → Appendix 1 (valproic acid).

- **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · gastric irritation · hyperammonaemia · nausea · thrombocytopenia · transient hair loss (regrowth may be curly) · weight gain
- ▶ **Uncommon** Aggression · ataxia · behavioural disturbances · hyperactivity · increased alertness · tremor · vasculitis
- ▶ **Rare** Anaemia · blood disorders · confusion · drowsiness · hallucinations · hearing loss · hepatic dysfunction · lethargy · leucopenia · pancytopenia · rash · stupor
- ▶ **Very rare** Acne · coma · dementia · encephalopathy · enuresis · extrapyramidal symptoms · Fanconi's syndrome · gynaecomastia · hirsutism · hyponatraemia · increase in bleeding time · pancreatitis · peripheral oedema · reduced bone mineral density · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- ▶ **Frequency not known** Drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · hypersensitivity reactions · male infertility · menstrual disturbances · syndrome of inappropriate secretion of antidiuretic hormone

- **SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
- ▶ **Pancreatitis** Discontinue treatment if symptoms of pancreatitis develop.
- **CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

- **PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia). Neonatal hepatotoxicity also reported.

Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.
- **RENAL IMPAIRMENT** Reduce dose.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor closely if dose greater than 45 mg/kg daily.
  - ▶ Monitor liver function before therapy and during first 6 months especially in patients most at risk.
  - ▶ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

- **TREATMENT CESSATION** <sup>EvGr</sup> Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. 

- **PRESCRIBING AND DISPENSING INFORMATION**

**CONVULEX**® Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral valproic acid product.

- **PATIENT AND CARER ADVICE**

**Risk of abnormal pregnancy outcomes** A patient guide and card should be provided to all female patients. **Blood or hepatic disorders** Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

**Pancreatitis** Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

**MHRA advice: Valproate and the risk of abnormal pregnancy outcomes**

Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:

- the risks associated with valproate during pregnancy;
- the need to use effective contraception;
- the need for regular review of treatment;
- the need to rapidly consult if she is planning a pregnancy or becomes pregnant

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## ANTI-PSYCHOTICS > SECOND-GENERATION

361

### Asenapine

- **INDICATIONS AND DOSE**

**Monotherapy for the treatment of moderate to severe manic episodes associated with bipolar disorder**

- ▶ BY MOUTH
- ▶ **Adult:** Initially 10 mg twice daily, reduced to 5 mg twice daily, adjusted according to response

**Combination therapy for the treatment of moderate to severe manic episodes associated with bipolar disorder**

- ▶ BY MOUTH
- ▶ **Adult:** Initially 5 mg twice daily, increased if necessary to 10 mg twice daily, adjusted according to response

- **CAUTIONS** Dementia with Lewy Bodies

- **SIDE-EFFECTS** Anxiety · dysphagia · glossodynia · hypersalivation · rhabdomyolysis · speech disturbance · taste disturbance · tongue swelling · transient oral hypoesthesia · transient paraesthesia
- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>—no information available.
- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer asenapine sublingual tablet.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

##### ▸ Sycrest (Lundbeck Ltd)

**Asenapine (as Asenapine maleate) 5 mg** Sycrest 5mg sublingual tablets sugar-free | 60 tablet (Pom) £102.60 DT price = £102.60

**Asenapine (as Asenapine maleate) 10 mg** Sycrest 10mg sublingual tablets sugar-free | 60 tablet (Pom) £102.60 DT price = £102.60

## ANTIPSYCHOTICS > LITHIUM SALTS

### Lithium salts

- **CONTRA-INDICATIONS** Addison's disease · cardiac insufficiency · dehydration · family history of Brugada syndrome · low sodium diets · personal history of Brugada syndrome · rhythm disorder · untreated hypothyroidism
- **CAUTIONS** Avoid abrupt withdrawal · cardiac disease · concurrent ECT (may lower seizure threshold) · diuretic treatment (risk of toxicity) · elderly (reduce dose) · epilepsy (may lower seizure threshold) · myasthenia gravis · psoriasis (risk of exacerbation) · QT interval prolongation · review dose as necessary in diarrhoea · review dose as necessary in intercurrent infection (especially if sweating profusely) · review dose as necessary in vomiting · surgery
- CAUTIONS, FURTHER INFORMATION**
  - Long-term use Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).
 

The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.
- **INTERACTIONS** → Appendix 1 (lithium). Caution with concomitant use of drugs and any therapy that may lower seizure threshold. Caution with concomitant use of drugs that prolong the QT interval. Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided.
- **SIDE-EFFECTS**
  - Very rare Nystagmus
  - Frequency not known Acneiform eruptions · alopecia · anorexia · arrhythmia · arthralgia · AV block · benign intracranial hypertension · bradycardia · cardiomyopathy · cognitive impairment · dry mouth · dysgeusia · ECG changes · electrolyte imbalance · encephalopathy · euthyroid goitre · extrapyramidal side-effects · fine tremor · gastritis · gastro-intestinal disturbances · hallucinations · hyperparathyroidism · hypersalivation · hyperthyroidism ·

hypothyroidism · kidney changes · leucocytosis · malaise · memory loss · myalgia · myasthenia gravis · nephrogenic diabetes insipidus · nephrotic syndrome · oedema · other skin disorders · parathyroid adenoma · peripheral neuropathy · polydipsia · psoriasis exacerbation · QT interval prolongation · Raynaud's phenomena · renal impairment · sexual dysfunction · sinus node dysfunction · speech disorder · thyroid changes · vertigo · weight changes

#### Overdose

Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdosage seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1204.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.
- **PREGNANCY** Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal). Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).
 

Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).
- **BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment. In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.
- **MONITORING REQUIREMENTS**
  - Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available. Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).

A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient. Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient's sodium or fluid intake.

- Renal function should be monitored at baseline and every 6 months thereafter (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).
- Assess cardiac and thyroid function before initiating, and thereafter every 6 months on stabilised regimens.

- **TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of

the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance).

Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

**Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving, operating machinery).

**Lithium treatment packs** A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from

## Lithium carbonate

### ● INDICATIONS AND DOSE

**Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

### CAMCOLIT® IMMEDIATE-RELEASE TABLET

**Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

### CAMCOLIT® MODIFIED-RELEASE TABLET

**Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

### LISKONUM®

**Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Initially 450–675 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour**

► BY MOUTH

- **Adult:** Initially 450 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained

constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

#### PRIADEL® TABLETS

**Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour**

##### ► BY MOUTH

- ▶ Adult (body-weight up to 50 kg): Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- ▶ Adult (body-weight 50 kg and above): Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- ▶ Elderly: Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ **Preparations vary widely in bioavailability;** changing the preparation requires the same precautions as initiation of treatment.

#### Choice

The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 344 has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdosage is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

**St John's wort** (*Hypericum perforatum*) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John's wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John's wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John's wort, the concentration of interacting drugs may increase, leading to toxicity.

#### Management

Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

#### Hyponatraemia and antidepressant therapy

Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

## 3.4 Depression

### Antidepressant drugs

#### Overview

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression (typically of at least 2 years duration)).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

### Suicidal behaviour and antidepressant therapy

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

### Serotonin syndrome

Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to lifethreatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

### Failure to respond

Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 349. Other second-line choices include lofepramine p. 354, moclobemide p. 340, and reboxetine p. 340. Other tricyclic antidepressants and venlafaxine p. 345 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 370 [unlicensed], olanzapine p. 373 [unlicensed], quetiapine p. 375, or risperidone p. 377 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

### Anxiety disorders and obsessive-compulsive disorder

Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 320. For chronic anxiety (of longer than 4 weeks' duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with *generalised anxiety disorder*, a form of chronic anxiety, should be offered psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 342, paroxetine p. 344, or sertraline p. 344 [unlicensed], can be used. Duloxetine p. 345 and venlafaxine p. 345 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 304 can be considered.

*Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder*, and phobic states such as *social anxiety disorder* are treated with SSRIs. Clomipramine hydrochloride p. 351 or imipramine hydrochloride p. 353 can be used second-line in panic disorder [unlicensed];

clomipramine hydrochloride can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 340 is licensed for the treatment of social anxiety disorder.

### Tricyclic and related antidepressant drugs

#### Choice

Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride is more selective for serotonergic transmission, and imipramine hydrochloride is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with **sedative** properties include amitriptyline hydrochloride p. 349, clomipramine hydrochloride, dosulepin hydrochloride p. 352, doxepin p. 353, mianserin hydrochloride p. 348, trazodone hydrochloride p. 347, and trimipramine p. 356. Those with **less sedative** properties include imipramine hydrochloride, lofepramine p. 354, and nortriptyline p. 355.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdose, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdose but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdose and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

#### Dosage

About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the **elderly**. In most patients the long half-life of tricyclic antidepressant drugs allows **once-daily** administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of *panic* and other *anxiety disorders*. Some tricyclic antidepressants may also have a role in some forms of *neuralgia* and in *nocturnal enuresis* in children.

#### Children and adolescents

Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

### Monoamine-oxidase inhibitors

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine p. 339 has a greater stimulant action than phenelzine p. 339 or isocarboxazid p. 339 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Moclobemide should be reserved as a second line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any

patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

### Other antidepressant drugs

The thioxanthene flupentixol (Fluanxol<sup>®</sup>) p. 362 has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses.

Vortioxetine p. 357, an antidepressant thought to directly modulate serotonergic receptor activity and inhibit the re-uptake of serotonin, is recommended in patients whose condition has responded inadequately to 2 antidepressants within the current episode.

**Other drugs used for Depression** Lithium carbonate, p. 334  
• Lithium citrate, p. 335

## ANTIDEPRESSANTS > MELATONIN RECEPTOR AGONISTS

### Agomelatine

- **DRUG ACTION** A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

#### ● INDICATIONS AND DOSE

##### Major depression

###### ▶ BY MOUTH

- ▶ **Adult:** 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Caution—dose adjustment may be necessary if smoking started or stopped during treatment.

- **CONTRA-INDICATIONS** Dementia · patients over 75 years of age
- **CAUTIONS** Bipolar disorder · diabetes · excessive alcohol consumption · hypomania · mania · non-alcoholic fatty liver disease · obesity
- **INTERACTIONS** → Appendix 1 (agomelatine).  
Caution with concomitant use of drugs associated with hepatic injury.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · agitation · anxiety · back pain · constipation · diarrhoea · dizziness · drowsiness · fatigue · headache · increased serum transaminases · nausea · sleep disturbances · sweating · vomiting
  - ▶ **Uncommon** Blurred vision · eczema · paraesthesia · restless legs syndrome · tinnitus
  - ▶ **Rare** Hepatic failure · hepatic injury · hepatitis · rash · weight changes
  - ▶ **Frequency not known** Pruritus · suicidal behaviour

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Suicidal behaviour** The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid. Do not start if serum transaminases exceed 3 times the upper limit of reference range.

- **RENAL IMPAIRMENT** Caution in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.
- **PATIENT AND CARER ADVICE** Patients should be given a booklet with more information on the risk of hepatic side-effects.  
Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

▶ **Valdoxan** (Servier Laboratories Ltd)

**Agomelatine 25 mg** Valdoxan 25mg tablets | 28 tablet  **POM**  
£30.00 DT price = £30.00

## ANTIDEPRESSANTS > MONOAMINE-OXIDASE INHIBITORS

### Monoamine-oxidase inhibitors

- **DRUG ACTION** MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.
- **CONTRA-INDICATIONS** Cerebrovascular disease · not indicated in manic phase · pheochromocytoma
- **CAUTIONS** Acute porphyria · avoid in agitated patients · blood disorders · cardiovascular disease · concurrent electroconvulsive therapy · diabetes mellitus · elderly (great caution) · epilepsy · severe hypertensive reactions to certain drugs and foods · surgery
- **INTERACTIONS** → Appendix 1 (MAOIs).  
The metabolism of some amine drugs such as *indirect-acting sympathomimetics* (present in many cough and decongestant preparations) is inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and *Bovril*<sup>®</sup>, *Oxo*<sup>®</sup>, *Marmite*<sup>®</sup> or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued.  
Some psychiatrists use selected tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dizziness · postural hypotension (especially in elderly)
  - ▶ **Uncommon** Agitation · arrhythmias · blurred vision · confusion · constipation · convulsions · difficulty in micturition · drowsiness · dry mouth · elevated liver enzymes · euphoria · fatigue · gastro-intestinal disturbances · hallucinations · headache · hyperreflexia · insomnia · leucopenia · myoclonic movement · nervousness · nystagmus · oedema · psychotic episodes with hypomanic behaviour · purpura · rashes · sexual disturbances · suicidal behaviour · sweating · tremors · weakness · weight gain with inappropriate appetite

- ▶ **Rare** Fatal progressive hepatocellular necrosis
- ▶ **Frequency not known** Jaundice · hyponatraemia · paraesthesia · peripheral neuritis · peripheral neuropathy (may be due to pyridoxine deficiency)
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Risk of postural hypotension and hypertensive responses. Discontinue use if palpitations or frequent headaches occur.
- **PREGNANCY** Increased risk of neonatal malformations—manufacturer advises avoid unless there are compelling reasons.
- **HEPATIC IMPAIRMENT** MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment.
- **MONITORING REQUIREMENTS** Monitor blood pressure (risk of postural hypotension and hypertensive responses).

#### ● TREATMENT CESSATION

Withdrawal If possible avoid abrupt withdrawal.

MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

#### ● PATIENT AND CARER ADVICE

Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or 'going off'. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued.

Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

#### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

## ANTIDEPRESSANTS > MONOAMINE-OXIDASE A AND B INHIBITORS, IRREVERSIBLE

F 338

### Isocarboxazid

#### ● INDICATIONS AND DOSE

##### Depressive illness

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks, increased to 60 mg daily for 4–6 weeks, dose to be increased under close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg daily may be required
- ▶ **Elderly:** 5–10 mg daily

- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.
- **RENAL IMPAIRMENT** Use with caution.

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

£197.95 DT price = £179.95

F 338

## Phenelzine

#### ● INDICATIONS AND DOSE

##### Depressive illness

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 15 mg 3 times a day, response is usually seen within first week; dose may be increased if necessary after 2 weeks if response is not evident, increased if necessary to 15 mg 4 times a day, doses up to 30 mg three times a day may be used in hospital patients; response may not become apparent for up to 4 weeks; once satisfactory response has been achieved, reduce dose gradually to lowest suitable maintenance dose (15 mg on alternate days may be adequate)

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment or if abnormal liver function tests.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 10

###### ▶ Nardil (Kyowa Kirin Ltd)

F 338

## Tranlycypromine

#### ● INDICATIONS AND DOSE

##### Depressive illness

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 10 mg twice daily, dose to be taken at a time no later than 3 p.m., dose may be increased if necessary after 1 week, increased if necessary to 10 mg daily, dose to be taken in the morning and 20 mg daily, dose to be taken in the afternoon, doses above 30 mg daily, under close supervision only; maintenance 10 mg daily

- **CONTRA-INDICATIONS** Congestive heart failure · history of hepatic disease · hyperthyroidism
- **INTERACTIONS** The combination of tranlycypromine with clomipramine is particularly **dangerous**.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Insomnia
  - ▶ **Uncommon** Hyponatraemia · lupus erythematosus-like syndrome · speech disturbances
  - ▶ **Very rare** Angle-closure glaucoma · hypertensive crises with throbbing headache · liver damage (less frequent than with phenelzine)
- ▶ **Frequency not known** Blood dyscrasias

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hypertensive crisis** Hypertensive crisis and throbbing headache requiring discontinuation of treatment is more frequent than with other MAOIs.
- **BREAST FEEDING** Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid if history of hepatic disease or if abnormal liver function tests.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3, 10

▶ **Tranlycypromine (Non-proprietary)**

**Tranlycypromine (as Tranlycypromine sulfate)**

10 mg Tranlycypromine 10mg tablets | 28 tablet **[PoM]** £243.98 DT price = £236.44

**ANTIDEPRESSANTS > MONOAMINE-OXIDASE A INHIBITORS, REVERSIBLE****Moclobemide**

- **DRUG ACTION** Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

**INDICATIONS AND DOSE****Depressive illness**▶ **BY MOUTH**

- ▶ **Adult:** Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food

**Social anxiety disorder**▶ **BY MOUTH**

- ▶ **Adult:** Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy

- **CONTRA-INDICATIONS** Acute confusional states · phaeochromocytoma
- **CAUTIONS** Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks) · may provoke manic episodes in bipolar disorders · thyrotoxicosis
- **INTERACTIONS** → Appendix 1 (moclobemide).  
The risk of drug interactions is claimed to be less than with the traditional (irreversible) MAOIs, but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after a MAOI has been stopped.
- **SIDE-EFFECTS**
  - ▶ **Rare** Galactorrhoea · hyponatraemia · raised liver enzymes
  - ▶ **Frequency not known** Agitation · confusional states · dizziness · dry mouth · gastrointestinal disorders · headache · oedema · paraesthesia · restlessness · skin reactions · sleep disturbances · visual disturbances
- **PREGNANCY** Safety in pregnancy has not been established—manufacturer advises avoid unless there are compelling reasons.
- **BREAST FEEDING** Amount too small to be harmful, but patient information leaflet advises avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in severe hepatic disease.

- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **PATIENT AND CARER ADVICE** Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 10, 21

**ANTIDEPRESSANTS > NORADRENALINE REUPTAKE INHIBITORS****Reboxetine**

- **DRUG ACTION** Reboxetine is a selective inhibitor of noradrenaline re-uptake.

**INDICATIONS AND DOSE****Major depression**▶ **BY MOUTH**

- ▶ **Adult:** 4 mg twice daily for 3–4 weeks, then increased if necessary to 10 mg daily in divided doses; maximum 12 mg per day

- **CAUTIONS** Bipolar disorder · history of cardiovascular disease · history of epilepsy · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1 (reboxetine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · chills · constipation · dizziness · dry mouth · headache · impaired visual accommodation · impotence · insomnia · lowering of plasma-potassium concentration on prolonged administration in the elderly · nausea · palpitation · postural hypotension · sweating · tachycardia · urinary retention · vasodilation
  - ▶ **Very rare** Angle-closure glaucoma
  - ▶ **Frequency not known** Aggression · agitation · anxiety · cold extremities · hallucinations · hypertension · hyponatraemia · irritability · paraesthesia · rash · Raynaud's syndrome · suicidal behaviour · testicular pain · vomiting
- **PREGNANCY** Use only if potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Small amount present in milk—use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Initial dose 2 mg twice daily, increased according to tolerance.

- **RENAL IMPAIRMENT** Initial dose 2 mg twice daily, increased according to tolerance.
- **TREATMENT CESSATION** Caution— avoid abrupt withdrawal.
- **PATIENT AND CARER ADVICE**  
Driving and skilled tasks  
Counselling advised.

#### MEDICINAL FORMS

Reboxetine (as Reboxetine mesilate) 4 mg Edronax 4mg tablets | 60 tablet [PoM] £18.91 DT price = £18.91

## ANTIDEPRESSANTS > SELECTIVE SEROTONIN RE- UPTAKE INHIBITORS

### Selective serotonin re-uptake inhibitors

- **DRUG ACTION** Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
- **CONTRA-INDICATIONS** Poorly controlled epilepsy · SSRIs should not be used if the patient enters a manic phase.
- **CAUTIONS** Cardiac disease · concurrent electroconvulsive therapy · diabetes mellitus · epilepsy (discontinue if convulsions develop) · history of bleeding disorders (especially gastro-intestinal bleeding) · history of mania · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1 (antidepressants, SSRI). Caution with other drugs that increase the risk of bleeding.
- **SIDE-EFFECTS**  
▶ **Common or very common** Abdominal pain (dose-related) · constipation (dose-related) · diarrhoea (dose-related) · dyspepsia (dose-related) · gastro-intestinal effects (dose-related) · nausea (dose-related) · vomiting (dose-related)  
▶ **Uncommon** Serotonin syndrome  
▶ **Very rare** Angle-closure glaucoma  
▶ **Frequency not known** Anaphylaxis · angioedema · anorexia with weight loss · anxiety · arthralgia · asthenia · bleeding disorders · convulsions · dizziness · drowsiness · dry mouth · dyskinesias · ecchymoses · galactorrhoea · hallucinations · headache · hypersensitivity reactions · hypomania · hyponatraemia · increased appetite · insomnia · mania · movement disorders · myalgia · nervousness · photosensitivity · purpura · rash · sexual dysfunction · suicidal behaviour · sweating · tremor · urinary retention · urticaria · visual disturbances · weight gain

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.

#### Overdose

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken

during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

- **TREATMENT CESSATION** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PATIENT AND CARER ADVICE**

#### Driving and skilled tasks

May also impair performance of skilled tasks (e.g. driving, operating machinery).

▮ above

## Citalopram

### INDICATIONS AND DOSE

#### Depressive illness

##### ▶ BY MOUTH USING TABLETS

- ▶ **Adult:** 20 mg once daily, increased in steps of 20 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 40 mg per day
  - ▶ **Elderly:** 10–20 mg once daily; maximum 20 mg per day
- ##### ▶ BY MOUTH USING ORAL DROPS
- ▶ **Adult:** 16 mg once daily, increased in steps of 16 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 32 mg per day
  - ▶ **Elderly:** 8–16 mg daily; maximum 16 mg per day

#### Panic disorder

##### ▶ BY MOUTH USING TABLETS

- ▶ **Adult:** Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; usual dose 20–30 mg daily; maximum 40 mg per day
  - ▶ **Elderly:** Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; maximum 20 mg per day
- ##### ▶ BY MOUTH USING ORAL DROPS
- ▶ **Adult:** Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; usual dose 16–24 mg daily; maximum 32 mg per day
  - ▶ **Elderly:** Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; maximum 16 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

- **CONTRA-INDICATIONS** QT-interval prolongation
- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS** Taste disturbance · abnormal dreams · aggression · amnesia · bradycardia · confusion · coughing · euphoria · haemorrhage · hepatitis · hypokalaemia ·

impaired concentration · increased salivation · malaise · micturition disorders · migraine · mydriasis · oedema · palpitation · paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · paraesthesia · polyuria · postural hypotension · pruritus · QT-interval prolongation · rhinitis · tachycardia · tinnitus · yawning

- **BREAST FEEDING** Present in milk—use with caution.
- **HEPATIC IMPAIRMENT** Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.
- **RENAL IMPAIRMENT** No information available for eGFR less than 20 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.
- **PATIENT AND CARER ADVICE** Counselling on administration of oral drops is advised.

#### Driving and skilled tasks

Patients should be advised of the effects of citalopram on driving and skilled tasks.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Escitalopram

- **DRUG ACTION** Escitalopram is the active enantiomer of citalopram.

#### INDICATIONS AND DOSE

**Depressive illness | Generalised anxiety disorder | Obsessive-compulsive disorder**

##### ▶ BY MOUTH

- ▶ Adult: 10 mg once daily; increased if necessary up to 20 mg daily
- ▶ Elderly: Initially 5 mg once daily; maximum 10 mg per day

#### Panic disorder

##### ▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily for 7 days, then increased to 10 mg daily; maximum 20 mg per day
- ▶ Elderly: Initially 2.5 mg once daily; maximum 10 mg per day

#### Social anxiety disorder

##### ▶ BY MOUTH

- ▶ Adult: Initially 10 mg once daily for 2–4 weeks, dose to be adjusted after 2–4 weeks of treatment; usual dose 5–20 mg daily

- **CONTRA-INDICATIONS** QT-interval prolongation

- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abnormal dreams · fatigue · paraesthesia · pyrexia · restlessness · sinusitis · yawning
  - ▶ **Uncommon** Alopecia · bruxism · confusion · epistaxis · menstrual disturbances · mydriasis · oedema · pruritus · syncope · tachycardia · taste disturbance · tinnitus
  - ▶ **Rare** Aggression · bradycardia · depersonalisation
  - ▶ **Frequency not known** Hepatitis · paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · postural hypotension · QT interval prolongation · thrombocytopenia
- **BREAST FEEDING** Present in breast milk; avoid.
- **HEPATIC IMPAIRMENT** Initial dose 5 mg daily for 2 weeks, thereafter increased to max. 10 mg daily according to response; particular caution in severe impairment.
- **RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** Oral drops can be mixed with water, orange juice, or apple juice before taking.
- **PATIENT AND CARER ADVICE** Counselling on administration of oral drops advised.

#### Driving and skilled tasks

Patients should be counselled about the effects on driving.

## Fluoxetine

#### INDICATIONS AND DOSE

##### Major depression

###### ▶ BY MOUTH

- ▶ Adult: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
- ▶ Elderly: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

**Bulimia nervosa**

## ▶ BY MOUTH

- ▶ Adult: 60 mg daily, daily dose may be administered as a single or divided dose
- ▶ Elderly: Up to 40 mg daily, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

**Obsessive-compulsive disorder**

## ▶ BY MOUTH

- ▶ Adult: 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks; maximum 60 mg per day
- ▶ Elderly: 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

**PHARMACOKINETICS**

Consider the long half-life of fluoxetine when adjusting dosage (or in overdose).

- **SIDE-EFFECTS** Alopecia · changes in blood sugar · chills · confusion · diarrhoea · dysphagia · dyspnoea · euphoria · flushing · haemorrhage · hepatitis · hypotension · impaired concentration · malaise · neuroleptic malignant syndrome-like event · palpitation · pharyngitis · priapism · pulmonary fibrosis · pulmonary inflammation · sleep disturbances · taste disturbance · toxic epidermal necrolysis · urinary frequency · vasodilatation · yawning

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Reduce dose or increase dose interval.

- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.

- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of dispersible tablets.

**Driving and skilled tasks**

Patients should be counselled about the effects on driving and skilled tasks.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Dispersible tablet**

CAUTIONARY AND ADVISORY LABELS 10

▶ **Oxactin** (Discovery Pharmaceuticals)

**Fluoxetine (as Fluoxetine hydrochloride) 20 mg** Oxactin 20mg capsules | 30 capsule **[PoM]** £0.83 DT price = £0.94

▶ **Prozac** (Eli Lilly and Company Ltd)

**Fluoxetine (as Fluoxetine hydrochloride) 20 mg** Prozac 20mg capsules | 30 capsule **[PoM]** £1.50 DT price = £0.94

**Oral solution**▶ **Fluoxetine (Non-proprietary)**

**Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml** Fluoxetine 20mg/5ml oral solution | 70 ml **[PoM]** £3.06 DT price = £2.96

Fluoxetine 20mg/5ml oral solution sugar free sugar-free | 70 ml **[PoM]** £5.56 DT price = £12.95

▶ **Prozac** (Eli Lilly and Company Ltd)

**Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml** Prozac 20mg/5ml liquid | 70 ml **[PoM]** £11.12 DT price = £2.96

▶ **Prozep** (Chemidex Pharma Ltd)

**Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml** Prozep 20mg/5ml oral solution sugar-free | 70 ml **[PoM]** £12.95 DT price = £12.95

**Fluvoxamine maleate**● **INDICATIONS AND DOSE****Depressive illness**

## ▶ BY MOUTH

- ▶ Adult: Initially 50–100 mg daily, dose to be taken in the evening, dose to be increased gradually, increased if necessary up to 300 mg daily, doses over 150 mg daily are given in divided doses; maintenance 100 mg daily

**Obsessive-compulsive disorder**

## ▶ BY MOUTH

- ▶ Adult: Initially 50 mg daily, dose to be taken in the evening, dose is increased gradually if necessary after several weeks, increased if necessary up to 300 mg daily; maintenance 100–300 mg daily, doses over 150 mg daily are given in divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

● **SIDE-EFFECTS**

- ▶ **Common or very common** Malaise · palpitation · tachycardia
- ▶ **Uncommon** Ataxia · confusion · postural hypotension
- ▶ **Rare** Abnormal liver function, usually symptomatic (discontinue treatment)
- ▶ **Frequency not known** Neuroleptic malignant syndrome-like event · paraesthesia · taste disturbance

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Start with low dose.

- **RENAL IMPAIRMENT** Start with low dose.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Patients should be counselled about the effects on driving and skilled tasks.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**▶ **Fluvoxamine maleate (Non-proprietary)**

**Fluvoxamine maleate 50 mg** Fluvoxamine 50mg tablets | 60 tablet **[PoM]** £29.99 DT price = £25.25

**Fluvoxamine maleate 100 mg** Fluvoxamine 100mg tablets | 30 tablet **[PoM]** £29.99 DT price = £25.25

▶ **Faverin** (BGP Products Ltd)

**Fluvoxamine maleate 50 mg** Faverin 50mg tablets | 60 tablet **[PoM]** £17.10 DT price = £25.25

**Fluvoxamine maleate 100 mg** Faverin 100mg tablets | 30 tablet **[PoM]** £17.10 DT price = £25.25

## Paroxetine

### ● INDICATIONS AND DOSE

#### Major depression | Social anxiety disorder | Post-traumatic stress disorder | Generalised anxiety disorder

##### ► BY MOUTH

- **Adult:** 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 50 mg per day
- **Elderly:** 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 40 mg per day

#### Obsessive-compulsive disorder

##### ► BY MOUTH

- **Adult:** Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- **Elderly:** Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

#### Panic disorder

##### ► BY MOUTH

- **Adult:** Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- **Elderly:** Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

- **CAUTIONS** Achlorhydria · high gastric pH

#### CAUTIONS, FURTHER INFORMATION

- Achlorhydria or high gastric pH Causes reduced absorption of the oral suspension.

#### ● SIDE-EFFECTS

- **Common or very common** Abnormal dreams · raised cholesterol · yawning
- **Uncommon** Arrhythmias · confusion · urinary incontinence
- **Rare** Depersonalisation · neuroleptic malignant syndrome-like event · panic attacks · paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · restless legs syndrome
- **Very rare** Acute glaucoma · hepatic disorders · hepatitis · peripheral oedema · priapism
- **Frequency not known** Extrapyramidal reactions · orofacial dystonias · tinnitus · withdrawal reactions

- **PREGNANCY** Increased risk of congenital malformations, especially if used in the first trimester.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Reduce dose.

- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **TREATMENT CESSATION** Associated with a higher risk of withdrawal reactions.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Patients should be counselled about the effect on driving.

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

##### ► Paroxetine (Non-proprietary)

**Paroxetine (as Paroxetine hydrochloride) 10 mg** Paroxetine 10mg tablets | 28 tablet [PoM] £18.12 DT price = £16.65

**Paroxetine (as Paroxetine hydrochloride) 20 mg** Paroxetine 20mg tablets | 30 tablet [PoM] £3.00 DT price = £1.64

**Paroxetine (as Paroxetine hydrochloride) 30 mg** Paroxetine 30mg tablets | 30 tablet [PoM] £4.04 DT price = £1.67

**Paroxetine (as Paroxetine hydrochloride) 40 mg** Paroxetine 40mg tablets | 28 tablet [PoM] £17.03 | 30 tablet [PoM] £25.07

**Paroxetine (as Paroxetine hydrochloride) 20 mg** Seroxat 20mg tablets | 30 tablet [PoM] £15.23 DT price = £1.64

**Paroxetine (as Paroxetine hydrochloride) 30 mg** Seroxat 30mg tablets | 30 tablet [PoM] £26.74 DT price = £1.67

#### Oral suspension

CAUTIONARY AND ADVISORY LABELS 5, 21

##### ► Seroxat (GlaxoSmithKline UK Ltd)

**Paroxetine (as Paroxetine hydrochloride) 2 mg per 1 ml** Seroxat 20mg/10ml liquid sugar-free | 150 ml [PoM] £9.12 DT price = £9.12

## Sertraline

### ● INDICATIONS AND DOSE

#### Depressive illness

##### ► BY MOUTH

- **Adult:** Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maintenance 50 mg daily; maximum 200 mg per day

#### Obsessive-compulsive disorder

##### ► BY MOUTH

- **Adult:** Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

#### Panic disorder | Post-traumatic stress disorder | Social anxiety disorder

##### ► BY MOUTH

- **Adult:** Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required, increase only if response is partial and if drug is tolerated; maximum 200 mg per day

- **SIDE-EFFECTS** Aggression · amnesia · bronchospasm · hepatitis · hypercholesterolaemia · hyperprolactinaemia · hypertension · hypoglycaemia · hypothyroidism · jaundice · leucopenia · liver failure · menstrual irregularities · palpitation · pancreatitis · paraesthesia · postural hypotension · stomatitis · tachycardia · tinnitus · urinary incontinence

- **BREAST FEEDING** Not known to be harmful but consider discontinuing breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose or increase dose interval in mild or moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Patients should be counselled on the effects on driving and skilled tasks.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**▶ **Sertraline (Non-proprietary)**

**Sertraline (as Sertraline hydrochloride) 50 mg** Sertraline 50mg tablets | 28 tablet [PoM] £19.25 DT price = £1.23

**Sertraline (as Sertraline hydrochloride) 100 mg** Sertraline 100mg tablets | 28 tablet [PoM] £29.09 DT price = £1.38

▶ **Lustral (Pfizer Ltd)**

**Sertraline (as Sertraline hydrochloride) 50 mg** Lustral 50mg tablets | 28 tablet [PoM] £17.82 DT price = £1.23

**Sertraline (as Sertraline hydrochloride) 100 mg** Lustral 100mg tablets | 28 tablet [PoM] £29.16 DT price = £1.38

**ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UP TAKE INHIBITORS****Duloxetine**

- **DRUG ACTION** Inhibits the re-uptake of serotonin and noradrenaline.

● **INDICATIONS AND DOSE****Major depressive disorder**

## ▶ BY MOUTH

- ▶ Adult: 60 mg once daily

**Generalised anxiety disorder**

## ▶ BY MOUTH

- ▶ Adult: Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

**Diabetic neuropathy**

## ▶ BY MOUTH

- ▶ Adult: 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

**Moderate to severe stress urinary incontinence**

## ▶ BY MOUTH

- ▶ Adult (female): 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

- **CAUTIONS** Bleeding disorders · cardiac disease · elderly · history of mania · history of seizures · hypertension (avoid if uncontrolled) · raised intra-ocular pressure · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (duloxetine). Caution with concomitant use of drugs that increase risk of bleeding.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · abnormal dreams · anorexia · anxiety · constipation · decreased appetite · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · fatigue · flatulence · headache · hot flush · insomnia · nausea · nervousness · palpitation · paraesthesia · pruritus · sexual dysfunction · sweating · tremor · visual disturbances · vomiting · weakness · weight changes
- ▶ **Uncommon** Bruxism · cold extremities · dysphagia · gastritis · halitosis · hepatitis · hypertension · hypothyroidism · impaired attention · impaired temperature regulation · movement disorders · muscle twitching · musculoskeletal pain · photosensitivity · postural hypotension · raised cholesterol · stomatitis · syncope · tachycardia · taste disturbance · thirst · urinary disorders · vertigo
- ▶ **Rare** Mania
- ▶ **Very rare** Angle-closure glaucoma

- ▶ **Frequency not known** Anaphylaxis · angioedema · chest pain · hallucinations · hypersensitivity reactions · hyponatraemia · rash · seizures · Stevens-Johnson syndrome · suicidal behaviour · supraventricular arrhythmia · urticaria

- **PREGNANCY** Toxicity in *animal studies*—avoid in patients with stress urinary incontinence; in other conditions use only if potential benefit outweighs risk. Risk of neonatal withdrawal symptoms if used near term.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **TREATMENT CESSATION** Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.

● **NATIONAL FUNDING/ACCESS DECISIONS****CYMBALTA®****Scottish Medicines Consortium (SMC) Decisions**

- ▶ With oral use for Diabetic neuropathy The *Scottish Medicines Consortium* has advised (September 2006) that duloxetine (*Cymbalta*®) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

## CAUTIONARY AND ADVISORY LABELS 2

▶ **Duloxetine (Non-proprietary)**

**Duloxetine (as Duloxetine hydrochloride) 20 mg** Duloxetine 20mg gastro-resistant capsules | 28 capsule [PoM] £18.48 DT price = £3.99

**Duloxetine (as Duloxetine hydrochloride) 30 mg** Duloxetine 30mg gastro-resistant capsules | 28 capsule [PoM] £22.40 DT price = £2.90

**Duloxetine (as Duloxetine hydrochloride) 40 mg** Duloxetine 40mg gastro-resistant capsules | 56 capsule [PoM] £36.96 DT price = £6.61

**Duloxetine (as Duloxetine hydrochloride) 60 mg** Duloxetine 60mg gastro-resistant capsules | 28 capsule [PoM] £27.72 DT price = £3.34

▶ **Cymbalta (Eli Lilly and Company Ltd)**

**Duloxetine (as Duloxetine hydrochloride) 30 mg** Cymbalta 30mg gastro-resistant capsules | 28 capsule [PoM] £22.40 DT price = £2.90

**Duloxetine (as Duloxetine hydrochloride) 60 mg** Cymbalta 60mg gastro-resistant capsules | 28 capsule [PoM] £27.72 DT price = £3.34

▶ **Ducilicta (CEB Pharma Ltd)**

**Duloxetine (as Duloxetine hydrochloride) 30 mg** Ducilicta 30mg gastro-resistant capsules | 28 capsule [PoM] £22.40 DT price = £2.90

**Duloxetine (as Duloxetine hydrochloride) 60 mg** Ducilicta 60mg gastro-resistant capsules | 28 capsule [PoM] £27.72 DT price = £3.34

▶ **Yentreve (Eli Lilly and Company Ltd)**

**Duloxetine (as Duloxetine hydrochloride) 20 mg** Yentreve 20mg gastro-resistant capsules | 28 capsule [PoM] £18.48 DT price = £3.99

**Duloxetine (as Duloxetine hydrochloride) 40 mg** Yentreve 40mg gastro-resistant capsules | 56 capsule [PoM] £36.96 DT price = £6.61

**Venlafaxine**

- **DRUG ACTION** A serotonin and noradrenaline re-uptake inhibitor.

● **INDICATIONS AND DOSE****Major depression**

## ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

continued →

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

#### Generalised anxiety disorder

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

#### Social anxiety disorder

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

- **CONTRA-INDICATIONS** Conditions associated with high risk of cardiac arrhythmia · uncontrolled hypertension
- **CAUTIONS** Diabetes · heart disease (monitor blood pressure) · history of bleeding disorders · history of epilepsy · history or family history of mania · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1 (venlafaxine). Concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abnormal dreams · anorexia · anxiety · anxiety (on withdrawal) · asthenia · changes in serum cholesterol · chills · confusion · constipation · difficulty with micturition · dizziness · dizziness (on withdrawal) · drowsiness · dry mouth · gastro-intestinal disturbances (on withdrawal) · headache · headache (on withdrawal) · hypertension · hypertonia · insomnia · menstrual disturbances · mydriasis · nausea · nervousness · palpitation · paraesthesia (on withdrawal) · sensory disturbances · sexual dysfunction · sleep disturbances (on withdrawal) · sweating · sweating (on withdrawal) · tremor · tremor (on withdrawal) · vasodilatation · visual disturbances · vomiting · weight changes · yawning
  - ▶ **Uncommon** Agitation · alopecia · angioedema · apathy · arrhythmias · bleeding disorders · bruxism · diarrhoea · ecchymosis · gastro-intestinal haemorrhage · hallucinations · incoordination · myoclonus · photosensitivity · postural hypotension · rash · taste disturbance · tinnitus · urinary retention
  - ▶ **Rare** Akathisia · extrapyramidal symptoms · hypomania · mania · seizures · urinary incontinence
  - ▶ **Very rare** Angle-closure glaucoma
  - ▶ **Frequency not known** Aggression · blood dyscrasias · delirium · hepatitis · hyperprolactinaemia · hypotension · neuroleptic malignant syndrome · pancreatitis · pruritus · QT interval prolongation · rhabdomyolysis · Stevens-Johnson syndrome · suicidal behaviour · syndrome of inappropriate anti-diuretic hormone secretion · urticaria · vertigo
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Risk of withdrawal effects in neonate.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment.
- **RENAL IMPAIRMENT** Use with caution. Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **TREATMENT CESSATION** Associated with a higher risk of withdrawal effects compared with other antidepressants. Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and

sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

## ANTIDEPRESSANTS > SEROTONIN UPTAKE INHIBITORS

### Trazodone hydrochloride

#### ● INDICATIONS AND DOSE

**Depressive illness (particularly where sedation is required)**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 150 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only
- ▶ **Elderly:** Initially 100 mg daily in divided doses, dose to be taken after food, alternatively initially 100 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

#### **Anxiety**

##### ▶ BY MOUTH

- ▶ **Adult:** 75 mg daily, increased if necessary to 300 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

#### CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial

doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** Antidepressants, tricyclic (related).

#### ● SIDE-EFFECTS

- **Rare** Extrapyramidal symptoms · paralytic ileus
- ▶ **Very rare** Precipitation of angle-closure glaucoma
- ▶ **Frequency not known** Changes in blood sugar · dry mouth · postural hypotension · agitation · alopecia · anorexia · anxiety · arrhythmia · arthralgia · blurred vision · breast enlargement · chills (on withdrawal) · confusion · constipation · convulsions · delusions · dizziness · drowsiness · dysarthria · dyspepsia · dyspnoea · ECG changes · galactorrhoea · gynecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypersalivation · hypertension · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · palpitation · paraesthesia · photosensitivity · priapism (discontinue immediately) · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · tremor · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

#### SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

#### Overdose

The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and

epileptogenic effects are dangerous in overdose.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

## ANTIDEPRESSANTS > TETRACYCLIC ANTIDEPRESSANTS

### Mianserin hydrochloride

#### ● INDICATIONS AND DOSE

**Depressive illness (particularly where sedation is required)**

##### ▶ BY MOUTH

▶ Adult: Initially 30–40 mg daily in divided doses, alternatively initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

▶ Elderly: Initially 30 mg daily in divided doses, alternatively initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

● **CONTRA-INDICATIONS** Acute porphyrias p. 930 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

● **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

#### CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

● **INTERACTIONS** Antidepressants, tricyclic (related).

#### ● SIDE-EFFECTS

▶ **Common or very common** Agitation · anxiety · arrhythmia · blurred vision · confusion · dizziness · dry mouth · ECG changes · heart block · irritability · paraesthesia · postural hypotension · sleep disturbances · sudden death of patients with cardiac disease · tachycardia

▶ **Rare** Dysarthria · extrapyramidal symptoms · paralytic ileus · tremor · urinary retention

▶ **Very rare** Constipation · neuroleptic malignant syndrome · precipitation of angle-closure glaucoma

▶ **Frequency not known** Alopecia · anorexia · arthralgia · arthritis · blood dyscrasias · breast enlargement · changes in blood sugar · chills (on withdrawal) · convulsions · delusions · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · Insomnia (on withdrawal) · jaundice · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · oedema · photosensitivity · pruritus · rash · sexual dysfunction · suicidal behaviour · sweating · sweating (on withdrawal) · taste disturbance · tinnitus · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

#### SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

#### Overdose

The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1204.

● **PREGNANCY** Avoid.

● **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

● **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

● **RENAL IMPAIRMENT** Caution in renal impairment.

● **MONITORING REQUIREMENTS** A full **blood count** is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if *fever, sore throat, stomatitis*, or other signs of infection develop.

● **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

● **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

#### ► Mianserin hydrochloride (Non-proprietary)

**Mianserin hydrochloride 10 mg** Mianserin 10mg tablets | 28 tablet [PoM] £8.37 DT price = £8.34

**Mianserin hydrochloride 30 mg** Mianserin 30mg tablets | 28 tablet [PoM] £18.34 DT price = £18.34

## Mirtazapine

- **DRUG ACTION** Mirtazapine is a presynaptic alpha<sub>2</sub>-adrenoreceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

### ● INDICATIONS AND DOSE

#### Major depression

##### ► BY MOUTH

- **Adult:** Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily, alternatively up to 45 mg daily in 2 divided doses

- **CAUTIONS** Cardiac disorders · diabetes mellitus · elderly · history of bipolar depression · history of seizures · history of urinary retention · hypotension · psychoses (may aggravate psychotic symptoms) · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (mirtazapine).

### ● SIDE-EFFECTS

- **Common or very common** Abnormal dreams · agitation (on withdrawal) · anxiety · anxiety (on withdrawal) · arthralgia · confusion · dizziness · dizziness (on withdrawal) · drowsiness · dry mouth · fatigue · headache (on withdrawal) · increased appetite · insomnia · myalgia · nausea (on withdrawal) · oedema · postural hypotension · tremor · vomiting (on withdrawal) · weight gain
- **Uncommon** Hallucinations · mania · movement disorders · syncope
- **Rare** Aggression · myoclonus · pancreatitis
- **Frequency not known** Angle-closure glaucoma · blood disorders · convulsions · dysarthria · hypersalivation · hyponatraemia · inappropriate secretion of antidiuretic hormone · sedation during initial treatment · Stevens-Johnson syndrome · suicidal behaviour · toxic epidermal necrolysis

- **PREGNANCY** Use with caution—limited experience; monitor neonate for withdrawal effects.

- **BREAST FEEDING** Present in milk; use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Use with caution. Discontinue if jaundice occurs.

- **RENAL IMPAIRMENT** Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m<sup>2</sup>; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- **TREATMENT CESSATION** Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

- **DIRECTIONS FOR ADMINISTRATION** Orodispersible tablet (*Zispin SolTab*<sup>®</sup>) should be placed on the tongue, allowed to disperse and swallowed.

- **PATIENT AND CARER ADVICE** Counselling on administration of orodispersible tablet advised. Blood Disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected.

## ANTIDEPRESSANTS > TRICYCLIC ANTIDEPRESSANTS

### Amitriptyline hydrochloride

### ● INDICATIONS AND DOSE

**Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)**

#### ► BY MOUTH

- **Adult:** Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 30 mg per day

**Depressive illness (not recommended—increased risk of fatality in overdose)**

#### ► BY MOUTH

- **Adult:** Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually
- **Elderly:** Initially 30–75 mg daily in divided doses, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually

#### Neuropathic pain

##### ► BY MOUTH

- **Adult:** Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

continued →

**Migraine prophylaxis**

## ▶ BY MOUTH

▶ **Adult:** Initially 10 mg once daily, then increased if necessary to 50–75 mg once daily (max. per dose 150 mg), dose to be taken at night

- **UNLICENSED USE** Not licensed for use in neuropathic pain. Not licensed for use in migraine prophylaxis. Not licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics.
  - **CONTRA-INDICATIONS** Acute porphyrias p. 930 · arrhythmias · during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
  - **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- CAUTIONS, FURTHER INFORMATION**  
Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1 (Antidepressants, tricyclic).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · fatigue · hypertension · mydriasis · oedema · palpitation · restlessness · stomatitis
  - ▶ **Rare** Dysarthria · extrapyramidal symptoms · paralytic ileus · tremor
  - ▶ **Very rare** Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma
  - ▶ **Frequency not known** Agitation · alopecia · anorexia · anxiety · arrhythmia · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · dizziness · drowsiness · dry mouth · ECG changes · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · increased intra-ocular pressure · influenza-like symptoms (on withdrawal) · Insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**Overdose**

Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and

urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks**  
Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Amitriptyline hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 336.

**MEDICINAL FORMS**

## Dosulepin hydrochloride

(Dothiepin hydrochloride)

### ● INDICATIONS AND DOSE

**Depressive illness, particularly where sedation is required (not recommended—increased risk of fatality in overdose) (initiated by a specialist)**

#### ▶ BY MOUTH

- ▶ **Adult:** Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)
- ▶ **Elderly:** Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

#### CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1 (antidepressants, tricyclic).
- **SIDE-EFFECTS**
  - ▶ **Rare** Dysarthria · extrapyramidal symptoms · paralytic ileus · tremor
  - ▶ **Very rare** Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma
  - ▶ **Frequency not known** Agitation · alopecia · anorexia · anxiety · arrhythmias · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · dizziness · dry mouth · ECG changes · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · increased intraocular pressure · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

#### SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

### Overdose

Overdosage with dosulepin is associated with a relatively high rate of fatality.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

A maximum prescription equivalent to 2 weeks' supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING** Dosulepin hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 336.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### ▶ Prothiaden (Teofarma)

**Dosulepin hydrochloride 25 mg** Prothiaden 25mg capsules | 28 capsule **[PoM]** £1.70 DT price = £1.40

## Doxepin

### ● INDICATIONS AND DOSE

**Depressive illness (particularly where sedation is required)**

#### ► BY MOUTH

- Adult: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses
- Elderly: Start with lower doses and adjust according to response

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · arrhythmias · during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

#### CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1 (antidepressants, tricyclic).

#### ● SIDE-EFFECTS

- **Common or very common** Agitation · anxiety · confusion · dizziness · drowsiness · irritability · paraesthesia · sleep disturbances
- **Rare** Dysarthria · extrapyramidal symptoms · paralytic ileus · tremor
- **Very rare** Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma
- **Frequency not known** Abdominal pain · alopecia · anorexia · arrhythmia · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · constipation · convulsions · delusions · diarrhoea · dry mouth · ECG changes · flushing · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · oedema · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · stomatitis · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

#### SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

#### Overdose

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also

occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Use with caution—limited information available.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

### ● INDICATIONS AND DOSE

**Depressive illness**

#### ► BY MOUTH

- Adult: Initially up to 75 mg daily in divided doses, then increased to 150–200 mg daily, up to 150 mg may be given as a single dose at bedtime, dose to be increased gradually
- Elderly: Initially 10 mg daily, increased to 30–50 mg daily, dose to be increased gradually

**Depressive illness in hospital patients**

#### ► BY MOUTH

- Adult: Initially up to 75 mg daily in divided doses, dose to be increased gradually, increased to up to 300 mg daily in divided doses

**Nocturnal enuresis**

#### ► BY MOUTH

- Child 6-7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Child 8-10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

continued →

▶ Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

- **CONTRA-INDICATIONS** Immediate recovery period after myocardial infarction (in adults) · Acute porphyrias p. 930 · arrhythmia · during the manic phase of bipolar disorder · heart block
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure (in adults) · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy (in adults) · susceptibility to angle-closure glaucoma · urinary retention

#### CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1 (antidepressants tricyclic).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Fatigue · flushing · headache · palpitation · restlessness
  - ▶ **Rare** Extrapyrmidal symptoms · paralytic ileus
  - ▶ **Very rare** Abdominal pain · aggression · allergic alveolitis · cardiac decompensation · diarrhoea (in children) · hypertension · mydriasis · myoclonus · neuroleptic malignant syndrome · oedema · peripheral vasospasm · precipitation of angle-closure glaucoma · stomatitis
  - ▶ **Frequency not known** Agitation · alopecia · anorexia · anxiety · arrhythmia · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · dizziness · drowsiness · dry mouth · dysarthria · ECG changes · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hyponatraemia · increased appetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · paraesthesia · photosensitivity · postural hypotension · pruritus · rash · sexual dysfunction · sleep disturbances · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · tremor · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ In adults The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

#### Overdose

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal

symptoms reported in neonates when used in the third trimester.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. ## OTHER ANTIDEPRESSANTS

### Vortioxetine

17-May-2016

- **DRUG ACTION** Vortioxetine inhibits the re-uptake of serotonin (5-HT) and is an antagonist at 5-HT<sub>3</sub> and an agonist at 5-HT<sub>1A</sub> receptors. This multimodal activity appears to be associated with antidepressant and anxiolytic-like effects.

#### ● INDICATIONS AND DOSE

##### Major depression

###### ▶ BY MOUTH

- ▶ Adult: Initially 10 mg once daily; adjusted according to response to 5–20 mg once daily
- ▶ Elderly: Initially 5 mg once daily; increased if necessary up to 20 mg once daily

- **CAUTIONS** Bleeding disorders · cirrhosis of the liver (risk of hyponatraemia) · elderly (risk of hyponatraemia) · history of mania (discontinue if patient entering manic phase) · history of seizures · unstable epilepsy

#### CAUTIONS, FURTHER INFORMATION

- ▶ Seizures Discontinue treatment in patients who develop seizures or if there is an increase in seizure frequency.
- ▶ Elderly Manufacturer advises caution when treating elderly patients with doses over 10 mg daily—limited information.
- **INTERACTIONS** → Appendix 1 (vortioxetine).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · constipation · diarrhoea · dizziness · nausea · pruritus · vomiting
- ▶ **Uncommon** Flushing · night sweats
- ▶ **Rare** Bleeding disorders
- ▶ **Frequency not known** Neuroleptic malignant syndrome—discontinue (potentially fatal) · serotonin syndrome · sexual dysfunction (with 20 mg dose only)
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. If used during the later stages of pregnancy, there is a risk of neonatal withdrawal symptoms and persistent pulmonary hypertension in the newborn.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.
- **TREATMENT CESSATION** Manufacturer advises treatment can be stopped abruptly, without need for gradual dose reduction.
- **PATIENT AND CARER ADVICE**

##### Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks, especially when starting treatment or changing the dose.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Vortioxetine for treating major depressive episodes (November 2015)** NICE TA367

Vortioxetine is recommended as an option for treating major depressive episodes in adults whose condition has responded inadequately to 2 antidepressants within the current episode.

Patients currently receiving vortioxetine whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA367](http://www.nice.org.uk/TA367)

## 3.5 Inappropriate sexual behaviour

### ANTI-PSYCHOTICS > FIRST-GENERATION

361

#### Benperidol

#### ● INDICATIONS AND DOSE

##### Control of deviant antisocial sexual behaviour

###### ▶ BY MOUTH

- ▶ Adult: 0.25–1.5 mg daily in divided doses, adjusted according to response, for debilitated patients, use elderly dose
- ▶ Elderly: Initially 0.125–0.75 mg daily in divided doses, adjusted according to response

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Risk factors for stroke
- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal* studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Manufacturer advises regular blood counts and liver function tests during long-term treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** The proprietary name *Benquil*® has been used for benperidol tablets.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2

#### ▶ Benperidol (Non-proprietary)

**Benperidol 250 microgram** Benperidol 250microgram tablets | 112 tablet [PoM] £117.31 DT price = £117.31

#### ▶ Anquil (Kyowa Kirin Ltd)

**Benperidol 250 microgram** Anquil 250microgram tablets | 112 tablet [PoM] £117.31 DT price = £117.31

## 3.6 Psychoses and schizophrenia

### Psychoses and related disorders

#### Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore **unlicensed**

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.
- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

**Important:** When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for **each route** and should **not** imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

#### Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

#### Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

#### First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D<sub>2</sub> receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The **phenothiazine** derivatives can be divided into 3 main groups:

- **Group 1:** chlorpromazine hydrochloride p. 361, levomepromazine p. 411, and promazine hydrochloride p. 379, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2:** pericyazine p. 364, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3:** fluphenazine decanoate p. 368, perphenazine p. 364, prochlorperazine p. 365, and trifluoperazine p. 366, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

**Butyrophenones** (benperidol p. 357 and haloperidol p. 363) resemble the group 3 phenothiazines in their clinical properties. **Thioxanthenes** (flupentixol p. 362 and zuclopentixol p. 367) have moderate sedative, antimuscarinic effects, and extrapyramidal effects.

**Diphenylbutylpiperidines** (pimozide p. 364) and the **substituted benzamides** (sulpiride p. 366) have reduced sedative, antimuscarinic, and extrapyramidal effects.

#### Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of

receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

#### Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient's weight, comorbidity, and concomitant medication.
- Treatment should be reviewed regularly.

#### Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- *parkinsonian symptoms* (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- *dystonia* (abnormal face and body movements) and *dyskinesia*, which occur more commonly in children or young adults and appear after only a few doses;
- *akathisia* (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- *tardive dyskinesia* (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

*Parkinsonian symptoms* remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

*Tardive dyskinesia* is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

#### Hyperprolactinaemia

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced

bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

#### Sexual dysfunction

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and  $\alpha_1$ -adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

#### Cardiovascular side-effects

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

#### Hyperglycaemia

Hyperglycaemia and sometimes diabetes can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

#### Hypotension and interference with temperature regulation

Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients.

#### Neuroleptic malignant syndrome

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

#### Blood dyscrasias

Perform blood counts if unexplained infection or fever develops.

#### Choice

There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 371), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient's medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

#### Negative symptoms

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

**Extrapyramidal side-effects**

Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 370, clozapine, olanzapine p. 373, and quetiapine p. 375 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 370 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

**QT interval**

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, flupentixol p. 362, fluphenazine decanoate p. 368, olanzapine, perphenazine p. 364, prochlorperazine p. 365, risperidone p. 377, and sulpiride p. 366.

**Diabetes**

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate and haloperidol p. 363 are lowest risk. Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulpiride, and trifluoperazine p. 366 are least likely to cause weight gain.

**Sexual dysfunction and prolactin**

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks' treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

**Monitoring**

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of

cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

**Other uses**

Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tics. Chlorpromazine hydrochloride p. 361 and haloperidol can be used for intractable hiccup. Benperidol p. 357 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride p. 361 or haloperidol p. 363 used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

**Equivalent doses of oral antipsychotics**

These equivalences are intended **only** as an approximate guide; individual dosage instructions should **also** be checked; patients should be carefully monitored after **any** change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

**Important:** These equivalences must **not** be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

**Dosage**

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

**Antipsychotic depot injections**

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 377 and olanzapine embonate p. 378.

**Choice**

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopentixol p. 367 may be suitable for the treatment of agitated or aggressive patients whereas flupentixol decanoate p. 367 can cause over-excitement in such patients. Zuclopentixol decanoate p. 369 may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

**Equivalent doses of depot antipsychotics**

Antipsychotic drug/interval	Dosage (mg)
Flupentixol decanoate / 2 weeks	40
Fluphenazine decanoate / 2 weeks	25
Haloperidol (as decanoate) / 4 weeks	100
Zuclopentixol decanoate / 2 weeks	200

**Important:** These equivalences must not be extrapolated beyond the maximum dose for the drug

These equivalences are intended **only** as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

**Dosage**

Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient's response.

**ANTIPSYCHOTICS****Antipsychotic drugs**

- **CAUTIONS** Blood dyscrasias · cardiovascular disease · conditions predisposing to seizures · depression · epilepsy · history of jaundice · myasthenia gravis · Parkinson's disease (may be exacerbated)(in adults) · photosensitisation (may occur with higher dosages) · prostatic hypertrophy (in adults) · severe respiratory disease · susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Cardiovascular disease** An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

- **INTERACTIONS** → Appendix 1 (antipsychotics). Increased risk of toxicity with myelosuppressive drugs.

**● SIDE-EFFECTS**

- ▶ **Rare** Neuroleptic malignant syndrome—discontinuation (potentially fatal)
- ▶ **Very rare** Precipitation of angle-closure glaucoma
- ▶ **Frequency not known** Agitation · agranulocytosis · akathisia · antimuscarinic symptoms · apathy · blood dyscrasias · blurred vision · cardiovascular side-effects · confusion · constipation · contact sensitisation · convulsions · corneal and lens opacities · diabetes · difficulty with micturition · dizziness · drowsiness · dry mouth · dystonia · excitement · extrapyramidal symptoms · gastro-intestinal disturbances · headache · hyperglycaemia · hyperprolactinaemia · hypotension (dose related) · insomnia · interference with temperature regulation (dose related) · jaundice (including cholestatic) · leucopenia · nasal congestion · parkinsonian symptoms · photosensitisation · purplish pigmentation of the conjunctiva · purplish pigmentation of the cornea · purplish pigmentation of the retina · purplish pigmentation of the skin · rashes · sexual dysfunction · tardive dyskinesia · venous thromboembolism · weight gain

**Overdose**

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of

antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal studies* indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

**● MONITORING REQUIREMENTS**

- ▶ It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- ▶ Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
- ▶ In children Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

- **TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

- **PATIENT AND CARER ADVICE** As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

**ANTIPSYCHOTICS > FIRST-GENERATION**
 above
**Chlorpromazine hydrochloride****● INDICATIONS AND DOSE**

**Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour**

**▶ BY MOUTH**

- ▶ **Adult:** Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses; use a third to half adult dose in the elderly or debilitated patients

**▶ BY RECTUM**

- ▶ **Adult:** 100 mg every 6–8 hours, dose expressed as chlorpromazine base

**Intractable hiccup****▶ BY MOUTH**

- ▶ **Adult:** 25–50 mg 3–4 times a day

continued →

**Relief of acute symptoms of psychoses (under expert supervision)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 25–50 mg every 6–8 hours

**Nausea and vomiting of terminal illness (where other drugs have failed or are not available)**

- ▶ BY MOUTH
- ▶ Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- ▶ Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- ▶ Child 12–17 years: 10–25 mg every 4–6 hours
- ▶ Adult: 10–25 mg every 4–6 hours
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
- ▶ Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
- ▶ Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
- ▶ Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

## ▶ BY RECTUM

- ▶ Adult: 100 mg every 6–8 hours

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For equivalent therapeutic effect 100 mg chlorpromazine base given *rectally* as a suppository ≡ 20–25 mg chlorpromazine hydrochloride *by intramuscular injection* ≡ 40–50 mg of chlorpromazine base or hydrochloride given *by mouth*.

**● UNLICENSED USE**

- ▶ With rectal use in adults Rectal route is not licensed.

- **CONTRA-INDICATIONS** CNS depression · comatose states · hypothyroidism · phaeochromocytoma

- **CAUTIONS** Diabetes

**● SIDE-EFFECTS****SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Acute dystonic reactions Phenothiazines can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS**
- ▶ With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.
- **HANDLING AND STORAGE** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

**● MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, suppository

**Tablet**

**Flupentixol****(Flupenthixol)****● INDICATIONS AND DOSE****Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity**

## ▶ BY MOUTH

- ▶ Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
- ▶ Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

**Depressive illness**

## ▶ BY MOUTH

- ▶ Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
- ▶ Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

- **CONTRA-INDICATIONS** Circulatory collapse · CNS depression · comatose states · excitable patients · impaired consciousness · overactive patients · phaeochromocytoma

- **CAUTIONS** Acute porphyrias p. 930 · cardiac disorders · cardiovascular disease · cerebral arteriosclerosis · diabetes · elderly · parkinsonism · QT-interval prolongation · senile confusional states

- **INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.

- **SIDE-EFFECTS** Asthenia · dyspnoea · hypersalivation · myalgia · sudden death · torsade de pointes

**SIDE-EFFECTS, FURTHER INFORMATION**

Less sedating but extrapyramidal symptoms frequent.

- **PREGNANCY** Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in breast milk—avoid.
- **HEPATIC IMPAIRMENT** Can precipitate coma. Consider serum-flupentixol concentration monitoring in hepatic impairment.
- **RENAL IMPAIRMENT** Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Manufacturer advises caution in renal failure.

- **PATIENT AND CARER ADVICE** Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

## Haloperidol

#### ● INDICATIONS AND DOSE

##### Nausea and vomiting

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 mg

##### Nausea and vomiting in palliative care

- ▶ BY MOUTH
- ▶ Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses
- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION
- ▶ Adult: 5–15 mg, to be administered over 24 hours
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 2.5–10 mg/24 hours

##### Schizophrenia | Psychoses | Mania and hypomania | Organic brain damage (depending on symptoms)

- ▶ BY MOUTH
- ▶ Adult: Initially 2–20 mg once daily, alternatively initially 2–20 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses, for debilitated patients, use elderly dose; maximum 20 mg per day
- ▶ Elderly: Initially 1–10 mg once daily, alternatively initially 1–10 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; maximum 20 mg per day
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 2–5 mg, repeated if necessary, repeated dose given according to response and tolerability, for debilitated patients, use elderly dose; maximum 12 mg per day
- ▶ Elderly: Initially 1–2.5 mg, repeated if necessary, repeated dose given according to response and tolerability; maximum 12 mg per day

##### Agitation and restlessness in the elderly

- ▶ BY MOUTH
- ▶ Elderly: Initially 0.75–1.5 mg 2–3 times a day, adjusted according to response, if necessary

**Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in patients with intellectual disabilities and in patients with organic brain damage (depending on symptoms) | Gilles de la Tourette syndrome | Severe tics | Intractable hiccup | Adjunct to short-term management of moderate to severe psychomotor agitation, excitement and, violent or dangerously impulsive behaviour**

- ▶ BY MOUTH
- ▶ Adult: Initially 1.5–3 mg 2–3 times a day, alternatively initially 3–5 mg 2–3 times a day, higher dose in

severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose, for debilitated patients, use elderly dose

- ▶ Elderly: Initially 0.75–1.5 mg 2–3 times a day, alternatively initially 1.5–2.5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose

##### Restlessness and confusion in palliative care

- ▶ BY MOUTH
- ▶ Adult: 2 mg, then 2 mg every 2 hours if required
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 2.5 mg, then 2.5 mg every 2 hours if required
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 5–15 mg/24 hours

##### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **UNLICENSED USE** BNF doses for schizophrenia, psychoses, mania, hypomania, and organic brain damage differ from those in product literature.

##### IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering for mental health disorders, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

- **CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · lesions of the basal ganglia · Parkinson's disease · phaeochromocytoma · QT-interval prolongation
- **CAUTIONS** Arteriosclerosis · hypocalcaemia · hypokalaemia · hypomagnesaemia · metabolic disturbances · subarachnoid haemorrhage · thyrotoxicosis
- **INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Depression · weight loss
  - ▶ **Uncommon** Dyspnoea · oedema
  - ▶ **Rare** Bronchospasm · hypoglycaemia · inappropriate antidiuretic hormone secretion · photosensitivity reactions · pigmentation
  - ▶ **Frequency not known** Hypertension · Stevens-Johnson syndrome · sweating · toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION** Less sedating and fewer antimuscarinic or hypotensive symptoms.
- **PREGNANCY** Avoid unless benefits outweigh risks.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.
- **PRESCRIBING AND DISPENSING INFORMATION**

##### Palliative care

For further information on the use of haloperidol in palliative care, see [www.palliativedrugs.com/formulary/en/haloperidol.html](http://www.palliativedrugs.com/formulary/en/haloperidol.html).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

F 361

**Pericyazine****(Pericazine)****INDICATIONS AND DOSE****Schizophrenia** | **Psychoses**▶ **BY MOUTH**

- ▶ **Adult:** Initially 75 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day
- ▶ **Elderly:** Initially 15–30 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day

**Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour**▶ **BY MOUTH**

- ▶ **Adult:** Initially 15–30 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime
- ▶ **Elderly:** Initially 5–10 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime

**CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma**SIDE-EFFECTS**

- ▶ **Common or very common** Hypotension (when treatment initiated)
- ▶ **Frequency not known** Respiratory depression

**SIDE-EFFECTS, FURTHER INFORMATION**

More sedating.

**HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.**RENAL IMPAIRMENT** Avoid in renal impairment.**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

▶ **Pericyazine (Non-proprietary)**

**Pericyazine 2.5 mg** Pericyazine 2.5mg tablets | 84 tablet [PoM] £16.95 DT price = £16.23

**Pericyazine 10 mg** Pericyazine 10mg tablets | 84 tablet [PoM] £40.94 DT price = £40.47

**Oral solution**

CAUTIONARY AND ADVISORY LABELS 2

▶ **Pericyazine (Non-proprietary)**

**Pericyazine 2 mg per 1 ml** Pericyazine 10mg/5ml oral solution | 100 ml [PoM] £46.00-£46.01 DT price = £46.01

F 361

**Perphenazine****INDICATIONS AND DOSE****Schizophrenia and other psychoses** | **Mania** | **Short-term adjunctive management of anxiety** | **Severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour** | **Severe nausea and vomiting unresponsive to other anti-emetics**▶ **BY MOUTH**

- ▶ **Adult:** Initially 4 mg 3 times a day, adjusted according to response; maximum 24 mg per day
- ▶ **Elderly:** Initially 1–2 mg 3 times a day; maximum 12 mg per day

**CONTRA-INDICATIONS** Agitation in the elderly · CNS depression · comatose states · phaeochromocytoma · restlessness in the elderly**CAUTIONS** Hypothyroidism**SIDE-EFFECTS**

- ▶ **Rare** Systemic lupus erythematosus
- ▶ **Frequency not known** Dystonic reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Less sedating.

- ▶ **Acute dystonic reactions** Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

**HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.**RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

F 361

**Pimozide****INDICATIONS AND DOSE****Schizophrenia**▶ **BY MOUTH**

- ▶ **Adult:** Initially 2 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily
- ▶ **Elderly:** Initially 1 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily

**Monosymptomatic hypochondriacal psychosis | Paranoid psychosis**

## ▶ BY MOUTH

- ▶ Adult: Initially 4 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day
- ▶ Elderly: Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · history of arrhythmias · history or family history of congenital QT prolongation · phaeochromocytoma

● **SIDE-EFFECTS**

- ▶ **Rare** Hyponatraemia
- ▶ **Frequency not known** Glycosuria · serious arrhythmias

**SIDE-EFFECTS, FURTHER INFORMATION**

Less sedating.

- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● **MONITORING REQUIREMENTS**

- ▶ ECG monitoring Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antiarrhythmals, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

## CAUTIONARY AND ADVISORY LABELS 2

▶ **Pimozide (Non-proprietary)**

**Pimozide 4 mg** Pimozide 4mg tablets | 100 tablet **[PoM]** no price available DT price = £40.31

▶ **Orap** (Eumedica Pharmaceuticals)

**Pimozide 4 mg** Orap 4mg tablets | 100 tablet **[PoM]** £40.31 DT price = £40.31

F 361

**Prochlorperazine**● **INDICATIONS AND DOSE****Schizophrenia and other psychoses | Mania**

## ▶ BY MOUTH

- ▶ Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 12.5–25 mg 2–3 times a day

**Short-term adjunctive management of severe anxiety**

## ▶ BY MOUTH

- ▶ Adult: 15–20 mg daily in divided doses; maximum 40 mg per day

**Nausea and vomiting, acute attack**

## ▶ BY MOUTH

- ▶ Adult: Initially 20 mg, then 10 mg after 2 hours
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

**Nausea and vomiting, prevention**

## ▶ BY MOUTH

- ▶ Adult: 5–10 mg 2–3 times a day
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

**Prevention and treatment of nausea and vomiting**

## ▶ BY MOUTH

- ▶ Child 11–17 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
- ▶ Child 12–17 years: 5–10 mg up to 3 times a day if required
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
- ▶ Child 5–11 years: 5–6.25 mg up to 3 times a day if required
- ▶ Child 12–17 years: 12.5 mg up to 3 times a day if required

**Labyrinthine disorders**

## ▶ BY MOUTH

- ▶ Adult: 5 mg 3 times a day, increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks

**Nausea and vomiting in previously diagnosed migraine**

## ▶ BY MOUTH USING BUCCAL TABLET

- ▶ Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
- ▶ Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate ≡ 1 mg prochlorperazine mesilate.

● **UNLICENSED USE**

- ▶ With intramuscular use in children Injection not licensed for use in children.
- ▶ With buccal use in children Buccal tablets not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid oral route in child under 10 kg · children (in psychotic disorders) · CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Elderly · hypotension (more likely after intramuscular injection)

- **SIDE-EFFECTS** Dystonic reactions · respiratory depression may occur in susceptible patients

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With buccal use Buccal tablets are placed high between upper lip and gum and left to dissolve.

● **PATIENT AND CARER ADVICE**

- ▶ With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Sulpiride****INDICATIONS AND DOSE****Schizophrenia with predominantly negative symptoms**

## ▶ BY MOUTH

- ▶ **Adult:** 200–400 mg twice daily; maximum 800 mg per day
- ▶ **Elderly:** Lower initial dose to be given, increased gradually according to response

**Schizophrenia with mainly positive symptoms**

## ▶ BY MOUTH

- ▶ **Adult:** 200–400 mg twice daily; maximum 2.4 g per day
- ▶ **Elderly:** Lower initial dose to be given, increased gradually according to response

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) · agitated patients (even low doses may aggravate symptoms) · excited patients (even low doses may aggravate symptoms)

- **SIDE-EFFECTS** Hepatitis

- **HEPATIC IMPAIRMENT** Can precipitate coma.

- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include lemon and aniseed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Trifluoperazine****INDICATIONS AND DOSE****Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour**

## ▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response
- ▶ **Elderly:** Initially up to 2.5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response

**Short-term adjunctive management of severe anxiety**

## ▶ BY MOUTH

- ▶ **Adult:** 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
- ▶ **Elderly:** Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

**Severe nausea and vomiting**

## ▶ BY MOUTH

- ▶ **Adult:** 2–4 mg daily in divided doses; maximum 6 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **SIDE-EFFECTS** Anorexia · dystonic reactions · muscle weakness

**SIDE-EFFECTS, FURTHER INFORMATION**

Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily.

Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**ANTIPSYCHOTICS > FIRST-GENERATION (DEPOT INJECTIONS)****Flupentixol decanoate****(Flupentixol Decanoate)****INDICATIONS AND DOSE****Maintenance in schizophrenia and other psychoses**▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ **Adult:** Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20–40 mg every 2–4 weeks, adjusted according to response, usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; maximum 400 mg per week
- ▶ **Elderly:** Dose is initially quarter to half adult dose

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · excitable patients · overactive patients · pheochromocytoma
- **CAUTIONS** An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear · avoid in Acute porphyrias p. 930 · diabetes · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **SIDE-EFFECTS** Erythema · hyperglycaemia · mood elevating effect · nodules · pain at injection site · swelling
- **SIDE-EFFECTS, FURTHER INFORMATION** If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.  
Less sedating but extrapyramidal symptoms frequent.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Flupentixol decanoate (Non-proprietary)

Flupentixol decanoate 100 mg per 1 ml Flupentixol 100mg/1ml solution for injection ampoules | 10 ampoule [PoM] no price available

Flupentixol decanoate 200 mg per 1 ml Flupentixol 200mg/1ml solution for injection ampoules | 5 ampoule [PoM] no price available

##### ▶ Depixol (Flupentixol decanoate) (Lundbeck Ltd)

Flupentixol decanoate 20 mg per 1 ml Depixol 40mg/2ml solution for injection ampoules | 10 ampoule [PoM] £25.39  
Depixol 20mg/1ml solution for injection ampoules | 10 ampoule [PoM] £15.17

Flupentixol decanoate 100 mg per 1 ml Depixol Conc 100mg/1ml solution for injection ampoules | 10 ampoule [PoM] £62.51

Flupentixol decanoate 200 mg per 1 ml Depixol Low Volume 200mg/1ml solution for injection ampoules | 5 ampoule [PoM] £97.59

##### ▶ Psytixol (Mylan Ltd)

Flupentixol decanoate 20 mg per 1 ml Psytixol 40mg/2ml solution for injection ampoules | 10 ampoule [PoM] £25.38  
Psytixol 20mg/1ml solution for injection ampoules | 10 ampoule [PoM] £15.16

Flupentixol decanoate 100 mg per 1 ml Psytixol 50mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £34.12  
Psytixol 100mg/1ml solution for injection ampoules | 10 ampoule [PoM] £62.50

Flupentixol decanoate 200 mg per 1 ml Psytixol 200mg/1ml solution for injection ampoules | 5 ampoule [PoM] £97.58

F 361

## Fluphenazine decanoate

#### ● INDICATIONS AND DOSE

##### Maintenance in schizophrenia and other psychoses

###### ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
- ▶ Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after

4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · marked cerebral atherosclerosis · pheochromocytoma
- **CAUTIONS** QT-interval prolongation · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** Avoid concomitant drugs that prolong QT interval.
- **SIDE-EFFECTS** Erythema · inappropriate antidiuretic hormone secretion · nodules · oedema · pain at injection site · swelling · systemic lupus erythematosus
- **SIDE-EFFECTS, FURTHER INFORMATION** Less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent. Extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed.

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- **HEPATIC IMPAIRMENT** Avoid in hepatic failure. Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Manufacturer advises caution. Avoid in renal failure.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

#### ● MEDICINAL FORMS

Modecate 25mg/1ml solution for injection ampoules | 10 ampoule [PoM] £22.55 DT price = £22.55

Modecate 12.5mg/0.5ml solution for injection ampoules | 5 ampoule [PoM] £6.51

Fluphenazine decanoate 100 mg per 1 ml Modecate Concentrate 100mg/1ml solution for injection ampoules | 5 ampoule [PoM] £43.73 DT price = £43.73

Modecate Concentrate 50mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £44.73

F 361

## Haloperidol decanoate

### ● INDICATIONS AND DOSE

#### Maintenance in schizophrenia and other psychoses

##### ► BY DEEP INTRAMUSCULAR INJECTION

- Adult: Initially 50 mg every 4 weeks, increased in steps of 50 mg if required, increased if necessary up to 300 mg every 4 weeks, higher doses may be needed in some patients, dose to be administered into gluteal muscle, if 2-weekly administration preferred, doses should be halved
- Elderly: Initially 12.5–25 mg every 4 weeks, if 2-weekly administration preferred, doses should be halved

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

### IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute episode*.

- **CONTRA-INDICATIONS** Bradycardia · children · CNS depression · comatose states · lesions of the basal ganglia · Parkinson's disease · phaeochromocytoma · QT-interval prolongation
- **CAUTIONS** Arteriosclerosis · hypocalcaemia · hypokalaemia · hypomagnesaemia · metabolic disturbances · subarachnoid haemorrhage · thyrotoxicosis · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - **Common or very common** Depression · weight loss
  - **Uncommon** Dyspnoea · oedema
  - **Rare** Bronchospasm · hypoglycaemia · inappropriate antidiuretic hormone secretion · photosensitivity reactions · pigmentation
  - **Frequency not known** Erythema · hypertension · nodules · pain may occur at injection site · Stevens-Johnson syndrome · sweating · swelling · toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION** Less sedating and fewer antimuscarinic or hypotensive symptoms.
- **PREGNANCY** Avoid unless benefits outweigh risk.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS**
  - Treatment requires careful monitoring for optimum effect.
  - Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

## Zuclophenthixol decanoate

### ● INDICATIONS AND DOSE

#### Maintenance in schizophrenia and paranoid psychoses

##### ► BY DEEP INTRAMUSCULAR INJECTION

- Adult: Test dose 100 mg, dose to be administered into the upper outer buttock or lateral thigh, followed by 200–500 mg after at least 7 days, then 200–500 mg every 1–4 weeks, adjusted according to response, higher doses of more than 500mg can be used; do not exceed 600 mg weekly
- Elderly: A quarter to half usual starting dose to be used

### IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the short-term management of an *acute episode*.

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Avoid in acute porphyrias p. 930 · QT interval prolongation · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** Avoid concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS** Erythema · nodules · pain at injection site · swelling
- **SIDE-EFFECTS, FURTHER INFORMATION** If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

## ANTIPSYCHOTICS &gt; SECOND-GENERATION

F 361

F 361

## Amisulpride

- **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D<sub>2</sub> and D<sub>3</sub> receptors.

● **INDICATIONS AND DOSE****Acute psychotic episode in schizophrenia**

- ▶ **BY MOUTH**
- ▶ Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day

**Schizophrenia with predominantly negative symptoms**

- ▶ **BY MOUTH**
- ▶ Adult: 50–300 mg daily

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma · prolactin-dependent tumours

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety
- ▶ **Uncommon** Bradycardia

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—no information available.

- **RENAL IMPAIRMENT** Halve dose if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>. Use one-third dose if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>. No information available if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include caramel.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Aripiprazole

- **DRUG ACTION** Aripiprazole is a dopamine D<sub>2</sub> partial agonist with weak 5-HT<sub>1A</sub> partial agonism and 5-HT<sub>2A</sub> receptor antagonism.

● **INDICATIONS AND DOSE****Maintenance in schizophrenia in patients stabilised with oral aripiprazole**▶ **INITIALLY BY INTRAMUSCULAR INJECTION**

- ▶ Adult: 400 mg every month, to be injected into the gluteal muscle, minimum of 26 days between injections, for dose adjustment due to side effects or concomitant use of interacting drugs, consult product literature and (by mouth) 10–20 mg daily continued for 14 consecutive days after the first injection, for missed depot doses consult product literature

**Schizophrenia**▶ **BY MOUTH**

- ▶ Adult: 10–15 mg once daily; usual dose 15 mg once daily (max. per dose 30 mg once daily), for dose adjustments due to concomitant use of interacting drugs—consult product literature

**Treatment and recurrence prevention of mania**▶ **BY MOUTH**

- ▶ Adult: 15 mg once daily, increased if necessary up to 30 mg once daily, for dose adjustments due to concomitant use of interacting drugs—consult product literature

**Control of agitation and disturbed behaviour in schizophrenia**▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Adult: Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg, for dose adjustments due to concomitant use of interacting drugs—consult product literature

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an *acute episode* (solution for injection containing aripiprazole 7.5 mg/mL) should **not** be confused with depot preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for *maintenance treatment*.

- **CONTRA-INDICATIONS** CNS depression · comatose state · phaeochromocytoma

● **CAUTIONS****GENERAL CAUTIONS**

Cerebrovascular disease · elderly (reduce initial dose)

**SPECIFIC CAUTIONS**

- ▶ With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · hypersalivation · malaise
- ▶ **Uncommon** Depression · dry mouth
- ▶ **Frequency not known** Alopecia · anorexia · bradycardia · hepatitis · hyponatraemia · infection · laryngospasm · myalgia · oedema · oropharyngeal spasm · pancreatitis · pathological gambling · respiratory disorders · rhabdomyolysis · suicidal ideation · sweating · urinary disorders

**SPECIFIC SIDE-EFFECTS**

- ▶ With intramuscular use Erythema · nodules · pain at injection site · swelling

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose of the *depot injection*, therefore it may be a month or longer before side-effects subside.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment (oral treatment preferred to intramuscular administration).

**MONITORING REQUIREMENTS**

- ▶ Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

**DIRECTIONS FOR ADMINISTRATION**

- ▶ With oral use Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

**PATIENT AND CARER ADVICE**

- ▶ With oral use Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

F 361

**Clozapine**

- **DRUG ACTION** Clozapine is a dopamine D<sub>1</sub>, dopamine D<sub>2</sub>, 5-HT<sub>2A</sub>, alpha<sub>1</sub>-adrenoceptor, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE****Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs****▶ BY MOUTH**

- ▶ Adult 18–59 years: 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
- ▶ Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

**Psychosis in Parkinson's disease****▶ BY MOUTH**

- ▶ Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CONTRA-INDICATIONS** Alcoholic and toxic psychoses · bone-marrow disorders · coma · drug intoxication · history of agranulocytosis · history of circulatory collapse · history of neutropenia · paralytic ileus · severe cardiac disorders (e.g. myocarditis) · severe CNS depression · uncontrolled epilepsy

- **CAUTIONS** Age over 60 years · prostatic hypertrophy · susceptibility to angle-closure glaucoma · taper off other antipsychotics before starting

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Agranulocytosis** Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm<sup>3</sup> or if absolute neutrophil count below 1500/mm<sup>3</sup> discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.
- ▶ **Myocarditis and cardiomyopathy** Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.
  - Perform physical examination and take full medical history before starting
  - Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
  - Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
  - If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
  - Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy
- ▶ **Intestinal obstruction** Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.
- **INTERACTIONS** Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · constipation · hypersalivation · malaise · speech disorders · urinary incontinence
  - ▶ **Uncommon** Agranulocytosis
  - ▶ **Rare** Circulatory collapse · dysphagia · hepatitis · myocarditis · pancreatitis · pericarditis · pneumonia · pulmonary aspiration
  - ▶ **Very rare** Cardiomyopathy · hypercholesterolaemia · hypertriglyceridaemia · interstitial nephritis · intestinal obstruction (including fatal cases) · myocardial infarction · obsessive compulsive disorder · parotid gland enlargement · respiratory depression
  - ▶ **Frequency not known** Hepatic disorders · hepatic failure · muscle disorders · renal failure
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Hypersalivation** Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in symptomatic liver disease. Avoid in progressive liver disease. Avoid in hepatic failure. Monitor hepatic function regularly.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

#### MONITORING REQUIREMENTS

- ▶ Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
- ▶ Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
- ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- ▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- ▶ Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.
- **TREATMENT CESSATION** On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.
- **DIRECTIONS FOR ADMINISTRATION** Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.
- **PRESCRIBING AND DISPENSING INFORMATION** Clozapine has been used for psychosis in Parkinson's disease in children aged 16 years and over.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clozapine oral suspension.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10

▶ **Clozariil** (Novartis Pharmaceuticals UK Ltd)

**Clozapine 25 mg** Clozariil 25mg tablets | 28 tablet PoM £2.95 | 84 tablet PoM £6.30 (Hospital only) | 100 tablet PoM £7.50 (Hospital only)

**Clozapine 100 mg** Clozariil 100mg tablets | 28 tablet PoM £11.76 | 84 tablet PoM £25.21 (Hospital only) | 100 tablet PoM £30.01 (Hospital only)

▶ **Denzapine** (Britannia Pharmaceuticals Ltd)

**Clozapine 25 mg** Denzapine 25mg tablets | 84 tablet PoM £16.64 | 100 tablet PoM £19.80

**Clozapine 100 mg** Denzapine 100mg tablets | 84 tablet PoM £66.53 | 100 tablet PoM £79.20

##### Oral suspension

CAUTIONARY AND ADVISORY LABELS 2, 10

▶ **Denzapine** (Britannia Pharmaceuticals Ltd)

**Clozapine 50 mg per 1 ml** Denzapine 50mg/ml oral suspension sugar-free | 100 ml PoM £39.60

## Lurasidone hydrochloride

- **DRUG ACTION** Lurasidone is a dopamine D<sub>2</sub>, 5-HT<sub>2A</sub>, 5-HT<sub>7</sub>, alpha<sub>2A</sub>- and alpha<sub>2C</sub>-adrenoceptor antagonist, and is a partial agonist at 5-HT<sub>1A</sub> receptors.

### ● INDICATIONS AND DOSE

#### Schizophrenia

- ▶ BY MOUTH
- ▶ Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily

#### Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)

- ▶ BY MOUTH
- ▶ Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)

- **CAUTIONS** High doses in elderly · susceptibility to QT-interval prolongation
- **INTERACTIONS** Contra-indicated with concomitant use of potent CYP3A4 inhibitors and potent CYP3A4 inducers. Caution with concomitant use of drugs that prolong the QT interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · musculoskeletal stiffness
  - ▶ **Uncommon** Catatonia · decreased appetite · dysarthria · dysuria · hot flush · myalgia · nightmares
  - ▶ **Frequency not known** Angina · AV block · bradycardia · dysphagia · panic attacks · pruritus · suicidal behaviour · vertigo
- **PREGNANCY** Use only if potential benefit outweighs risk—limited information available.
- **HEPATIC IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment. Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.
- **RENAL IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>. Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 21, 25

- ▶ **Latuda** (Sunovion Pharmaceuticals Europe Ltd) ▼

  - Lurasidone (as Lurasidone hydrochloride) 74 mg Latuda 74mg tablets | 28 tablet [POM] £90.72

## Olanzapine

- **DRUG ACTION** Olanzapine is a dopamine D<sub>1</sub>, D<sub>2</sub>, D<sub>4</sub>, 5-HT<sub>2</sub>, histamine-1-, and muscarinic-receptor antagonist.

### ● INDICATIONS AND DOSE

#### Schizophrenia | Combination therapy for mania

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

#### Preventing recurrence in bipolar disorder

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

#### Monotherapy for mania

- ▶ BY MOUTH
- ▶ Adult: 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

#### Control of agitation and disturbed behaviour in schizophrenia or mania

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
- ▶ Elderly: Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

### ● CONTRA-INDICATIONS

- ▶ With intramuscular use Acute myocardial infarction · bradycardia · recent heart surgery · severe hypotension · sick sinus syndrome · unstable angina

- **CAUTIONS** Bone-marrow depression · diabetes mellitus (risk of exacerbation or ketoacidosis) · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus

### CAUTIONS, FURTHER INFORMATION

- ▶ CNS and respiratory depression
- ▶ With intramuscular use Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving a benzodiazepine or another antipsychotic (leave

at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · hypercholesterolaemia · hypertriglyceridaemia · increased appetite · malaise · oedema
- ▶ **Uncommon** Alopecia · amnesia · bradycardia · epistaxis
- ▶ **Rare** Hepatitis · pancreatitis · rhabdomyolysis

#### SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Hypoventilation · sinus pause
- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Consider initial dose of 5 mg daily.
- **RENAL IMPAIRMENT** Consider initial dose of 5 mg daily.
- **MONITORING REQUIREMENTS**
  - ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - ▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- **DIRECTIONS FOR ADMINISTRATION** Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ With intramuscular use When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should not be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible tablets.

## Paliperidone

- **DRUG ACTION** Paliperidone is a metabolite of risperidone.

### ● INDICATIONS AND DOSE

#### Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

##### ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ **Adult:** 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle, for missed doses see product literature

#### Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder

##### ▶ BY MOUTH

- ▶ **Adult:** 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily

**• CAUTIONS****GENERAL CAUTIONS**

Cataract surgery (risk of intraoperative floppy iris syndrome) · elderly patients with dementia · elderly patients with risk factors for stroke · predisposition to gastro-intestinal obstruction · prolactin-dependent tumours

**SPECIFIC CAUTIONS**

- With intramuscular use When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

**• SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- Common or very common** Anxiety · appetite changes · arthralgia · depression · epistaxis · hypertension · infection · malaise · myalgia · oedema · respiratory disorders · sleep disorders · toothache · urinary disorders
- Uncommon** Alopecia · elevated plasma-cholesterol concentrations · elevated plasma-triglyceride concentrations · hyposaesthesia · paraesthesia · taste disturbances · tinnitus · visual disorders
- Rare** Inappropriate antidiuretic hormone secretion · intestinal obstruction · intra-operative floppy iris syndrome · pancreatitis · pulmonary embolism · rhabdomyolysis

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use Erythema · nodules · pain at injection site · swelling

**SIDE-EFFECTS, FURTHER INFORMATION**

- With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- PREGNANCY** Use only if potential benefit outweighs risk—toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually.

- BREAST FEEDING** Avoid—present in milk.

- HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

**• RENAL IMPAIRMENT**

- With oral use Initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m<sup>2</sup> (max. 6 mg once daily). Initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m<sup>2</sup> (max. 3 mg once daily). Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- With intramuscular use Initial dose 100 mg on day 1 and then 75 mg on day 8 if eGFR 50–80 mL/minute/1.73 m<sup>2</sup>; recommended maintenance dose 50 mg (range 25–100 mg) monthly if eGFR 50–80 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

**• MONITORING REQUIREMENTS**

- With intramuscular use Treatment requires careful monitoring for optimum effect.

**• DIRECTIONS FOR ADMINISTRATION**

- With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
- With oral use Always take with breakfast or always take on an empty stomach.

- PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer paliperidone tablets.

**Missed doses**

- With intramuscular use For missed doses see product literature.

**• MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**Quetiapine**

- DRUG ACTION** Quetiapine is a dopamine D<sub>1</sub>, dopamine D<sub>2</sub>, 5-HT<sub>2</sub>, 1α<sub>1</sub>-adrenoceptor, and histamine-1 receptor antagonist.

**• INDICATIONS AND DOSE****Schizophrenia****▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day

**▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day
- Elderly: Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

**Treatment of mania in bipolar disorder****▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day

**▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily
- Elderly: Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily continued →

**Treatment of depression in bipolar disorder**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Adult:** 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ **Adult:** 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

**Prevention of mania and depression in bipolar disorder**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Adult:** Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ **Adult:** Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

**Adjunctive treatment of major depression**

- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ **Adult:** 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily
- ▶ **Elderly:** Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

- **CAUTIONS** Cerebrovascular disease · elderly · patients at risk of aspiration pneumonia · treatment of depression in patients under 25 years (increased risk of suicide)
- **SIDE-EFFECTS**
- ▶ **Common or very common** Asthenia · dysarthria · dyspnoea · elevated plasma-cholesterol concentrations · elevated plasma-triglyceride concentrations · increased appetite · irritability · peripheral oedema · sleep disorders
- ▶ **Uncommon** Hyponatraemia · hypothyroidism · restless legs syndrome · rhinitis
- ▶ **Rare** Hepatitis · pancreatitis
- ▶ **Very rare** Angioedema · inappropriate secretion of antidiuretic hormone · rhabdomyolysis · Stevens-Johnson syndrome
- ▶ **Frequency not known** Suicidal behaviour (particularly on initiation) · toxic epidermal necrolysis
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** For *immediate-release tablets*, initially 25 mg daily, increased daily in steps of 25–50 mg. For *modified-release tablets*, initially 50 mg daily, increased daily in steps of 50 mg.

## Risperidone

- **DRUG ACTION** Risperidone is a dopamine D<sub>2</sub>, 5-HT<sub>2A</sub>, α<sub>1A</sub>-adrenoceptor, and histamine-1 receptor antagonist.

### ● INDICATIONS AND DOSE

#### Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**  
 ▶ Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

#### Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**  
 ▶ Adult: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

#### Acute and chronic psychosis

- ▶ **BY MOUTH**  
 ▶ Adult: 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower

titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day

▶ **Elderly:** Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

#### Mania

- ▶ **BY MOUTH**  
 ▶ Adult: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1–6 mg daily  
 ▶ Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

#### Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer's dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others

- ▶ **BY MOUTH**  
 ▶ Adult: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily)

### ● CAUTIONS

#### GENERAL CAUTIONS

Avoid in acute porphyrias p. 930 · cataract surgery (risk of intra-operative floppy iris syndrome) · dehydration · dementia with Lewy bodies · prolactin-dependent tumours

#### SPECIFIC CAUTIONS

- ▶ With intramuscular use When transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **SIDE-EFFECTS**
- #### GENERAL SIDE-EFFECTS
- ▶ **Common or very common** Anxiety · appetite changes · arthralgia · depression · epistaxis · hypertension · infection · malaise · myalgia · oedema · respiratory disorders · sleep disorders · toothache · urinary disorders
- ▶ **Uncommon** Alopecia · elevated plasma-cholesterol concentrations · elevated plasma-triglyceride concentrations · hypoaesthesia · paraesthesia · taste disturbances · tinnitus · visual disorders
- ▶ **Rare** Inappropriate antidiuretic hormone secretion · intestinal obstruction · intra-operative floppy iris syndrome · pancreatitis · pulmonary embolism · rhabdomyolysis

#### SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Erythema · nodules · pain at injection site · swelling

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—small amount present in milk.
- **HEPATIC IMPAIRMENT**
- ▶ With intramuscular use If an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks.
- ▶ With oral use Initial and subsequent oral doses should be halved.
- **RENAL IMPAIRMENT** Initial and subsequent oral doses should be halved.
- **MONITORING REQUIREMENTS**
- ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.
- ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

### ● PATIENT AND CARER ADVICE

- ▶ With oral use Patients or carers should be given advice on how to administer risperidone orodispersible tablets and oral liquid (counselling on use of dose syringe advised).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

## ANTIPSYCHOTICS > SECOND-GENERATION

### (DEPOT INJECTIONS)

See under individual antipsychotics, second-generation monographs above for details of other depot injections

FR 361

## Olanzapine embonate

### (Olanzapine pamoate)

### ● INDICATIONS AND DOSE

#### Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)

##### ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

#### Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

##### ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

#### Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)

##### ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

### IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute* episode.

- **CAUTIONS** Bone-marrow depression · diabetes mellitus (risk of exacerbation or ketoacidosis) · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

### ● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · hypercholesterolaemia · hypertriglyceridaemia · increased appetite · malaise · oedema
- ▶ **Uncommon** Alopecia · amnesia · bradycardia · epistaxis
- ▶ **Rare** Hepatitis · pancreatitis · rhabdomyolysis
- ▶ **Frequency not known** Erythema · nodules · pain at injection site · swelling

### SIDE-EFFECTS, FURTHER INFORMATION

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

### Overdose

Post-injection reactions have been reported leading to signs and symptoms of overdose.

- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Initially 150 mg every 4 weeks; increase with caution in moderate impairment.
- **RENAL IMPAIRMENT** Initially 150 mg every 4 weeks.
- **MONITORING REQUIREMENTS**
  - ▶ Observe patient for at least 3 hours after injection.
  - ▶ Treatment requires careful monitoring for optimum effect.
  - ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - ▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- **DIRECTIONS FOR ADMINISTRATION** Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

F 361

### Promazine hydrochloride

#### ● INDICATIONS AND DOSE

##### Short-term adjunctive management of psychomotor agitation

- ▶ BY MOUTH
- ▶ Adult: 100–200 mg 4 times a day

##### Agitation and restlessness in elderly

- ▶ BY MOUTH
- ▶ Elderly: 25–50 mg 4 times a day

- **CONTRA-INDICATIONS** CNS depression · comatose states · pheochromocytoma
- **CAUTIONS** Cerebral arteriosclerosis
- **SIDE-EFFECTS** Haemolytic anaemia
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **LESS SUITABLE FOR PRESCRIBING** Promazine hydrochloride is less suitable for prescribing.

## CNS STIMULANTS

### Piracetam

#### ● INDICATIONS AND DOSE

##### Adjunctive treatment of cortical myoclonus

- ▶ BY MOUTH
- ▶ Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

- **CONTRA-INDICATIONS** Cerebral haemorrhage · Huntington's chorea
- **CAUTIONS** Gastric ulcer · history of haemorrhagic stroke · increased risk of bleeding · major surgery · underlying disorders of haemostasis
- **INTERACTIONS** Caution with concomitant drugs that increase bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Hyperkinesia · nervousness · weight gain

- ▶ **Uncommon** Abdominal pain · anxiety · asthenia · ataxia · confusion · depression · dermatitis · diarrhoea · drowsiness · haemorrhagic disorder · hallucination · headache · insomnia · nausea · pruritus · urticaria · vertigo · vomiting

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Adjust dose if both hepatic and renal impairment.

● **RENAL IMPAIRMENT** Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m<sup>2</sup>; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>.

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

● **DIRECTIONS FOR ADMINISTRATION** Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

● **PRESCRIBING AND DISPENSING INFORMATION** Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.

#### ● MEDICINAL FORMS

## MONOAMINE DEPLETING DRUGS

### Tetrabenazine

#### ● INDICATIONS AND DOSE

**Movement disorders due to Huntington's chorea, hemiballismus, senile chorea, and related neurological conditions**

▶ BY MOUTH

▶ **Adult:** Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day

▶ **Elderly:** Lower initial dose may be necessary

**Moderate to severe tardive dyskinesia**

▶ BY MOUTH

▶ **Adult:** Initially 12.5 mg daily, dose to be gradually increased according to response

● **CONTRA-INDICATIONS** Depression · parkinsonism · phaeochromocytoma · prolactin-dependent tumours

● **CAUTIONS** Susceptibility to QT-interval prolongation

● **INTERACTIONS** → Appendix 1 (tetrabenazine). Caution with concomitant use of drugs that prolong QT interval.

#### ● SIDE-EFFECTS

▶ **Common or very common** Anxiety · confusion · constipation · depression · diarrhoea · drowsiness · dysphagia · hypotension · insomnia · nausea · parkinsonism · vomiting

▶ **Uncommon** Altered consciousness level · extrapyramidal disorders · hyperthermia

▶ **Rare** Neuroleptic malignant syndrome

▶ **Very rare** Rhabdomyolysis

▶ **Frequency not known** Agitation · amnesia · ataxia · bradycardia · disorientation · dizziness · dry mouth · dyspepsia

● **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Use half initial dose and slower dose titration in mild to moderate impairment. Use with caution in severe impairment.

● **RENAL IMPAIRMENT** Use with caution.

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

● **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May affect performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

## MUSCLE RELAXANTS > MUSCLE RELAXANTS, PERIPHERALLY ACTING > NEUROTOXINS (BOTULINUM TOXINS)

### Botulinum toxin type A

#### ● INDICATIONS AND DOSE

**Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) | Blepharospasm (specialist use only) | Hemifacial spasm (specialist use only) | Spasmodic torticollis (specialist use only) | Severe hyperhidrosis of the axillae (specialist use only) | Prophylaxis of headaches in adults with chronic migraine (specialist use only) | Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) | Ankle disability due to lower limb spasticity associated with stroke (specialist use only) | Management of bladder dysfunctions (specialist use only) | Temporary improvement of moderate to severe crow's feet (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRADERMAL INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** (consult product literature)

#### DOSE EQUIVALENCE AND CONVERSION

▶ **Important:** information is specific to each individual preparation.

● **CONTRA-INDICATIONS** Acute urinary retention (specific to use in bladder disorders only) · catheterisation difficulties (specific to use in bladder disorders only) · generalised disorders of muscle activity · infection at injection site · myasthenia gravis · presence of bladder calculi (specific to use in bladder disorders only) · urinary tract infection (specific to use in bladder disorders only)

#### ● CAUTIONS

##### GENERAL CAUTIONS

Atrophy in target muscle · chronic respiratory disorder · elderly · excessive weakness in target muscle · history of

aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

#### SPECIFIC CAUTIONS

- ▶ When used for blepharospasm or hemifacial spasm Risk of angle-closure glaucoma

#### CAUTIONS, FURTHER INFORMATION

Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.

- ▶ Blepharospasm or hemifacial spasm When used for blepharospasm and hemifacial spasm, reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed.

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Excessive doses may paralyse distant muscles · increased electrophysiologic jitter in some distant muscles · influenza-like symptoms · misplaced injections may paralyse nearby muscle groups
- ▶ **Rare** Antibody formation (substantial deterioration in response) · arrhythmias · myocardial infarction · seizures
- ▶ **Very rare** Aspiration · dysphagia · dysphonia · exaggerated muscle weakness · respiratory disorders

##### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - ▶ When used for axillary hyperhidrosis Abnormal skin odour · alopecia · hot flushes · non-axillary sweating · paraesthesia · pruritus · subcutaneous nodule
  - ▶ When used for blepharospasm Dry eye · ecchymosis · facial oedema · irritation · keratitis · lacrimation · lagophthalmos · photophobia · ptosis
  - ▶ When used for focal upper-limb spasticity associated with stroke Dysphagia · hypertonia · purpura
  - ▶ When used for hemifacial spasm Dry eye · ecchymosis · facial oedema · irritation · keratitis · lacrimation · lagophthalmos · photophobia · ptosis
  - ▶ When used for spasmodic torticollis Back pain · dizziness · drowsiness · dry mouth · dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle) · headache · hypertonia · malaise · nausea · numbness · rhinitis · stiffness · weakness
  - ▶ When used for temporary improvement of moderate to severe wrinkles between the eyebrows Facial oedema · headache · ptosis
  - ▶ When used for axillary hyperhidrosis Pain in extremities
- ▶ **Uncommon**
  - ▶ When used for axillary hyperhidrosis Joint pain · myalgia
  - ▶ When used for blepharospasm Conjunctivitis · dermatitis · diplopia · dizziness · drooping · dry mouth · ectropion · entropion · facial weakness · headache · paraesthesia · tiredness · visual disturbances
  - ▶ When used for focal upper-limb spasticity associated with stroke Amnesia · arthralgia · bursitis · cough · depression · dry mouth · dysaesthesia · haematoma · headache · insomnia · malaise · pain in extremities · paraesthesia · peripheral oedema · vertigo
  - ▶ When used for focal upper-limb spasticity associated with stroke Nausea
  - ▶ When used for hemifacial spasm Conjunctivitis · dermatitis · diplopia · dizziness · drooping · dry mouth · ectropion · entropion · facial weakness · headache · paraesthesia · tiredness · visual disturbances
  - ▶ When used for spasmodic torticollis Colitis · diarrhoea · diplopia · dyspnoea · eye pain · myalgia · ptosis · skeletal pain · sweating · tremor · voice alteration · vomiting

- ▶ When used for temporary improvement of moderate to severe wrinkles between the eyebrows Anxiety · asthenia · blepharitis · dizziness · dry mouth · dry skin · muscle cramp · nausea · paraesthesia · photosensitivity reactions · tinnitus · visual disturbances
- ▶ **Rare**

- ▶ When used for blepharospasm Eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)
- ▶ When used for hemifacial spasm Eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)
- ▶ **Very rare**
  - ▶ When used for blepharospasm Angle-closure glaucoma · corneal epithelial defect · corneal perforation · corneal ulceration
  - ▶ When used for hemifacial spasm Angle-closure glaucoma · corneal epithelial defect · corneal perforation · corneal ulceration
- ▶ **Frequency not known**
  - ▶ When used for focal lower-limb spasticity associated with stroke Arthralgia · peripheral oedema · rash

- **CONCEPTION AND CONTRACEPTION** Avoid in women of child-bearing age unless using effective contraception.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies (manufacturer of *Botox*<sup>®</sup> advise avoid).

- **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.

- **PRESCRIBING AND DISPENSING INFORMATION**

Preparations are not interchangeable.

- **PATIENT AND CARER ADVICE** Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

- **NATIONAL FUNDING/ACCESS DECISIONS**

##### NICE technology appraisals (TAs)

- ▶ **Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012)** NICE TA260 Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse. [www.nice.org.uk/TA260](http://www.nice.org.uk/TA260)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2011 and March 2013) that *Botox*<sup>®</sup> is **not** recommended for use within NHS Scotland for prophylaxis of headaches in adults with chronic migraine.

The *Scottish Medicines Consortium* has advised that *Azzalure*<sup>®</sup> and *Vistabel*<sup>®</sup> (December 2010), and *Bocouture*<sup>®</sup> (February 2011) are **not** recommended for use within NHS Scotland.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for injection

- ▶ **Azzalure** (Galderma (UK) Ltd)  
**Botulinum toxin type A 125 unit** Azzalure 125unit powder for solution for injection vials | 1 vial [PoM] £64.00 | 2 vial [PoM] £128.00
- ▶ **Bocouture** (Merz Pharma UK Ltd)  
**Botulinum toxin type A 50 unit** Bocouture 50unit powder for solution for injection vials | 1 vial [PoM] £72.00
- ▶ **Botox** (Allergan Ltd)  
**Botulinum toxin type A 50 unit** Botox 50unit powder for solution for injection vials | 1 vial [PoM] £77.50

**Botulinum toxin type A 100 unit** Botox 100unit powder for solution for injection vials | 1 vial [PoM] £138.20

**Botulinum toxin type A 200 unit** Botox 200unit powder for solution for injection vials | 1 vial [PoM] £276.40

▶ **Dysport** (Ipsen Ltd)

**Botulinum toxin type A 300 unit** Dysport 300unit powder for solution for injection vials | 1 vial [PoM] £92.40

**Botulinum toxin type A 500 unit** Dysport 500unit powder for solution for injection vials | 2 vial [PoM] £308.00

▶ **Xeomin** (Merz Pharma UK Ltd)

**Botulinum toxin type A 50 unit** Xeomin 50unit powder for solution for injection vials | 1 vial [PoM] £72.00

**Botulinum toxin type A 100 unit** Xeomin 100unit powder for solution for injection vials | 1 vial [PoM] £129.90

**Botulinum toxin type A 200 unit** Xeomin 200unit powder for solution for injection vials | 1 vial [PoM] no price available (Hospital only)

## Botulinum toxin type B

### ● INDICATIONS AND DOSE

#### Spasmodic torticollis (cervical dystonia) (specialist use only)

▶ BY INTRAMUSCULAR INJECTION

- Adult: Initially 5000–10 000 units, adjusted according to response, dose to be divided between 2–4 most affected muscles

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ **Important:** information specific to each individual preparation.

- **CONTRA-INDICATIONS** Neuromuscular disorders · neuromuscular junctional disorders
- **CAUTIONS** History of dysphagia or aspiration · off-label use (risk of toxin spread) · tolerance may occur
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dry mouth · dyspepsia · dysphagia · dysphonia · headache · increased electrophysiologic jitter in some distant muscles · influenza-like symptoms · myasthenia · neck pain · taste disturbances · visual disturbances · worsening torticollis
  - ▶ **Frequency not known** Aspiration pneumonia · constipation · exaggerated muscle weakness · malaise · ptosis · respiratory disorders · vomiting
- **PREGNANCY** Low risk of systemic absorption but avoid unless essential.
- **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION** Injection may be diluted with sodium chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION** **Important:** not interchangeable with other botulinum toxin preparations.
- **PATIENT AND CARER ADVICE** Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

▶ **NeuroBloc** (Eisai Ltd)

**Botulinum toxin type B 5000 unit per 1 ml** NeuroBloc 5,000units/1ml solution for injection vials | 1 vial [PoM] £148.27 (Hospital only)

NeuroBloc 10,000units/2ml solution for injection vials | 1 vial [PoM] £197.69 (Hospital only)

NeuroBloc 2,500units/0.5ml solution for injection vials | 1 vial [PoM] £111.20 (Hospital only)

## NEUROPROTECTIVE DRUGS

### Tafamidis

#### ● INDICATIONS AND DOSE

**Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision)**

▶ BY MOUTH

- Adult: 20 mg once daily

- **SIDE-EFFECTS** Abdominal pain · diarrhoea · urinary tract infection · vaginal infection
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.
- **PREGNANCY** Avoid (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Tafamidis should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

## 4.2 Parkinson's disease

### Parkinson's disease and related disorders

#### Parkinson's disease

In idiopathic Parkinson's disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients' quality of life.

Patients with suspected Parkinson's disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson's disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson's disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson's disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. **Levodopa, non-ergot-derived dopamine-receptor agonists, or monoamine-oxidase-B inhibitors** can be prescribed for initial treatment in early Parkinson's disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

**Elderly**

Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

**Dopaminergic drugs used in Parkinson's disease****Dopamine-receptor agonists**

The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson's disease is often with the dopamine-receptor agonists pramipexole p. 395, ropinirole p. 396, and rotigotine p. 398. The ergot-derived dopamine-receptor agonists bromocriptine p. 391, cabergoline p. 393, and pergolide p. 394 are rarely used because of the risk of fibrotic reactions.

When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa.

Dopamine-receptor agonists are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced.

Apomorphine hydrochloride p. 390 is a potent dopamine-receptor agonist that is sometimes helpful in advanced disease for patients experiencing unpredictable 'off' periods with levodopa treatment. Apomorphine hydrochloride should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an 'off' episode, the threshold dose of apomorphine hydrochloride is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine hydrochloride by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an 'off' episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications.

**Levodopa**

**Levodopa**, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral **dopa-decarboxylase inhibitor**, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa p. 387) and carbidopa (in co-careldopa p. 388).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone p. 402 can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period. 'End-of-dose' deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

**Monoamine-oxidase-B inhibitors**

Rasagiline p. 399 and selegiline hydrochloride p. 399 are monoamine-oxidase-B inhibitors used in Parkinson's disease. Early treatment with selegiline hydrochloride alone can delay the need for levodopa therapy.

**Antimuscarinic drugs used in parkinsonism**

Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson's disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine hydrochloride p. 384, procyclidine hydrochloride p. 384, and trihexyphenidyl hydrochloride p. 385 reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson's disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.

There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 321 can be given for life-threatening acute drug-induced dystonic reactions.

**Drugs used in essential tremor, chorea, tics, and related disorders**

Tetrabenazine p. 380 is mainly used to control movement disorders in Huntington's chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 363 [unlicensed indication], olanzapine p. 373 [unlicensed indication], risperidone p. 377 [unlicensed indication], and quetiapine p. 375 [unlicensed indication], can also be used to suppress chorea in Huntington's disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 364 [unlicensed indication] (**important**: ECG monitoring required), clonidine hydrochloride p. 136 [unlicensed indication], and sulpiride p. 366 [unlicensed indication]. Trihexyphenidyl hydrochloride in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 361 and haloperidol are used to relieve intractable hiccup.

Propranolol hydrochloride p. 142 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 313 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 379 is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 983 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

**Torsion dystonia and other involuntary movements**

Treatment with botulinum toxin type A p. 380 can be considered after an acquired non-progressive brain injury if

rapid-onset spasticity causes postural or functional difficulties.

## ANTIMUSCARINICS

### Orphenadrine hydrochloride

● **DRUG ACTION** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

#### ● INDICATIONS AND DOSE

**Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)**

##### ► BY MOUTH

- Adult: Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
- Elderly: Preferably dose at lower end of range

● **CONTRA-INDICATIONS** Acute porphyrias p. 930 · gastro-intestinal obstruction · myasthenia gravis

● **CAUTIONS** Cardiovascular disease · elderly · hypertension · in patients susceptible to angle-closure glaucoma · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia

● **INTERACTIONS** → Appendix 1 (antimuscarinics). Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

#### ● SIDE-EFFECTS

- **Common or very common** Urinary retention
- **Uncommon** Drowsiness · impaired coordination · insomnia · seizures
- **Very rare** Angle-closure glaucoma
- **Frequency not known** Anxiety · blurred vision · confusion · constipation · dizziness · dry mouth · euphoria · hallucinations · impaired memory · nausea · rash · restlessness · tachycardia · vomiting

● **PREGNANCY** Caution.

● **BREAST FEEDING** Caution.

● **HEPATIC IMPAIRMENT** Use with caution.

● **RENAL IMPAIRMENT** Use with caution.

● **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks**

May affect performance of skilled tasks (e.g. driving).

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

##### Tablet

EXCIPIENTS: May contain Tartrazine

##### ► Orphenadrine hydrochloride (Non-proprietary)

Orphenadrine hydrochloride 50 mg Orphenadrine 50mg tablets | 100 tablet [PoM] £80.00 | 250 tablet [PoM] no price available

##### Oral solution

##### ► Orphenadrine hydrochloride (Non-proprietary)

Orphenadrine hydrochloride 10 mg per 1 ml Orphenadrine 50mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £36.80 DT price = £35.65

## Procyclidine hydrochloride

● **DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

#### ● INDICATIONS AND DOSE

**Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)**

##### ► BY MOUTH

- Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day
- Elderly: Lower end of range preferable

##### Acute dystonia

##### ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
- Elderly: Lower end of range preferable

● **CONTRA-INDICATIONS** Gastro-intestinal obstruction · myasthenia gravis

● **CAUTIONS** Cardiovascular disease · elderly · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma

● **INTERACTIONS** → Appendix 1 (antimuscarinics). Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urinary retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

● **SIDE-EFFECTS** Angle-closure glaucoma · anxiety · blurred vision · confusion · constipation · dizziness · dry mouth · euphoria · gingivitis · hallucinations · impaired memory · nausea · rash · restlessness · tachycardia · urinary retention · vomiting

● **PREGNANCY** Use only if potential benefit outweighs risk.

● **BREAST FEEDING** No information available.

● **HEPATIC IMPAIRMENT** Use with caution.

● **RENAL IMPAIRMENT** Use with caution.

● **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks**

May affect performance of skilled tasks (e.g. driving).

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

##### ► Procyclidine hydrochloride (Non-proprietary)

**DOPAMINERGIC DRUGS > CATECHOL-O-METHYLTRANSFERASE INHIBITORS****Entacapone**

- **DRUG ACTION** Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-*O*-methyltransferase, allowing more levodopa to reach the brain.

● **INDICATIONS AND DOSE****Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)**▶ **BY MOUTH**

- ▶ **Adult:** 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day

- **CONTRA-INDICATIONS** History of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · pheochromocytoma
- **CAUTIONS** Concurrent levodopa dose may need to be reduced by about 10–30% · ischaemic heart disease
- **INTERACTIONS** → Appendix 1 (entacapone). Avoid iron-containing products at the same time of day.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abnormal dreams · confusion · constipation · diarrhoea · dizziness · dry mouth · dyskinesia · dystonia · fatigue · hallucinations · insomnia · ischaemic heart disease · nausea · sweating · urine may be coloured reddish-brown · vomiting
  - ▶ **Uncommon** Myocardial infarction
  - ▶ **Rare** Rash
  - ▶ **Very rare** Agitation · anorexia · urticaria · weight loss
  - ▶ **Frequency not known** Colitis · hepatitis · neuroleptic malignant syndrome · rhabdomyolysis · skin, hair, and nail discoloration
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **PATIENT AND CARER ADVICE** Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 14

Combinations available: **Carbidopa with entacapone and levodopa**, p. 386

## Tolcapone

● **DRUG ACTION** Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-*O*-methyltransferase, allowing more levodopa to reach the brain.

### ● INDICATIONS AND DOSE

**Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-*O*-methyltransferase inappropriate (under expert supervision)**

#### ► BY MOUTH

► Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks **only** if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

● **CONTRA-INDICATIONS** Pheochromocytoma · previous history of hyperthermia · previous history of neuroleptic malignant syndrome · previous history of rhabdomyolysis · severe dyskinesia

● **CAUTIONS** Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

### CAUTIONS, FURTHER INFORMATION

► **Hepatotoxicity** Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcapone once discontinued.

● **INTERACTIONS** → Appendix 1 (tolcapone).

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · chest pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dyskinesia · dyspepsia · dystonia · excessive dreaming · hallucinations · headache · hepatotoxicity · nausea · sleep disturbances · sweating · syncope · urine discoloration · vomiting · xerostomia

► **Frequency not known** Neuroleptic malignant syndrome reported on dose reduction or withdrawal · rhabdomyolysis reported on dose reduction or withdrawal

● **PREGNANCY** Toxicity in *animal studies*—use only if potential benefit outweighs risk.

● **BREAST FEEDING** Avoid—present in milk in *animal studies*.

● **HEPATIC IMPAIRMENT** Avoid.

● **RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

● **MONITORING REQUIREMENTS** Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

● **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

The properties listed below are those particular to the combination only. For the properties of the components please consider, co-careldopa p. 388, entacapone p. 385.

### ● INDICATIONS AND DOSE

#### STALEVO® 100/25/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

#### STALEVO® 125/31.25/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

#### STALEVO® 150/37.5/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

#### STALEVO® 175/43.75/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 8 tablets per day

#### STALEVO® 200/50/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 7 tablets per day

#### STALEVO® 50/12.5/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

#### STALEVO® 75/18.75/200

**Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment**

#### ► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

● **PRESCRIBING AND DISPENSING INFORMATION** Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate *Stalevo*® at a dose that provides similar (or slightly lower) amount of levodopa.

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring

to *Stalevo*® (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate *Stalevo*® at a dose that provides similar (or slightly higher) amount of levodopa.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with carbidopa with entacapone and levodopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

## Co-beneldopa

#### ● INDICATIONS AND DOSE

##### Parkinson's disease

###### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

• **Adult:** Initially 50 mg 3–4 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

• **Elderly:** Initially 50 mg 1–2 times a day, then increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

##### Parkinson's disease (in advanced disease)

###### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

• **Adult:** Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

##### Parkinson's disease (patients not taking levodopa/dopa-decarboxylase inhibitor therapy)

###### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

• **Adult:** Initially 1 capsule 3 times a day; maximum 6 capsules per day

#### Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

• **Adult:** Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release *Madopar*® may be needed with first morning dose; if response still poor to total daily dose of *Madopar*® CR plus *Madopar*® corresponding to 1.2 g levodopa—consider alternative therapy.

##### DOSE EQUIVALENCE AND CONVERSION

▶ Dose is expressed as levodopa.

#### IMPORTANT SAFETY INFORMATION

##### IMPULSE CONTROL DISORDERS

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Cushing's syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1 (co-beneldopa, levodopa).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abnormal dreams · anorexia · anxiety · arrhythmias · chorea · confusion · dementia · depression · dizziness · drowsiness · dry mouth · dyskinesia · dystonia · euphoria · fatigue · insomnia · nausea · palpitations · postural hypotension · psychosis · syncope · taste disturbances · vomiting
  - ▶ **Uncommon** Ataxia · chest pain · constipation · diarrhoea · dysphagia · flatulence · hand tremor · hoarseness · hypersalivation · hypertension · malaise · muscle cramps · oedema · reddish discoloration of the urine and other body fluids · weakness · weight changes
  - ▶ **Rare** Abdominal pain · activation of Horner's syndrome · activation of malignant melanoma · agitation · agranulocytosis · alopecia · blepharospasm · blurred vision · bruxism · convulsions · diplopia · disorientation · duodenal ulcer · dyspepsia · dyspnoea · exanthema · flushing · gastro-intestinal bleeding · haemolytic anaemia · headache · Henoch-Schönlein purpura · hiccups · leucopenia · neuroleptic malignant syndrome (associated with abrupt withdrawal) · non-haemolytic anaemia · oculo-gyric crisis · paraesthesia · phlebitis · priapism · pupil dilatation · reduced mental acuity · sweating · thrombocytopenia · trismus · urinary incontinence · urinary retention
  - ▶ **Very rare** Angle-closure glaucoma · suicidal ideation
  - ▶ **Frequency not known** Compulsive behaviour
- **PREGNANCY** Caution in pregnancy—toxicity has occurred in animal studies.
- **BREAST FEEDING** May suppress lactation; present in milk—avoid.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

- **EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).
- **DIRECTIONS FOR ADMINISTRATION** The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa.
 

When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%.

When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

**Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Co-careldopa**

28-Sep-2016

**INDICATIONS AND DOSE****Parkinson's disease**▶ **BY MOUTH**

- ▶ **Adult:** Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, alternatively increased in steps of 25/100 mg once daily or on alternate days, dose to be adjusted according to response; dose increased until 800 mg levodopa (with 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

**Parkinson's disease—alternative regimen**▶ **BY MOUTH**

- ▶ **Adult:** Initially 12.5/50 mg 3–4 times a day, alternatively initially 10/100 mg 3–4 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 10/100 mg once daily or on alternate days, adjusted according to response, dose increased until 800 mg levodopa (with up to 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- ▶ 2 tablets *Sinemet*<sup>®</sup> 12.5 mg/50 mg is equivalent to 1 tablet *Sinemet*<sup>®</sup> Plus 25 mg/100 mg.

**CARAMET<sup>®</sup> CR****Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)**▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**

- ▶ **Adult:** Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

**Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)**▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**

- ▶ **Adult:** Discontinue previous preparation at least 12 hours before first dose of *Caramet*<sup>®</sup> CR; substitute *Caramet*<sup>®</sup> CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days.

**DUODOPA<sup>®</sup>****Severe Parkinson's disease inadequately controlled by other preparations**

- ▶ **Adult:** Administered as intestinal gel, for use with enteral tube (consult product literature)

**HALF SINEMET® CR****Parkinson's disease (for fine adjustment of Sinemet® CR dose)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

**SINEMET® CR****Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor therapy)**

- ▶ BY MOUTH
- ▶ Adult: Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

**Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release *Sinemet*® tablets (substitute *Sinemet*® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

**IMPORTANT SAFETY INFORMATION****IMPULSE CONTROL DISORDERS**

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.  
When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.  
Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

**● PATIENT AND CARER ADVICE****Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**● NATIONAL FUNDING/ACCESS DECISIONS****DUODOPA®****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2016) that *Duodopa*® intestinal gel is accepted for restricted use within NHS Scotland, within its licensed indication, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

## DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

### Amantadine hydrochloride

- **DRUG ACTION** Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.

#### ● INDICATIONS AND DOSE

##### Parkinson's disease

▶ BY MOUTH

- ▶ Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
- ▶ Elderly: 100 mg daily, adjusted according to response

##### Post-herpetic neuralgia

▶ BY MOUTH

- ▶ Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

##### Treatment of influenza A (but not recommended)

▶ BY MOUTH

- ▶ Adult: 100 mg daily 4–5 days

##### Prophylaxis of influenza A (but not recommended)

▶ BY MOUTH

- ▶ Adult: 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

- **CONTRA-INDICATIONS** Epilepsy · history of gastric ulceration
- **CAUTIONS** Confused or hallucinatory states · congestive heart disease (may exacerbate oedema) · elderly · tolerance to the effects of amantadine may develop in Parkinson's disease
- **INTERACTIONS** → Appendix 1 (amantadine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · anxiety · dizziness · dry mouth · gastro-intestinal disturbances · hallucinations · headache · impaired concentration · insomnia · lethargy · livedo reticularis · mood changes · myalgia · palpitation ·

peripheral oedema · postural hypotension · slurred speech · sweating

- ▶ **Uncommon** Confusion · movement disorders · neuroleptic malignant syndrome · psychosis · rash · seizure · tremor · urinary incontinence · urinary retention · visual disturbances
- ▶ **Frequency not known** Heart failure · leucopenia · photosensitisation
- **PREGNANCY** Avoid; toxicity in *animal* studies.
- **BREAST FEEDING** Avoid; present in milk; toxicity in infant reported.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Reduce dose. Avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.
- **TREATMENT CESSATION** Avoid abrupt withdrawal in Parkinson's disease.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks** May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)**
    - ▶ Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158  
Amantadine is **not** recommended for prophylaxis of influenza.  
[www.nice.org.uk/TA158](http://www.nice.org.uk/TA158)
    - ▶ Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168  
Amantadine is **not** recommended for treatment of influenza.  
[www.nice.org.uk/TA168](http://www.nice.org.uk/TA168)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

##### Capsule

▶ **Amantadine hydrochloride (Non-proprietary)**

**Amantadine hydrochloride 100 mg** Amantadine 100mg capsules | 14 capsule [PoM] £10.25 | 56 capsule [PoM] £41.00 DT price = £41.00

##### Oral solution

▶ **Amantadine hydrochloride (Non-proprietary)**

**Amantadine hydrochloride 10 mg per 1 ml** Amantadine 50mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £138.18-£140.00 DT price = £138.64

## Apomorphine hydrochloride

#### ● INDICATIONS AND DOSE

**Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 1 mg, dose to be administered at the first sign of 'off' episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

**Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)**

► BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid if 'on' response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression
- **CAUTIONS** Cardiovascular disease · history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1 (apomorphine).
- **SIDE-EFFECTS**
  - **Common or very common** Confusion · drowsiness · hallucinations · nausea · sudden onset of sleep · vomiting · yawning
  - **Uncommon** Dyskinesia during 'on' periods (may require discontinuation) · dyspnoea · haemolytic anaemia (with levodopa) · postural hypotension · rash · thrombocytopenia (with levodopa)
  - **Rare** Eosinophilia
  - **Frequency not known** Compulsive behaviour · dizziness · peripheral oedema
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to opioids.
- **PREGNANCY** Avoid unless clearly necessary.
- **BREAST FEEDING** No information available; may suppress lactation.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
  - Monitor hepatic, haemopoietic, renal, and cardiovascular function.
  - *With concomitant levodopa* test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Drugs and driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see *Drugs and driving* under Guidance on prescribing p. 1.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sulfités

► **AP0-go** (Britannia Pharmaceuticals Ltd)

**Apomorphine hydrochloride 10 mg per 1 ml** APO-go 50mg/5ml solution for injection ampoules | 5 ampoule [PoM] £73.11 DT price = £73.11

► **AP0-go Pen** (Britannia Pharmaceuticals Ltd)

**Apomorphine hydrochloride 10 mg per 1 ml** APO-go PEN 30mg/3ml solution for injection | 5 pre-filled disposable injection [PoM] £123.91 DT price = £123.91

**Solution for infusion**

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sulfités

► **AP0-go PFS** (Britannia Pharmaceuticals Ltd)

**Apomorphine hydrochloride 5 mg per 1 ml** APO-go PFS 50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection [PoM] £73.11 DT price = £73.11

**Bromocriptine**

- **DRUG ACTION** Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

● **INDICATIONS AND DOSE**

**Prevention of lactation**

► BY MOUTH

- **Adult:** Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days continued →

**Suppression of lactation**

## ▶ BY MOUTH

- ▶ Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

**Hypogonadism | Galactorrhoea | Infertility**

## ▶ BY MOUTH

- ▶ Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

**Acromegaly**

## ▶ BY MOUTH

- ▶ Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

**Prolactinoma**

## ▶ BY MOUTH

- ▶ Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

**Parkinson's disease**

## ▶ BY MOUTH

- ▶ Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

**IMPORTANT SAFETY INFORMATION****FIBROTIC REACTIONS**

Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · hypertension in postpartum women or in puerperium

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures

or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop.

- **CAUTIONS** Acute porphyrias p. 930 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
  - **INTERACTIONS** → Appendix 1 (bromocriptine). Tolerance may be reduced by alcohol.
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Constipation · headache · nasal congestion · nausea
    - ▶ **Uncommon** Confusion (particularly with high doses) · dizziness · dry mouth · fatigue · hallucinations (particularly with high doses) · postural hypotension · psychomotor excitation (particularly with high doses) · vomiting
    - ▶ **Rare** Abdominal pain · arrhythmia · bradycardia · diarrhoea · gastric ulcer · gastro-intestinal bleeding · insomnia · paraesthesia · psychosis · tachycardia · tinnitus · visual disturbances
    - ▶ **Very rare** Neuroleptic malignant syndrome on withdrawal · vasospasm of fingers and toes (particularly in patients with Raynaud's syndrome)
    - ▶ **Frequency not known** Allergic skin reactions · alopecia · cardiac valvulopathy · constrictive pericarditis · drowsiness · dyskinesia · hypersexuality · hyponatraemia · hypotension · increased libido · leg cramps · leucopenia · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis · reversible hearing loss · thrombocytopenia · urinary incontinence
  - SIDE-EFFECTS, FURTHER INFORMATION**
    - ▶ Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.
  - **ALLERGY AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.
  - **CONCEPTION AND CONTRACEPTION** Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).
  - **BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.
  - **HEPATIC IMPAIRMENT** Dose reduction may be necessary.
  - **MONITORING REQUIREMENTS**
    - ▶ Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
    - ▶ Monitor for fibrotic disease.
    - ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.
  - **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
  - **PATIENT AND CARER ADVICE**
    - Driving and skilled tasks**  
Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.  
Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have

experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

## Cabergoline

- **DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

#### ● INDICATIONS AND DOSE

##### Prevention of lactation

###### ▶ BY MOUTH

- ▶ Adult: 1 mg, to be taken as a single dose on the first day postpartum

##### Suppression of established lactation

###### ▶ BY MOUTH

- ▶ Adult: 250 micrograms every 12 hours for 2 days

##### Hyperprolactinaemic disorders

###### ▶ BY MOUTH

- ▶ Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on separate days, then increased in steps of 500 micrograms every month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25–2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week

##### Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

###### ▶ BY MOUTH

- ▶ Adult: Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

#### IMPORTANT SAFETY INFORMATION

##### FIBROTIC REACTIONS

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

##### IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders
- **CAUTIONS** Acute porphyrias p. 930 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1 (cabergoline). Tolerance may be reduced by alcohol.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · angina · breast pain · confusion · constipation · depression · dyspepsia · epigastric pain · gastritis · hallucinations · headache · nausea · syncope
  - ▶ **Rare** Digital vasospasm · epistaxis · hot flushes · muscle weakness · palpitation · paraesthesia · transient hemianopia · vomiting
  - ▶ **Frequency not known** Allergic skin reactions · alopecia · cardiac valvulopathy · constrictive pericarditis · drowsiness · dyskinesia · erythromelalgia · hypersexuality · hypotension · increased libido · leg cramps · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.
- **ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).
- **PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation; avoid breast-feeding if lactation prevention fails.
- **HEPATIC IMPAIRMENT** Reduce dose in severe hepatic impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for fibrotic disease.
  - ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

## Pergolide

### ● INDICATIONS AND DOSE

**Monotherapy in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate**

#### ▶ BY MOUTH

▶ **Adult:** Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

**Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate**

#### ▶ BY MOUTH

▶ **Adult:** Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

### IMPORTANT SAFETY INFORMATION

#### FIBROTIC REACTIONS

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

#### IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Cardiac valvulopathy (exclude before treatment) · history of fibrotic disorders
- **CAUTIONS** Acute porphyrias p. 930 · arrhythmias · dyskinesia (may exacerbate) · hallucinations · history of confusion · psychosis · underlying cardiac disease
- **INTERACTIONS** → Appendix 1 (pergolide).
- **SIDE-EFFECTS** Abdominal pain · atrial premature contractions · compulsive behaviour · confusion · constipation · diarrhoea · diplopia · dizziness · drowsiness · dyskinesia · dyspepsia · dyspnoea · erythromelalgia · fever · hallucinations · hiccups · hypotension · insomnia · nausea ·

palpitation · rash · Raynaud's phenomenon · rhinitis · sudden onset of sleep · syncope · tachycardia · vomiting

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER EDUCATION**

#### Driving and skilled tasks

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**Pergolide (as Pergolide mesilate) 250 microgram** Pergolide 250microgram tablets | 100 tablet [PoM] £36.00-£39.00 DT price = £38.00

## Pramipexole

#### ● INDICATIONS AND DOSE

**Parkinson's disease, used alone or as an adjunct to co-beneldopa or co-careldopa**

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 88 micrograms 3 times a day, if tolerated dose to be increased by doubling dose every 5–7 days, increased to 350 micrograms 3 times a day, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ **Adult:** Initially 260 micrograms once daily, dose to be increased by doubling dose every 5–7 days, increased to 1.05 mg once daily, then increased in steps of 520 micrograms every week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

#### Moderate to severe restless legs syndrome

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days if necessary, repeat dose titration if restarting treatment after an interval

of more than a few days; maximum 540 micrograms per day

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses and strengths are stated in terms of pramipexole (base).
- ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:
  - 88 micrograms base = 125 micrograms salt;
  - 180 micrograms base = 250 micrograms salt;
  - 350 micrograms base = 500 micrograms salt;
  - 700 micrograms base = 1 mg salt.
- ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:
  - 260 micrograms base = 375 micrograms salt;
  - 520 micrograms base = 750 micrograms salt;
  - 1.05 mg base = 1.5 mg salt;
  - 1.57 mg base = 2.25 mg salt;
  - 2.1 mg base = 3 mg salt;
  - 2.62 mg base = 3.75 mg salt;
  - 3.15 mg base = 4.5 mg salt.

#### IMPORTANT SAFETY INFORMATION

##### IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease
- **INTERACTIONS** → Appendix 1 (pramipexole).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Confusion · constipation · decreased appetite · dizziness · drowsiness · dyskinesia · hallucinations · headache · hyperkinesia · hypotension · nausea · peripheral oedema · postural hypotension · restlessness · sleep disturbances · sudden onset of sleep · visual disturbances · vomiting · weight changes
- ▶ **Uncommon** Amnesia · binge eating · cardiac failure · compulsive behaviour · delusion · dyspnoea · hiccups · paranoia · pneumonia · pruritus · rash · syncope
- ▶ **Frequency not known** Paradoxical worsening of restless legs syndrome
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** May suppress lactation; avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** For *immediate-release* tablets in Parkinson's disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m<sup>2</sup>; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>. If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR. For *immediate-release* tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>. For *modified-release* tablets, initially 260 micrograms on alternate days if eGFR

30–50 mL/minute/1.73 m<sup>2</sup>, increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily. For *modified-release* tablets, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Risk of postural hypotension (especially on initiation)—monitor blood pressure.

● **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

## Ropinirole

- **INDICATIONS AND DOSE**

**Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa**

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose

to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- **Adult:** Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at intervals of at least 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at intervals of at least 2 weeks if required; maximum 24 mg per day

**Parkinson's disease in patients transferring from ropinirole immediate-release tablets**

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- **Adult:** Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose, consider slower titration in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

**Moderate to severe restless legs syndrome**

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **UNLICENSED USE** Doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Elderly · major psychotic disorders · severe cardiovascular disease (risk of hypotension—monitor blood pressure)
- **INTERACTIONS** ► Appendix 1 (ropinirole).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · confusion · constipation · dizziness · dryness · dyskinesia · dyspepsia · fatigue · gastro-oesophageal reflux disease ·

hallucinations · hypotension · nausea · nervousness · peripheral oedema · sudden onset of sleep · syncope · vomiting

- **Uncommon** Compulsive behaviour · psychosis
- **Very rare** Hepatic disorders
- **Frequency not known** Paradoxical worsening of restless legs syndrome

- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** May suppress lactation—avoid.
- **HEPATIC IMPAIRMENT** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

*The Scottish Medicines Consortium* has advised (June 2006) that *Adartrel*<sup>®</sup> should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### IMPORTANT SAFETY INFORMATION

##### IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Avoid exposure of patch to heat · remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion
- **INTERACTIONS** → Appendix 1 (rotigotine).
- **SIDE-EFFECTS**
  - **Common or very common** Abnormal behaviour · abnormal thinking · aggression · application site reactions · confusion · constipation · dizziness · drowsiness · dry mouth · dyskinesia · dyspepsia · hallucinations · headache · hiccup · hypertension · malaise · nausea · palpitation · paranoia · peripheral oedema · postural hypotension · pruritus · psychosis · rash · sleep disturbances · sudden onset of sleep · sweating · syncope · vomiting · weight changes
  - **Uncommon** Abdominal pain · atrial fibrillation · erectile dysfunction · hypotension · impulse control disorders · visual disturbances
  - **Rare** Irritability · obsessive compulsive disorder · seizures · tachycardia
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** May suppress lactation; avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Ophthalmic testing recommended.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **DIRECTIONS FOR ADMINISTRATION** Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days).
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as

## Rotigotine

### ● INDICATIONS AND DOSE

#### Monotherapy in Parkinson's disease

► BY TRANSDERMAL APPLICATION USING PATCHES

► **Adult:** Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 8 mg/24 hours per day

#### Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease

► BY TRANSDERMAL APPLICATION USING PATCHES

► **Adult:** Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 16 mg/24 hours per day

depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Neupro*<sup>®</sup> is accepted for restricted use for the treatment of advanced Parkinson's disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The *Scottish Medicines Consortium* has advised that *Neupro*<sup>®</sup> is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson's disease (June 2007).

The *Scottish Medicines Consortium* has advised (April 2009) that rotigotine (*Neupro*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Transdermal patch

CAUTIONARY AND ADVISORY LABELS 10

##### ▶ *Neupro* (UCB Pharma Ltd)

**Rotigotine 1 mg per 24 hour** *Neupro* 1mg/24hours transdermal patches | 28 patch [PoM] £77.24

**Rotigotine 2 mg per 24 hour** *Neupro* 2mg/24hours transdermal patches | 7 patch [PoM] no price available | 28 patch [PoM] £81.10  
DT price = £81.10

**Rotigotine 3 mg per 24 hour** *Neupro* 3mg/24hours transdermal patches | 28 patch [PoM] £102.35

**Rotigotine 4 mg per 24 hour** *Neupro* 4mg/24hours transdermal patches | 7 patch [PoM] no price available | 28 patch [PoM] £123.60  
DT price = £123.60

**Rotigotine 6 mg per 24 hour** *Neupro* 6mg/24hours transdermal patches | 7 patch [PoM] no price available | 28 patch [PoM] £149.93  
DT price = £149.93

**Rotigotine 8 mg per 24 hour** *Neupro* 8mg/24hours transdermal patches | 7 patch [PoM] no price available | 28 patch [PoM] £149.93  
DT price = £149.93

## DOPAMINERGIC DRUGS > MONOAMINE-OXIDASE B INHIBITORS

### Rasagiline

- **DRUG ACTION** Rasagiline is a monoamine-oxidase B inhibitor.

#### • INDICATIONS AND DOSE

**Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa for 'end-of-dose' fluctuations**

- ▶ BY MOUTH
- ▶ Adult: 1 mg daily

- **INTERACTIONS** → Appendix 1 (rasagiline).

#### • SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · angina · anorexia · arthralgia · conjunctivitis · constipation · depression · dry mouth · dyspepsia · flatulence · hallucinations · headache · influenza-like symptoms · leucopenia · rash · rhinitis · skin carcinoma · urinary urgency · vertigo · weight loss
- ▶ **Uncommon** Cerebrovascular accident · myocardial infarction
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—may suppress lactation.

- **HEPATIC IMPAIRMENT** Use with caution in mild impairment. Avoid in moderate to severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

##### ▶ *Rasagiline (Non-proprietary)*

**Rasagiline 1 mg** *Rasagiline* 1mg tablets | 28 tablet [PoM] £70.72 DT price = £13.38

##### ▶ *Azilect* (Teva UK Ltd)

**Rasagiline 1 mg** *Azilect* 1mg tablets | 28 tablet [PoM] £70.72 DT price = £13.38

## Selegiline hydrochloride

- **DRUG ACTION** Selegiline is a monoamine-oxidase-B inhibitor.

#### • INDICATIONS AND DOSE

**Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce 'end of dose' deterioration | Symptomatic parkinsonism**

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning

##### ▶ BY MOUTH USING ORAL LYOPHILISATE

▶ Adult: 1.25 mg once daily, dose to be taken before breakfast

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1.25-mg oral lyophilisate is equivalent to 10-mg tablet.
- ▶ Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (*Zelapar*<sup>®</sup>) 1.25 mg.

- **CONTRA-INDICATIONS** Active duodenal ulceration · active gastric ulceration · avoid or use with great caution in postural hypotension (when used in combination with levodopa)
- **CAUTIONS** Angina · arrhythmias · avoid in acute porphyrias p. 930 · duodenal ulceration · gastric ulceration · history of hepatic dysfunction · patients predisposed to confusion and psychosis · psychosis · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (selegiline). Avoid with drugs that increase blood pressure.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arthralgia · bradycardia · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · fatigue · hair loss · headache · hypertension · hypotension · impaired balance · mouth ulcers · movement disorders · muscle cramps · myalgia · myopathy · nasal congestion · nausea · psychosis · sleeping disorders · stomatitis · sweating · tremor
  - ▶ **Uncommon** Agitation · angina · ankle oedema · anxiety · arrhythmias · blurred vision · dyspnoea · leucocytopenia · loss of appetite · micturition difficulties · palpitation · postural hypotension · skin reactions · supraventricular tachycardia · thrombocytopenia
  - ▶ **Frequency not known** Hypersexuality
- **SIDE-EFFECTS, FURTHER INFORMATION**  
Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in steps of 10% every 3–4 days.
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet.
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on how to administer selegiline hydrochloride oral lyophilisates.

#### Driving and skilled tasks

**Drugs and driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

2015 legislation regarding driving whilst taking certain drugs, may also apply to selegiline, see *Drugs and driving* under Guidance on prescribing p. 1.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Tablet

##### ▶ Selegiline hydrochloride (Non-proprietary)

**Selegiline hydrochloride 5 mg** Selegiline 5mg tablets | 60 tablet [PoM] £28.08

**Selegiline hydrochloride 10 mg** Selegiline 10mg tablets | 30 tablet [PoM] £27.20

##### ▶ Eldepryl (Orion Pharma (UK) Ltd)

**Selegiline hydrochloride 5 mg** Eldepryl 5mg tablets | 100 tablet [PoM] £16.52 DT price = £16.52

**Selegiline hydrochloride 10 mg** Eldepryl 10mg tablets | 100 tablet [PoM] £32.23 DT price = £32.23

#### Oral lyophilisate

EXCIPIENTS: May contain Aspartame

##### ▶ Zelapar (Teva UK Ltd)

**Selegiline hydrochloride 1.25 mg** Zelapar 1.25mg oral lyophilisates sugar-free | 30 tablet [PoM] £43.16

trifluoperazine p. 366 are less sedating than chlorpromazine hydrochloride p. 361; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 363 and levomepromazine p. 411 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 403 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 402 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson's disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 405 and ondansetron p. 406 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 407 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy. Palonosetron is also available in combination with netupitant, a neurokinin 1-receptor antagonist, for the prevention of acute and delayed nausea and vomiting associated with moderately emetogenic chemotherapy and highly emetogenic cisplatin-based chemotherapy.

Dexamethasone p. 618 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine, lorazepam p. 317, or a 5HT<sub>3</sub>-receptor antagonist.

Aprepitant p. 404 and fosaprepitant p. 404 are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a 5HT<sub>3</sub>-receptor antagonist.

Nabilone p. 402 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

#### Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as **promethazine**, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 950 must be considered in order to reduce the risk of Wernicke's encephalopathy.

#### Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent

## 5 Nausea and labyrinth disorders

### Nausea and labyrinth disorders

#### Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 103 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

**Antihistamines** are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 365, perphenazine p. 364, and

postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include **5HT<sub>3</sub>-receptor antagonists**, droperidol p. 410, dexamethasone, some **phenothiazines** (e.g. prochlorperazine), and **antihistamines** (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

### Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 409. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired **promethazine** is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 408 is preferred. Domperidone, metoclopramide hydrochloride, 5HT<sub>3</sub>-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are **ineffective** in motion sickness.

### Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière's disease and middle-ear surgery can be difficult to treat.

Bethahistidine dihydrochloride p. 411 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Bethahistidine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière's disease.

A **diuretic** alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière's disease; **antihistamines** (such as cinnarizine), and **phenothiazines** (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

### Cytotoxic chemotherapy, palliative care, and migraine

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

#### Other drugs used for Nausea and labyrinth disorders

Paracetamol with metoclopramide, p. 439 · Promethazine hydrochloride, p. 269

## ANTIEMETICS AND ANTINAUSEANTS > ANTIHISTAMINES

### Cyclizine

#### ● INDICATIONS AND DOSE

**Nausea | Vomiting | Vertigo | Motion sickness | Labyrinthine disorders**

##### ► BY MOUTH

• Adult: 50 mg up to 3 times a day, for motion sickness, take 1–2 hours before departure

##### ► BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

• Adult: 50 mg 3 times a day

### Nausea and vomiting of known cause | Nausea and vomiting associated with vestibular disorders and palliative care

#### ► BY MOUTH, OR BY INTRAVENOUS INJECTION

- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

#### ► BY RECTUM

- Child 2–5 years: 12.5 mg up to 3 times a day
  - Child 6–11 years: 25 mg up to 3 times a day
  - Child 12–17 years: 50 mg up to 3 times a day
- #### ► BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
- Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
  - Child 2–5 years: 50 mg, dose to be given over 24 hours
  - Child 6–11 years: 75 mg, dose to be given over 24 hours
  - Child 12–17 years: 150 mg, dose to be given over 24 hours

### Nausea and vomiting associated with palliative care

#### ► BY SUBCUTANEOUS INFUSION

► Adult: 150 mg, dose to be given over 24 hours

#### ► BY MOUTH

► Adult: 50 mg up to 3 times a day

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)
- **CAUTIONS** Epilepsy · glaucoma (in children) · may counteract haemodynamic benefits of opioids · neuromuscular disorders—increased risk of transient paralysis with intravenous use · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · severe heart failure—may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure · susceptibility to angle-closure glaucoma (in adults) · urinary retention
- **INTERACTIONS** → Appendix 1 (antihistamines).
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- **Common or very common** Drowsiness
- **Rare** Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · paradoxical stimulation (especially with high doses in children) · paradoxical stimulation (especially with high doses in the elderly) · photosensitivity reactions · rashes · sleep disturbances · tremor
- **Frequency not known** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · hallucinations · headache · hypertension · movement disorders · oculogyric crisis · paraesthesia · psychomotor impairment · tachycardia · transient speech disorders · twitching · urinary retention

#### SPECIFIC SIDE-EFFECTS

- **Rare**
- With intravenous use Transient paralysis
- **Frequency not known**
- With subcutaneous use Local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

▶ **Cyclizine (Non-proprietary)**

**Cyclizine hydrochloride 50 mg** Cyclizine 50mg tablets | 30 tablet **£**2.27–£5.00 | 100 tablet **£**13.64 DT price = £7.58

**Solution for injection**▶ **Cyclizine (Non-proprietary)**

**Cyclizine lactate 50 mg per 1 ml** Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule **£**13.54 DT price = £13.54

**ANTIEMETICS AND ANTINAUSEANTS > CANNIBINOIDS****Nabilone**● **INDICATIONS AND DOSE**

**Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)**

▶ **BY MOUTH**

- ▶ **Adult:** Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

- **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping · elderly · heart disease · history of psychiatric disorder · hypertension

● **SIDE-EFFECTS**

- ▶ **Common or very common** Ataxia · concentration difficulties · drowsiness · dry mouth · dysphoria · euphoria · headache · hypotension · nausea · sleep disturbance · vertigo · visual disturbance
- ▶ **Frequency not known** Abdominal pain · confusion · decreased appetite · decreased coordination · depression · disorientation · hallucinations · psychosis · tachycardia · tremors

**SIDE-EFFECTS, FURTHER INFORMATION**

Drowsiness and dizziness occur frequently with standard doses.

- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see *Drugs and driving* under Guidance on prescribing p. 1. Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

● **MEDICINAL FORMS**

17-Oct-2016

● **INDICATIONS AND DOSE**

**Relief of nausea and vomiting**

▶ **BY MOUTH**

- ▶ **Child (body-weight up to 35 kg):** 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day
- ▶ **Child 12–17 years (body-weight 35 kg and above):** 10 mg up to 3 times a day; maximum 30 mg per day
- ▶ **Adult (body-weight 35 kg and above):** 10 mg up to 3 times a day; maximum 30 mg per day

**Gastro-intestinal pain in palliative care**

▶ **BY MOUTH**

- ▶ **Adult:** 10 mg 3 times a day, before meals

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE**

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and duration of treatment have been made, and new contra-indications added:

- Domperidone should only be used for the relief of the symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);

- Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;
  - The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;
  - The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;
  - Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.
- This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

- **CONTRA-INDICATIONS** Cardiac disease · conditions where cardiac conduction is, or could be, impaired (in adults) · gastro-intestinal haemorrhage (in children) · increased gastrointestinal motility harmful (in adults) · mechanical obstruction (in children) · mechanical perforation (in children) · predisposition to cardiac conduction disorders (in children) · prolactinoma
- **CAUTIONS** Children · if there are cardiac concerns, obtain ECG before and during treatment (in children) · patients over 60 years—increased risk of ventricular arrhythmia (in adults)
- **INTERACTIONS** → Appendix 1 (domperidone).  
Contra-indicated with concomitant use of drugs that prolong the QT interval.  
Contra-indicated with concomitant use of potent CYP3A4 inhibitors.

#### • SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness · dry mouth · malaise
- ▶ **Uncommon** Anxiety · breast pain · decreased libido · diarrhoea · galactorrhoea · headache · pruritus · rash
- ▶ **Frequency not known** Agitation · amenorrhoea · convulsions · extrapyramidal disorders · gynaecomastia · nervousness · oculogyric crisis · QT-interval prolongation · sudden cardiac death · urinary retention · ventricular arrhythmias

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment.

- **RENAL IMPAIRMENT** Reduce frequency.
- **PRESCRIBING AND DISPENSING INFORMATION**

#### Palliative care

For further information on the use of domperidone in palliative care, see [www.palliativedrugs.com/formulary/en/domperidone.html](http://www.palliativedrugs.com/formulary/en/domperidone.html).

- **PATIENT AND CARER ADVICE**  
Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## Metoclopramide hydrochloride

21-Nov-2016

#### • INDICATIONS AND DOSE

**Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting**

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult (body-weight up to 60 kg): Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes
- ▶ Adult (body-weight 60 kg and above): 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

#### Hiccup in palliative care

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 10 mg every 6–8 hours

#### Nausea and vomiting in palliative care

- ▶ BY MOUTH
- ▶ Adult: 10 mg 3 times a day
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 30–100 mg/24 hours

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)**

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

- In adults over 18 years, metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

- **CONTRA-INDICATIONS** 3–4 days after gastrointestinal surgery · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma

• **CAUTIONS** Asthma · atopic allergy · bradycardia · cardiac conduction disturbances · children · elderly · epilepsy · may mask underlying disorders such as cerebral irritation · Parkinson's disease · uncorrected electrolyte imbalance · young adults (15–19 years old)

• **INTERACTIONS** → Appendix 1 (metoclopramide). Caution with concomitant use of other drugs affecting cardiac conduction.

• **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Extrapyramidal effects (especially in children and young adults (15–19 years old)) · galactorrhoea · gynaecomastia · hyperprolactinaemia · menstrual changes
- ▶ **Very rare** Depression · methaemoglobinaemia (more severe in G6PD deficiency) · neuroleptic malignant syndrome
- ▶ **Frequency not known** Anxiety · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · hypotension · oedema · pruritus · rash · restlessness · tardive dyskinesia on prolonged administration · tremor · urticaria · visual disturbances

**SPECIFIC SIDE-EFFECTS**

- **Very rare**
- ▶ With intravenous use Cardiac conduction abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.
- **DIRECTIONS FOR ADMINISTRATION** Oral liquid preparation to be given via a graduated oral dosing syringe.

• **PRESCRIBING AND DISPENSING INFORMATION**

**Palliative care**

For further information on the use of metoclopramide hydrochloride in palliative care, see [www.palliativedrugs.com/formulary/en/metoclopramide.html](http://www.palliativedrugs.com/formulary/en/metoclopramide.html).

- **PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

- ▶ **Metoclopramide hydrochloride (Non-proprietary)**  
Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 28 tablet [PoM](#) £1.23 DT price = £0.74
- ▶ **Maxolon (AMCo)**  
Metoclopramide hydrochloride 10 mg Maxolon 10mg tablets | 84 tablet [PoM](#) £5.24

**Oral solution**

- ▶ **Metoclopramide hydrochloride (Non-proprietary)**  
Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM](#) £19.77 DT price = £19.77

**Solution for injection**

- ▶ **Metoclopramide hydrochloride (Non-proprietary)**  
Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule [PoM](#) £1.31 | 10 ampoule [PoM](#) £3.30 DT price = £3.29

- ▶ **Maxolon (AMCo)**

Metoclopramide hydrochloride 5 mg per 1 ml Maxolon 10mg/2ml solution for injection ampoules | 12 ampoule [PoM](#) £3.21  
Maxolon High Dose 100mg/20ml solution for injection ampoules | 10 ampoule [PoM](#) £26.68

Combinations available: **Paracetamol with metoclopramide**, p. 439

## ANTIEMETICS AND ANTINAUSEANTS > NEUROKININ RECEPTOR ANTAGONISTS

### Aprepitant

• **INDICATIONS AND DOSE**

**Adjunct to dexamethasone and a 5HT<sub>3</sub>-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy**

▶ **BY MOUTH**

- ▶ **Adult:** Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant corticosteroid and 5HT<sub>3</sub>-antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (aprepitant).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
  - ▶ **Uncommon** Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hyponatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes
  - ▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · Stevens-Johnson syndrome · urticaria · visual disturbances
- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

- ▶ **Emend (Merck Sharp & Dohme Ltd)**  
Aprepitant 80 mg Emend 80mg capsules | 2 capsule [PoM](#) £31.61  
Aprepitant 125 mg Emend 125mg capsules | 1 capsule [PoM](#) no price available | 5 capsule [PoM](#) £79.03

### Fosaprepitant

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

• **INDICATIONS AND DOSE**

**Adjunct to dexamethasone and a 5HT<sub>3</sub>-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy**

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT<sub>3</sub>-receptor antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (fosaprepitant).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- ▶ **Uncommon** Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hyponatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes
- ▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · Stevens-Johnson syndrome · urticaria · visual disturbances
- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Ivemend*<sup>®</sup>), give intermittently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (January 2011) that fosaprepitant (*Ivemend*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

- ▶ *Ivemend* (Merck Sharp & Dohme Ltd)

Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg *Ivemend* 150mg powder for solution for infusion vials | 1 vial **[PoM]** £47.42

## ANTIEMETICS AND ANTINAUSEANTS > SEROTONIN (5HT<sub>3</sub>) RECEPTOR ANTAGONISTS

### Granisetron

- **DRUG ACTION** Granisetron is a specific 5HT<sub>3</sub>-receptor antagonist which blocks 5HT<sub>3</sub> receptors in the gastrointestinal tract and in the CNS.

#### ● INDICATIONS AND DOSE

**Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used**

- ▶ **BY TRANSFERMAL APPLICATION USING PATCHES**
- ▶ **Adult:** Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

#### **Prevention of postoperative nausea and vomiting**

- ▶ **BY INTRAVENOUS INJECTION**
- ▶ **Adult:** 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

#### **Treatment of postoperative nausea and vomiting**

- ▶ **BY INTRAVENOUS INJECTION**
- ▶ **Adult:** 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

#### **Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy**

- ▶ **BY MOUTH**
- ▶ **Adult:** 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ **Adult:** 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

- **CAUTIONS** Subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (5HT<sub>3</sub>-receptor Antagonists). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Constipation · diarrhoea · headache · insomnia
- ▶ **Uncommon** Extrapyramidal reactions · QT-interval prolongation · rash
- **SPECIFIC SIDE-EFFECTS**
- ▶ **Uncommon**
- ▶ With transdermal use Application-site reactions
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute up to 3 mL in 20–50 mL infusion fluid; give over 5 minutes.
- **PATIENT AND CARER ADVICE**
- ▶ With transdermal use Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Tablet**

- ▶ **Granisetron (Non-proprietary)**

**Granisetron (as Granisetron hydrochloride) 1 mg** Granisetron 1mg tablets | 10 tablet **[PoM]** £51.20 DT price = £40.35

**Granisetron (as Granisetron hydrochloride) 2 mg** Granisetron 2mg tablets | 5 tablet **[PoM]** no price available DT price = £52.39

- ▶ **Kytril (Roche Products Ltd)**

**Granisetron (as Granisetron hydrochloride) 1 mg** Kytril 1mg tablets | 10 tablet **[PoM]** £52.39 DT price = £40.35

**Granisetron (as Granisetron hydrochloride) 2 mg** Kytril 2mg tablets | 5 tablet **[PoM]** £52.39 DT price = £52.39

#### **Solution for injection**

- ▶ **Granisetron (Non-proprietary)**

**Granisetron (as Granisetron hydrochloride) 1 mg per**

**1 mL** Granisetron 3mg/3mL concentrate for solution for injection ampoules | 5 ampoule **[PoM]** £24.00

Granisetron 1mg/1mL concentrate for solution for injection ampoules | 5 ampoule **[PoM]** £8.00

**Transdermal patch**

- ▶ **Sancuso** (Kyowa Kirin Ltd)  
**Granisetron 3.1 mg per 24 hour** Sancuso 3.1mg/24hours  
transdermal patches | 1 patch [PoM] £56.00

**Ondansetron**

- **DRUG ACTION** Ondansetron is a specific 5HT<sub>3</sub>-receptor antagonist which blocks 5HT<sub>3</sub> receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE****Moderately emetogenic chemotherapy or radiotherapy**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 8 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
- ▶ **BY RECTUM**
- ▶ **Adult:** Initially 16 mg, dose to be taken 1–2 hours before treatment, then 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ **Elderly:** Initially 8 mg, dose to be administered immediately before treatment, intravenous infusion to be given over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 24 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
- ▶ **BY RECTUM**
- ▶ **Adult:** 16 mg, dose to be administered 1–2 hours before treatment, then 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION**
- ▶ **Adult 65–74 years:** Initially 8 mg, to be given immediately before treatment, followed by (by intramuscular injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **Adult 65–74 years:** Initially 8–16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

- ▶ **Adult 75 years and over:** Initially 8 mg, immediately before treatment (over at least 15 minutes), followed by (by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Prevention of postoperative nausea and vomiting**

- ▶ **INITIALLY BY MOUTH**
- ▶ **Adult:** 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

**Treatment of postoperative nausea and vomiting**

- ▶ **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** 4 mg for 1 dose

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Adenotonsillar surgery · subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (5HT<sub>3</sub>-receptor Antagonists). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Constipation · flushing · headache · injection site-reactions
- ▶ **Uncommon** Arrhythmias · bradycardia · chest pain · hiccups · hypotension · movement disorders · seizures
- SPECIFIC SIDE-EFFECTS**
- ▶ **Rare**
- ▶ With intravenous use Dizziness · transient visual disturbances
- ▶ **Very rare**
- ▶ With intravenous use Transient blindness
- ▶ **Frequency not known**
- ▶ With rectal use Rectal irritation
- **PREGNANCY** No information available; avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk in *animal* studies—avoid.
- **HEPATIC IMPAIRMENT** Maximum 8 mg daily in moderate or severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion* (Zofran<sup>®</sup>), give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
- ▶ With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Ondansetron (Non-proprietary)**

**Ondansetron (as Ondansetron hydrochloride) 4 mg** Ondansetron 4mg tablets | 10 tablet [PoM] £25.46 DT price = £1.19 | 30 tablet [PoM] £76.38

## Palonosetron

- **DRUG ACTION** Palonosetron is a specific 5HT<sub>3</sub>-receptor antagonist which blocks 5HT<sub>3</sub> receptors in the gastrointestinal tract and in the CNS.

**● INDICATIONS AND DOSE****Moderately emetogenic chemotherapy**

## ▶ INITIALLY BY MOUTH

- ▶ **Adult:** 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

**Severely emetogenic chemotherapy**

## ▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **CAUTIONS** History of constipation · intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (5HT<sub>3</sub>-receptor Antagonists). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation · diarrhoea · dizziness · headache
  - ▶ **Uncommon** Abdominal pain · amblyopia · anorexia · anxiety · arrhythmia · arthralgia · asthenia · atrioventricular block · bradycardia · changes in blood pressure · dry mouth · dyspepsia · dyspnoea · electrolyte disturbance · euphoria · extrasystoles · eye irritation · eye swelling · flatulence · glycosuria · hiccups · hyperglycaemia · influenza-like symptoms · insomnia · motion sickness · myalgia · myocardial ischaemia · peripheral neuropathy · rash · tachycardia · tinnitus · urinary retention
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- ▶ **Aloxi** (Sinclair IS Pharma Plc)  
**Palonosetron (as Palonosetron hydrochloride)**  
**500 microgram** Aloxi 500microgram capsules | 1 capsule [PoM](#) £55.89

**Solution for injection**

- ▶ **Palonosetron (Non-proprietary)**  
**Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml** Palonosetron 250micrograms/5ml solution for injection vials | 1 vial [PoM](#) £55.89
- ▶ **Aloxi** (Sinclair IS Pharma Plc)  
**Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml** Aloxi 250micrograms/5ml solution for injection vials | 1 vial [PoM](#) £55.89

## Palonosetron with netupitant

20-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, palonosetron above.

**● INDICATIONS AND DOSE****Moderately emetogenic chemotherapy | Highly emetogenic cisplatin-based chemotherapy**

## ▶ BY MOUTH

- ▶ **Adult:** 1 capsule, to be taken approximately 1 hour before the start of each chemotherapy cycle

- **CAUTIONS** Patients over 75 years
- **INTERACTIONS** → Appendix 1 (5HT<sub>3</sub>-receptor Antagonists, netupitant).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Fatigue
  - ▶ **Uncommon** Alopecia · blood disorders · cardiomyopathy · conduction disorder · decreased appetite · urticaria · vertigo
  - ▶ **Rare** Back pain · blurred vision · conjunctivitis · cystitis · dysphagia · hyposaesthesia · hypokalaemia · non-cardiac chest pain · psychosis (acute) · sleep disorder
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (December 2015) has advised that palonosetron in combination with netupitant (*Akynzeo*®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based cancer chemotherapy.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 25

#### ► Akynzeo (Chugai Pharma UK Ltd) ▼

Netupitant 300 mg, Palonosetron (as Palonosetron hydrochloride) 500 microgram Akynzeo 300mg/0.5mg capsules | 1 capsule [PoM] £69.00 (Hospital only)

## ANTIHISTAMINES > SEDATING ANTIHISTAMINES

### Cinnarizine

#### ● INDICATIONS AND DOSE

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease

#### ► BY MOUTH

- Child 5–11 years: 15 mg 3 times a day
- Child 12–17 years: 30 mg 3 times a day
- Adult: 30 mg 3 times a day

#### Motion sickness

#### ► BY MOUTH

- Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
- Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
- Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)
- **CAUTIONS** Epilepsy · glaucoma (in children) · Parkinson's disease (in adults) · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma (in adults) · urinary retention
- **SIDE-EFFECTS**
  - **Common or very common** Drowsiness
  - **Rare** Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · lichen planus · liver dysfunction · lupus-like skin reactions · palpitation · paradoxical stimulation (especially with high doses in children) · paradoxical stimulation (especially with high doses in the elderly) · photosensitivity reactions · rashes · sleep disturbances · sweating · tremor · weight gain
  - **Frequency not known** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention

#### SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PATIENT AND CARER ADVICE**

#### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2

#### ► Cinnarizine (Non-proprietary)

Cinnarizine 15 mg Cinnarizine 15mg tablets | 84 tablet [P] £15.40 DT price = £5.23

#### ► Stugeron (McNeil Products Ltd, Janssen-Cilag Ltd)

Cinnarizine 15 mg Stugeron 15mg tablets | 15 tablet [P] £1.84 | 100 tablet [P] £4.18

## Cinnarizine with dimenhydrinate

The properties listed below are those particular to the combination only. For the properties of the components please consider, cinnarizine above.

#### ● INDICATIONS AND DOSE

#### Vertigo

#### ► BY MOUTH

- Adult: 1 tablet 3 times a day

## ▶ BY MOUTH

- ▶ Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
- ▶ Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- ▶ Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- ▶ BY TRANSDERMAL APPLICATION
- ▶ Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
- ▶ Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

**Hypersalivation associated with clozapine therapy**

## ▶ BY MOUTH

- ▶ Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

**Excessive respiratory secretion (in palliative care)**

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

## ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION

- ▶ Adult: 1.2–2 mg/24 hours

**Bowel colic in palliative care**

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 1.2–2 mg/24 hours

**Bowel colic pain in palliative care**

## ▶ BY MOUTH USING SUBLINGUAL TABLETS

- ▶ Adult: 300 micrograms 3 times a day, as *Kwells*®.

**Premedication**

## ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

- **UNLICENSED USE** Not licensed for hypersalivation associated with clozapine therapy.

#### IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **CAUTIONS** Epilepsy
- **CAUTIONS, FURTHER INFORMATION**
  - Anticholinergic syndrome
  - With systemic use In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).
- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION**
  - With transdermal use in children *Patch* applied to hairless area of skin behind ear; if less than whole patch required **either** cut with scissors along full thickness ensuring membrane is not peeled away **or** cover portion to prevent contact with skin.
  - With oral use in children For administration *by mouth*, injection solution may be given orally.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.
 

**Palliative care**  
For further information on the use of hyoscine hydrobromide in palliative care, see [www.palliativedrugs.com/formulary/en/hyoscine-hydrobromide.html](http://www.palliativedrugs.com/formulary/en/hyoscine-hydrobromide.html).
- **PATIENT AND CARER ADVICE**
  - With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.

**Driving and skilled tasks**  
Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

F 361

### Droperidol

- **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

#### INDICATIONS AND DOSE

##### Prevention and treatment of postoperative nausea and vomiting

- BY INTRAVENOUS INJECTION
  - Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
  - Elderly: 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

##### Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)

- BY INTRAVENOUS INJECTION
  - Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

- **CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation
- **CAUTIONS** Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure
- **INTERACTIONS** → Appendix 1 (droperidol). Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS** Anxiety · cardiac arrest · hallucinations · inappropriate antidiuretic hormone secretion
- **BREAST FEEDING** Limited information available—avoid repeated administration.
- **HEPATIC IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.
 

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.
- **RENAL IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.
 

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.
- **MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

## Levomepromazine

### (Methotrimeprazine)

#### ● INDICATIONS AND DOSE

##### Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Seek specialist advice

##### Restlessness and confusion in palliative care

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION
- ▶ Child 1–11 years: 0.35–3 mg/kg, to be administered over 24 hours
- ▶ Child 12–17 years: 12.5–200 mg, to be administered over 24 hours
- ▶ BY MOUTH
- ▶ Adult: 6 mg every 2 hours as required
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 6.25 mg every 2 hours as required
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

##### Nausea and vomiting in palliative care

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
- ▶ Child 1 month–11 years: 100–400 micrograms/kg, to be administered over 24 hours
- ▶ Child 12–17 years: 5–25 mg, to be administered over 24 hours
- ▶ BY MOUTH
- ▶ Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 5–25 mg/24 hours, sedation can limit the dose

##### Schizophrenia (bed patients)

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily

##### Schizophrenia

- ▶ BY MOUTH
- ▶ Adult: Initially 25–50 mg daily in divided doses, dose can be increased as necessary

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Diabetes · patients receiving large initial doses should remain supine
- CAUTIONS, FURTHER INFORMATION**
  - ▶ In adults Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed.
- **SIDE-EFFECTS** Raised erythrocyte sedimentation rate
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With subcutaneous use in children For administration by *subcutaneous infusion* dilute with a suitable volume of Sodium Chloride 0.9%.

## 6 Pain

### Analgesics

#### Drugs used for pain

The non-opioid drugs, paracetamol p. 414 and aspirin p. 114 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

#### Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine phosphate p. 421, or dihydrocodeine tartrate p. 423. Severe crises may require the use of morphine p. 429 or diamorphine hydrochloride p. 423; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 434 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

#### Dental and orofacial pain

Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzydamine hydrochloride mouthwash or spray p. 1069 until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol or ibuprofen p. 999 is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac sodium p. 993, and aspirin. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

*Temporomandibular dysfunction* can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 321, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

#### Dysmenorrhoea

Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 82) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

#### Non-opioid analgesics and compound analgesic preparations

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties. Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium p. 131 is a **special hazard**.

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 416 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

**Non-steroidal anti-inflammatory analgesics** (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (**ziconotide** (*Prialt*®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

### Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin p. 114 or paracetamol p. 414) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate p. 421 per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

**Important:** the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

**Caffeine** is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

**Co-proxamol** tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

### Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

#### Strong opioids

Morphine p. 429 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in *palliative care*. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 417 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1214.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in *palliative care*.

Diamorphine hydrochloride p. 423 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 1187, fentanyl p. 424 and remifentanyl p. 1188 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 464 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 431 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in *palliative care*.

Papaveretum p. 434 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 434 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate p. 423 or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 434 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tapentadol p. 435 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 435 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

#### Weak opioids

Codeine phosphate can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen p. 999 have proved ineffective.

Dihydrocodeine tartrate has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 428 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

#### Postoperative analgesia

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not

recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine p. 429.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

#### Pain management and opioid dependence

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**Other drugs used for Pain** Dexibuprofen, p. 990 • Diclofenac potassium, p. 992 • Fenoprofen, p. 997 • Levomepromazine, p. 411 • Mefenamic acid, p. 1004

## ANALGESICS > NON-OPIOID

### Paracetamol

05-May-2016

#### (Acetaminophen)

#### ● INDICATIONS AND DOSE

##### Mild to moderate pain | Pyrexia

###### ▶ BY MOUTH

▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day

▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

###### ▶ BY RECTUM

▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

##### Mild to moderate pain in patients with risk factors for hepatotoxicity | Pyrexia in patients with risk factors for hepatotoxicity

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day

▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

##### Pain | Pyrexia with discomfort

###### ▶ BY MOUTH

▶ Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day

▶ Child 6 months–1 year: 120 mg every 4–6 hours; maximum 4 doses per day

▶ Child 2–3 years: 180 mg every 4–6 hours; maximum 4 doses per day

▶ Child 4–5 years: 240 mg every 4–6 hours; maximum 4 doses per day

▶ Child 6–7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day

▶ Child 8–9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day

- ▶ Child 10–11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 12–15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 16–17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day
- ▶ BY RECTUM
- ▶ Child 3–11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
- ▶ Child 1–4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
- ▶ Child 5–11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
- ▶ Child 12–17 years: 500 mg every 4–6 hours

#### Prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine

##### ▶ BY MOUTH

▶ Child 2 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours

▶ Child 4 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours

#### Post-immunisation pyrexia in infants

##### ▶ BY MOUTH

▶ Child 2–3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required

▶ Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

#### PANADOL OA®

#### Mild to moderate pain | Pyrexia

##### ▶ BY MOUTH

▶ Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

- **UNLICENSED USE** Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. [EvGr](#) Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine. [E](#)

- **CAUTIONS** Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours • body-weight under 50 kg • chronic alcohol consumption • chronic dehydration • chronic malnutrition • hepatocellular insufficiency • long-term use (especially in those who are malnourished)

#### CAUTIONS, FURTHER INFORMATION

[EvGr](#) Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients.

Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced. [E](#)

- **INTERACTIONS** → Appendix 1 (paracetamol).

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Rare** Acute generalised exanthematous pustulosis • malaise • skin reactions • Stevens-Johnson syndrome • toxic epidermal necrolysis
- ▶ **Frequency not known** Blood disorders • leucopenia • neutropenia • thrombocytopenia

##### SPECIFIC SIDE-EFFECTS

- ▶ **Rare**
- ▶ With intravenous use Flushing • tachycardia
- ▶ **Frequency not known**
- ▶ With intravenous use Hypotension

**Overdose**

**Important:** liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1204

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Dose-related toxicity—avoid large doses.
- **RENAL IMPAIRMENT**
  - ▶ In adults Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion (Perfalgan®)*, give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Paracetamol for mild-to-moderate pain [www.medicinesforchildren.org.uk/paracetamol-for-mildtomoderate-pain](http://www.medicinesforchildren.org.uk/paracetamol-for-mildtomoderate-pain)
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners' formulary Paracetamol Tablets may be prescribed. Paracetamol Soluble Tablets 500 mg may be prescribed. Paracetamol Oral Suspension may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

**Tablet**

- **CONTRA-INDICATIONS** Acute respiratory depression · comatose patients · head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment)

- raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment)
- risk of paralytic ileus
- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) · asthma (avoid during an acute attack) · convulsive disorders · debilitated patients (reduced dose is recommended) (in adults) · diseases of the biliary tract · elderly (reduced dose is recommended) (in adults) · hypotension · hypothyroidism (reduced dose is recommended) · impaired respiratory function (avoid in chronic obstructive pulmonary disease) · inflammatory bowel disorders · myasthenia gravis · obstructive bowel disorders · prostatic hypertrophy (in adults) · shock · urethral stenosis (in adults)
- CAUTIONS, FURTHER INFORMATION**
- ▶ **Dependence** Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
- ▶ **Palliative care** In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.
- **INTERACTIONS** → Appendix 1 (opioid analgesics).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Biliary spasm · bradycardia · confusion · constipation · dependence · difficulty with micturition · dizziness · drowsiness · dry mouth · dysphoria · euphoria · flushing · hallucinations · headache · hypotension (larger doses) · miosis · mood changes · muscle rigidity (larger doses) · nausea (particularly in initial stages) · oedema · palpitation · postural hypotension · pruritus · rash · respiratory depression (larger doses) · sexual dysfunction · sleep disturbances · sweating · tachycardia · ureteric spasm · urinary retention · urticaria · vertigo · visual disturbances · vomiting (particularly in initial stages)
- ▶ **Frequency not known** Adrenal insufficiency (long-term use) · hyperalgesia (long-term use) · hypogonadism (long-term use)
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ **Hypogonadism and adrenal insufficiency** Long-term use of opioid analgesics can cause hypogonadism and adrenal insufficiency in both males and females. This is thought to be dose related and can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction.
- ▶ **Hyperalgesia** Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.
- ▶ **Respiratory depression** Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.
- ▶ **Dependence and withdrawal** Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.
- Overdose**  
Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1204 and consider the specific antidote, naloxone hydrochloride p. 1214.
- **PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation

pneumonia has been reported in the mother if opioid analgesics are used during labour.

- **HEPATIC IMPAIRMENT** Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.
- **PATIENT AND CARER ADVICE**

#### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see *Drugs and driving* under Guidance on prescribing p. 1.

416

## Buprenorphine

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

### ● INDICATIONS AND DOSE

#### Moderate to severe pain

- ▶ **BY SUBLINGUAL ADMINISTRATION**
- ▶ Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
- ▶ Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
- ▶ Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
- ▶ Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
- ▶ Adult: 200–400 micrograms every 6–8 hours
- ▶ **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- ▶ Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
- ▶ Child 12–17 years: 300–600 micrograms every 6–8 hours
- ▶ Adult: 300–600 micrograms every 6–8 hours

#### Premedication

- ▶ **BY SUBLINGUAL ADMINISTRATION**
- ▶ Adult: 400 micrograms
- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Adult: 300 micrograms

#### Intra-operative analgesia

- ▶ **BY SLOW INTRAVENOUS INJECTION**
- ▶ Adult: 300–450 micrograms

#### Adjunct in the treatment of opioid dependence

- ▶ **BY SUBLINGUAL ADMINISTRATION**
- ▶ Adult: Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day

### DOSE EQUIVALENCE AND CONVERSION

- ▶ For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily.

### BUTRANS®

#### Moderate, non-malignant pain unresponsive to non-opioid analgesics

- ▶ **BY TRANSDERMAL APPLICATION USING PATCHES**
- ▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, continued →

analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

#### HAPTOCTASIN®

**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

##### ► BY TRANSDERMAL APPLICATION USING PATCHES

- **Adult:** Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic**

##### ► BY TRANSDERMAL APPLICATION USING PATCHES

- **Adult:** The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

#### PHARMACOKINETICS

For *Haptoctasin*®: It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

#### TRANSTEC®

**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

##### ► BY TRANSDERMAL APPLICATION USING PATCHES

- **Adult:** Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic**

##### ► BY TRANSDERMAL APPLICATION USING PATCHES

- **Adult:** The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

#### PHARMACOKINETICS

For *Transtec*®: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

- **UNLICENSED USE** Sublingual tablets not licensed for use in children under 6 years. Injection not licensed for use in children under 6 months.

#### IMPORTANT SAFETY INFORMATION

Do not confuse the formulations of transdermal patches which are available as 72-hourly, 96-hourly and 7-day patches, see *Prescribing and dispensing information*.

- **CAUTIONS**
  - GENERAL CAUTIONS** Impaired consciousness
  - SPECIFIC CAUTIONS**
    - With transdermal use Other opioids should not be administered within 24 hours of patch removal (long duration of action)
    - When used for adjunct in the treatment of opioid dependence Hepatitis B infection · hepatitis C infection · pre-existing liver enzyme abnormalities
  - **INTERACTIONS** Caution with concomitant use of hepatotoxic drugs.
  - **SIDE-EFFECTS**
    - **Common or very common** Abdominal pain · agitation · anorexia · anxiety · asthenia · diarrhoea · dyspepsia · dyspnoea · fatigue · mild withdrawal symptoms in patients dependent on opioids · paraesthesia · vasodilatation
    - **Uncommon** Angina (in adults) · cough · depersonalisation · dry eye · dry skin · dysarthria · flatulence · hypertension · hypoaesthesia · hypoxia · impaired memory · influenza-like symptoms · muscle cramp · myalgia · pyrexia · restlessness · rhinitis · rigors · syncope · taste disturbance · tinnitus · tremor · wheezing
    - **Rare** Diverticulitis (in children) · dysphagia · impaired concentration · paralytic ileus · psychosis
    - **Very rare** Hiccups · hyperventilation · muscle fasciculation · retching
    - **Frequency not known** Hepatic necrosis · hepatitis
  - SIDE-EFFECTS, FURTHER INFORMATION**
    - Fever or external heat
    - With transdermal use in adults Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).
  - Overdose** The effects of buprenorphine are only partially reversed by naloxone.

**TRANSTEC®****SIDE-EFFECTS, FURTHER INFORMATION**

In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch.

**HAPOCTASIN®****SIDE-EFFECTS, FURTHER INFORMATION**

In view of the long duration of action, patients who have severe side-effects should be monitored for up to 25 hours after removing patch.

- **BREAST FEEDING** Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRE-TREATMENT SCREENING** Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.
- **MONITORING REQUIREMENTS** Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With sublingual use in children For administration by *mouth*, tablets may be halved.
- **TRANSTEC®** Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).
- **BUTRANS®** Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).
- **HAPOCTASIN®** Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

**● PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With transdermal use in adults Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.

Transdermal patches are available as 72-hourly, 96-hourly and 7-day formulations; prescribers and dispensers must ensure that the correct preparation is prescribed and dispensed. Preparations that should be applied up to every 72 hours include *Hapocytasin®*. Preparations that should be applied up to every 96 hours include *Transtec®*. Preparations that should be applied up to every 7 days include *BuTrans®*.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buprenorphine transdermal patches.

**● NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114**  
Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

[www.nice.org.uk/TA114](http://www.nice.org.uk/TA114)

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**

## Co-codamol

### ● INDICATIONS AND DOSE

#### Mild to moderate pain (using co-codamol 8/500 preparations only)

▶ BY MOUTH

- ▶ Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

#### Mild to moderate pain (using co-codamol 15/500 preparations only)

▶ BY MOUTH

- ▶ Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

#### Severe pain (using co-codamol 30/500 preparations only)

▶ BY MOUTH

- ▶ Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

#### KAPAKE® 15/500

##### Mild to moderate pain

▶ BY MOUTH

- ▶ Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

#### SOLPADOL® CAPLETS

##### Severe pain

▶ BY MOUTH

- ▶ Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

#### SOLPADOL® CAPSULES

##### Severe pain

▶ BY MOUTH

- ▶ Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

#### SOLPADOL® EFFERVESCENT TABLETS

##### Severe pain

▶ BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers
- **CAUTIONS** Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepatocellular insufficiency

### CAUTIONS, FURTHER INFORMATION

- ▶ Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
- **INTERACTIONS** → Appendix 1 (paracetamol).
- **SIDE-EFFECTS** Abdominal pain · anorexia · blood disorders · depression (with larger doses) · hypothermia · leucopenia · malaise · muscle fasciculation · neutropenia · pancreatitis · seizures · thrombocytopenia

### Overdose

**Important:** liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST FEEDING** Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.
- **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
- **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and *vice versa*.

- **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

## Codeine phosphate

### ● INDICATIONS AND DOSE

#### Acute diarrhoea

- ▶ BY MOUTH
- ▶ Child 12-17 years: 30 mg 3-4 times a day; usual dose 15-60 mg 3-4 times a day
- ▶ Adult: 30 mg 3-4 times a day; usual dose 15-60 mg 3-4 times a day

#### Mild to moderate pain

- ▶ BY MOUTH
- ▶ Adult: 30-60 mg every 4 hours if required; maximum 240 mg per day
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 30-60 mg every 4 hours if required

#### Short-term treatment of acute moderate pain

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 12-17 years: 30-60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

#### Dry or painful cough

- ▶ BY MOUTH USING LINCTUS
- ▶ Adult: 15-30 mg 3-4 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- in children aged 12-18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, 'pin-point' pupils, nausea, vomiting)

MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12-18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old

- patients of any age known to be CYP2D6 ultra-rapid metabolisers
  - breastfeeding mothers
- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers
- **CAUTIONS** Acute abdomen · cardiac arrhythmias · gallstones · not recommended for adolescents aged 12–18 years with breathing problems
- CAUTIONS, FURTHER INFORMATION**
- ▶ Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
- **SIDE-EFFECTS** Abdominal pain · anorexia · antidiuretic effect · hypothermia · malaise · muscle fasciculation · pancreatitis · seizures
- **BREAST FEEDING** Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged, and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Codeine phosphate for pain [www.medicinesforchildren.org.uk/codeine-phosphate-pain-0](http://www.medicinesforchildren.org.uk/codeine-phosphate-pain-0)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2

##### ▶ Codeine phosphate (Non-proprietary)

**Codeine phosphate 15 mg** Codeine 15mg tablets | 28 tablet [PoM] £1.40 DT price = £0.96 [CD5] | 30 tablet [PoM] no price available [CD5] | 100 tablet [PoM] £3.43 DT price = £3.43 [CD5] | 500 tablet [PoM] no price available [CD5]

**Codeine phosphate 30 mg** Codeine 30mg tablets | 28 tablet [PoM] £1.59 DT price = £1.16 [CD5] | 30 tablet [PoM] no price available [CD5] | 100 tablet [PoM] £5.68 DT price = £4.14 [CD5] | 500 tablet [PoM] no price available [CD5]

**Codeine phosphate 60 mg** Codeine 60mg tablets | 28 tablet [PoM] £5.95 DT price = £1.83 [CD5]

#### Oral solution

CAUTIONARY AND ADVISORY LABELS 2

##### ▶ Codeine phosphate (Non-proprietary)

**Codeine phosphate 3 mg per 1 ml** Codeine 15mg/5ml linctus sugar free sugar-free | 200 ml [P] £1.87 DT price = £1.63 [CD5] sugar-free | 2000 ml [P] £16.30 [CD5]

Codeine 15mg/5ml linctus | 200 ml [P] £1.84 DT price = £1.84 [CD5] | 2000 ml [P] no price available [CD5]

**Codeine phosphate 5 mg per 1 ml** Codeine 25mg/5ml oral solution | 500 ml [PoM] £6.46 DT price = £6.46 [CD5]

##### ▶ Galcodine (Thornton & Ross Ltd)

**Codeine phosphate 3 mg per 1 ml** Galcodine 15mg/5ml linctus sugar-free | 2000 ml [P] £9.90 [CD5]

#### Solution for injection

##### ▶ Codeine phosphate (Non-proprietary)

**Codeine phosphate 60 mg per 1 ml** Codeine 60mg/1ml solution for injection ampoules | 10 ampoule [PoM] £23.70-£25.70 [CD2]

F 416

## Co-dydramol

#### ● INDICATIONS AND DOSE

**Mild to moderate pain (using co-dydramol 10/500 preparations only)**

##### ▶ BY MOUTH

▶ Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

**Severe pain (using co-dydramol 20/500 preparations only)**

##### ▶ BY MOUTH

▶ Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

**Severe pain (using co-dydramol 30/500 preparations only)**

##### ▶ BY MOUTH

▶ Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

▶ A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

- **CAUTIONS** Alcohol dependence · before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · chronic alcoholism · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · pancreatitis · severe cor pulmonale
  - **INTERACTIONS** → Appendix 1 (paracetamol).
  - **SIDE-EFFECTS** Abdominal pain · acute generalised exanthematous pustulosis · blood disorders · leucopenia · malaise · neutropenia · pancreatitis · paraesthesia · paralytic ileus · skin reactions · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis
- Overdose**  
**Important:** liver damage (and less frequently renal damage) following overdosage with paracetamol.
- **BREAST FEEDING** Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.
  - **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
  - **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.
  - **PRESCRIBING AND DISPENSING INFORMATION** When co-dydramol tablets are prescribed and **no strength is stated**, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.
  - **LESS SUITABLE FOR PRESCRIBING** Co-dydramol is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2 (does not apply to the 10/500 tablet), 29, 30

##### ▶ Co-dydramol (Non-proprietary)

**Dihydrocodeine tartrate 10 mg, Paracetamol 500 mg** Co-dydramol 10mg/500mg tablets | 30 tablet [PoM] £1.14 DT price = £1.01 [CD5] | 100 tablet [PoM] £3.37 DT price = £3.37 [CD5] | 500 tablet [PoM] £16.85 [CD5]

F 416

## Diamorphine hydrochloride

### (Heroin hydrochloride)

10-Jun-2016

#### ● INDICATIONS AND DOSE

##### Acute pain

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5 mg every 4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1.25–2.5 mg every 4 hours if required

##### Acute pain (heavier, well-muscled patients)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Up to 10 mg every 4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2.5–5 mg every 4 hours if required

##### Chronic pain not currently treated with a strong opioid analgesic

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

##### Acute pulmonary oedema

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

##### Myocardial infarction

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute
- ▶ Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

##### Myocardial infarction (frail patients)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- **CONTRA-INDICATIONS** Delayed gastric emptying · phaeochromocytoma
- **CAUTIONS** CNS depression · severe cor pulmonale · severe diarrhoea · toxic psychosis
- **SIDE-EFFECTS** Anorexia · asthenia · myocardial infarction · raised intracranial pressure · syncope · taste disturbance
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, powder for solution for injection

##### Powder for solution for injection

###### ▶ Diamorphine hydrochloride (Non-proprietary)

**Diamorphine hydrochloride 5 mg** Diamorphine 5mg powder for solution for injection vials | 5 vial [PoM] £12.00–£15.00 [CD2]

Diamorphine 5mg powder for solution for injection ampoules | 5 ampoule [PoM] £11.36 DT price = £11.36 [CD2]

**Diamorphine hydrochloride 10 mg** Diamorphine 10mg powder for solution for injection ampoules | 5 ampoule [PoM] £16.56 DT price = £13.72 [CD2]

Diamorphine 10mg powder for solution for injection vials | 5 vial [PoM] £12.49–£19.00 [CD2]

**Diamorphine hydrochloride 30 mg** Diamorphine 30mg powder for solution for injection vials | 5 vial [PoM] £13.00–£21.00 [CD2]

Diamorphine 30mg powder for solution for injection ampoules | 5 ampoule [PoM] £16.52 DT price = £12.18 [CD2]

**Diamorphine hydrochloride 100 mg** Diamorphine 100mg powder for solution for injection vials | 5 vial [PoM] £54.00 [CD2]

Diamorphine 100mg powder for solution for injection ampoules | 5 ampoule [PoM] £42.39 DT price = £42.39 [CD2]

**Diamorphine hydrochloride 500 mg** Diamorphine 500mg powder for solution for injection vials | 5 vial [PoM] £190.00–£235.00 DT price = £205.00 [CD2]

Diamorphine 500mg powder for solution for injection ampoules | 5 ampoule [PoM] £187.70 DT price = £187.70 [CD2]

## Dihydrocodeine tartrate

F 416

#### ● INDICATIONS AND DOSE

##### Moderate to severe pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
- ▶ Child 12–17 years: 30 mg every 4–6 hours
- ▶ Adult: 30 mg every 4–6 hours as required
- ▶ BY DEEP SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Up to 50 mg every 4–6 hours if required

##### Chronic severe pain

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 60–120 mg every 12 hours
- ▶ Adult: 60–120 mg every 12 hours

##### DF118 FORTE®

##### Severe pain

- ▶ BY MOUTH
- ▶ Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day
- ▶ Adult: 40–80 mg 3 times a day; maximum 240 mg per day

- **UNLICENSED USE** Most preparations not licensed for use in children under 4 years.
- **CAUTIONS** Pancreatitis · severe cor pulmonale
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · paraesthesia · paralytic ileus · seizures
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PROFESSION SPECIFIC INFORMATION**  
**Dental practitioners' formulary**  
Dihydrocodeine tablets 30 mg may be prescribed.

## Dipipanone hydrochloride with cyclizine

### ● INDICATIONS AND DOSE

#### Acute pain

- ▶ BY MOUTH
- ▶ Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

- **CAUTIONS** Diabetes mellitus · palliative care (not recommended) · phaeochromocytoma
- **SIDE-EFFECTS** Psychosis · raised intracranial pressure · restlessness
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

#### ▶ Dipipanone hydrochloride with cyclizine (Non-proprietary)

**Dipipanone hydrochloride 10 mg, Cyclizine hydrochloride 30 mg** Dipipanone 10mg / Cyclizine 30mg tablets | 50 tablet **[PoM]** £353.06 DT price = £353.06 **[CD2]**

416

## Fentanyl

### ● INDICATIONS AND DOSE

#### Chronic intractable pain not currently treated with a strong opioid analgesic

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Child 16–17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
- ▶ Adult: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic

therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

#### Chronic intractable pain currently treated with a strong opioid analgesic

##### ▶ BY TRANSFERMAL APPLICATION

- ▶ Child 2–17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* p. 22.
- ▶ Adult: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* p. 22.

#### Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation

##### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 3–4.8 micrograms/kg/hour, adjusted according to response

#### Assisted ventilation: analgesia and enhancement of anaesthesia during operation

##### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

#### Assisted ventilation: analgesia and respiratory depression in intensive care

##### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

#### Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

##### ▶ BY BUCCAL ADMINISTRATION USING LOZENGES

- ▶ Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia
- ▶ Adult: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if

required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

- ▶ BY BUCCAL ADMINISTRATION USING BUCCAL FILMS
- ▶ Adult: Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Fentanyl films are **not bioequivalent** to other fentanyl preparations.
- ▶ Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

#### ABSTRAL<sup>®</sup>

##### Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- ▶ BY MOUTH USING SUBLINGUAL TABLETS
- ▶ Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

#### EFFENTORA<sup>®</sup>

##### Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- ▶ BY MOUTH USING SUBLINGUAL TABLETS
- ▶ Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration

#### INSTANYL<sup>®</sup>

##### Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

#### PECFENT<sup>®</sup>

##### Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and

minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

#### RECIVIT<sup>®</sup> SUBLINGUAL TABLETS

##### Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- ▶ BY MOUTH
- ▶ Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary. Consult product literature for dose adjustments, no more than 2 dose units, 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia; maximum 4 doses per day

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

#### ● CAUTIONS

##### GENERAL CAUTIONS

- Cerebral tumour · diabetes mellitus (with *Actiq*<sup>®</sup> lozenges)
- impaired consciousness

##### SPECIFIC CAUTIONS

- ▶ With buccal use Mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)
- ▶ With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
- ▶ With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · aesthenia · anorexia · anxiety · appetite changes · application-site reactions · diarrhoea · dyspepsia · dyspnoea · gastro-oesophageal reflux disease · hypertension · myoclonus · paraesthesia · pharyngitis · rhinitis · stomatitis · tremor · vasodilation
- ▶ **Uncommon** Amnesia · arthralgia · blood disorders · chills · depressed level of consciousness · dysgeusia · flatulence · hypoventilation · ileus · impaired concentration · impaired coordination · loss of consciousness · malaise · parosmia · pyrexia · seizures · speech disorder · thirst · thrombocytopenia
- ▶ **Rare** Hiccups
- ▶ **Very rare** Apnoea · arrhythmia · ataxia · bladder pain · delusions · haemoptysis

##### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Myoclonic movements
- ▶ **Uncommon**
- ▶ With intravenous use Laryngospasm
- ▶ **Rare**
- ▶ With intravenous use Asystole · insomnia

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).
- ▶ Muscle rigidity Intravenous administration of fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.
- **BREAST FEEDING** Monitor infant for opioid-induced side-effects.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With transdermal use For *patches*, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
- ▶ With intravenous use in adults For *intravenous infusion (Sublimaze)*, give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
- ▶ With buccal use in adults For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
- ▶ With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

**INSTANYL®** Patient should sit or stand during administration.

**EFFENTORA®** Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

- **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write 'Fentanyl 25 patches' to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. 'one patch to be applied every 72 hours'. The total quantity of patches to be supplied should be written in words and figures.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Fentanyl lozenges for pain [www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain](http://www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain)

Medicines for Children leaflet: Fentanyl patches for pain [www.medicinesforchildren.org.uk/fentanyl-patches-for-pain](http://www.medicinesforchildren.org.uk/fentanyl-patches-for-pain)

- ▶ With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.
- ▶ In adults Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges. Patients or carers should be given advice on how to administer fentanyl nasal spray.

**INSTANYL®** Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer *Instanyl®* spray.

**PECFENT®** Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer *PecFent®* spray.

**EFFENTORA®** Patients or carers should be given advice on how to administer *Effentora®* buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

**ABSTRAL®** Patients should be advised not to eat or drink until the tablet is completely dissolved. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**RECIVIT® SUBLINGUAL TABLETS** Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**INSTANYL®**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised that *Instanyl®* nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**PECFENT®**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (September 2008) that *PecFent®* nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**EFFENTORA®**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised that *Effentora®* buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

**ABSTRAL®**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2009) that *Abstral®* sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

**Sublingual tablet**

## Hydromorphone hydrochloride

### • INDICATIONS AND DOSE

#### Severe pain in cancer

► **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain

► **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
- Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

### • CONTRA-INDICATIONS Acute abdomen

### • CAUTIONS Pancreatitis · toxic psychosis

### • SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · anxiety

► **Uncommon** Agitation · diarrhoea · dysgeusia · dyskinesia · myoclonus · paraesthesia · paralytic ileus · peripheral oedema · seizures · tremor

### • BREAST FEEDING Avoid—no information available.

### • RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

### • DIRECTIONS FOR ADMINISTRATION For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

### • PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Capsule

## Meptazinol

### • INDICATIONS AND DOSE

#### Moderate to severe pain, including post-operative pain and renal colic

► **BY MOUTH**

- Adult: 200 mg every 3–6 hours as required

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 75–100 mg every 2–4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 50–100 mg every 2–4 hours if required

**Obstetric analgesia**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 2 mg/kg, usual dose 100–150 mg

- **CONTRA-INDICATIONS** Myocardial infarction · phaeochromocytoma
- **SIDE-EFFECTS** Abdominal pain · can induce withdrawal symptoms in patients dependent on opioids · diarrhoea · dyspepsia · hyperthermia
- Overdose**  
Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Morphine****INDICATIONS AND DOSE****Pain**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
- ▶ Child 6 months-1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 2-11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 12-17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response
- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Child 1-5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
- ▶ Child 6 months-11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- ▶ Child 12-17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous

intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response

- ▶ BY MOUTH, OR BY RECTUM
- ▶ Child 1-2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 3-5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 6-11 months: 200 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 2-11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
- ▶ Child 12-17 years: Initially 5–10 mg every 4 hours, adjusted according to response

**Acute pain**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
- ▶ Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 5 mg every 4 hours, adjusted according to response, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

**Chronic pain**

▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
- ▶ BY RECTUM
- ▶ Adult: Initially 15–30 mg every 4 hours, adjusted according to response

**Pain (with modified-release 12-hourly preparations)**

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

**Pain (with modified-release 24-hourly preparations)**

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

**Pain management in palliative care (starting dose for opioid-naïve patients)**

▶ BY MOUTH

- ▶ Adult: 20–30 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* p. 22.

**Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)**

▶ BY MOUTH

- ▶ Adult: 40–60 mg daily in divided doses, using immediate-release preparation 4-hourly or 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* p. 22. continued →

**Pain in palliative care (following initial titration)**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Adult: Usual dose 30 mg every 4 hours; up to 200 mg every 4 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see *Pain management with opioids* p. 22.
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - ▶ Adult: Usual dose 100 mg every 12 hours; up to 600 mg every 12 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see *Pain management with opioids* p. 22.

**Cough in terminal disease**

- ▶ BY MOUTH
  - ▶ Adult: Initially 5 mg every 4 hours

**Premedication**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

**Patient controlled analgesia (PCA)**

- ▶ BY INTRAVENOUS INFUSION
  - ▶ Adult: (consult local protocol)

**Myocardial infarction**

- ▶ BY SLOW INTRAVENOUS INJECTION
  - ▶ Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
  - ▶ Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Acute pulmonary oedema**

- ▶ BY SLOW INTRAVENOUS INJECTION
  - ▶ Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
  - ▶ Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

**Dyspnoea at rest in palliative care**

- ▶ BY MOUTH
  - ▶ Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ The doses stated refer equally to morphine hydrochloride and sulfate.

**● UNLICENSED USE**

- ▶ With oral use in children *Oramorph*<sup>®</sup> solution not licensed for use in children under 1 year. *Sevredol*<sup>®</sup> tablets not licensed for use in children under 3 years. *Oramorph*<sup>®</sup> unit dose vials not licensed for use in children under 6 years.
- ▶ With rectal use in children Suppositories are not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma
- **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale
- **SIDE-EFFECTS** Abdominal pain · agitation · amenorrhoea · anorexia · asthenia · bronchospasm · delirium · disorientation · dyspepsia · exacerbation of pancreatitis · excitation · hypertension · hypothermia · inhibition of cough reflex · malaise · muscle fasciculation · myoclonus · nystagmus · paraesthesia · paralytic ileus · raised intracranial pressure · restlessness · rhabdomyolysis · seizures · syncope · taste disturbance

- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

**● DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- ▶ With oral use For *modified release capsules*—swallow whole or open capsule and sprinkle contents on soft food.
- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include *Filinarine*<sup>®</sup> SR, *MST Continus*<sup>®</sup>, *Morphesic*<sup>®</sup> SR and *Zomorph*<sup>®</sup>. Preparations that should be given 24-hourly include *MXL*<sup>®</sup>. Prescriptions must specify the 'form'.
- ▶ With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**Palliative care**

- ▶ In adults For further information on the use of morphine in palliative care, see [www.palliativedrugs.com/formulary/en/morphine.html](http://www.palliativedrugs.com/formulary/en/morphine.html).

**● PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Morphine for pain

[www.medicinesforchildren.org.uk/morphine-for-pain](http://www.medicinesforchildren.org.uk/morphine-for-pain)

- ▶ With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules.
- **EXCEPTIONS TO LEGAL CATEGORY**  
Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg  
Chloroform water to 5 mL

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Sevredol** (Napp Pharmaceuticals Ltd)

**Morphine sulfate 120 mg** MXL 120mg capsules | 28 capsule [PoM] £29.15 [CD2]

**Morphine sulfate 150 mg** MXL 150mg capsules | 28 capsule [PoM] £36.43 [CD2]

**Morphine sulfate 200 mg** MXL 200mg capsules | 28 capsule [PoM] £46.15 [CD2]

- ▶ **Zomorph** (Ethypharm UK Ltd)

**Morphine sulfate 10 mg** Zomorph 10mg modified-release capsules | 60 capsule [PoM] £3.47 DT price = £3.47 [CD2]

**Morphine sulfate 30 mg** Zomorph 30mg modified-release capsules | 60 capsule [PoM] £8.30 DT price = £8.30 [CD2]

**Morphine sulfate 60 mg** Zomorph 60mg modified-release capsules | 60 capsule [PoM] £16.20 DT price = £16.20 [CD2]

**Morphine sulfate 100 mg** Zomorph 100mg modified-release capsules | 60 capsule [PoM] £21.80 [CD2]

**Morphine sulfate 200 mg** Zomorph 200mg modified-release capsules | 60 capsule [PoM] £43.60 DT price = £43.60 [CD2]

### Modified-release granules

CAUTIONARY AND ADVISORY LABELS 2, 13

- ▶ **MST Continus** (Napp Pharmaceuticals Ltd)

**Morphine sulfate 20 mg** MST Continus Suspension 20mg granules sachets sugar-free | 30 sachet [PoM] £24.58 [CD2]

**Morphine sulfate 30 mg** MST Continus Suspension 30mg granules sachets sugar-free | 30 sachet [PoM] £25.54 [CD2]

**Morphine sulfate 60 mg** MST Continus Suspension 60mg granules sachets sugar-free | 30 sachet [PoM] £51.09 [CD2]

**Morphine sulfate 100 mg** MST Continus Suspension 100mg granules sachets sugar-free | 30 sachet [PoM] £85.15 [CD2]

**Morphine sulfate 200 mg** MST Continus Suspension 200mg granules sachets sugar-free | 30 sachet [PoM] £170.30 [CD2]

### Oral solution

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Morphine (Non-proprietary)**

**Morphine sulfate 2 mg per 1 ml** Morphine sulfate 10mg/5ml oral solution unit dose vials sugar free sugar-free | 1 unit dose [PoM] no price available [CD5]

Morphine sulfate 10mg/5ml oral solution | 100 ml [PoM] £1.82 [CD5] | 300 ml [PoM] £5.45 DT price = £5.45 [CD5] | 500 ml [PoM] £9.08 [CD5]

- ▶ **Oramorph** (Boehringer Ingelheim Ltd)

**Morphine sulfate 2 mg per 1 ml** Oramorph 10mg/5ml oral solution | 100 ml [PoM] £1.89 [CD5] | 300 ml [PoM] £5.45 DT price = £5.45 [CD5] | 500 ml [PoM] £8.50 [CD5]

**Morphine sulfate 20 mg per 1 ml** Oramorph 20mg/ml concentrated oral solution sugar-free | 30 ml [PoM] £4.98 [CD2] sugar-free | 120 ml [PoM] £19.50 DT price = £19.50 [CD2]

### Solution for injection

- ▶ **Morphine (Non-proprietary)**

**Morphine sulfate 1 mg per 1 ml** Morphine sulfate 5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £35.90 [CD2]

Morphine sulfate 1mg/1ml solution for injection ampoules | 10 ampoule [PoM] £26.10 [CD2]

Morphine sulfate 10mg/10ml solution for injection ampoules | 10 ampoule [PoM] £15.00-£38.00 [CD2]

**Morphine sulfate 10 mg per 1 ml** Morphine sulfate 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £9.36 DT price = £9.36 [CD2]

**Morphine sulfate 15 mg per 1 ml** Morphine sulfate 15mg/1ml solution for injection ampoules | 10 ampoule [PoM] £8.95 DT price = £8.95 [CD2]

**Morphine sulfate 20 mg per 1 ml** Morphine sulfate 20mg/1ml solution for injection ampoules | 10 ampoule [PoM] £51.69 [CD2]

**Morphine sulfate 30 mg per 1 ml** Morphine sulfate 30mg/1ml solution for injection ampoules | 10 ampoule [PoM] £9.04 DT price = £8.84 [CD2]

Morphine sulfate 60mg/2ml solution for injection ampoules | 5 ampoule [PoM] £10.07 [CD2]

### Solution for infusion

- ▶ **Morphine (Non-proprietary)**

**Morphine sulfate 1 mg per 1 ml** Morphine sulfate 50mg/50ml solution for infusion vials | 1 vial [PoM] £5.78 DT price = £5.78 [CD2] | 10 vial [PoM] £28.90 [CD2]

**Morphine sulfate 2 mg per 1 ml** Morphine sulfate 100mg/50ml solution for infusion vials | 1 vial [PoM] £6.48 [CD2] | 10 vial [PoM] £57.60 [CD2]

### Suppository

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Morphine (Non-proprietary)**

**Morphine sulfate 10 mg** Morphine sulfate 10mg suppositories | 12 suppository [PoM] £18.34-£19.45 DT price = £18.90 [CD2]

**Morphine sulfate 15 mg** Morphine sulfate 15mg suppositories | 12 suppository [PoM] £16.48 DT price = £16.48 [CD2]

## Morphine with cyclizine

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 429, cyclizine p. 401.

### ● INDICATIONS AND DOSE

#### CYCLIMORPH-10<sup>®</sup>

##### Moderate to severe pain (short-term use only)

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

▶ Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

#### CYCLIMORPH-15<sup>®</sup>

##### Moderate to severe pain (short-term use only)

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

▶ Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

● **CAUTIONS** Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) - not recommended in palliative care

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Cyclimorph** (AMCo)

**Morphine tartrate 15 mg per 1 ml, Cyclizine tartrate 50 mg per 1 ml** Cyclimorph 15 solution for injection 1ml ampoules | 5 ampoule [PoM] £9.12 [CD2]

**Morphine tartrate 10 mg per 1 ml, Cyclizine tartrate 50 mg per 1 ml** Cyclimorph 10 solution for injection 1ml ampoules | 5 ampoule [PoM] £8.77 [CD2]

◀ 416

## Oxycodone hydrochloride

12-Dec-2016

### ● INDICATIONS AND DOSE

#### Postoperative pain | Severe pain | Moderate to severe pain in palliative care

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose

continued →

## ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 1–10 mg every 4 hours as required
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 2 mg/hour, adjusted according to response
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 5 mg every 4 hours as required
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: Initially 7.5 mg/24 hours, adjusted according to response

**Patient controlled analgesia (PCA)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

- **CONTRA-INDICATIONS** Acute abdomen · chronic constipation · cor pulmonale · delayed gastric emptying

- **CAUTIONS** Pancreatitis · toxic psychosis

**SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anorexia · anxiety · asthenia · bronchospasm · chills · diarrhoea · dyspepsia · dyspnoea · impaired cough reflex
- ▶ **Uncommon** Agitation · amenorrhoea · amnesia · belching · cholestasis · dehydration · disorientation · dry skin · dysphagia · flatulence · gastritis · hiccups · hypoaesthesia · hypotonia · malaise · muscle fasciculation · paraesthesia · paralytic ileus · pyrexia · restlessness · seizures · speech disorder · supraventricular tachycardia · syncope · taste disturbance · thirst · tremor · vasodilatation

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment. Avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment. Opioid effects increased and prolonged and increased cerebral sensitivity occurs. Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*OxyNorm*<sup>®</sup>), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

**PRESCRIBING AND DISPENSING INFORMATION****Palliative care**

For further information on the use of oxycodone in palliative care, see [www.palliativedrugs.com/formulary/en/oxycodone.html](http://www.palliativedrugs.com/formulary/en/oxycodone.html).

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (October 2004 and November 2010) that *OxyNorm*<sup>®</sup> injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for infusion

## Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, oxycodone hydrochloride p. 431, naloxone hydrochloride p. 1214.

### ● INDICATIONS AND DOSE

#### Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics

▶ BY MOUTH

- ▶ Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose

#### Second-line treatment of symptomatic severe to very severe idiopathic restless legs syndrome after failure of dopaminergic therapy

▶ BY MOUTH

- ▶ Adult: Initially 5/2.5 mg every 12 hours, adjusted weekly according to response, usual dose 10/5 mg every 12 hours; maximum 60/30 mg per day

### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Modified-release tablet

#### CAUTIONARY AND ADVISORY LABELS 2, 25

▶ **Targinact** (Napp Pharmaceuticals Ltd)

**Naloxone hydrochloride 2.5 mg, Oxycodone hydrochloride 5 mg** Targinact 5mg/2.5mg modified-release tablets | 28 tablet [PoM] £21.16 DT price = £21.16 [CD2]

**Naloxone hydrochloride 5 mg, Oxycodone hydrochloride 10 mg** Targinact 10mg/5mg modified-release tablets | 56 tablet [PoM] £42.32 DT price = £42.32 [CD2]

**Naloxone hydrochloride 10 mg, Oxycodone hydrochloride 20 mg** Targinact 20mg/10mg modified-release tablets | 56 tablet [PoM] £84.62 DT price = £84.62 [CD2]

**Naloxone hydrochloride 20 mg, Oxycodone hydrochloride 40 mg** Targinact 40mg/20mg modified-release tablets | 56 tablet [PoM] £169.28 [CD2]

## Papaveretum

### ● INDICATIONS AND DOSE

#### Postoperative analgesia | Severe chronic pain

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 7.7–15.4 mg every 4 hours if required
- ▶ Elderly: Initially 7.7 mg every 4 hours if required
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

#### Premedication

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

### IMPORTANT SAFETY INFORMATION

Do **not** confuse with papaverine.

- **CONTRA-INDICATIONS** Heart failure secondary to chronic lung disease · phaeochromocytoma
- **CAUTIONS** Supraventricular tachycardia
- **SIDE-EFFECTS** Hypothermia
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** The name *Omnipon*<sup>®</sup> was formerly used for papaveretum preparations.  
Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.
- **LESS SUITABLE FOR PRESCRIBING** Papaveretum is less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### Solution for injection

- ▶ **Papaveretum (Non-proprietary)**  
Papaveretum 15.4 mg per 1 ml Papaveretum 15.4mg/1ml solution for injection ampoules | 10 ampoule [PoM] £48.96 [CD2]

F 416

## Pentazocine

### ● INDICATIONS AND DOSE

#### Moderate to severe pain

- ▶ BY MOUTH
- ▶ Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

#### Moderate pain

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

#### Severe pain

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)

- **CAUTIONS** Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension
  - **SIDE-EFFECTS** Abdominal pain · blood disorders · chills · disorientation · hypertension · hypothermia · myalgia · paraesthesia · raised intracranial pressure · seizures · syncope · toxic epidermal necrolysis · tremor
- Overdose**  
Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use with caution—limited information available.
  - **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
  - **LESS SUITABLE FOR PRESCRIBING** Pentazocine is less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 21

#### Solution for injection

#### ▶ Pentazocine (Non-proprietary)

**Pentazocine (as Pentazocine lactate) 30 mg per 1 ml** Pentazocine 60mg/2ml solution for injection ampoules | 10 ampoule [PoM] £32.14 DT price = £32.14 [CD3]

F 416

## Pethidine hydrochloride (Meperidine)

### ● INDICATIONS AND DOSE

#### Acute pain

- ▶ BY MOUTH
- ▶ Adult: 50–150 mg every 4 hours
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients
- ▶ Elderly: Initially 25 mg, then 25–100 mg after 4 hours
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients
- ▶ Elderly: Initially 25 mg, then 25–50 mg after 4 hours

#### Obstetric analgesia

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

#### Premedication

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients
- ▶ Elderly: 25 mg, dose to be given 1 hour before operation

**Postoperative pain**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients
- ▶ Elderly: Initially 25 mg every 2–3 hours if required

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Accumulation of metabolites may result in neurotoxicity · cardiac arrhythmias · not suitable for severe continuing pain · severe cor pulmonale
- **SIDE-EFFECTS** Hypothermia · restlessness · tremor
- Overdose**  
Convulsions reported in overdose.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

▶ **Pethidine hydrochloride (Non-proprietary)**

**Pethidine hydrochloride 50 mg** Pethidine 50mg tablets | 50 tablet [PoM] £49.92 DT price = £49.92 [CD2]

**Solution for injection**▶ **Pethidine hydrochloride (Non-proprietary)**

**Pethidine hydrochloride 10 mg per 1 ml** Pethidine 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] £52.91 [CD2]

F 416

**Tapentadol****INDICATIONS AND DOSE**

**Moderate to severe acute pain which can be managed only with opioid analgesics**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day

**Severe chronic pain**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

- **SIDE-EFFECTS** Abdominal discomfort · anxiety · ataxia · decreased appetite · diarrhoea · dysarthria · dyspepsia · hyposensitivity · malaise · muscle spasms · paraesthesia · seizures · tremor · weight loss

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** For *immediate-release tablets*, initial max. daily dose 150 mg; for *modified-release tablets*, initial max. daily dose 50 mg.
- **RENAL IMPAIRMENT** Manufacturer advises no dose adjustment needed in mild or moderate impairment. Avoid in severe impairment; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (May 2011) that tapentadol (*Palexia*® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Tramadol hydrochloride****INDICATIONS AND DOSE**

**Moderate to severe pain**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

**Moderate to severe acute pain**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours
- ▶ Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

**Moderate to severe chronic pain**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours
- ▶ Adult: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours

**Postoperative pain**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day continued →

**Moderate to severe pain (with modified-release 12-hourly preparations)**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours
- ▶ Adult: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

**Moderate to severe pain (with modified-release 24-hourly preparations)**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours
- ▶ Adult: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

**ZYDOL® XL****Moderate to severe pain**

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
- ▶ Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

**IMPORTANT SAFETY INFORMATION**

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute intoxication with alcohol · acute intoxication with analgesics · acute intoxication with hypnotics · acute intoxication with opioids · not suitable for narcotic withdrawal treatment · uncontrolled epilepsy
- **CAUTIONS** Excessive bronchial secretions · history of epilepsy—use tramadol only if compelling reasons · impaired consciousness · not suitable as a substitute in opioid-dependent patients · not suitable in some types of general anaesthesia · susceptibility to seizures—use tramadol only if compelling reasons
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Malaise
  - ▶ **Uncommon** Diarrhoea · flatulence · gastritis · retching
  - ▶ **Rare** Abnormal coordination · anorexia · anxiety · bronchospasm · changes in appetite · delirium · dyspnoea · hypertension · muscle weakness · nightmares · paraesthesia · seizures · syncope · tremor · wheezing
  - ▶ **Frequency not known** Blood disorders · hypoglycaemia · speech disorders
- **PREGNANCY** Embryotoxic in *animal* studies—manufacturers advise avoid.
- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution (avoid for *oral drops*) in severe impairment.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for *oral drops*) in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Tramadol hydrochloride *orodispersible tablets* should be sucked and then swallowed. May also be dispersed in water. Some

tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

For *intravenous infusion*, dilute in Glucose 5% or Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include *Invadol® SR*, *Mabron®*, *Maneo®*, *Marol®*, *Maxtram® SR*, *Oldaram®*, *Tilodal® SR*, *Tramquet® SR*, *Tramulief® SR*, *Zamadol® SR*, *Zeridame® SR* and *Zydol® SR*. Preparations that should be given 24-hourly include *Tradorec XL®*, *Zamadol® 24hr*, and *Zydol XL®*.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.  
Medicines for Children leaflet: Tramadol for pain [www.medicinesforchildren.org.uk/tramadol-for-pain](http://www.medicinesforchildren.org.uk/tramadol-for-pain)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## 6.1 Headache

**Other drugs used for Headache** Clonidine hydrochloride, p. 136 · Sumatriptan, p. 444 · Verapamil hydrochloride, p. 155

## ANTIHISTAMINES &gt; SEDATING ANTIHISTAMINES

## Pizotifen

## ● INDICATIONS AND DOSE

**Prevention of vascular headache | Prevention of classical migraine | Prevention of common migraine | Prevention of cluster headache**

## ▶ BY MOUTH

- Adult: Initially 500 micrograms once daily, then increased to 1.5 mg once daily, dose to be increased gradually and taken at night, alternatively increased to 1.5 mg daily in 3 divided doses, doses to be increased gradually; increased if necessary up to 4.5 mg daily (max. per dose 3 mg), this dose is rarely necessary

**Prophylaxis of migraine**

## ▶ BY MOUTH

- Child 5-17 years: Initially 500 micrograms once daily, dose to be taken at night, then increased to up to 1.5 mg daily in divided doses, dose to be increased gradually, max. single dose (at night) 1 mg

- **UNLICENSED USE** 1.5 mg tablets not licensed for use in children.
- **CAUTIONS** Avoid abrupt withdrawal · history of epilepsy · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1 (pizotifen).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dizziness · drowsiness · dry mouth · increased appetite · nausea · weight gain
  - ▶ **Uncommon** Constipation
  - ▶ **Rare** Aggression · anxiety · arthralgia · depression · hallucination · insomnia · myalgia · paraesthesia
  - ▶ **Very rare** Rash (in adults) · seizures · urticaria (in adults)
  - ▶ **Frequency not known** Hepatitis · jaundice · muscle cramps
- **PREGNANCY** Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

## 6.1a Migraine

**Migraine****Treatment of acute migraine**

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A

**simple analgesic** such as aspirin p. 114, paracetamol p. 414 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant **antiemetic** treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a **5HT<sub>1</sub>-receptor agonist** ('triptan'). **Ergot alkaloids** are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT<sub>1</sub>-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

**Analgesics**

Most migraine headaches respond to analgesics such as aspirin or paracetamol but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 440 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 992, flurbiprofen p. 998, and ibuprofen p. 999 are also licensed for use in migraine.

**5HT<sub>1</sub>-receptor agonists**

A 5HT<sub>1</sub>-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT<sub>1</sub>-receptor agonists ('triptans') act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT<sub>1B/1D</sub>-receptor agonists. A 5HT<sub>1</sub>-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT<sub>1</sub>-receptor agonists are **not** indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

The 5HT<sub>1</sub>-receptor agonists available for treating migraine are almotriptan p. 441, eletriptan p. 442, frovatriptan p. 442, naratriptan p. 443, rizatriptan p. 443, sumatriptan p. 444, and zolmitriptan p. 445. If a patient does not respond to one 5HT<sub>1</sub>-receptor agonist, an alternative 5HT<sub>1</sub>-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT<sub>1</sub>-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

**Ergot Alkaloids**

The value of ergotamine tartrate p. 441 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should **not** be exceeded and treatment should **not** be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine tartrate should be limited to **no more than twice** a month. It should **never** be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

**Antiemetics**

Antiemetics, such as metoclopramide hydrochloride p. 403 or domperidone p. 402, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.

## Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
  - suffer an increasing frequency of headaches;
  - suffer significant disability despite suitable treatment for migraine attacks;
  - cannot take suitable treatment for migraine attacks.
- Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The beta-blockers propranolol hydrochloride p. 142, atenolol p. 143, metoprolol tartrate p. 145, nadolol p. 141, and timolol maleate p. 142 are all effective. Propranolol hydrochloride is the most commonly used.

Tricyclic antidepressants [unlicensed indication], topiramate p. 309, sodium valproate p. 306 [unlicensed indication], valproic acid p. 331 [unlicensed indication], and gabapentin p. 295 [unlicensed indication] are also effective for preventing migraine.

Pizotifen p. 438 is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine.

## Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the *treatment* of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

*Prophylaxis* of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 155 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 622 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride during verapamil titration.

Ergotamine tartrate, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 1001), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

**Other drugs used for Migraine** Amitriptyline hydrochloride, p. 349 • Botulinum toxin type A, p. 380 • Clonidine hydrochloride, p. 136 • Trifluoperazine, p. 366

## ANALGESICS > NON-OPIOID

### Paracetamol with isometheptene

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 414.

#### ● INDICATIONS AND DOSE

##### Treatment of acute attacks of migraine

- ▶ BY MOUTH
- ▶ Adult: 2 capsules, dose to be taken at onset of attack, followed by 1 capsule every 1 hour if required, maximum of 5 capsules in 12 hours

- **PATIENT AND CARER ADVICE** Patient counselling is advised (dosage).

- **LESS SUITABLE FOR PRESCRIBING** Isometheptene with paracetamol is less suitable for prescribing (more effective treatments available).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 30

- ▶ **Midrid** (DHP Healthcare Ltd)

Isometheptene mucate 65 mg, Paracetamol 325 mg Midrid 325mg/65mg capsules | 30 capsule **[PoM]** £7.50

### Paracetamol with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 414, metoclopramide hydrochloride p. 403.

#### ● INDICATIONS AND DOSE

##### Acute migraine

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 2 tablets, to be taken at the onset of attack, followed by 2 tablets every 4 hours if required; maximum 6 tablets per day
- ▶ BY MOUTH USING EFFERESCENT POWDER SACHETS
- ▶ Adult: 2 sachets, to be taken at the onset of attack, followed by 2 sachets every 4 hours if required, sachets to be dissolved in a quarter tumblerful of water; maximum 6 sachets per day

#### IMPORTANT SAFETY INFORMATION

Metoclopramide can cause **severe extrapyramidal effects**, particularly in young adults.

- **CAUTIONS** Treatment should not exceed 3 months due to risk of tardive dyskinesia

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 17, 30

- ▶ **Paramax** (Zentiva)

Metoclopramide hydrochloride 5 mg, Paracetamol

500 mg Paramax tablets | 42 tablet **[PoM]** £9.64 DT price = £9.64

##### Effervescent powder

CAUTIONARY AND ADVISORY LABELS 13, 17, 30

500 mg Paramax sachets sugar-free | 42 sachet **[PoM]** £12.52 DT price = £12.52

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

### Aspirin with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 114, metoclopramide hydrochloride p. 403.

#### ● INDICATIONS AND DOSE

##### Acute migraine

###### ► BY MOUTH

- Adult: 1 sachet, sachet to be mixed in water, and dose to be taken at the start of the attack, then 1 sachet after 2 hours if required; maximum 3 sachets per day

#### IMPORTANT SAFETY INFORMATION

Metoclopramide can cause **severe extrapyramidal effects**, particularly in children and young adults.

- **CAUTIONS** Treatment should not exceed 3 months due to risk of tardive dyskinesia
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder

CAUTIONARY AND ADVISORY LABELS 13, 21, 32

EXCIPIENTS: May contain Aspartame

###### ► MigraMax (Zentiva)

Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine

900 mg MigraMax oral powder sachets sugar-free | 6 sachet [PoM]  
£6.61 DT price = £6.61

### Tolfenamic acid

#### ● INDICATIONS AND DOSE

##### Treatment of acute migraine

###### ► BY MOUTH

- Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · confusion · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dysuria (most commonly in men) · euphoria · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · hallucination · headache · hearing disturbances · hypersensitivity reactions · insomnia · malaise · nausea · nervousness · paraesthesia · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · tremor · vertigo · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount too small to be harmful. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## ANTIHISTAMINES > SEDATING ANTIHISTAMINES

### Paracetamol with buclizine hydrochloride and codeine phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 414, codeine phosphate p. 421.

#### ● INDICATIONS AND DOSE

##### MIGRALEVE®

##### Acute migraine

###### ► BY MOUTH

- Child 12–14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed

- by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours
- ▶ Child 15–17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours
  - ▶ Adult: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours

#### ● LESS SUITABLE FOR PRESCRIBING

**MIGRALEVE®** *Migravele®* is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## ERGOT ALKALOIDS

### Ergotamine tartrate

#### ● INDICATIONS AND DOSE

##### Management of cluster headache

###### ▶ BY MOUTH USING TABLETS

- ▶ Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

- **UNLICENSED USE** Not licensed for the management of cluster headache.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · coronary heart disease · hyperthyroidism · inadequately controlled hypertension · obliterative vascular disease · peripheral vascular disease · Raynaud's syndrome · sepsis · severe hypertension · temporal arteritis
- **CAUTIONS** Anaemia · cardiac disease · dependence · elderly · risk of peripheral vasospasm
- **INTERACTIONS** → Appendix 1 (ergot alkaloids).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · dizziness · nausea · vomiting
  - ▶ **Uncommon** Cyanosis · diarrhoea · hypoaesthesia · pain in extremities · paraesthesia · peripheral vasoconstriction · weakness in extremities
  - ▶ **Rare** Arrhythmias · bradycardia · dyspnoea · ergotism (including absence of pulse and numbness in extremities) · increased blood pressure · intestinal ischaemia · myalgia · rash · tachycardia · urticaria
  - ▶ **Very rare** Gangrene · heart-valve fibrosis · myocardial infarction · myocardial ischaemia
  - ▶ **Frequency not known** Anxiety · arthralgia · blood disorders · blurred vision · cerebral ischaemia · confusion · constipation · depression · drowsiness · dry mouth · extrapyramidal effects · hallucinations · renal artery spasm · seizures · sleep disturbances · thrombosis · tremor · urinary retention
- **PREGNANCY** Avoid; oxytocic effect on the uterus.
- **BREAST FEEDING** Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of toxicity increased.

- **RENAL IMPAIRMENT** Avoid; risk of renal vasoconstriction.
- **PATIENT AND CARER ADVICE**  
Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.
- **LESS SUITABLE FOR PRESCRIBING** Ergotamine tartrate is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified

### Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergotamine tartrate above, cyclizine p. 401.

#### ● INDICATIONS AND DOSE

##### Treatment of acute migraine and migraine variants unresponsive to analgesics

###### ▶ BY MOUTH

- ▶ Adult: 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

- **PATIENT AND CARER ADVICE** Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).
- **LESS SUITABLE FOR PRESCRIBING** Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (*Migril®*) is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 18

Ergotamine tartrate 2 mg, Cyclizine hydrochloride 50 mg, Caffeine hydrate 100 mg Migril tablets | 100 tablet [PoM] £51.00

## TRIPTRANS

### Almotriptan

#### ● INDICATIONS AND DOSE

##### Treatment of acute migraine

###### ▶ BY MOUTH

- ▶ Adult: 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 25 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina · severe hypertension · uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly
- **INTERACTIONS** → Appendix 1 (5HT<sub>1</sub> agonists).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Drowsiness · transient increase in blood pressure

- ▶ **Uncommon** Bone pain · chest pain · diarrhoea · dry mouth · dyspepsia · headache · myalgia · palpitation · paraesthesia · tinnitus
- ▶ **Very rare** Myocardial infarction · tachycardia
- ▶ **Frequency not known** Dizziness · fatigue · feeling of weakness · flushing · nausea · seizures · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.
- **PREGNANCY** There is limited experience of using 5HT<sub>1</sub>-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk in *animal* studies— withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

## Sumatriptan

#### ● INDICATIONS AND DOSE

##### Treatment of acute migraine

###### ▶ BY MOUTH

- ▶ Adult: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

###### ▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult 18–65 years: Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

##### Treatment of acute cluster headache

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for

intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

###### ▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult 18–65 years: Initially 10–20 mg, dose to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.

- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · mild uncontrolled hypertension · moderate and severe hypertension · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina

- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly · history of seizures · mild, controlled hypertension · pre-existing cardiac disease · risk factors for seizures

- **INTERACTIONS** → Appendix 1 (5HT<sub>1</sub> agonists).

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · drowsiness · dyspnoea · fatigue · flushing · myalgia · nausea · sensory disturbances · transient increase in blood pressure · vomiting · weakness
- ▶ **Frequency not known** Arrhythmias · angina · anxiety · arthralgia · bradycardia · diarrhoea · dystonia · hypersensitivity reactions · hypotension · ischaemic colitis · myocardial infarction · neck stiffness · nystagmus · palpitation · Raynaud's syndrome · seizures · sweating · tachycardia · transient ischaemic ECG changes · tremor · visual disturbances

##### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intranasal use Dysgeusia · epistaxis

##### SIDE-EFFECTS, FURTHER INFORMATION

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

- **PREGNANCY** There is limited experience of using 5HT<sub>1</sub>-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

- **HEPATIC IMPAIRMENT** Reduce oral dose to 25–50 mg. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

#### ● EXCEPTIONS TO LEGAL CATEGORY

Max. 5 mg in 24 hours with concomitant cimetidine, flvoxamine, moclobemide, or quinolone antibiotics.

**DOSE EQUIVALENCE AND CONVERSION**

▶ 1 spray of *Zomig*<sup>®</sup> nasal spray = 5 mg zolmitriptan.

**● UNLICENSED USE** Not licensed for use in elderly. Not licensed for treatment of cluster headaches.

**● CONTRA-INDICATIONS** Arrhythmias associated with accessory cardiac conduction pathways · coronary vasospasm · ischaemic heart disease · previous cerebrovascular accident · previous myocardial infarction · Prinzmetal's angina · severe hypertension · transient ischaemic attack · uncontrolled hypertension · Wolff-Parkinson-White syndrome

**● CAUTIONS** Conditions which predispose to coronary artery disease · elderly · should not be taken within 24 hours of any other 5HT<sub>1</sub>-receptor agonist

**● INTERACTIONS** → Appendix 1 (5HT<sub>1</sub> agonists).

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

**▶ Common or very common** Abdominal pain · drowsiness · dry mouth · dysphagia · headache · muscle weakness · myalgia · palpitation · paraesthesia

**▶ Uncommon** Polyuria · tachycardia · transient increase in blood pressure

**▶ Rare** Urticaria

**▶ Very rare** Angina · gastro-intestinal infarction · ischaemic colitis · myocardial infarction · splenic infarction

**▶ Frequency not known** Dizziness · fatigue · feeling of weakness · flushing

**SPECIFIC SIDE-EFFECTS**

**▶ With intranasal use** Epistaxis · taste disturbance

**SIDE-EFFECTS, FURTHER INFORMATION**

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest)—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

**● PREGNANCY** There is limited experience of using 5HT<sub>1</sub>-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

**● BREAST FEEDING** Use with caution—present in milk in animal studies.

**● HEPATIC IMPAIRMENT** Max. 5 mg in 24 hours in moderate or severe impairment.

**● DIRECTIONS FOR ADMINISTRATION** Zolmitriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed.

**● PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer zolmitriptan orodispersible tablets.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**▶ Zolmitriptan (Non-proprietary)**

## 6.2 Neuropathic pain

### Neuropathic pain

#### Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes *phantom limb pain*, *compression neuropathies*, *peripheral neuropathies* (e.g. due to diabetes p. 625, chronic excessive alcohol intake, HIV infection p. 590, chemotherapy, idiopathic neuropathy), *trauma*, *central pain* (e.g. pain following stroke, spinal cord injury, and syringomyelia), and *postherpetic neuralgia* (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

*Trigeminal neuralgia* is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a **tricyclic antidepressant** or with certain **antiepileptic drugs**. Amitriptyline hydrochloride p. 349 [unlicensed indication] and pregabalin p. 304 are effective treatments for neuropathic pain. Amitriptyline hydrochloride and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 355 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 295 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to **opioid analgesics**. There is evidence of efficacy for tramadol hydrochloride p. 435, morphine p. 429, and oxycodone hydrochloride p. 431; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from **topical local anaesthetic preparations**, such as lidocaine hydrochloride p. 97 medicated plasters, while awaiting specialist review.

Capsaicin below is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of *postherpetic neuralgia*. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

#### Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 291 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 302; the drug may be given by intravenous infusion

(possibly as fosphenytoin sodium p. 294) in a crisis (specialist use only).

#### Chronic facial pain

Chronic oral and facial pain including *persistent idiopathic facial pain* (also termed 'atypical facial pain') and *temporomandibular dysfunction* (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs.

**Tricyclic antidepressants** may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

**Other drugs used for Neuropathic pain** Amantadine hydrochloride, p. 390

## ANALGESICS > PLANT ALKALOIDS

### Capsaicin

#### ● INDICATIONS AND DOSE

##### AXSAIN®

#### Post-herpetic neuralgia

##### ▶ TO THE SKIN

- ▶ Adult: Apply 3–4 times a day, dose to be applied sparingly; **important**; after lesions have healed, not more often than every 4 hours

#### Painful diabetic neuropathy (under expert supervision)

##### ▶ TO THE SKIN

- ▶ Adult: Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

##### QUTENZA®

#### Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)

##### ▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: (consult product literature)

##### ZACIN®

#### Symptomatic relief in osteoarthritis

##### ▶ TO THE SKIN

- ▶ Adult: Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

#### ● CAUTIONS

##### GENERAL CAUTIONS

Avoid contact with broken skin · avoid contact with inflamed skin

##### SPECIFIC CAUTIONS

- ▶ With topical use Avoid contact with eyes · avoid hot shower or bath just before or after application (burning sensation enhanced) · avoid inhalation of vapours · not to be used under tight bandages
- ▶ With transdermal use avoid contact with the face, scalp or in proximity to mucous membranes · avoid holding near eyes or mucous membranes · recent cardiovascular events · uncontrolled hypertension

#### ● SIDE-EFFECTS

##### ▶ Common or very common

- ▶ With topical use Transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily)
- ▶ With transdermal use Application site reactions · erythema · pruritus · transient burning
- ▶ Uncommon
- ▶ With transdermal use Burning sensation · cough · dysgeusia · eye irritation · first degree AV block · hypertension · hypoaesthesia · muscle spasm · nausea · pain in extremities

• palpitations • peripheral oedema • pruritus • tachycardia • throat irritation

▶ **Rare**

• With topical use Cough • eye irritation • sneezing

▶ **Frequency not known**

• With topical use Dyspnoea • exacerbation of asthma

● **MONITORING REQUIREMENTS**

• With transdermal use Monitor blood pressure during treatment procedure.

● **HANDLING AND STORAGE**

• With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).

• With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

● **NATIONAL FUNDING/ACCESS DECISIONS**

**QUTENZA®**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2011) that capsaicin 179 mg (8%) patch (*Qutenza*®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second line treatments. Treatment should be under the supervision of a specialist in pain management.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

▶ **Axsain** (Teva UK Ltd)

**Capsaicin 750 microgram per 1 gram** Axsain 0.075% cream | 45 gram [PoM] £14.58 DT price = £14.58

▶ **Zacin** (Teva UK Ltd)

**Capsaicin 250 microgram per 1 gram** Zacin 0.025% cream | 45 gram [PoM] £17.71 DT price = £17.71

**Cutaneous patch**

EXCIPIENTS: May contain Butylated hydroxyanisole

▶ **Qutenza** (Astellas Pharma Ltd)

**Capsaicin 179 mg** Qutenza 179mg cutaneous patches | 1 patch [PoM] £210.00

## 7 Sleep disorders

### 7.1 Insomnia

#### Hypnotics and anxiolytics

##### Overview

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 324 and barbiturates are **not** recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

##### Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term 'mild' anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

##### Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient's clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg

- ≡ alprazolam 250 micrograms
- ≡ clobazam 10 mg
- ≡ clonazepam 250 micrograms
- ≡ flurazepam 7.5–15 mg
- ≡ chlordiazepoxide 12.5 mg
- ≡ loprazolam 0.5–1 mg
- ≡ lorazepam 500 micrograms
- ≡ lormetazepam 0.5–1 mg
- ≡ nitrazepam 5 mg
- ≡ oxazepam 10 mg
- ≡ temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be **avoided** where possible.

Counselling can be of considerable help both during and after the taper.

## Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

*Transient insomnia* may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

*Short-term insomnia* is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

*Chronic insomnia* is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 351 or mirtazapine p. 349 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should **not** be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

### Elderly

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

### Dental patients

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 451 or diazepam p. 321. Temazepam is preferred when it is important to minimise any residual effect the following day.

### Benzodiazepines

Benzodiazepines used as hypnotics include nitrazepam p. 450 and flurazepam p. 449 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Loprazolam p. 449, lormetazepam p. 450, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as

diazepam given as a single dose at night may effectively treat both symptoms.

### Zaleplon, zolpidem, and zopiclone

Zaleplon p. 453, zolpidem tartrate p. 454 and zopiclone p. 454 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.

### Cloral and derivatives

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

### Clomethiazole

Clomethiazole p. 452 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

### Antihistamines

Some **antihistamines** such as promethazine hydrochloride p. 269 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

### Alcohol

**Alcohol** is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

### Melatonin

Melatonin p. 453 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

## Anxiolytics

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 268) for their sedative effect in anxiety is not appropriate.

**Beta-adrenoceptor blocking drugs** do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

**Benzodiazepines**

**Benzodiazepines** are indicated for the *short-term relief of severe anxiety*; long-term use should be avoided. Diazepam, alprazolam p. 320, chlordiazepoxide hydrochloride p. 321, and clobazam p. 314 have a sustained action. Shorter-acting compounds such as lorazepam p. 317 and oxazepam p. 324 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In *panic disorders* (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the *control of panic attacks*. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

**Bupirone**

Bupirone hydrochloride p. 320 is thought to act at specific serotonin (5HT<sub>1A</sub>) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting bupirone hydrochloride. The dependence and abuse potential of bupirone hydrochloride is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

**Meprobamate**

Meprobamate p. 324 is **less effective** than the benzodiazepines, more hazardous in overdose, and can also induce dependence. It is **not** recommended.

**Barbiturates**

The intermediate-acting **barbiturates** have a place only in the treatment of severe intractable insomnia in patients **already taking** barbiturates; they should be **avoided** in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 316 is used in anaesthesia.

Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

**HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES**

320

**Flurazepam****● INDICATIONS AND DOSE****Insomnia (short-term use)****► BY MOUTH**

- Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 15 mg once daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · respiratory depression

- **CAUTIONS** Acute porphyrias p. 930 · hypoalbuminaemia · marked personality disorder · muscle weakness

**CAUTIONS, FURTHER INFORMATION**

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking

benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**● SIDE-EFFECTS**

- **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

**● PATIENT AND CARER ADVICE****Driving and skilled tasks**

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**● NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Flurazepam capsules are not prescribable under the NHS.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## Nitrazepam

#### ● INDICATIONS AND DOSE

##### Insomnia (short-term use)

###### ▶ BY MOUTH

- ▶ **Adult:** 5–10 mg daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- ▶ **Elderly:** 2.5–5 mg daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · respiratory depression

- **CAUTIONS** Acute porphyrias p. 930 · hypoalbuminaemia · marked personality disorder · muscle weakness

##### CAUTIONS, FURTHER INFORMATION

- ▶ **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer.

Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 19

- ▶ **Nitrazepam (Non-proprietary)**

**Nitrazepam 5 mg** Nitrazepam 5mg tablets | 28 tablet [PoM] £5.00 DT price = £1.20 [CD4-1] | 500 tablet [PoM] £21.43 [CD4-1]

**Nitrazepam 500 microgram per 1 ml** Nitrazepam 2.5mg/5ml oral suspension | 70 ml [PoM] £114.00 DT price = £114.00 [CD4-1]

F 320

## Temazepam

- **INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- ▶ **BY MOUTH**

- ▶ **Adult:** 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose
- ▶ **Elderly:** 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

**Conscious sedation for dental procedures**

- ▶ **BY MOUTH**

- ▶ **Adult:** 15–30 mg, to be administered 30–60 minutes before procedure

**Premedication before surgery or investigatory procedures**

- ▶ **BY MOUTH**

- ▶ **Adult:** 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
- ▶ **Elderly:** 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

- **UNLICENSED USE** Temazepam doses in BNF may differ from those in product literature.

Not licensed for conscious sedation for dental procedures.

- **CONTRA-INDICATIONS** CNS depression · compromised airway · hyperkinesia · not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · obsessional state · phobic states · respiratory depression

- **CAUTIONS** Hypoalbuminaemia · muscle weakness · organic brain changes · personality disorder (within the fearful

group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · jaundice · skin reactions
- ▶ **Frequency not known** Respiratory depression (may be marked when used for sedation; facilities for its treatment are essential)

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

If treatment is necessary, benzodiazepines with shorter half-lives are safer.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

- **PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary**

Temazepam Tablets and Oral Solution may be prescribed.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 19

## HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

### Chloral hydrate

#### ● INDICATIONS AND DOSE

**Insomnia (short-term use) using Chloral Mixture, BP 2000**

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 0.5–2 g daily, dose to be taken at bedtime

**Insomnia (short-term use), using chloral hydrate 143.3 mg/5 ml oral solution**

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 15–30 mL, alternatively 430–860 mg once daily, dose to be taken with water or milk at bedtime; maximum 70 mL per day; maximum 2 g per day

**Insomnia (short-term use), using chloral betaine 707 mg (≡ 414 mg chloral hydrate) tablets**

▶ BY MOUTH USING TABLETS

▶ Adult: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · gastritis · severe cardiac disease
- **CAUTIONS** Avoid contact with mucous membranes · avoid contact with skin · avoid prolonged use (and abrupt withdrawal thereafter) · reduce dose in debilitated · reduce dose in elderly
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS** Abdominal distention · delirium (especially on abrupt withdrawal) · dependence · excitement · flatulence · gastric irritation · headache · ketonuria · nausea · rash · tolerance · vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Risk of sedation in infant—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use For administration *by mouth* dilute liquid with plenty of water or juice to mask unpleasant taste.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant.
  - When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 mL in a suitable vehicle.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Chloral hydrate is less suitable for prescribing in insomnia.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 19, 27

▶ **Chloral hydrate (Non-proprietary)**

**Chloral hydrate 28.66 mg per 1 ml** Chloral hydrate 143.3mg/5ml oral solution BP | 150 ml **[PoM]** £120.00–£244.25 DT price = £244.25

### Clomethiazole

#### (Chlormethiazole)

#### ● INDICATIONS AND DOSE

**Severe insomnia (short-term use)**

▶ BY MOUTH USING CAPSULES

▶ Elderly: 192–384 mg once daily, dose to be taken at bedtime

▶ BY MOUTH USING ORAL SOLUTION

▶ Elderly: 5–10 mL once daily, dose to be taken at bedtime

**Restlessness and agitation**

▶ BY MOUTH USING CAPSULES

▶ Elderly: 192 mg 3 times a day

▶ BY MOUTH USING ORAL SOLUTION

▶ Elderly: 5 mL 3 times a day

**Alcohol withdrawal**

▶ BY MOUTH USING CAPSULES

▶ Adult: Initially 2–4 capsules, to be repeated if necessary after some hours, 9–12 capsules daily in 3–4 divided doses on day 1 (first 24 hours), then 6–8 capsules daily in 3–4 divided doses on day 2, then 4–6 capsules daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses on day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses on day 2, then 20–30 mL daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · alcohol-dependent patients who continue to drink
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · cardiac disease (confusional state may indicate hypoxia) · chronic pulmonary insufficiency · elderly · excessive sedation may occur (particularly with higher doses); · history of drug abuse · marked personality disorder · respiratory disease (confusional state may indicate hypoxia) · sleep apnoea syndrome
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Conjunctival irritation · headache · increased bronchial secretions · increased nasopharyngeal secretions · nasal congestion · nasal irritation
  - ▶ **Rare** Alterations in liver enzymes · anaphylaxis · bullous eruption · confusion · dependence · gastro-intestinal disturbances · paradoxical excitement · rash · urticaria
- **PREGNANCY** Avoid if possible—especially during the first and third trimesters.
- **BREAST FEEDING** Use only if benefit outweighs risk—present in breast milk but effects unknown.
- **HEPATIC IMPAIRMENT** Reduce dose. Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment. Increased cerebral sensitivity.

## ● PATIENT AND CARER ADVICE

### Driving and skilled tasks

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Capsule

Clomethiazole (as Clomethiazole edisilate) 50 mg per 1 ml Clomethiazole 31.5mg/ml oral solution sugar free sugar-free | 300 ml [PoM] £30.00

## Melatonin

### ● INDICATIONS AND DOSE

#### Insomnia (short-term use)

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Adult 55 years and over: 2 mg once daily for up to 13 weeks, dose to be taken 1–2 hours before bedtime

- **CAUTIONS** Autoimmune disease (manufacturer advises avoid—no information available)
- **INTERACTIONS** → Appendix 1 (melatonin).
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Abdominal pain · abnormal dreams · anxiety · chest pain · dizziness · dry mouth · dry skin · dyspepsia · glycosuria · headache · hypertension · irritability · malaise · mouth ulceration · nausea · nervousness · proteinuria · pruritus · rash · restlessness · weight gain
  - ▶ **Rare** Aggression · angina · arthritis · electrolyte disturbances · flatulence · gastritis · haematuria · halitosis · hot flushes · hypertriglyceridaemia · impaired memory · increased libido · lacrimation · leucopenia · mood changes · muscle spasm · nail disorder · palpitation · paraesthesia · polyuria · priapism · prostatitis · restless legs syndrome · salivation · syncope · thirst · thrombocytopenia · visual disturbances · vomiting
  - ▶ **Frequency not known** Galactorrhoea · mouth oedema · tongue oedema
- **PREGNANCY** No information available—avoid.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Clearance reduced—avoid.
- **RENAL IMPAIRMENT** No information available—use with caution.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 21, 25

#### ▶ Melatonin (Non-proprietary)

Melatonin 3 mg Melatonin 3mg modified-release tablets | 120 tablet [PoM] no price available

#### ▶ Circadin (Flynn Pharma Ltd)

Melatonin 2 mg Circadin 2mg modified-release tablets | 30 tablet [PoM] £15.39 DT price = £15.39

## Zaleplon

### ● INDICATIONS AND DOSE

#### Insomnia (short-term use)

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep
- ▶ Elderly: 5 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep

- **CONTRA-INDICATIONS** Marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (risk of tolerance and withdrawal symptoms) · depression (risk of suicidal ideation) · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis · respiratory insufficiency (avoid if severe)
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Amnesia · drowsiness · dysmenorrhoea · paraesthesia
  - ▶ **Uncommon** Anorexia · asthenia · confusion · depersonalisation · depression · disturbances of hearing · disturbances of smell · disturbances of speech · disturbances of vision · dizziness · hallucinations · impaired concentration · incoordination · nausea · photosensitivity
  - ▶ **Frequency not known** Paradoxical effects · sleep-walking
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.
- **PREGNANCY** Use only if necessary and restrict to occasional short-term use. Risk of withdrawal symptoms in neonate if used in late pregnancy.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised not to take a second dose during a single night.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

  - ▶ Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77  
Zaleplon is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only.  
[www.nice.org.uk/TA77](http://www.nice.org.uk/TA77)
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Zolpidem tartrate

### ● INDICATIONS AND DOSE

#### Insomnia (short-term use)

##### ► BY MOUTH

- Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

● **CONTRA-INDICATIONS** Acute respiratory depression · marked neuromuscular respiratory weakness · obstructive sleep apnoea · psychotic illness · severe respiratory depression · unstable myasthenia gravis

● **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · depression · elderly · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis

● **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).

● **SIDE-EFFECTS** Agitation · amnesia · asthenia · ataxia · changes in libido · confusion · dependence · depression · diarrhoea · diplopia · dizziness · drowsiness · falls · hallucination · headache · memory disturbances · muscular weakness · nausea · nightmares · paradoxical effects · perceptual disturbances · skin reactions · sleep-walking · tremor · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

► Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

● **PREGNANCY** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

● **BREAST FEEDING** Small amounts present in milk—avoid.

● **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.

● **RENAL IMPAIRMENT** Use with caution.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g. driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

► Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77

## Zopiclone

### ● INDICATIONS AND DOSE

#### Insomnia (short-term use)

##### ► BY MOUTH

- Adult: 7.5 mg once daily for up to 4 weeks, dose to be taken at bedtime
- Elderly: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

#### Insomnia (short-term use) in patients with chronic pulmonary insufficiency

##### ► BY MOUTH

- Adult: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

● **CONTRA-INDICATIONS** Marked neuromuscular respiratory weakness · respiratory failure · severe sleep apnoea syndrome · unstable myasthenia gravis

● **CAUTIONS** Avoid prolonged use (risk of tolerance and withdrawal symptoms) · chronic pulmonary insufficiency (increased risk of respiratory depression) · elderly · history of drug abuse · muscle weakness · myasthenia gravis (avoid if unstable) · psychiatric illness

● **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).

#### ● SIDE-EFFECTS

- **Common or very common** Taste disturbance
- **Uncommon** Dizziness · drowsiness · dry mouth · headache · nausea · vomiting
- **Rare** Amnesia · confusion · depression · hallucinations · nightmares
- **Very rare** Incoordination · light headedness
- **Frequency not known** Paradoxical effects · sleep-walking

#### SIDE-EFFECTS, FURTHER INFORMATION

► Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

● **PREGNANCY** Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

● **BREAST FEEDING** Present in milk—avoid.

● **HEPATIC IMPAIRMENT** Reduce dose to 3.75 mg in mild to moderate impairment, dose can be increased with caution if necessary. Avoid in severe impairment—can precipitate encephalopathy.

● **RENAL IMPAIRMENT** Start with reduced dose of 3.75 mg. Increased cerebral sensitivity.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

## 7.2 Narcolepsy

**Other drugs used for Narcolepsy** Dexamfetamine sulfate, p. 328 · Methylphenidate hydrochloride, p. 326

### CENTRAL NERVOUS SYSTEM DEPRESSANTS

#### Sodium oxybate

- **DRUG ACTION** A central nervous system depressant.

#### ● INDICATIONS AND DOSE

##### Narcolepsy with cataplexy (under expert supervision)

#### ▶ BY MOUTH

- ▶ **Adult:** Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

- **CONTRA-INDICATIONS** Major depression · succinic semi-aldehyde dehydrogenase deficiency
- **CAUTIONS** Body mass index of 40 kg/m<sup>2</sup> or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of depression · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms
- **INTERACTIONS** → Appendix 1 (sodium oxybate).  
If sodium oxybate and sodium valproate or valproic acid used concomitantly, reduce initial dose of sodium oxybate to 1.8 g on retiring and repeat 2.5–4 hours later.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · back pain · blurred vision · confusion · depression · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · headache · hypertension · hypoaesthesia · impaired attention · muscle spasm · nasal congestion · nausea · nocturnal enuresis · palpitation · paraesthesia · peripheral oedema · rash · sleep disorders · sleep paralysis · sleep walking · sweating · taste disturbance · tremor · urinary incontinence · vertigo · vomiting

- ▶ **Uncommon** Agitation · amnesia · faecal incontinence · hallucination · myoclonus · paranoia · psychosis · restless legs syndrome · suicidal behaviour
- ▶ **Frequency not known** Dependence · euphoria · respiratory depression · seizures · sleep apnoea · suicidal ideation · urticaria

- **PREGNANCY** Avoid.

- **BREAST FEEDING** No information available.

- **HEPATIC IMPAIRMENT** Halve initial dose.

- **RENAL IMPAIRMENT** Caution—contains 3.96 mmol Na<sup>+</sup> per mL.

- **DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium oxybate oral solution.

#### Driving and skilled tasks

Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

CAUTIONARY AND ADVISORY LABELS 13, 19

ELECTROLYTES: May contain Sodium

#### ▶ Xyrem (UCB Pharma Ltd)

**Sodium oxybate 500 mg per 1 ml** Xyrem 500mg/ml oral solution sugar-free | 180 ml **[POM]** £360.00 DT price = £360.00 **[CD2]**

### CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS

#### Modafinil

#### ● INDICATIONS AND DOSE

##### Excessive sleepiness associated with narcolepsy with or without cataplexy

#### ▶ BY MOUTH

- ▶ **Adult:** Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily
- ▶ **Elderly:** Initially 100 mg daily

- **CONTRA-INDICATIONS** Arrhythmia · history of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) · history of cor pulmonale · history of left ventricular hypertrophy · moderate uncontrolled hypertension · severe uncontrolled hypertension
- **CAUTIONS** History of alcohol abuse · history of depression · history of drug abuse · history of mania · history of psychosis · possibility of dependence
- **INTERACTIONS** → Appendix 1 (modafinil).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anxiety · appetite changes · asthenia · chest pain · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · gastrointestinal disturbances · headache · nausea · palpitation · paraesthesia · sleep disturbances · tachycardia · vasodilatation · visual disturbances

- ▶ **Uncommon** Abnormal dreams · acne · aggression · agitation · amnesia · arrhythmia · arthralgia · bradycardia · decreased libido · dry eye · dyskinesia · dysphagia · dyspnoea · emotional lability · eosinophilia · epistaxis · flatulence · glossitis · hypercholesterolaemia · hyperglycaemia · hypertension · hypertonia · hypotension · leucopenia · menstrual disturbances · migraine · mouth ulcers · muscle cramps · myalgia · myasthenia · peripheral oedema · pruritus · rash · reflux · rhinitis · sinusitis · suicidal ideation · sweating · taste disturbance · thirst · tremor · urinary frequency · vomiting · weight changes
- ▶ **Rare** Hallucinations · mania · psychosis
- ▶ **Frequency not known** Multi-organ hypersensitivity reaction · psychiatric symptoms · Stevens-Johnson syndrome · toxic epidermal necrolysis

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Discontinue treatment if rash develops.
- ▶ **Psychiatric symptoms** Discontinue treatment if psychiatric symptoms develop.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Halve dose in severe impairment.
- **RENAL IMPAIRMENT** Use with caution—limited information available.
- **PRE-TREATMENT SCREENING** ECG required before initiation.
- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate in hypertensive patients.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ▶ Modafinil (Non-proprietary)

**Modafinil 100 mg** Modafinil 100mg tablets | 30 tablet **[PoM]** £52.60  
DT price = £6.83

**Modafinil 200 mg** Modafinil 200mg tablets | 30 tablet **[PoM]**  
£105.21 DT price = £13.87

##### ▶ Provigil (Teva UK Ltd)

**Modafinil 100 mg** Provigil 100mg tablets | 30 tablet **[PoM]** £52.60  
DT price = £6.83

**Modafinil 200 mg** Provigil 200mg tablets | 30 tablet **[PoM]** £105.21  
DT price = £13.87

patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually chlordiazepoxide hydrochloride p. 321, are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with decompensated liver disease should be treated under specialist supervision.

Carbamazepine p. 291 [unlicensed indication] is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole p. 452 is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol p. 363 or olanzapine p. 373 [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam p. 317 [unlicensed indication] or rectal diazepam p. 321) should be prescribed; thereafter an increase in the dose of oral benzodiazepine should be considered to prevent further seizures from occurring.

#### Alcohol dependence

Acamprosate calcium p. 459 and naltrexone hydrochloride p. 460 are effective treatments for relapse prevention in patients with alcohol dependence; disulfiram p. 459 is an alternative. Disulfiram should only be used in patients in whom acamprosate calcium and naltrexone hydrochloride are not suitable, or if the patient prefers disulfiram.

Nalmefene p. 460 is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification.

Patients with alcohol dependence are at risk of developing Wernicke's encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 950 (as *Pabrinex*<sup>®</sup>) should be prescribed for treatment of suspected or confirmed Wernicke's encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke's encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed **pancreatic enzyme supplements**; supplements are not indicated when pain is the only symptom.

**Corticosteroids** are used in patients with severe acute alcohol-related hepatitis.

## 8 Substance dependence

### Substance dependence

#### Guidance on treatment of drug misuse

The UK health departments have produced guidance on the treatment of drug misuse in the UK. *Drug Misuse and Dependence: UK Guidelines on Clinical Management (2007)* is available at [www.nta.nhs.uk/uploads/clinical\\_guidelines\\_2007.pdf](http://www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf).

#### Alcohol dependence

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by *The Severity of Alcohol Dependence Questionnaire (SADQ)*; other assessment questionnaires are also available.

#### Acute alcohol withdrawal

People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent

## Drugs used in alcohol dependence

### Acamprosate

Acamprosate calcium, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible *after* abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium is not effective in all patients, so efficacy should be regularly assessed.

### Disulfiram

Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

### Nalmefene

Nalmefene should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene is not recommended for patients aiming to achieve immediate abstinence.

### Naltrexone

Naltrexone hydrochloride is an opioid-receptor antagonist, but is useful as an adjunct in the treatment of alcohol dependence after a successful withdrawal. Treatment should be initiated by a specialist and continued under specialist supervision. Naltrexone hydrochloride should be stopped if drinking continues for 4–6 weeks after starting treatment.

## Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker's likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker's preferences. **Nicotine replacement therapy**, bupropion hydrochloride p. 461, and varenicline p. 464 are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion hydrochloride is not recommended.

### Concomitant medication

Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline p. 256, cinacalcet p. 918, ropinirole p. 396, and some antipsychotics (including clozapine p. 371, olanzapine p. 373, chlorpromazine hydrochloride p. 361, and

haloperidol p. 363, may need to be reduced. Regular monitoring for adverse effects is advised.

### Drugs used in nicotine dependence

Bupropion hydrochloride has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

### Nicotine replacement therapy

**Nicotine replacement therapy** can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

### Choice

Nicotine p. 462 patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

### Side-effects of specific nicotine preparations

Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and *inhalation cartridges* can cause irritation of the throat, *gum, lozenges, and oral spray* can cause increased salivation, and *patches* can cause minor skin irritation. The *nasal spray* commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the *oral spray* can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of *lozenges, patches, oral spray, and sublingual tablets*. *Lozenges* cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The *oral spray* may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely *patches* and *oral spray* can cause arrhythmia. *Patches, lozenges, and oral spray* can cause chest pain. The *inhalator* can very rarely cause reversible atrial fibrillation.

Paraesthesia is a common side-effect of *oral spray*. Abnormal dreams can occur with *patches*; removal of the patch before bed may help. *Lozenges and oral spray* may cause rash and hot flushes. Sweating and myalgia can occur with *patches* and *oral spray*; the *patches* can also cause arthralgia.

## Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at

36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 464 or buprenorphine p. 417 withdrawal occurs later, with longer-lasting symptoms.

#### Opioid substitution therapy

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

#### Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine because of the risk of precipitated withdrawal.

#### Buprenorphine

Buprenorphine is preferred by some patients because it is less sedating than methadone hydrochloride; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 460 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine p. 417 is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride p. 466, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride p. 464. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or

precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 466 (Suboxone<sup>®</sup>) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1214 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

#### Methadone

Methadone hydrochloride, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

#### Opioid substitution during pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued (buprenorphine is not licensed for use in pregnancy). Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

#### Opioid substitution during breastfeeding

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed

babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

#### Adjunctive therapy and symptomatic treatment

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 63 may be used for the control of diarrhoea; mebeverine hydrochloride p. 82 for controlling stomach cramps; paracetamol p. 414 and **non-steroidal anti-inflammatory drugs** for muscular pains and headaches; metoclopramide hydrochloride p. 403 or prochlorperazine p. 365 may be useful for nausea or vomiting. Topical **rubefaciants** can be helpful for relieving muscle pain associated with methadone hydrochloride withdrawal. If a patient is suffering from insomnia, short-acting **benzodiazepines** or zopiclone p. 454 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

#### Lofexidine

Lofexidine hydrochloride may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

#### Opioid-receptor antagonists

Patients dependant on opioids can be given a supply of naloxone hydrochloride to be used in case of accidental overdose.

Naltrexone hydrochloride p. 460 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

#### Opioid dependence in children

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

## 8.1 Alcohol dependence

**Other drugs used for Alcohol dependence** Carbamazepine, p. 291 · Chlordiazepoxide hydrochloride, p. 321 · Clomethiazole, p. 452 · Diazepam, p. 321

### ALDEHYDE DEHYDROGENASE INHIBITORS

#### Disulfiram

##### ● INDICATIONS AND DOSE

**Adjunct in the treatment of alcohol dependence (under expert supervision)**

▶ BY MOUTH

- ▶ Adult: 200 mg daily, increased if necessary up to 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Cardiac failure · coronary artery disease · history of cerebrovascular accident · hypertension · psychosis · severe personality disorder · suicide risk
- **CAUTIONS** Alcohol challenge **not** recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) · avoid in Acute porphyrias p. 930 · diabetes mellitus · epilepsy · respiratory disease
- **INTERACTIONS** → Appendix 1 (disulfiram). Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Drowsiness · fatigue · halitosis · nausea · reduced libido · vomiting
  - ▶ **Rare** Allergic dermatitis · depression · hepatic cell damage · mania · paranoia · peripheral neuritis · psychotic reactions · schizophrenia
- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** Before initiating disulfiram, prescribers should evaluate the patient's suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.
- **MONITORING REQUIREMENTS** During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE** Patient counselling is advised (alcohol reaction).

### GAMMA-AMINO BUTYRIC ACID ANALOGUES AND DERIVATIVES

#### Acamprosate calcium

##### ● INDICATIONS AND DOSE

**Maintenance of abstinence in alcohol-dependent patients**

▶ BY MOUTH

- ▶ Adult 18–65 years (body-weight up to 60 kg): 666 mg once daily at breakfast and 333 mg twice daily at midday and at night
- ▶ Adult 18–65 years (body-weight 60 kg and above): 666 mg 3 times a day

- **CAUTIONS** Continued alcohol abuse (risk of treatment failure)

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · flatulence · frigidity · impotence · maculopapular rash · nausea · pruritus · vomiting
- ▶ **Very rare** Angioedema · hypersensitivity reactions · urticaria
- ▶ **Frequency not known** Fluctuation in libido · vesiculobullous skin reactions
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if severe.
- **RENAL IMPAIRMENT** Avoid if serum-creatinine greater than 120 micromol/litre.
- **PRESCRIBING AND DISPENSING INFORMATION**  
Acamprosate calcium has been used for the maintenance of abstinence in alcohol dependence in children aged 16 years and over.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 21, 25  
ELECTROLYTES: May contain Calcium

## OPIOID RECEPTOR ANTAGONISTS

### Nalmefene

#### ● INDICATIONS AND DOSE

**Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification**

#### ▶ BY MOUTH

- ▶ **Adult:** 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

- **CONTRA-INDICATIONS** Recent history of acute alcohol withdrawal syndrome · recent or current opioid use
- **CAUTIONS** Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness
- **INTERACTIONS** → Appendix 1 (nalmefene).  
Avoid concomitant use of opioids—discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic may be necessary (monitor for opioid intoxication).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Confusion · decreased appetite · decreased libido · disturbance in attention · dizziness · dry mouth · headache · hyperhidrosis · hypoaesthesia · malaise · muscle spasms · nausea · palpitation · paraesthesia · restlessness · sleep disorders · somnolence · tachycardia · tremor · vomiting · weight loss
  - ▶ **Frequency not known** Dissociation · hallucinations
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution—avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution—avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Before initiating treatment, prescribers should evaluate the patient's clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.
- **MONITORING REQUIREMENTS** During treatment, patients should be monitored regularly and the need for continued treatment assessed.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ **Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014) NICE TA325**  
Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:
    - who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization's drinking risk levels) without physical withdrawal symptoms, **and**
    - who do not require immediate detoxification.
 The marketing authorisation states that nalmefene should:
    - only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, **and**
    - be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment.[www.nice.org.uk/TA325](http://www.nice.org.uk/TA325)

## Naltrexone hydrochloride

- **DRUG ACTION** Naltrexone is an opioid-receptor antagonist.

#### ● INDICATIONS AND DOSE

**Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days) (initiated under specialist supervision)**

#### ▶ BY MOUTH

- ▶ **Adult:** Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

**Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)**

#### ▶ BY MOUTH

- ▶ **Adult:** 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

- **UNLICENSED USE** 25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.
- **CONTRA-INDICATIONS** Patients currently dependent on opioids

- **INTERACTIONS** Avoid concomitant use of opioids but increased dose of opioid analgesic may be required for pain (monitor for opioid intoxication).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Joint and muscle pain · abdominal pain · anxiety · chest pain · chills · constipation · decreased potency · delayed ejaculation · diarrhoea · dizziness · headache · increased energy · increased lacrimation · increased sweating · increased thirst · irritability · mood swings · nausea · rash · reduced appetite · sleep disorders · urinary retention · vomiting
  - ▶ **Rare** Depression · hepatic dysfunction · speech disorders · suicidal ideation · tinnitus
  - ▶ **Very rare** Exanthema · hallucinations · idiopathic thrombocytopenia · tremor
- **PREGNANCY** Use only if benefit outweighs risk.
- **BREAST FEEDING** Avoid—potential toxicity.
- **HEPATIC IMPAIRMENT** Avoid in acute hepatitis, hepatic failure, or severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Test for opioid dependence with naloxone before treatment.
- **MONITORING REQUIREMENTS** Liver function tests needed before and during treatment.
- **PATIENT AND CARER ADVICE** Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

- ▶ **Naltrexone for the management of opioid dependence (January 2007)** NICE TA115
- Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

[www.nice.org.uk/TA115](http://www.nice.org.uk/TA115)

## 8.2 Nicotine dependence

### ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

#### Bupropion hydrochloride

##### (Amfebutamone hydrochloride)

- **INDICATIONS AND DOSE**

**To aid smoking cessation in combination with motivational support in nicotine-dependent patients**

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
    - ▶ **Elderly:** 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- **CONTRA-INDICATIONS** Acute alcohol withdrawal · acute benzodiazepine withdrawal · bipolar disorder · CNS tumour · eating disorders · history of seizures · severe hepatic cirrhosis

- **CAUTIONS** Alcohol abuse · diabetes · elderly · history of head trauma · predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- **INTERACTIONS** → Appendix 1 (bupropion). Caution with concomitant use of drugs that lower seizure threshold.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Agitation · anxiety · depression · dizziness · dry mouth · fever · gastro-intestinal disturbances · headache · impaired concentration · insomnia (reduced by avoiding dose at bedtime) · pruritus · rash · sweating · taste disturbance · tremor
  - ▶ **Uncommon** Anorexia · asthenia · chest pain · confusion · flushing · hypertension · tachycardia · tinnitus · visual disturbances
  - ▶ **Rare** Abnormal dreams · ataxia · blood-glucose changes · depersonalisation · dystonia · exacerbation of psoriasis · hallucinations · hepatitis · hostility · impaired memory · incoordination · irritability · jaundice · palpitation · paraesthesia · postural hypotension · seizures · Stevens-Johnson syndrome · twitching · urinary frequency · urinary retention · vasodilatation
  - ▶ **Very rare** Aggression · delusions · paranoid ideation · restlessness
  - ▶ **Frequency not known** Suicidal ideation

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Reduce dose to 150 mg daily. Avoid in severe hepatic cirrhosis.

- **RENAL IMPAIRMENT** Reduce dose to 150 mg daily.

- **MONITORING REQUIREMENTS** Measure blood pressure before and during treatment.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May impair performance of skilled tasks (e.g. driving).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

► **Bupropion hydrochloride 150 mg** Zyban 150mg modified-release tablets | 60 tablet (POM) £41.76 DT price = £41.76

## NICOTINIC RECEPTOR AGONISTS

### Nicotine

#### ● INDICATIONS AND DOSE

##### Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

► BY MOUTH USING CHEWING GUM

► Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

► BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS

► Adult: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

##### Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

► BY MOUTH USING CHEWING GUM

► Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, individuals should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

##### Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

► BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS

► Adult: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

##### Nicotine replacement therapy

► BY INHALATION USING INHALATOR

► Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily

► BY MOUTH USING LOZENGES

► Adult: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the lower-strength lozenges should use the higher-strength lozenges; If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day

► BY MOUTH USING OROMUCOSAL SPRAY

► Adult: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day

► BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

► Adult: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking

cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day

► BY TRANSDERMAL APPLICATION USING PATCHES

► Adult: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 2 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

#### ● CAUTIONS

##### GENERAL CAUTIONS

Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment · haemodynamically unstable patients hospitalised with cerebrovascular accident · haemodynamically unstable patients hospitalised with myocardial infarction · haemodynamically unstable patients hospitalised with severe arrhythmias · phaeochromocytoma · uncontrolled hyperthyroidism

##### SPECIFIC CAUTIONS

- When used by inhalation Bronchospastic disease · chronic throat disease · obstructive lung disease
- With intranasal use Bronchial asthma (may exacerbate)
- With oral (topical) use Gum may also stick to and damage dentures
- With oral use Gastritis (can be aggravated by swallowed nicotine) · oesophagitis (can be aggravated by swallowed nicotine) · peptic ulcers (can be aggravated by swallowed nicotine)
- With transdermal use Patches should not be placed on broken skin · patients with skin disorders

##### CAUTIONS, FURTHER INFORMATION

Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

- **INTERACTIONS** → Appendix 1 (nicotine).

#### ● SIDE-EFFECTS

- **Common or very common** Bloating · blurred vision · constipation · coughing · diarrhoea · dry mouth · dyspepsia · dysphagia · epistaxis · flatulence · gastritis · gastrointestinal disturbances (may be caused by swallowed nicotine) · hiccup · increased salivation · irritation of the throat · mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine · minor skin irritation · mouth ulcers · nasal irritation · nausea · oesophagitis · paraesthesia · sneezing · vomiting · watery eyes
- **Uncommon** Gingival bleeding · halitosis · thirst
- **Rare** Arrhythmia
- **Very rare** Reversible atrial fibrillation
- **Frequency not known** Abdominal pain · abnormal dreams (may occur with patches, removal of the patch before bed may help) · arthralgia · chest pain · flatulence · hot flushes ·

myalgia · palpitations · rash · sweating · taste disturbance · ulcerative stomatitis

#### SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See *Nicotine replacement therapy*, under Substance dependence p. 456 for further details on individual preparations.

- **Nicotine withdrawal** Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms.
 

Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.
- **PREGNANCY** The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.
- **BREAST FEEDING** Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Use with caution in severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.
 

Administration by transdermal patch Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet Each tablet should be placed under the tongue and allowed to dissolve.

Administration by lozenge Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

Administration by medicated chewing gum Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**

▶ Brands may include Nicorette, Nicorette QuickMist

## Varenicline

- **DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

### ● INDICATIONS AND DOSE

#### To aid smoking cessation

##### ► BY MOUTH

- **Adult:** Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

- **CAUTIONS** Conditions that may lower seizure threshold · history of cardiovascular disease · history of psychiatric illness (may exacerbate underlying illness including depression) · predisposition to seizures
- **SIDE-EFFECTS**
  - **Common or very common** Taste disturbance · abnormal dreams · appetite changes · dizziness · drowsiness · dry mouth · gastro-intestinal disturbances · headache · sleep disorders
  - **Uncommon** Acne · anxiety · aphthous stomatitis · arthralgia · asthenia · atrial fibrillation · chest pain · depression · dysarthria · dysuria · eye pain · gingival pain · hallucinations · hypertension · hypertonia · hypoaesthesia · impaired temperature regulation · incoordination · lacrimation · menorrhagia · mood swings · muscle spasm · palpitation · panic attack · pruritus · rash · restlessness · seizure · sexual dysfunction · sweating · tachycardia · thirst · tinnitus · tremor · vaginal discharge · visual disturbances · weight gain
  - **Rare** Cerebrovascular accident
  - **Frequency not known** Aggression · diabetes mellitus · hyperglycaemia · irrational behaviour · myocardial infarction · psychosis · sleep-walking · Stevens-Johnson syndrome · suicidal ideation
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** If eGFR less than 30 mL/minute/1.73 m<sup>2</sup>, initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.
- **TREATMENT CESSATION** Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

  - Varenicline for smoking cessation (July 2007) NICE TA123 Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support. [www.nice.org.uk/TA123](http://www.nice.org.uk/TA123)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Champix 0.5mg/1mg 4 week treatment initiation pack | 53 tablet [PoM] £54.60

## 8.3 Opioid dependence

**Other drugs used for Opioid dependence** Naltrexone hydrochloride, p. 460

### ANALGESICS > OPIOIDS

F 416

## Methadone hydrochloride

### ● INDICATIONS AND DOSE

#### Severe pain

► BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- **Adult:** 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours

#### Adjunct in treatment of opioid dependence

► BY MOUTH USING ORAL SOLUTION

- **Adult:** Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

#### Adjunct in treatment of opioid dependence if tolerance low or not known

► BY MOUTH USING ORAL SOLUTION

- **Adult:** Initially 10–20 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

#### Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

► BY MOUTH USING ORAL SOLUTION

- **Adult:** Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

#### Cough in terminal disease

► INITIALLY BY MOUTH USING LINCTUS

- **Adult:** 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

#### DOSE EQUIVALENCE AND CONVERSION

- See p. 417 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

- **UNLICENSED USE** Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

#### IMPORTANT SAFETY INFORMATION

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Family history of sudden death (ECG monitoring recommended) · history of cardiac conduction abnormalities

#### CAUTIONS, FURTHER INFORMATION

- ▶ **QT-interval prolongation** Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

- **SIDE-EFFECTS** Dry eyes · dysmenorrhoea · hyperprolactinaemia · hypothermia · QT-interval prolongation · raised intracranial pressure · restlessness · torsades de pointes

#### SIDE-EFFECTS, FURTHER INFORMATION

Methadone is a long-acting opioid therefore effects may be cumulative.

Methadone, even in low doses is a **special hazard** for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

#### Overdose

Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

- **BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.

**METHADOSE®** The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

**Important**—care is required in prescribing and dispensing the **correct strength** since any confusion could lead to an overdose; this preparation should be dispensed only **after dilution** as appropriate with *Methadose®* Diluent (life of diluted solution 3 months) and is for drug dependent persons.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ **Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114**  
Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or

buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

[www.nice.org.uk/TA114](http://www.nice.org.uk/TA114)

- **LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

## OPIOID RECEPTOR ANTAGONISTS

## Buprenorphine with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 417, naloxone hydrochloride p. 1214.

## ● INDICATIONS AND DOSE

**Adult in the treatment of opioid dependence (dose expressed as buprenorphine)**

- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient's requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

## ● NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**

CAUTIONARY AND ADVISORY LABELS 2, 26

▶ **Suboxone** (Indivior UK Ltd)

**Naloxone (as Naloxone hydrochloride) 2 mg, Buprenorphine (as Buprenorphine hydrochloride) 8 mg** Suboxone 8mg/2mg sublingual tablets sugar-free | 28 tablet [PoM] £76.19 DT price = £76.19 [CD3]

**Naloxone (as Naloxone hydrochloride) 4 mg, Buprenorphine (as Buprenorphine hydrochloride) 16 mg** Suboxone 16mg/4mg sublingual tablets sugar-free | 28 tablet [PoM] £152.38 [CD3]

**Buprenorphine (as Buprenorphine hydrochloride) 2 mg, Naloxone (as Naloxone hydrochloride) 500 microgram** Suboxone 2mg/500microgram sublingual tablets sugar-free | 28 tablet [PoM] £25.40 DT price = £25.40 [CD3]

SYMPATHOMIMETICS > ALPHA<sub>2</sub>-ADRENOCEPTOR AGONISTS

## Lofexidine hydrochloride

● DRUG ACTION Lofexidine is an alpha<sub>2</sub>-adrenergic agonist.

## ● INDICATIONS AND DOSE

**Management of symptoms of opioid withdrawal**

## ▶ BY MOUTH

- ▶ Adult: Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required recommended duration of treatment 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

- **CAUTIONS** Bradycardia · cerebrovascular disease · depression · history of QT prolongation · hypotension (monitor pulse rate and blood pressure) · metabolic disturbances · recent myocardial infarction · severe coronary insufficiency

- **INTERACTIONS** → Appendix 1 (lofexidine). Caution with concomitant administration of drugs that prolong QT interval.

- **SIDE-EFFECTS** Bradycardia · dizziness · drowsiness · dry mucous membranes · hypotension · QT-interval prolongation

- **PREGNANCY** Use only if benefit outweighs risk—no information available.

- **BREAST FEEDING** Use only if benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Caution in chronic impairment.
- **MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.
- **TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.
- **PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years in the management of symptoms of opioid withdrawal.
- **PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

## 1 Amoebic infection

**Other drugs used for Amoebic infection** Metronidazole, p. 499 • Tinidazole, p. 501

### ANTIPROTOZOALS

#### Diloxanide furoate

##### ● INDICATIONS AND DOSE

**Chronic amoebiasis | Acute amoebiasis as adjunct to metronidazole or tinidazole**

► BY MOUTH

- Child 12–17 years: 500 mg 3 times a day for 10 days
- Adult: 500 mg 3 times a day for 10 days

- **UNLICENSED USE** Not licensed for use in children under 25 kg body-weight.
- **SIDE-EFFECTS** Flatulence • pruritus • urticaria • vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

CAUTIONARY AND ADVISORY LABELS 9

► **Diloxanide furoate (Non-proprietary)**

**Diloxanide furoate 500 mg** Diloxanide 500mg tablets | 30 tablet (PoM) £93.50

#### Mepacrine hydrochloride

##### ● INDICATIONS AND DOSE

**Giardiasis**

► BY MOUTH

- Adult: 100 mg every 8 hours for 5–7 days

- **UNLICENSED USE** Not licensed for use in giardiasis.

- **CAUTIONS** Avoid in psoriasis • elderly • history of psychosis
- **INTERACTIONS** → Appendix 1 (mepacrine).

- **SIDE-EFFECTS** Yellow discoloration of skin (on prolonged treatment) • aplastic anaemia (on prolonged treatment) • blue/black discoloration of nails • blue/black discoloration of palate • chronic dermatoses (on prolonged treatment) • CNS stimulation (with large doses) • corneal deposits with visual disturbances • dizziness • gastro-intestinal disturbances • headache • hepatitis (on prolonged treatment) • nausea (with large doses) • severe exfoliative dermatitis (on prolonged treatment) • transient acute toxic psychosis (with large doses) • vomiting (with large doses) • yellow discoloration of urine (on prolonged treatment)

- **HEPATIC IMPAIRMENT** Use with caution.

## 2 Bacterial infection

### Antibacterials, principles of therapy

#### Choice of a suitable drug

Before selecting an antibacterial the clinician must first consider two factors— the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a

patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 507 but sensitive to nitrofurantoin p. 544 (can cause nausea), gentamicin p. 479 (can be given only by injection and best avoided in pregnancy), tetracycline p. 523 (causes dental discoloration) and trimethoprim p. 529 (folate antagonist therefore theoretical teratogenic risk), and cefalexin p. 485. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

### Antibacterial policies

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

### Before starting therapy

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; 'blind' antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of **prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The **dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The **route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may

cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

### Superinfection

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or *antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

### Therapy

When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

### Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Anthrax	Mumps
Botulism	Paratyphoid fever
Brucellosis	Plague
Cholera	Poliomyelitis, acute
Diarrhoea (infectious bloody)	Rabies
Diphtheria	Rubella
Encephalitis, acute	SARS
Food poisoning	Scarlet fever
Haemolytic uraemic syndrome	Smallpox
Haemorrhagic fever (viral)	Streptococcal disease (Group A, invasive)
Hepatitis, viral	Tetanus
Legionnaires' disease	Tuberculosis
Leprosy	Typhoid fever
Malaria	Typhus
Measles	Whooping cough
Meningitis	Yellow fever
Meningococcal septicaemia	

**Note** It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

## Antibacterials, use for prophylaxis

### Prevention of recurrence of rheumatic fever

- Phenoxymethylpenicillin p. 505 *or* sulfadiazine p. 520.

### Prevention of secondary case of invasive group A streptococcal infection

- Phenoxymethylpenicillin.  
Patients who are penicillin allergic, *either* erythromycin p. 497 *or* azithromycin p. 495 [unlicensed indication].  
For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

### Prevention of secondary case of meningococcal meningitis

- Ciprofloxacin p. 514 *or* rifampicin p. 535 *or* i/m ceftriaxone p. 489 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

### Prevention of secondary case of *Haemophilus influenzae* type b disease

- Rifampicin *or* (if rifampicin cannot be used) i/m or i/v ceftriaxone [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against *Haemophilus influenzae* type b disease.

### Prevention of secondary case of diphtheria in non-immune patient

- Erythromycin (*or* another macrolide e.g. azithromycin *or* clarithromycin p. 496).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment.

### Prevention of pertussis

- Clarithromycin (*or* azithromycin *or* erythromycin).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, *or* if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

### Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

- Phenoxymethylpenicillin.

If penicillin-allergic, erythromycin. Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

### Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- Isoniazid p. 541 *or* isoniazid + rifampicin *or* (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin.

For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control).

### Prevention of infection from animal and human bites

- Co-amoxiclav p. 508 alone (*or* doxycycline p. 521 + metronidazole p. 499 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1143 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

### Prevention of early-onset neonatal infection

- i/v benzylpenicillin sodium p. 504 (*or* i/v clindamycin p. 493 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

### Prevention of infection in gastro-intestinal procedures

#### Operations on stomach or oesophagus

- Single dose of i/v gentamicin p. 479 *or* i/v cefuroxime p. 486 *or* i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 491 (*or* vancomycin p. 492) if high risk of methicillin-resistant *Staphylococcus aureus*.

#### Open biliary surgery

- Single dose of i/v cefuroxime + i/v metronidazole *or* i/v gentamicin + i/v metronidazole *or* i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (*or* vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*.

**Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy**

- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole p. 499 is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 491 (or vancomycin p. 492) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Endoscopic retrograde cholangiopancreatography**

- Single dose of i/v gentamicin p. 479 or oral or i/v ciprofloxacin p. 514.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 506 or i/v teicoplanin (or vancomycin).

**Percutaneous endoscopic gastrostomy or jejunostomy**

- Single dose of i/v co-amoxiclav p. 508 or i/v cefuroxime p. 486.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

**Prevention of infection in orthopaedic surgery****Joint replacement including hip and knee**

- Single dose of i/v cefuroxime alone or i/v flucloxacillin p. 511 + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Closed fractures**

- Single dose of i/v cefuroxime or i/v flucloxacillin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Open fractures**

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole (or i/v clindamycin p. 493 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

**High lower-limb amputation**

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Prevention of infection in urological procedures****Transrectal prostate biopsy**

- Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Transurethral resection of prostate**

- Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in obstetric and gynaecological surgery****Caesarean section**

- Single dose of i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Hysterectomy**

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v vancomycin + i/v metronidazole or add i/v teicoplanin (or gentamicin) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

#### Termination of pregnancy

- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 521 postoperatively.

### Prevention of infection in cardiology procedures

#### Cardiac pacemaker insertion

- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

### Prevention of infection in vascular surgery

#### Reconstructive arterial surgery of abdomen, pelvis or legs

- Single dose of i/v cefuroxime p. 486 alone or i/v flucloxacillin p. 511 + i/v gentamicin p. 479 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 499 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin p. 491 (or vancomycin p. 492) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

### Prevention of endocarditis

#### NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

- Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is **not** recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

- Patients at risk of endocarditis should be:
  - ▶ advised to maintain good oral hygiene;
  - ▶ told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

#### Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

### Joint prostheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

### Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

## Blood infections, bacterial

### Antibacterial therapy for septicaemia: community-acquired

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 503, ticarcillin with clavulanic acid p. 504) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 486)
- ▶ If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 492 (or teicoplanin p. 491).
- ▶ If anaerobic infection suspected, add metronidazole p. 499 or broad-spectrum cephalosporin.
- ▶ If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 483).

### Antibacterial therapy for septicaemia: hospital-acquired

- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime p. 488, imipenem with cilastatin p. 482, or meropenem)
- ▶ If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- ▶ If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin

### Septicaemia related to vascular catheter

- Vancomycin (or teicoplanin)
- ▶ If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- ▶ Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

### Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 504 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 487 may be an alternative in penicillin allergy; chloramphenicol p. 524 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 489)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- ▶ To eliminate nasopharyngeal carriage, ciprofloxacin p. 514, or rifampicin p. 535, or ceftriaxone may be used.

## Cardiovascular system infections, bacterial

### Antibacterial therapy for endocarditis: initial 'blind' therapy

- *Native valve endocarditis*, amoxicillin p. 506 (or ampicillin p. 507)
- ▶ Consider adding low-dose gentamicin p. 479
- If penicillin-allergic, or if methicillin-resistant *Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 492 + low-dose gentamicin
- ▶ If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 483
- If prosthetic valve endocarditis, vancomycin + rifampicin p. 535 + low-dose gentamicin

### Antibacterial therapy for native-valve endocarditis caused by staphylococci

- Flucloxacillin p. 511
- ▶ *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- If penicillin-allergic or if methicillin-resistant *Staphylococcus aureus*, vancomycin + rifampicin
- ▶ *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

### Antibacterial therapy for prosthetic valve endocarditis caused by staphylococci

- Flucloxacillin + rifampicin + low-dose gentamicin
- ▶ *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or if methicillin-resistant *Staphylococcus aureus*, vancomycin + rifampicin + low-dose gentamicin
- ▶ *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

### Antibacterial therapy for endocarditis caused by fully-sensitive streptococci

- Benzylpenicillin sodium p. 504
- ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic, vancomycin (or teicoplanin p. 491) + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks)

### Antibacterial therapy for endocarditis caused by less-sensitive streptococci

- Benzylpenicillin sodium + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

### Antibacterial therapy for endocarditis caused by enterococci

- Amoxicillin (or ampicillin) + low dose gentamicin or benzylpenicillin sodium + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If gentamicin resistant, amoxicillin (or ampicillin)
- ▶ Add streptomycin p. 480 (if susceptible) for 2 weeks
- ▶ *Suggested duration of treatment* at least 6 weeks

### Antibacterial therapy for endocarditis caused by *Haemophilus*, *Actinobacillus*, *Cardiobacterium*, *Eikenella*, and *Kingella* species ('HACEK' micro-organisms)

- Amoxicillin (or ampicillin) + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- ▶ If amoxicillin -resistant, ceftriaxone p. 489 (or cefotaxime p. 487) + low-dose gentamicin
- ▶ *Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

## Central nervous system infections, bacterial

### Antibacterial therapy for meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 504 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 487 may be an alternative in penicillin allergy; chloramphenicol p. 524 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 618 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery. In hospital, if aetiology unknown:
- *Adult and child 3 months–50 years*, cefotaxime (or ceftriaxone p. 489)
- ▶ Consider adding vancomycin p. 492 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
- ▶ *Suggested duration of treatment* at least 10 days
- *Adult over 50 years* cefotaxime (or ceftriaxone) + amoxicillin p. 506 (or ampicillin p. 507)
- ▶ Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
- ▶ *Suggested duration of treatment* at least 10 days

### Antibacterial therapy for meningitis caused by meningococci

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- ▶ *Suggested duration of treatment* 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- ▶ *Suggested duration of treatment* 7 days.

### Antibacterial therapy for meningitis caused by pneumococci

- Cefotaxime (or ceftriaxone)
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
- ▶ If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
- ▶ If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 535.
- ▶ *Suggested duration of antibacterial treatment* 14 days

### Antibacterial therapy for meningitis caused by *Haemophilus influenzae*

- Cefotaxime (or ceftriaxone)
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- ▶ *Suggested duration of antibacterial treatment* 10 days.
- ▶ For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- ▶ *Suggested duration of antibacterial treatment* 10 days.
- ▶ For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

### Antibacterial therapy for meningitis caused by *Listeria*

- Amoxicillin (or ampicillin) + gentamicin p. 479
- ▶ *Suggested duration of treatment* 21 days.
- ▶ Consider stopping gentamicin after 7 days.
- If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 518
- ▶ *Suggested duration of treatment* 21 days.

## Ear infections, bacterial

### Antibacterial therapy for otitis externa

For topical treatments, consider *Otitis externa*, under Ear p. 1050.

Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

- Flucloxacillin p. 511
- ▶ If penicillin-allergic, clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- ▶ If *pseudomonas* suspected, ciprofloxacin p. 514 (or an aminoglycoside)

### Antibacterial therapy for otitis media

Many infections are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression,

cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

- Amoxicillin p. 506 (or ampicillin p. 507)
- ▶ Consider co-amoxiclav p. 508 if no improvement after 48 hours.
- ▶ In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 486.
- ▶ *Suggested duration of treatment* 5 days (longer if severely ill).
- *If penicillin-allergic*, clarithromycin (or azithromycin or erythromycin)
- ▶ *Suggested duration of treatment* 5 days (longer if severely ill)

## Eye infections, bacterial

### Antibacterial therapy for purulent conjunctivitis

- Chloramphenicol eye drops p. 524.

## Gastro-intestinal system infections, bacterial

### Antibacterial therapy for gastro-enteritis

Frequently self-limiting and may not be bacterial.

- Antibacterial not usually indicated

### Antibacterial therapy for campylobacter enteritis

Frequently self-limiting; treat if immunocompromised or if severe infection.

- Clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- *Alternative*, ciprofloxacin p. 514
- ▶ Strains with decreased sensitivity to ciprofloxacin isolated frequently

### Antibacterial therapy for salmonella (non-typhoid)

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).

- Ciprofloxacin or cefotaxime p. 487

### Antibacterial therapy for shigellosis

Antibacterial not indicated for mild cases.

- Ciprofloxacin or azithromycin
- *Alternatives if micro-organism sensitive*, amoxicillin p. 506 or trimethoprim p. 529

### Antibacterial therapy for typhoid fever

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

- Cefotaxime (or ceftriaxone p. 489)
- ▶ azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- *Alternative if micro-organism sensitive*, ciprofloxacin

### Antibacterial therapy for *Clostridium difficile* infection

- *For first episode of mild to moderate infection*, oral metronidazole p. 499
- ▶ *Suggested duration of treatment* 10–14 days

- *For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole*, oral vancomycin p. 492
- ▶ For severe infection in patients with multiple comorbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin p. 525 can replace vancomycin
- ▶ *Suggested duration of treatment* 10–14 days
- *For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus*, oral vancomycin + i/v metronidazole
- ▶ For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
- ▶ *Suggested duration of treatment* 10–14 days

### Antibacterial therapy for biliary-tract infection

- Ciprofloxacin or gentamicin p. 479 or a cephalosporin

### Antibacterial therapy for peritonitis

- A cephalosporin + metronidazole or gentamicin + metronidazole or gentamicin + clindamycin p. 493 or piperacillin with tazobactam p. 503 alone

### Antibacterial therapy for peritonitis: peritoneal dialysis-associated

- Vancomycin (or teicoplanin p. 491) + ceftazidime p. 488 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
- ▶ *Suggested duration of treatment* 14 days or longer

## Genital system infections, bacterial

### Antibacterial therapy for bacterial vaginosis

- Oral metronidazole p. 499
- ▶ *Suggested duration of treatment* 5–7 days (or high-dose metronidazole as a single dose)
- *Alternatively*, topical metronidazole for 5 days or topical clindamycin p. 493 for 7 days

### Antibacterial therapy for uncomplicated genital chlamydia infection, non-gonococcal urethritis, and non-specific genital infection

Contact tracing recommended.

- Azithromycin p. 495 or doxycycline p. 521
- ▶ *Suggested duration of treatment* azithromycin as a single dose or doxycycline for 7 days
- *Alternatively*, erythromycin p. 497.
- ▶ *Suggested duration of treatment* 14 days

### Antibacterial therapy for gonorrhoea: uncomplicated

Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.

- Azithromycin + i/m ceftriaxone p. 489
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial
- *Alternatively, when parenteral administration is not possible*, cefixime p. 487 + azithromycin
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial
- *Alternatively, if micro-organism is sensitive to a quinolone*, ciprofloxacin p. 514 + azithromycin

- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial
- *Pharyngeal infection*, azithromycin + i/m ceftriaxone
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial

### Antibacterial therapy for pelvic inflammatory disease

Contact tracing recommended.

- Doxycycline + metronidazole + single-dose of i/m ceftriaxone or ofloxacin p. 517 + metronidazole
- ▶ *Suggested duration of treatment* 14 days (except i/m ceftriaxone).
- ▶ In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days' treatment

### Antibacterial therapy for early syphilis (infection of less than 2 years)

Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
- ▶ *Suggested duration of treatment* single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- *Alternatively*, doxycycline or erythromycin
- ▶ *Suggested duration of treatment* 14 days

### Antibacterial therapy for late latent syphilis (asymptomatic infection of more than 2 years)

Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
- ▶ *Suggested duration of treatment* once weekly for 2 weeks
- *Alternatively*, doxycycline
- ▶ *Suggested duration of treatment* 28 days

### Asymptomatic contacts of patients with infectious syphilis

- Doxycycline
- ▶ *Suggested duration of treatment* 14 days

## Musculoskeletal system infections, bacterial

### Antibacterial therapy for osteomyelitis

Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 511
- ▶ Consider adding fusidic acid p. 527 or rifampicin p. 535 for initial 2 weeks.
- ▶ *Suggested duration of treatment* 6 weeks for acute infection
- *If penicillin-allergic*, clindamycin p. 493
- ▶ Consider adding fusidic acid or rifampicin for initial 2 weeks.
- ▶ *Suggested duration of treatment* 6 weeks for acute infection
- *If meticillin-resistant Staphylococcus aureus suspected*, vancomycin p. 492 (or teicoplanin p. 491)
- ▶ Consider adding fusidic acid or rifampicin for initial 2 weeks.
- ▶ *Suggested duration of treatment* 6 weeks for acute infection

### Antibacterial therapy for septic arthritis

Seek specialist advice if prostheses present.

- Flucloxacillin
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).

- *If penicillin-allergic*, clindamycin
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- *If meticillin-resistant Staphylococcus aureus suspected*, vancomycin (or teicoplanin)
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- *If gonococcal arthritis or Gram-negative infection suspected*, cefotaxime p. 487 (or ceftriaxone p. 489)
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

## Nose infections, bacterial

### Antibacterial therapy for sinusitis

Antibacterial therapy should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial therapy for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 506 (or ampicillin p. 507) or doxycycline p. 521 or clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- ▶ *Suggested duration of treatment* 7 days.
- ▶ Consider oral co-amoxiclav p. 508 if no improvement after 48 hours.
- ▶ In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 486 may be required.

## Oral bacterial infections

### Antibacterial drugs

Antibacterial drugs should only be prescribed for the *treatment* of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget's disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be

changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 499 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

### Penicillins

Phenoxymethylpenicillin p. 505 is effective for dentoalveolar abscess.

#### Broad-spectrum penicillins

Amoxicillin p. 506 is as effective as phenoxymethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens.

Co-amoxiclav p. 508 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

### Cephalosporins

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 485 and cefradine p. 485 have been used in the treatment of oral infections.

### Tetracyclines

In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 521 has a longer duration of action than tetracycline p. 523 or oxytetracycline p. 523 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

### Macrolides

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

### Clindamycin

Clindamycin p. 493 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin p. 497-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

### Metronidazole and tinidazole

Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is

allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 501 is licensed for the treatment of acute ulcerative gingivitis.

## Respiratory system infections, bacterial

### Antibacterial therapy for *Haemophilus influenzae* epiglottitis

- Cefotaxime p. 487 (or ceftriaxone p. 489)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 524

### Antibacterial therapy for chronic bronchitis: acute exacerbations

Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

- Amoxicillin p. 506 (or ampicillin p. 507) or a tetracycline p. 523
  - ▶ Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant
  - ▶ Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients
- Alternative, clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
  - ▶ Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients

### Antibacterial therapy for pneumonia: low-severity community-acquired

- Amoxicillin (or ampicillin)
  - ▶ Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
  - ▶ If atypical pathogens suspected, add clarithromycin (or azithromycin or erythromycin).
  - ▶ If staphylococci suspected (e. g. in influenza or measles), add flucloxacillin p. 511.
  - ▶ Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)
- Alternatives, doxycycline p. 521 or clarithromycin (or azithromycin or erythromycin)
  - ▶ Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

### Antibacterial therapy for pneumonia: moderate-severity community-acquired

- Amoxicillin (or ampicillin) + clarithromycin (or azithromycin or erythromycin) or doxycycline alone
  - ▶ Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
  - ▶ If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 492 (or teicoplanin p. 491).
  - ▶ Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

### Antibacterial therapy for pneumonia: high-severity community-acquired

- Benzylpenicillin sodium p. 504 + clarithromycin (or azithromycin or erythromycin) or benzylpenicillin sodium + doxycycline

- ▶ If *meticillin-resistant Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- ▶ **Suggested duration of treatment** 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- *If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 508+ clarithromycin (or azithromycin or erythromycin)*
- ▶ If *meticillin-resistant Staphylococcus aureus* suspected, add vancomycin (or teicoplanin)
- ▶ **Suggested duration of treatment** 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- *Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 486 + clarithromycin (or azithromycin or erythromycin) or cefotaxime (or ceftriaxone) + clarithromycin (or azithromycin or erythromycin)*
- ▶ If *meticillin-resistant Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- ▶ **Suggested duration of treatment** 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

### Antibacterial therapy for pneumonia possibly caused by atypical pathogens

- Clarithromycin (or azithromycin or erythromycin)
- ▶ If high-severity Legionella infection, add rifampicin p. 535 for the first few days.
- ▶ **Suggested duration of treatment** 14 days (usually 7–10 days for Legionella)
- *Alternative if Legionella infection suspected, a quinolone*
- ▶ If high-severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
- ▶ **Suggested duration of treatment** usually 7–10 days
- *Alternative for chlamydial or mycoplasma infections, doxycycline*
- ▶ **Suggested duration of treatment** 14 days

### Antibacterial therapy for pneumonia: hospital-acquired

- *Early-onset infection* less than 5 days after admission to hospital), co-amoxiclav or cefuroxime
- ▶ If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant micro-organisms suspected, treat as for late-onset hospital-acquired pneumonia.
- ▶ **Suggested duration of treatment** 7 days
- *Late-onset infection* (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 503) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 488) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 514)
- ▶ If *meticillin-resistant Staphylococcus aureus* suspected, add vancomycin.
- ▶ For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.
- ▶ **Suggested duration of treatment** 7 days (longer if *Pseudomonas aeruginosa* confirmed)

## Skin infections, bacterial

### Antibacterial therapy for impetigo: small areas of skin infected

Seek local microbiology advice before using topical treatment in hospital.

- Topical fusidic acid p. 527
- ▶ **Suggested duration of treatment** 7 days is usually adequate (max. 10 days).
- *Alternatively, if *meticillin-resistant Staphylococcus aureus*, topical mupirocin p. 1086*
- ▶ **Suggested duration of treatment** 7 days is usually adequate (max. 10 days).

### Impetigo: widespread infection

- Oral flucloxacillin p. 511
- ▶ If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 505.
- ▶ **Suggested duration of treatment** 7 days.
- *If penicillin-allergic, oral clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)*
- ▶ **Suggested duration of treatment** 7 days.

### Antibacterial therapy for erysipelas

- Phenoxymethylpenicillin or benzylpenicillin sodium p. 504
- ▶ If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin
- ▶ **Suggested duration of treatment** at least 7 days.
- *If penicillin-allergic, clindamycin p. 493 or clarithromycin (or azithromycin or erythromycin)*
- ▶ **Suggested duration of treatment** at least 7 days

### Antibacterial therapy for cellulitis

- Flucloxacillin (high-dose)
- ▶ If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin or benzylpenicillin sodium
- ▶ If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
- *If penicillin-allergic, clindamycin or clarithromycin (or azithromycin or erythromycin) or vancomycin p. 492 (or teicoplanin p. 491)*
- ▶ If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

### Antibacterial therapy for animal and human bites

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1143 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

- Co-amoxiclav p. 508
- *If penicillin-allergic, doxycycline p. 521 + metronidazole p. 499*

### Antibacterial therapy for mastitis during breast-feeding

Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection.

- Flucloxacillin, *if penicillin-allergic, erythromycin*
- ▶ Continue breast-feeding or expressing milk during treatment.
- ▶ **Suggested duration of treatment** 10–14 days.

## ANTIBACTERIALS &gt; AMINOGLYCOSIDES

## Aminoglycosides

## Overview

These include amikacin p. 479, gentamicin p. 479, neomycin sulfate p. 480, streptomycin p. 480, and tobramycin p. 481. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 499 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

## Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

## Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and **must** be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection) 

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

- **CAUTIONS** Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) · conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) · if possible, dehydration should be corrected before starting an aminoglycoside · whenever possible, parenteral treatment should not exceed 7 days

- **INTERACTIONS** → Appendix 1 (aminoglycosides). If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable.

● **SIDE-EFFECTS**

- ▶ **Rare** Antibiotic-associated colitis · electrolyte disturbances · hypocalcaemia · hypokalaemia · hypomagnesaemia on prolonged therapy · nausea · peripheral neuropathy · stomatitis · vomiting
- ▶ **Very rare** Blood disorders · CNS effects · convulsions · encephalopathy · headache
- ▶ **Frequency not known** Auditory damage · impaired neuromuscular transmission · irreversible ototoxicity · nephrotoxicity · transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery · vestibular damage

## SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Nephrotoxicity
- ▶ In adults Occurs most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.
- ▶ In children Occurs most commonly in children with renal failure.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment.

Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

- ▶ In adults A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.
- ▶ In children A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over

1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m<sup>2</sup>.

#### ● MONITORING REQUIREMENTS

- ▶ Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and **must** be determined in obesity, if high doses are being given and in cystic fibrosis.
- ▶ In adults Serum aminoglycoside concentrations **must** be determined in the elderly. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
- ▶ In children In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen. Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.
- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

F 478

## Amikacin

#### ● INDICATIONS AND DOSE

##### Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

##### Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 15 mg/kg (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

#### ● SIDE-EFFECTS

- ▶ Uncommon Rash

#### ● MONITORING REQUIREMENTS

- ▶ Multiple daily dose regimen: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre.
- ▶ Once daily dose regimen: pre-dose ('trough') concentration should be less than 5 mg/litre.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous infusion (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.

- PRESCRIBING AND DISPENSING INFORMATION Once daily dose regime not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

###### ▶ Amikacin (Non-proprietary)

Amikacin (as Amikacin sulfate) 250 mg per 1 mL Amikacin 500mg/2mL solution for injection vials | 5 vial [PoM](#) £60.00

###### ▶ Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)

Amikacin (as Amikacin sulfate) 50 mg per 1 mL Amikin 100mg/2mL solution for injection vials | 5 vial [PoM](#) £10.33

F 478

## Gentamicin

#### ● INDICATIONS AND DOSE

##### Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

##### Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

##### CNS infections (administered on expert advice)

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

##### Surgical prophylaxis

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures; up to 3 further doses may be given

##### Surgical prophylaxis (including joint replacement surgery)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

#### ● SIDE-EFFECTS

- ▶ Uncommon Rash

#### ● MONITORING REQUIREMENTS

- ▶ For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.
- ▶ For multiple daily dose regimen in endocarditis, one-hour ('peak') serum concentration should be 3–5 mg/litre;

pre-dose ('trough') concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment).

- ▶ For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intrathecal use For *intrathecal* injection, use preservative-free intrathecal preparations only.
  - ▶ With intravenous use For *intravenous infusion* (*Cidomycin*®); *Gentamicin paediatric injection*, Beacon; *Gentamicin injection* Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ With intravenous use Local guidelines may vary in the dosing advice provided for once daily administration.
  - ▶ With intrathecal use Only preservative-free intrathecal preparation should be used.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml** Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule [PoM] £36.28 (Hospital only)
  - Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml** Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule [PoM] £11.25  
Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial [PoM] £11.25 DT price = £11.25
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml** Gentamicin 80mg/2ml solution for injection vials | 5 vial [PoM] £20.00  
Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88 | 10 ampoule [PoM] £10.00
- ▶ **Cidomycin (Sanofi)**
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml** Cidomycin Adult injectable 80mg/2ml solution for injection vials | 5 vial [PoM] £6.88  
Cidomycin Adult injectable 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88

#### Infusion

- ▶ **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml** Gentamicin 80mg/80ml infusion bags | 20 bag [PoM] £39.00
  - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml** Gentamicin 240mg/80ml infusion bags | 20 bag [PoM] £119.00
  - Gentamicin 360mg/120ml infusion bags | 20 bag [PoM] £169.00

## Neomycin sulfate

#### ● INDICATIONS AND DOSE

##### Bowel sterilisation before surgery

- ▶ BY MOUTH
  - ▶ Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

##### Hepatic coma

- ▶ BY MOUTH
  - ▶ Adult: Up to 4 g daily in divided doses usually for 5–7 days

- **CONTRA-INDICATIONS** Intestinal obstruction · myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Avoid prolonged use  
**CAUTIONS, FURTHER INFORMATION** Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.
- **INTERACTIONS** → Appendix 1 (aminoglycosides).

#### ● SIDE-EFFECTS

- ▶ **Uncommon** Rash
- ▶ **Frequency not known** Impaired intestinal absorption with steatorrhoea and diarrhoea · increased salivation
- SIDE-EFFECTS, FURTHER INFORMATION** Although neomycin is associated with the same side effects as other aminoglycosides it is generally considered too toxic for systemic use and is poorly absorbed after oral administration.
- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy.
- **HEPATIC IMPAIRMENT** Absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity.
- **RENAL IMPAIRMENT** Avoid—risk of ototoxicity and nephrotoxicity.
- **MONITORING REQUIREMENTS**
  - ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
  - ▶ Auditory and vestibular function should also be monitored during treatment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

##### Tablet

- ▶ **Neomycin sulfate (Non-proprietary)**
  - Neomycin sulfate 500 mg** Neomycin 500mg tablets | 100 tablet [PoM] £34.69 DT price = £34.69

##### Oral solution

- ▶ **Neomycin sulfate (Non-proprietary)**
  - Neomycin sulfate 25 mg per 1 ml** Neo-Fradin 125mg/5ml oral solution | 480 ml [PoM] no price available

F 478

## Streptomycin

#### ● INDICATIONS AND DOSE

##### Tuberculosis, resistant to other treatment, in combination with other drugs

- ▶ BY DEEP INTRAMUSCULAR INJECTION
  - ▶ Adult: 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

##### Adjunct to doxycycline in brucellosis (administered on expert advice)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
  - ▶ Adult: (consult local protocol)

##### Enterococcal endocarditis

- ▶ Adult: (consult local protocol)

- **UNLICENSED USE** Use in tuberculosis is an unlicensed indication.

#### IMPORTANT SAFETY INFORMATION

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

- **SIDE-EFFECTS**
  - ▶ **Common or very common** Rash
  - ▶ **Frequency not known** Hypersensitivity reactions · paraesthesia of mouth
- **RENAL IMPAIRMENT** Should preferably be avoided. If essential, use with great care and consider dose reduction.
- **MONITORING REQUIREMENTS**
  - ▶ One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection

✚ 478

## Tobramycin

30-Nov-2016

### ● INDICATIONS AND DOSE

**Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg daily as soon as clinically indicated

#### Urinary-tract infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 2–3 mg/kg for 1 dose

**Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis**

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
- ▶ BY INHALATION OF POWDER
- ▶ Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

### VANTOBRA® NEBULISER SOLUTION

**Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis**

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

### ● CAUTIONS

- ▶ When used by inhalation Conditions characterised by muscular weakness—may impair neuromuscular transmission · history of prolonged previous or concomitant intravenous aminoglycosides—increased risk of ototoxicity · renal impairment—limited information available · severe haemoptysis—risk of further haemorrhage

### ● SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used by inhalation Malaise · rhinitis · tinnitus
- ▶ **Uncommon**
- ▶ With systemic use Rash
- ▶ **Rare**
- ▶ When used by inhalation Aphonia · hearing loss
- ▶ **Very rare**
- ▶ When used by inhalation Pruritus · urticaria
- ▶ **Frequency not known**
- ▶ When used by inhalation Bronchospasm · cough (more frequent by inhalation of powder) · dysphonia · epistaxis · haemoptysis · laryngitis · mouth ulcers · pharyngitis · salivary hypersecretion · taste disturbances

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Ear effects
- ▶ When used by inhalation Manufacturer advises monitor serum-tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity

develops—discontinue treatment until serum concentration falls below 2 mg/litre.

### VANTOBRA® NEBULISER SOLUTION

- ▶ **Uncommon** Dyspnoea
- ▶ **Rare** Anorexia · asthenia · asthma · chest discomfort · dizziness · headache · nausea · pyrexia · vomiting
- ▶ **Very rare** Abdominal pain · back pain · diarrhoea · ear pain · fungal infection · hyperventilation · hypoxia · lymphadenopathy · sinusitis · somnolence

### ● RENAL IMPAIRMENT

- ▶ When used by inhalation Manufacturer advises monitor serum-tobramycin concentration; if nephrotoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.

### ● MONITORING REQUIREMENTS

- ▶ With intramuscular use or intravenous use One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.
- ▶ When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.
- ▶ When used by inhalation Other inhaled drugs should be administered before tobramycin.

### ● PATIENT AND CARER ADVICE

- ▶ When used by inhalation Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

### VANTOBRA® NEBULISER SOLUTION

#### Missed doses

Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276  
Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contraindications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA276](http://www.nice.org.uk/TA276)

### ● MEDICINAL FORMS

**ANTIBACTERIALS** > **CARBAPENEMS****Carbapenems****Overview**

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** (imipenem with cilastatin below) and meropenem p. 483 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin** (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

**Ertapenem**● **INDICATIONS AND DOSE**

**Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia**

► BY INTRAVENOUS INFUSION

► Adult: 1 g once daily

**Diabetic foot infections of the skin and soft-tissue**

► BY INTRAVENOUS INFUSION

► Adult: 1 g once daily

**Surgical prophylaxis, colorectal surgery**

► BY INTRAVENOUS INFUSION

► Adult: 1 g for 1 dose, dose to be completed within 1 hour before surgery

● **CAUTIONS** CNS disorders—risk of seizures · elderly

● **INTERACTIONS** → Appendix 1 (ertapenem).

● **SIDE-EFFECTS**

► **Common or very common** Diarrhoea · headache · injection-site reactions · nausea · pruritus · raised platelet count · rash (also reported with eosinophilia and systemic symptoms) · vomiting

► **Uncommon** Abdominal pain · anorexia · antibiotic-associated colitis · asthenia · bradycardia · chest pain · confusion · constipation · dizziness · dry mouth · dyspepsia · dyspnoea · hypotension · melaena · oedema · petechiae · pharyngeal discomfort · raised glucose · seizures · sleep disturbances · taste disturbances

► **Rare** Agitation · anxiety · arrhythmia · blood disorders · cholecystitis · cough · depression · dysphagia · electrolyte disturbances · haemorrhage · hypoglycaemia · increase in blood pressure · jaundice · liver disorder · muscle cramp · nasal congestion · neutropenia · pelvic peritonitis · renal impairment · scleral disorder · syncope · thrombocytopenia · tremor · wheezing

► **Frequency not known** Dyskinesia · hallucinations

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● **RENAL IMPAIRMENT** Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Invanz<sup>®</sup>), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

► **Invanz** (Merck Sharp & Dohme Ltd)

**Ertapenem (as Ertapenem sodium) 1 gram** Invanz 1g powder for solution for infusion vials | 1 vial [PoM] £31.65

**Imipenem with cilastatin**● **INDICATIONS AND DOSE**

**Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicaemia**

► BY INTRAVENOUS INFUSION

► Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

**Infection caused by *Pseudomonas* or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection**

► BY INTRAVENOUS INFUSION

► Adult: 1 g every 6 hours

**DOSE EQUIVALENCE AND CONVERSION**

► Dose expressed in terms of imipenem.

- **CAUTIONS** CNS disorders · epilepsy
- **INTERACTIONS** → Appendix 1 (imipenem with cilastatin).
- **SIDE-EFFECTS**
- **Common or very common** Diarrhoea · eosinophilia · nausea (may reduce rate of infusion) · rash · vomiting
- **Uncommon** Confusion · dizziness · drowsiness · hallucinations · hypotension · leucopenia · myoclonic activity · seizures · thrombocytopenia · thrombocytosis
- **Rare** Acute renal failure · anaphylactic reactions · antibiotic-associated colitis · encephalopathy · hearing loss · hepatitis · paraesthesia · polyuria · Stevens-Johnson syndrome · taste disturbances · tooth, tongue or urine discoloration · toxic epidermal necrolysis · tremor
- **Very rare** Abdominal pain · aggravation of myasthenia gravis · asthenia · cyanosis · dyspnoea · flushing · glossitis · haemolytic anaemia · headache · heartburn · hyperhidrosis · hypersalivation · hyperventilation · palpitation · polyarthralgia · tachycardia · tinnitus
- **Frequency not known** Neurotoxicity (at high dose, renal failure, CNS disease)
- **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.
  - Use with caution in patients with sensitivity to beta-lactam antibacterials.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Present in milk but unlikely to be absorbed.
- **RENAL IMPAIRMENT** Risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m<sup>2</sup>— consult product literature.
- **EFFECT ON LABORATORY TESTS** Positive Coombs' test.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

► **Imipenem with cilastatin (Non-proprietary)**

**Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg** Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 1 vial [PoM] £12.00 (Hospital only) | 5 vial [PoM] £60.00 (Hospital only) | 10 vial [PoM] £75.45

► **Primaxin IV.** (Merck Sharp & Dohme Ltd)

**Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg** Primaxin IV 500mg powder for solution for infusion vials | 1 vial [PoM] £12.00

**Meropenem****INDICATIONS AND DOSE**

**Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired septicæmia**

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 0.5–1 g every 8 hours

**Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis**

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

**Meningitis**

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

**Endocarditis (in combination with another antibacterial)**

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

- **UNLICENSED USE** Not licensed for use in endocarditis.
- **INTERACTIONS** → Appendix 1 (meropenem).
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · diarrhoea · disturbances in liver function tests · headache · nausea · pruritus · rash · thrombocythaemia · vomiting
- **Uncommon** Eosinophilia · leucopenia · paraesthesia · thrombocytopenia
- **Rare** Convulsions
- **Frequency not known** Antibiotic-associated colitis · haemolytic anaemia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.
  - Use with caution in patients with sensitivity to beta-lactam antibacterials.
- **PREGNANCY** Use only if potential benefit outweighs risk— no information available.
- **BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).
- **HEPATIC IMPAIRMENT** Monitor liver function in hepatic impairment.
- **RENAL IMPAIRMENT** Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m<sup>2</sup>. Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m<sup>2</sup>. Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- **EFFECT ON LABORATORY TESTS** Positive Coombs' test.
- **DIRECTIONS FOR ADMINISTRATION** *Intravenous injection* to be administered over 5 minutes.
  - For *intravenous infusion* (Meronem<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%.
  - Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

ELECTROLYTES: May contain Sodium

► **Meropenem (Non-proprietary)**

**Meropenem (as Meropenem trihydrate) 1 gram** Meropenem 1g powder for solution for injection vials | 10 vial [PoM] £153.50-£190.00 | 10 vial [PoM] £206.28-£206.30 (Hospital only)

**Meropenem (as Meropenem trihydrate) 500 mg** Meropenem 500mg powder for solution for injection vials | 10 vial [PoM] £76.90-£103.10

► **Meronem** (AstraZeneca UK Ltd)

**Meropenem (as Meropenem trihydrate) 1 gram** Meronem 1g powder for solution for injection vials | 10 vial [PoM] £206.28

**Meropenem (as Meropenem trihydrate) 500 mg** Meronem 500mg powder for solution for injection vials | 10 vial [PoM] £103.14

**ANTIBACTERIALS > CEPHALOSPORINS****Cephalosporins****Overview**

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicæmia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally

renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 487 and ceftriaxone p. 489 are suitable cephalosporins for infections of the CNS (e.g meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 487, cefotaxime, ceftazidime p. 488, ceftriaxone, or cefuroxime p. 486 can be used with caution; cefaclor p. 486, cefadroxil below, cefalexin p. 485, cefradine p. 485, and ceftaroline fosamil p. 490 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefradine, and cefadroxil and the 'second generation' cephalosporin, cefaclor, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes methicillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Ceftaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by methicillin-resistant *S. aureus*.

#### ● SIDE-EFFECTS

- ▶ **Rare** Antibiotic-associated colitis
- ▶ **Frequency not known** Abdominal discomfort · agranulocytosis · allergic reactions · anaphylaxis · aplastic anaemia · blood disorders · confusion · diarrhoea · disturbances in liver enzymes · dizziness · eosinophilia · haemolytic anaemia · hallucinations · headache · hyperactivity · hypertonia · leucopenia · nausea · nervousness · pruritus · rashes · reversible interstitial nephritis · serum sickness-like reactions with rashes, fever and arthralgia · sleep disturbances · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · transient cholestatic jaundice · transient hepatitis · urticaria · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Antibiotic-associated colitis Antibiotic-associated colitis may occur more commonly with second- and third-generation cephalosporins.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.
- ▶ Cross-sensitivity with other beta-lactam antibacterials About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of **immediate hypersensitivity** to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs' test.

## ANTIBACTERIALS > CEPHALOSPORINS, FIRST-GENERATION

▸ above

### Cefadroxil

#### ● INDICATIONS AND DOSE

##### Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH
- ▶ Child 6–17 years (body-weight up to 40 kg): 0.5 g twice daily
- ▶ Child 6–17 years (body-weight 40 kg and above): 0.5–1 g twice daily
- ▶ Adult: 0.5–1 g twice daily

##### Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

- ▶ BY MOUTH
- ▶ Child 6–17 years (body-weight 40 kg and above): 1 g once daily
- ▶ Adult: 1 g daily

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
- ▶ In adults 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m<sup>2</sup>. 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m<sup>2</sup>. 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m<sup>2</sup>.

## Cephalosporins

- **DRUG ACTION** Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.
- **INTERACTIONS** → Appendix 1 (cephalosporins).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 9

**Cefalexin****(Cephalexin)****INDICATIONS AND DOSE****Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

## ▶ BY MOUTH

- ▶ Child 1-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
- ▶ Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
- ▶ Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
- ▶ Child 12-17 years: 500 mg 2-3 times a day
- ▶ Adult: 250 mg every 6 hours, alternatively 500 mg every 8-12 hours; increased to 1-1.5 g every 6-8 hours, increased dose to be used for severe infections

**Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

## ▶ BY MOUTH

- ▶ Child 1 month-11 years: 25 mg/kg 2-4 times a day (max. per dose 1 g 4 times a day)
- ▶ Child 12-17 years: 1-1.5 g 3-4 times a day

**Prophylaxis of recurrent urinary-tract infection**

## ▶ BY MOUTH

- ▶ Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
- ▶ Adult: 125 mg once daily, dose to be taken at night

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
  - ▶ In adults Max. 3 g daily if eGFR 40-50 mL/minute/1.73 m<sup>2</sup>. Max. 1.5 g daily if eGFR 10-40 mL/minute/1.73 m<sup>2</sup>. Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Reduce dose in moderate impairment.

## Cefaclor

## ● INDICATIONS AND DOSE

**Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Child 1-11 months: 20 mg/kg daily in 3 divided doses, alternatively 62.5 mg 3 times a day
  - ▶ Child 1-4 years: 20 mg/kg daily in 3 divided doses, alternatively 125 mg 3 times a day
  - ▶ Child 5-11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
  - ▶ Child 12-17 years: 250 mg 3 times a day; maximum 4 g per day
  - ▶ Adult: 250 mg 3 times a day; maximum 4 g per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - ▶ Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
  - ▶ Adult: 375 mg every 12 hours, dose to be taken with food

**Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Child 1-11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
  - ▶ Child 1-4 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
  - ▶ Child 5-11 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily
  - ▶ Child 12-17 years: 500 mg 3 times a day; maximum 4 g per day
  - ▶ Adult: 500 mg 3 times a day; maximum 4 g per day

**Pneumonia**

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
  - ▶ Child 12-17 years: 750 mg every 12 hours, dose to be taken with food
  - ▶ Adult: 750 mg every 12 hours, dose to be taken with food

**Lower urinary-tract infections**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - ▶ Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
  - ▶ Adult: 375 mg every 12 hours, dose to be taken with food

**Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Child 1-11 months: 125 mg every 8 hours
  - ▶ Child 1-6 years: 250 mg 3 times a day
  - ▶ Child 7-17 years: 500 mg 3 times a day

## ● SIDE-EFFECTS

## SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Skin reactions Cefaclor is associated with protracted skin reactions, especially in children.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT** No dose adjustment required. Manufacturer advises caution.

## Cefuroxime

## ● INDICATIONS AND DOSE

**Susceptible infections due to Gram-positive and Gram-negative bacteria**

- ▶ BY MOUTH
  - ▶ Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
  - ▶ Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
  - ▶ Child 12-17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
  - ▶ Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50-60 mg/kg every 6-8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis
  - ▶ Adult: 750 mg every 6-8 hours; increased if necessary up to 1.5 g every 6-8 hours, increased dose used for severe infections

**Lyme disease**

## ▶ BY MOUTH

▶ Adult: 500 mg twice daily for 14-21 days (for 28 days in Lyme arthritis)

**Lower urinary-tract infection**

## ▶ BY MOUTH

- ▶ Child 12–17 years: 125 mg twice daily
- ▶ Adult: 125 mg twice daily

**Pyelonephritis**

## ▶ BY MOUTH

- ▶ Adult: 250 mg twice daily

**Surgical prophylaxis**

## ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

**Open fractures, prophylaxis**

## ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

- **UNLICENSED USE** Duration of treatment in Lyme disease is unlicensed.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
  - ▶ In adults Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m<sup>2</sup>. Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** Single doses over 750 mg should be administered by the intravenous route only.
  - ▶ With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.
  - ▶ With intravenous use in adults For intravenous infusion (Zinacef<sup>®</sup>), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

## Ceftriaxone

### ● INDICATIONS AND DOSE

**Community-acquired pneumonia** | **Hospital-acquired pneumonia** | **Intra-abdominal infections** | **Complicated urinary-tract infections** | **Acute exacerbations of chronic obstructive pulmonary disease**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

**Complicated skin and soft tissue infections** | **Infections of bones and joints**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g once daily

**Suspected bacterial infection in neutropenic patients**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

**Bacterial meningitis** | **Bacterial endocarditis**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

**Surgical prophylaxis**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

**Uncomplicated gonorrhoea** | **Pelvic inflammatory disease**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg for 1 dose

**Syphilis**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

**Disseminated Lyme borreliosis (early [Stage II] and late [Stage III])**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

**Prevention of secondary case of meningococcal meningitis**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 250 mg for 1 dose

**Prevention of secondary case of *Haemophilus influenzae* type b disease**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1 g daily for 2 days

**Acute otitis media**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

- **UNLICENSED USE** [\[EvGr\]](#) Not licensed for prophylaxis of *Haemophilus influenzae* type b disease. [\[E\]](#) Not licensed for prophylaxis of meningococcal meningitis.

[\[EvGr\]](#) Dose not licensed for treatment of pelvic inflammatory disease in adults. [\[A\]](#)

### ● CAUTIONS

**GENERAL CAUTIONS**

History of hypercalcaemia · history of kidney stones

**SPECIFIC CAUTIONS**

- ▶ With intravenous use concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) (in adults)
- **SIDE-EFFECTS**
- ▶ **Common or very common** Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic · calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic
- ▶ **Uncommon** Genital fungal infection
- ▶ **Rare** Bronchospasm · glycosuria · haematuria · prolongation of prothrombin time
- ▶ **Frequency not known** Convulsion · glossitis · oliguria · pancreatitis · stomatitis · toxic epidermal necrolysis · vertigo
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in *animal* studies. [\[EvGr\]](#) Specialist sources indicate suitable for use in pregnancy. [\[D\]](#)
- **BREAST FEEDING** [\[EvGr\]](#) Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. [\[D\]](#)
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.
  - ▶ In adults Manufacturer advises reduce dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup> (max. 2 g daily).
  - ▶ In children Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup> max. 50 mg/kg daily or max. 2 g daily).
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor full blood count regularly during prolonged treatment.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
- ▶ With intravenous use in children For *intravenous infusion* (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%;

give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.

For *intravenous injection*, give over 5 minutes; intravenous doses of 50 mg/kg or more in children under 12 years should be given by infusion.

- ▶ With intramuscular use in children For *intramuscular injection*, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous infusion or intravenous injection (see above). Displacement value may be significant, consult local guidelines.
- ▶ With intravenous use in adults For *intravenous infusion* (preferred route) (*Rocephin*<sup>®</sup>; *Ceftriaxone Injection*, Genus), give intermittently or *via* drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes. Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites.

For *intravenous injection*, give over 5 minutes.

- ▶ With intramuscular use in adults For *intramuscular injection*, doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous administration. Displacement value may be significant, consult local guidelines.

## ANTIBACTERIALS > CEPHALOSPORINS, OTHER

F 484

### Ceftaroline fosamil

#### • INDICATIONS AND DOSE

##### Community-acquired pneumonia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 600 mg every 12 hours for 5–7 days

##### Complicated skin infections | Complicated soft-tissue infections

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 600 mg every 12 hours for 5–14 days

- **CAUTIONS** Seizure disorders
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium*, has advised (Dec 2012) that ceftaroline fosamil (*Zinforo*<sup>®</sup>) is accepted for restricted use within NHS Scotland when meticillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

### Ceftobiprole

12-Dec-2016

#### • INDICATIONS AND DOSE

##### Hospital-acquired pneumonia (excluding ventilator-associated pneumonia) | Community-acquired pneumonia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours

- **CAUTIONS** Pre-existing seizure disorder—increased risk of seizures · supra-normal creatinine clearance
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Supra-normal creatinine clearance Manufacturer advises to measure baseline renal function and increase duration of infusion if creatinine clearance greater than 150 mL/minute.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dysgeusia · dyspepsia
- ▶ **Uncommon** Agitation · asthma · dyspnoea · muscle spasm · pharyngolaryngeal pain · renal failure
- ▶ **Frequency not known** Convulsions
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Reduce dose to 500 mg every 12 hours in moderate impairment and 250 mg every 12 hours in severe impairment. Manufacturer advises use with caution in severe impairment—limited information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Zevtera<sup>®</sup>), give intermittently in Glucose 5%, or Sodium Chloride 0.9%, or Lactated Ringer's solution; reconstitute each 500 mg with 10 mL Water for injections or Glucose 5%; dilute in 250 mL infusion fluid and give over 2 hours (increased to 4 hours if creatinine clearance greater than 150 mL/minute). Do not mix with calcium-containing solutions (except Lactated Ringer's solution) in the same intravenous line—precipitation may occur.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
 Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

 Ceftriboprole (as Ceftriboprole medocartil sodium) 500 mg Zevtera 500mg powder for concentrate for solution for infusion vials | 10 vial [PoM] £396.30 (Hospital only)

## ANTIBACTERIALS > GLYCOPEPTIDE ANTIBACTERIALS

### Teicoplanin

- **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

#### ● INDICATIONS AND DOSE

##### ***Clostridium difficile* infection**

- ▶ BY MOUTH
- ▶ Adult: 100–200 mg twice daily for 10–14 days

##### **Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia)**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult (body-weight up to 70 kg): Initially 400 mg every 12 hours for 3 doses, followed by 400 mg once daily
- ▶ Adult (body-weight 70 kg and above): Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

##### **Streptococcal or enterococcal endocarditis (in combination with another antibacterial)**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10 mg/kg every 12 hours for 3–5 doses, then 10 mg/kg once daily, subsequent doses can be given by intramuscular injection

#### **Bone and joint infections**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 12 mg/kg every 12 hours for 3–5 doses, then 12 mg/kg once daily subsequent doses can be given by intramuscular injection, increased risk of fever and rash with doses of 12 mg/kg

#### **Surgical prophylaxis**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg, to be administered up to 30 minutes before the procedure

#### **Surgical prophylaxis in open fractures**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

#### **Peritonitis associated with peritoneal dialysis (added to dialysis fluid)**

- ▶ BY INTRAPERITONEAL INFUSION
- ▶ Adult: (consult local protocol)

#### **PHARMACOKINETICS**

Teicoplanin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Not licensed for surgical prophylaxis. Teicoplanin doses in BNF may differ from those in product literature.
- **INTERACTIONS** → Appendix 1 (teicoplanin).  
 If other nephrotoxic or neurotoxic drugs given, monitor renal and auditory function on prolonged administration.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Pruritus · rash
  - ▶ **Uncommon** Bronchospasm · diarrhoea · dizziness · eosinophilia · fever · headache · leucopenia · mild hearing loss · nausea · thrombocytopenia · thrombophlebitis · tinnitus · vestibular disorders · vomiting
  - ▶ **Frequency not known** Exfoliative dermatitis · nephrotoxicity · renal failure · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Nephrotoxicity Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.
- **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m<sup>2</sup> and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose ('trough') concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre.  
 Plasma-teicoplanin concentration should be measured in elderly patients.
  - ▶ Blood counts and liver and kidney function tests required.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous infusion (*Targocid*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.
- ▶ With oral use Injection can be used to prepare solution for oral administration.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### **Powder and solvent for solution for injection**

ELECTROLYTES: May contain Sodium

- ▶ **Targocid** (Sanofi) ▼  
**Teicoplanin 200 mg** Targocid 200mg powder and solvent for solution for injection vials | 1 vial [PoM] £3.93
- Teicoplanin 400 mg** Targocid 400mg powder and solvent for solution for injection vials | 1 vial [PoM] £7.32

## Telavancin

- **DRUG ACTION** Telavancin is a glycopeptide antibacterial; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

### ● INDICATIONS AND DOSE

**Hospital-acquired pneumonia, known or suspected to be caused by methicillin-resistant *Staphylococcus aureus* when other antibacterials cannot be used**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 10 mg/kg once daily for 7–21 days

- **CAUTIONS** Conditions that predispose to renal impairment
  - predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)
- **INTERACTIONS** → Appendix 1 (telavancin). Use with caution if concomitant use with nephrotoxic drugs, drugs that prolong the QT interval or potentially ototoxic drugs.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Acute renal failure • chills • constipation • diarrhoea • dizziness • fungal infection • headache • insomnia • malaise • nausea • pruritus • rash • taste disturbances • vomiting
  - ▶ **Uncommon** Abdominal pain • agitation • altered sense of smell • angina • antibiotic-associated colitis • anxiety • arthralgia • atrial fibrillation • back pain • blood disorders • blurred vision • bradycardia • confusion • congestive cardiac failure • decreased appetite • depression • dry mouth • dyspepsia • dyspnoea • dysuria • electrolyte disturbances • erythema • eye irritation • flatulence • flushing • haematuria • hepatitis • hiccup • hyperhidrosis • hypertension • hypotension • increased INR • microalbuminuria • myalgia • nasal congestion • oedema • oliguria • oral hypoesthesia • palpitation • paraesthesia • pharyngolaryngeal pain • phlebitis • pollakiuria • pyrexia • QT interval prolongation • sinus tachycardia • somnolence • supraventricular extrasystoles • tinnitus • tremor • urinary tract infection • urticaria • ventricular extrasystoles
  - ▶ **Rare** Deafness
  - ▶ **Frequency not known** Flushing of the upper body ('red man' syndrome) • non-cardiac chest pain
- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with vancomycin or teicoplanin sensitivity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies).
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Vibativ*®). Avoid rapid infusion (can cause 'red man' syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL; give over at least 60 minutes.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

- ▶ **Vibativ** (Clingen Healthcare Ltd) ▼  
**Telavancin (as Telavancin hydrochloride) 750 mg** Vibativ 750mg powder for solution for infusion vials | 1 vial [PoM] £645.00 (Hospital only)

## Vancomycin

- **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.
- ▶ With intravenous use Vancomycin has a long duration of action and can therefore be given every 12 hours.

### ● INDICATIONS AND DOSE

#### ***Clostridium difficile* infection**

- ▶ BY MOUTH
- ▶ Adult: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day

#### **Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicaemia and soft-tissue infections**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 1–1.5 g every 12 hours
- ▶ Elderly: 500 mg every 12 hours, alternatively 1 g once daily

#### **Surgical prophylaxis (when high risk of MRSA)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 1 g for 1 dose

#### **Peritonitis associated with peritoneal dialysis**

- ▶ BY INTRAPERITONEAL ADMINISTRATION
- ▶ Adult: (consult local protocol)

### PHARMACOKINETICS

Vancomycin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.
- **CAUTIONS**
  - GENERAL CAUTIONS**  
Avoid if history of deafness · elderly
  - SPECIFIC CAUTIONS**
- ▶ With oral use systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses
- **INTERACTIONS** → Appendix 1 (vancomycin).
- **SIDE-EFFECTS**
  - ▶ **Common or very common**
  - ▶ With intravenous use Blood disorders, including neutropenia (usually after 1 week or cumulative dose of 25 g) · interstitial nephritis · nephrotoxicity · ototoxicity (discontinue if tinnitus occurs) · renal failure
  - ▶ **Rare**
  - ▶ With intravenous use Agranulocytosis · thrombocytopenia
  - ▶ **Frequency not known**
  - ▶ With intravenous use Anaphylaxis · cardiac arrest on rapid infusion · chills · dyspnoea · eosinophilia · exfoliative dermatitis · fever · flushing of the upper body ('red man' syndrome) · nausea · pain and muscle spasm of back and chest · phlebitis (irritant to tissue) · pruritus · rashes · severe hypotension on rapid infusion · shock on rapid infusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria · vasculitis · wheezing
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Nephrotoxicity Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.
- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.  
Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.
- **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.
- **RENAL IMPAIRMENT** Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function.
- **MONITORING REQUIREMENTS**
- ▶ All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
- ▶ With intravenous use Pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of methicillin-resistant *Staphylococcus aureus* or for complicated infections caused by *S. aureus*). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines.
- ▶ All patients require blood counts, urinalysis, and renal function tests.
- ▶ Monitor auditory function in elderly.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.
- ▶ With intravenous use For intravenous infusion (Vancocin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.

- ▶ With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pastille, solution for injection, infusion

## ANTIBACTERIALS > LINCOSAMIDES

### Clindamycin

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

#### ● INDICATIONS AND DOSE

**Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Methicillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)**

##### ▶ BY MOUTH

▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)

▶ Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours if required, increased dose used in severe infection

##### ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

**Treatment of mild to moderate pneumocystis pneumonia (in combination with primaquine)**

##### ▶ BY MOUTH

▶ Adult: 600 mg every 8 hours

continued →

**Treatment of falciparum malaria (to be given with or following quinine)**

- ▶ BY MOUTH
- ▶ Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
- ▶ Adult: 450 mg every 8 hours for 7 days

● **UNLICENSED USE** Not licensed for treatment of falciparum malaria. Not licensed for treatment of mild to moderate pneumocystis infection.

● **CONTRA-INDICATIONS** Diarrhoeal states

● **CAUTIONS** Avoid in acute porphyrias p. 930 · middle-aged and elderly women, especially after an operation (antibiotic-associated colitis more common)

● **INTERACTIONS** → Appendix 1 (clindamycin).

● **SIDE-EFFECTS**

- ▶ With intramuscular use Abscess · induration · pain
- ▶ With intravenous use Thrombophlebitis
- ▶ With systemic use Abdominal discomfort · anaphylactoid reactions · antibiotic-associated colitis · diarrhoea (discontinue treatment) · eosinophilia · exfoliative dermatitis · jaundice · leucopenia · nausea · oesophageal ulcers · oesophagitis · polyarthritides · pruritus · rash · Stevens-Johnson syndrome · taste disturbances · thrombocytopenia · toxic epidermal necrolysis · urticaria · vesiculobullous dermatitis · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Antibiotic-associated colitis Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

● **MONITORING REQUIREMENTS**

- ▶ Monitor liver and renal function if treatment exceeds 10 days.
- ▶ In children Monitor liver and renal function in neonates and infants.

● **DIRECTIONS FOR ADMINISTRATION** Avoid rapid intravenous administration. For *intravenous infusion (Dalacin® C Phosphate)*, give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).

● **PATIENT AND CARER ADVICE** Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops.

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Clindamycin capsules may be prescribed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

**ANTIBACTERIALS > MACROLIDES****Macrolides****Overview**

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many-penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 497 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin p. 495 is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 496 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 533.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

**Macrolides**

● **CAUTIONS** Electrolyte disturbances (predisposition to QT interval prolongation) · may aggravate myasthenia gravis · predisposition to QT interval prolongation

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal discomfort · diarrhoea · nausea · vomiting
- ▶ **Uncommon** Cholestatic jaundice · hepatotoxicity · rash
- ▶ **Rare** Antibiotic-associated colitis · arrhythmias · pancreatitis · QT interval prolongation · Stevens-Johnson syndrome · toxic epidermal necrolysis

- ▶ **Frequency not known** Reversible hearing loss (sometimes with tinnitus) can occur after large doses
- ▶ With intravenous use Local tenderness · phlebitis

#### SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects are mild and less frequent with azithromycin and clarithromycin than with erythromycin.

494

## Azithromycin

### ● INDICATIONS AND DOSE

**Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin**

#### ▶ BY MOUTH

- ▶ Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- ▶ Child 12-17 years: 500 mg once daily for 5 days
- ▶ Adult: 500 mg once daily for 5 days

**Respiratory-tract infections, otitis media, skin and soft-tissue infections**

#### ▶ BY MOUTH

- ▶ Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- ▶ Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

**Uncomplicated genital chlamydial infections | Non-gonococcal urethritis**

#### ▶ BY MOUTH

- ▶ Child 12-17 years: 1 g for 1 dose
- ▶ Adult: 1 g for 1 dose

**Uncomplicated gonorrhoea**

#### ▶ BY MOUTH

- ▶ Adult: 1 g for 1 dose

**Lyme disease (under expert supervision)**

#### ▶ BY MOUTH

- ▶ Adult: 500 mg once daily for 7-10 days

**Mild to moderate typhoid due to multiple-antibacterial resistant organisms**

#### ▶ BY MOUTH

- ▶ Adult: 500 mg once daily for 7 days

**Community-acquired pneumonia, low to moderate severity**

#### ▶ BY MOUTH

- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

**Community-acquired pneumonia, high severity**

#### ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7-10 days

**Antibacterial prophylaxis for insertion of intra-uterine device**

#### ▶ BY MOUTH

- ▶ Adult: 1 g for 1 dose

### ● UNLICENSED USE

- ▶ In children Not licensed for typhoid fever or prophylaxis of group A streptococcal infection.

- ▶ In adults Oral azithromycin not licensed for trachoma which results from chronic infection with *Chlamydia trachomatis*. Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

### ● INTERACTIONS → Appendix 1 (macrolides).

- ▶ Caution with concomitant use of drugs that prolong the QT interval.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Anorexia · arthralgia · disturbances in taste · disturbances in vision · dizziness · dyspepsia · flatulence · headache · malaise · paraesthesia · reversible hearing loss (sometimes with tinnitus) after long-term therapy
- ▶ **Uncommon** Anxiety · chest pain · constipation · gastritis · hypoaesthesia · leucopenia · oedema · photosensitivity · sleep disturbances
- ▶ **Rare** Agitation
- ▶ **Frequency not known** Acute renal failure · convulsions · haemolytic anaemia · interstitial nephritis · smell disturbances · syncope · thrombocytopenia · tongue discoloration

- **PREGNANCY** Manufacturers advise use only if adequate alternatives not available.

- **BREAST FEEDING** Present in milk; use only if no suitable alternatives.

- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe liver disease—no information available.

### ● RENAL IMPAIRMENT

- ▶ In adults Use with caution if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- ▶ In children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Zedbac*®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry or banana.

### ● PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Azithromycin for bacterial infections [www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0](http://www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0)

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

### ● MEDICINAL FORMS

### ● INDICATIONS AND DOSE

#### Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily
- ▶ Child 12-17 years: 250 mg twice daily usually for 7-14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- ▶ Adult: 250 mg twice daily usually for 7-14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 500 mg once daily usually for 7-14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
- ▶ Adult: 500 mg once daily usually for 7-14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

### Lyme disease

#### ▶ BY MOUTH

- ▶ Child 12-17 years: 500 mg twice daily for 14-21 days
- ▶ Adult: 500 mg twice daily for 14-21 days

### Prevention of pertussis

#### ▶ BY MOUTH

- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily for 7 days

- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily for 7 days
- ▶ Child 12-17 years: 500 mg twice daily for 7 days
- ▶ Adult: 500 mg twice daily for 7 days

### **Helicobacter pylori eradication in combination with a proton pump inhibitor and amoxicillin**

#### ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily

### **Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole**

#### ▶ BY MOUTH

- ▶ Adult: 250 mg twice daily

- **UNLICENSED USE** Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months.

- **INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Dyspepsia · headache · hyperhidrosis · insomnia · taste disturbances
- ▶ **Uncommon** Anorexia · anxiety · blood disorders · chest pain · constipation · dizziness · dry mouth · flatulence · gastritis · glossitis · hepatic dysfunction including jaundice · leucopenia · malaise · myalgia · stomatitis · tinnitus · tremor
- ▶ **Frequency not known** Abnormal dreams · confusion · convulsions · depression · hypoglycaemia · interstitial nephritis · myopathy · paraesthesia · psychotic disorders · renal failure · smell disturbances · tongue discoloration · tooth discoloration

- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.

- **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.

- ▶ In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>, max. duration 14 days.  
Avoid *Klaricid XL*<sup>®</sup> or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- ▶ In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>, max. duration 14 days. Avoid *Klaricid XL*<sup>®</sup> or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Klaricid*<sup>®</sup> I.V.), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

**Clarithromycin 500 mg** Klaricid IV 500mg powder for solution for infusion vials | 1 vial [PoM] £9.45 DT price = £9.45

F 494

**Erythromycin****● INDICATIONS AND DOSE**

**Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)**

▶ **BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - ▶ Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - ▶ Child 8-17 years: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections
  - ▶ Adult: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

- ▶ Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

**Lyme disease (under expert supervision)**▶ **BY MOUTH**

- ▶ Adult: 500 mg 4 times a day for 14-21 days

**Early syphilis**▶ **BY MOUTH**

- ▶ Adult: 500 mg 4 times a day for 14 days

**Uncomplicated genital chlamydia | Non-gonococcal urethritis**▶ **BY MOUTH**

- ▶ Adult: 500 mg twice daily for 14 days

**Chronic prostatitis**▶ **BY MOUTH**

- ▶ Adult: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 4 g daily in divided doses, dose increase may be used in severe infections

▶ **BY INTRAVENOUS INFUSION**

- ▶ Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

**Prevention and treatment of pertussis**▶ **BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
- ▶ Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
- ▶ Child 8-17 years: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections
- ▶ Adult: (consult local protocol)

**Prevention of secondary case of diphtheria in non-immune patient**▶ **BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Adult: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

**Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients**▶ **BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg every 6 hours for 10 days
- ▶ Child 2-7 years: 250 mg every 6 hours for 10 days
- ▶ Child 8-17 years: 250-500 mg every 6 hours for 10 days
- ▶ Adult: 250-500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)**▶ **BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
- ▶ Child 2-7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell continued →

disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

- ▶ Child 8–17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- ▶ Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

#### Prevention of recurrence of rheumatic fever

##### ▶ BY MOUTH

- ▶ Child 1 month–1 year: 125 mg twice daily
- ▶ Child 2–17 years: 250 mg twice daily

#### Rosacea

##### ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

#### Acne

##### ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily

- **CAUTIONS** Avoid in acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.
- **RENAL IMPAIRMENT**
  - ▶ In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
  - ▶ In children Reduce dose in severe renal impairment (ototoxicity).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
  - ▶ With intravenous use in adults For *intravenous infusion* (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Erythromycin for bacterial infections [www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections](http://www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections)
- **PROFESSION SPECIFIC INFORMATION**

#### Dental practitioners' formulary

Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 9

##### ▶ Erythromycin (Non-proprietary)

#### Erythromycin (as Erythromycin ethyl succinate)

**500 mg** Erythromycin ethyl succinate 500mg tablets | 28 tablet [PoM](#) £15.95–£19.50 DT price = £10.78

##### ▶ Erythrocin (AMCo)

#### Erythromycin (as Erythromycin ethyl succinate) 25 mg per

**1 ml** Erythromycin ethyl succinate 125mg/5ml oral suspension | 100 ml [PoM](#) £4.05 DT price = £4.05

Erythromycin ethyl succinate 125mg/5ml oral suspension sugar free sugar-free | 100 ml [PoM](#) £4.99 DT price = £3.58

#### Erythromycin (as Erythromycin ethyl succinate) 50 mg per

**1 ml** Erythromycin ethyl succinate 250mg/5ml oral suspension | 100 ml [PoM](#) £6.38 DT price = £6.38

Erythromycin ethyl succinate 250mg/5ml oral suspension sugar free sugar-free | 100 ml [PoM](#) £7.99 DT price = £5.27

#### Erythromycin (as Erythromycin ethyl succinate) 100 mg per

**1 ml** Erythromycin ethyl succinate 500mg/5ml oral suspension | 100 ml [PoM](#) £11.24 DT price = £11.24

Erythromycin ethyl succinate 500mg/5ml oral suspension sugar free sugar-free | 100 ml [PoM](#) no price available

##### ▶ Erythroped (AMCo)

#### Erythromycin (as Erythromycin ethyl succinate) 25 mg per

**1 ml** Erythroped PI SF 125mg/5ml oral suspension sugar-free | 140 ml [PoM](#) £3.06

#### Erythromycin (as Erythromycin ethyl succinate) 50 mg per

**1 ml** Erythroped SF 250mg/5ml oral suspension sugar-free | 140 ml [PoM](#) £5.95

#### Erythromycin (as Erythromycin ethyl succinate) 100 mg per

**1 ml** Erythroped Forte SF 500mg/5ml oral suspension sugar-free | 140 ml [PoM](#) £10.56 DT price = £10.56

#### Powder for solution for infusion

##### ▶ Erythromycin (Non-proprietary)

#### Erythromycin (as Erythromycin lactobionate)

**1 gram** Erythromycin 1g powder for solution for infusion vials | 1 vial [PoM](#) £22.92

## ANTIBACTERIALS &gt; MONOBACTAMS

## Aztreonam

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

## ● INDICATIONS AND DOSE

**Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis***

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g intravenous route only

**Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 6–8 hours

**Gonorrhoea | Cystitis**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 g for 1 single dose

**Urinary-tract infections**

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 0.5–1 g every 8–12 hours

**Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis**

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

## ● CAUTIONS

- ▶ When used by inhalation Haemoptysis— risk of further haemorrhage

- **INTERACTIONS** → Appendix 1 (aztreonam).

## ● SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

Bronchospasm · rash

**SPECIFIC SIDE-EFFECTS**

- ▶ Rare
- ▶ With systemic use Antibiotic-associated colitis · asthenia · blood disorders · breast tenderness · chest pain · confusion · diplopia · dizziness · dyspnoea · gastro-intestinal bleeding · halitosis · headache · hepatitis · hypotension · insomnia · jaundice · myalgia · neutropenia · paraesthesia · seizures · thrombocytopenia · tinnitus
- ▶ Frequency not known
- ▶ When used by inhalation Arthralgia · cough · haemoptysis · pharyngolaryngeal pain · pyrexia · rhinorrhoea · wheezing
- ▶ With systemic use Abdominal pain · diarrhoea · erythema multiforme · flushing · mouth ulcers · nausea · taste disturbances · toxic epidermal necrolysis · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.

Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

## ● PREGNANCY

- ▶ With systemic use No information available; manufacturer of injection advises avoid.
- ▶ When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.
- **BREAST FEEDING** Amount in milk probably too small to be harmful.
- **HEPATIC IMPAIRMENT**
- ▶ With systemic use Use injection with caution. Monitor liver function.
- **RENAL IMPAIRMENT**
- ▶ With systemic use If eGFR 10–30 mL/minute/1.73 m<sup>2</sup>, usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m<sup>2</sup>, usual initial dose of injection, then one-quarter normal dose.
- **MONITORING REQUIREMENTS**
- ▶ When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over 3–5 minutes.
- ▶ With intravenous use For intravenous infusion (*Azactam*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
- ▶ When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

## ● NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (December 2014) that aztreonam powder for nebuliser solution (*Cayston*®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second).

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- ▶ **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)  
**Aztreonam 1 gram** Azactam 1g powder for solution for injection vials  
| 1 vial [PoM] £9.40 (Hospital only)
- ▶ **Aztreonam 2 gram** Azactam 2g powder for solution for injection vials  
| 1 vial [PoM] £18.82 (Hospital only)

**Powder and solvent for nebuliser solution**

- ▶ **Cayston** (Gilead Sciences International Ltd)  
**Aztreonam (as Aztreonam lysine) 75 mg** Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset  
| 84 vial [PoM] £2,181.53

## ANTIBACTERIALS &gt; NITROIMIDAZOLE DERIVATIVES

## Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

## ● INDICATIONS AND DOSE

**Anaerobic infections**

- ▶ BY MOUTH
- ▶ Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection) continued →

- ▶ Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ BY RECTUM
- ▶ Child 11–1 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- ▶ Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

***Helicobacter pylori* eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily

***Helicobacter pylori* eradication; in combination with amoxicillin and omeprazole**

- ▶ BY MOUTH
- ▶ Adult: 400 mg 3 times a day

***Helicobacter pylori* eradication failure (two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate plus tetracycline)**

- ▶ BY MOUTH
- ▶ Adult: 400–500 mg 3 times a day for 2 weeks

**Fistulating Crohn's disease**

- ▶ BY MOUTH
- ▶ Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

**Leg ulcers and pressure sores**

- ▶ BY MOUTH
- ▶ Adult: 400 mg every 8 hours for 7 days

**Bacterial vaginosis (notably *Gardnerella vaginalis* infection)**

- ▶ BY MOUTH
- ▶ Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Bacterial vaginosis**

- ▶ BY VAGINA USING VAGINAL GEL
- ▶ Adult: 1 applicatorful daily for 5 days, dose to be administered at night

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ 1 applicatorful delivers a 5g dose of metronidazole 0.75%.

**Pelvic inflammatory disease**

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily for 14 days

**Acute ulcerative gingivitis**

- ▶ BY MOUTH
- ▶ Child 1–2 years: 50 mg every 8 hours for 3 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3 days

- ▶ Child 7–9 years: 100 mg every 8 hours for 3 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3 days
- ▶ Adult: 400 mg every 8 hours for 3 days

**Acute oral infections**

- ▶ BY MOUTH
- ▶ Child 1–2 years: 50 mg every 8 hours for 3–7 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3–7 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3–7 days
- ▶ Adult: 400 mg every 8 hours for 3–7 days

**Surgical prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
- ▶ BY RECTUM
- ▶ Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

**Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)**

- ▶ BY MOUTH
- ▶ Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

**Urogenital trichomoniasis**

- ▶ BY MOUTH
- ▶ Child 1–2 years: 50 mg 3 times a day for 7 days
- ▶ Child 3–6 years: 100 mg twice daily for 7 days
- ▶ Child 7–9 years: 100 mg 3 times a day for 7 days
- ▶ Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
- ▶ Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Giardiasis**

- ▶ BY MOUTH
- ▶ Child 1–2 years: 500 mg once daily for 3 days
- ▶ Child 3–6 years: 600–800 mg once daily for 3 days
- ▶ Child 7–9 years: 1 g once daily for 3 days
- ▶ Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
- ▶ Adult: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

**Established case of tetanus**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

● **UNLICENSED USE**

- ▶ With systemic use in adults Metronidazole doses in the BNF may differ from those in product literature.

### ● CAUTIONS

- ▶ With vaginal use Not recommended during menstruation. Some systemic absorption may occur with vaginal gel

### ● INTERACTIONS

- ▶ With systemic use → Appendix 1 (metronidazole). Caution—disulfiram-like reaction with alcohol.

### ● SIDE-EFFECTS

- ▶ **Very rare**
- ▶ With systemic use Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances
- ▶ **Frequency not known**
- ▶ With systemic use Anorexia · aseptic meningitis · furred tongue · gastro-intestinal disturbances · nausea · optic neuropathy · oral mucositis · taste disturbances · vomiting
- ▶ With vaginal use Abnormal vaginal discharge · local irritation · pelvic discomfort · vaginal candidiasis

### ● PREGNANCY

- ▶ With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

### ● BREAST FEEDING

- ▶ With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

### ● HEPATIC IMPAIRMENT

- ▶ With systemic use In severe liver disease reduce total daily dose to one-third, and give once daily. Use with caution in hepatic encephalopathy.

### ● MONITORING REQUIREMENTS

- ▶ With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give over 20–30 minutes.

### ● PRESCRIBING AND DISPENSING INFORMATION

Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Metronidazole for bacterial infections [www.medicinesforchildren.org.uk/metronidazole-bacterial-infections](http://www.medicinesforchildren.org.uk/metronidazole-bacterial-infections)

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25, 27

#### ▶ Metronidazole (Non-proprietary)

**Metronidazole 200 mg** Metronidazole 200mg tablets | 21 tablet [PoM] £4.99 DT price = £2.12 | 250 tablet [PoM] £19.69

**Metronidazole 400 mg** Metronidazole 400mg tablets | 21 tablet [PoM] £8.10 DT price = £1.47

**Metronidazole 500 mg** Metronidazole 500mg tablets | 21 tablet [PoM] £37.82 DT price = £37.82

#### ▶ Flagyl (Zentiva)

**Metronidazole 200 mg** Flagyl 200mg tablets | 21 tablet [PoM] £4.49 DT price = £2.12

**Metronidazole 400 mg** Flagyl 400mg tablets | 14 tablet [PoM] £6.34

### Oral suspension

CAUTIONARY AND ADVISORY LABELS 4, 9

#### ▶ Metronidazole (Non-proprietary)

**Metronidazole (as Metronidazole benzoate) 40 mg per 1 ml** Metronidazole 200mg/5ml oral suspension | 100 ml [PoM] £32.93 DT price = £32.93

### Infusion

ELECTROLYTES: May contain Sodium

#### ▶ Metronidazole (Non-proprietary)

**Metronidazole 5 mg per 1 ml** Metronidazole 500mg/100ml infusion 100ml bags | 20 bag [PoM] £62.00  
**Metronidazole 500mg/100ml infusion 100ml Macoflex bags** | 1 bag [PoM] no price available | 60 bag [PoM] no price available

### Suppository

CAUTIONARY AND ADVISORY LABELS 4, 9

#### ▶ Flagyl (Zentiva)

**Metronidazole 1 gram** Flagyl 1g suppositories | 10 suppository [PoM] £23.06

**Metronidazole 500 mg** Flagyl 500mg suppositories | 10 suppository [PoM] £15.18

### Vaginal gel

EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol

#### ▶ Metronidazole (Non-proprietary)

**Metronidazole 7.5 mg per 1 gram** Metronidazole 0.75% vaginal gel | 40 gram [PoM] no price available DT price = £4.31

#### ▶ Zidoval (Meda Pharmaceuticals Ltd)

**Metronidazole 7.5 mg per 1 gram** Zidoval 0.75% vaginal gel | 40 gram [PoM] £4.31 DT price = £4.31

## Tinidazole

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

### ● INDICATIONS AND DOSE

#### Anaerobic infections

##### ▶ BY MOUTH

- ▶ Adult: Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

#### Bacterial vaginosis | Acute ulcerative gingivitis

##### ▶ BY MOUTH

- ▶ Adult: 2 g for 1 single dose

#### Abdominal surgery prophylaxis

##### ▶ BY MOUTH

- ▶ Adult: 2 g for 1 single dose, to be administered approximately 12 hours before surgery

#### Intestinal amoebiasis

##### ▶ BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- ▶ Child 12–17 years: 2 g once daily for 2–3 days
- ▶ Adult: 2 g once daily for 2–3 days

#### Amoebic involvement of liver

##### ▶ BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- ▶ Child 12–17 years: 1.5–2 g once daily for 3–6 days
- ▶ Adult: 1.5–2 g once daily for 3–6 days

#### Urogenital trichomoniasis | Giardiasis

##### ▶ BY MOUTH

- ▶ Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- ▶ Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary
- ▶ Adult: 2 g for 1 single dose

#### Helicobacter pylori eradication

##### ▶ BY MOUTH

- ▶ Adult: (consult local protocol)

- **CAUTIONS** Avoid in acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (tinidazole).  
Caution—disulfiram-like reaction with alcohol.
- **SIDE-EFFECTS**
  - **Common or very common** Anorexia · furred tongue · gastro-intestinal disturbances · nausea · oral mucositis · taste disturbances · vomiting
  - ▶ **Very rare** Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances
  - ▶ **Frequency not known** Aseptic meningitis · optic neuropathy
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

#### ● MEDICINAL FORMS

Tinidazole 500 mg Fasigyn 500mg tablets | 16 tablet **[PoM]** £11.04

DT price = £11.04

## ANTIBACTERIALS > PENICILLINS

### Penicillins

#### Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 504 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 499 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection.

**Benzathine benzylpenicillin** is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 505 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

#### Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 511, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 512 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

#### Broad-spectrum penicillins

Ampicillin p. 507 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 506) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Co-amoxiclav p. 508 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 508) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

#### Antipseudomonal penicillins

**Piperacillin**, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 503 has activity against a wider range of Gram-negative

organisms than ticarcillin with clavulanic acid p. 504 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 479) since they have a synergistic effect.

### Mecillinams

Pivmecillinam hydrochloride p. 510 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

## Penicillins

- **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.
- **CAUTIONS** History of allergy
- **INTERACTIONS** → Appendix 1 (penicillins).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaphylaxis · angioedema · diarrhoea · fever · hypersensitivity reactions · joint pains · rashes · serum sickness-like reaction · urticaria
  - ▶ **Rare** Cerebral irritation · CNS toxicity (including convulsions) · coagulation disorders · encephalopathy · haemolytic anaemia · interstitial nephritis · leucopenia · thrombocytopenia
  - ▶ **Frequency not known** Antibiotic-associated colitis
- SIDE-EFFECTS, FURTHER INFORMATION**
- **CNS toxicity** A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.
- **Diarrhoea** Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.
- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate

hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

## ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA- LACTAMASE INHIBITOR

### Piperacillin with tazobactam

#### ● INDICATIONS AND DOSE

**Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues**

#### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

#### **Infections in neutropenic patients**

#### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 4.5 g every 6 hours

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Nausea · vomiting
  - ▶ **Uncommon** Constipation · dyspepsia · headache · hypotension · injection-site reactions · insomnia · jaundice · stomatitis
  - ▶ **Rare** Abdominal pain · eosinophilia · hepatitis
  - ▶ **Very rare** Hypoglycaemia · hypokalaemia · pancytopenia · Steven-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m<sup>2</sup>. Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin*<sup>®</sup> brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

#### **Powder for solution for injection**

ELECTROLYTES: May contain Sodium

#### ▶ **Piperacillin with tazobactam (Non-proprietary)**

**Piperacillin (as Piperacillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg** Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial [PoM] £7.96 DT price = £7.91 (Hospital only) | 1 vial [PoM] £7.91 DT price = £7.91 | 10 vial [PoM] £10.31-£60.80

Piperacillin (as Piperacillin sodium) 4 gram, Tazobactam (as Tazobactam sodium) 500 mg Piperacillin 4g / Tazobactam 500mg powder for solution for injection vials | 1 vial [PoM] £15.77-£15.79 (Hospital only) | 1 vial [PoM] £12.90

▶ **Tazocin** (Pfizer Ltd)

Piperacillin (as Piperacillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg Tazocin 2.25g powder for solution for injection vials | 1 vial [PoM] £7.65 DT price = £7.91

Piperacillin (as Piperacillin sodium) 4 gram, Tazobactam (as Tazobactam sodium) 500 mg Tazocin 4.5g powder for solution for injection vials | 1 vial [PoM] £15.17 (Hospital only)

F 503

## Ticarcillin with clavulanic acid

### ● INDICATIONS AND DOSE

#### Infections due to *Pseudomonas* and *Proteus* spp.

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Cholestatic jaundice** Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **SIDE-EFFECTS** Eosinophilia · haemorrhagic cystitis (more frequent in children) · hypokalaemia · injection-site reactions · nausea · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>. Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** For *Intravenous infusion* (Timentin®), give intermittently in Glucose 5%. Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

ELECTROLYTES: May contain Potassium, sodium

- ▶ **Timentin** (GlaxoSmithKline UK Ltd)

Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial [PoM] £21.32

## ANTIBACTERIALS > PENICILLINS, BETA-LACTAMASE SENSITIVE

F 503

### Benzylpenicillin sodium (Penicillin G)

#### ● INDICATIONS AND DOSE

#### Mild to moderate susceptible infections | Throat infections | Otitis media | Cellulitis | Pneumonia

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

#### Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

#### Anthrax (in combination with other antibacterials)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 2.4 g every 4 hours

#### Intrapartum prophylaxis against group B streptococcal infection

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

#### Meningitis | Meningococcal disease

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 2.4 g every 4 hours

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

#### Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

- ▶ Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

- ▶ Adult: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

#### Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 300 mg, administer as single dose prior to transfer to hospital

- ▶ Child 1–9 years: 600 mg, administer as single dose prior to transfer to hospital

- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to transfer to hospital

- ▶ Adult: 1.2 g, administer as single dose prior to transfer to hospital

- **UNLICENSED USE** Benzylpenicillin doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

Intrathecal injection of benzylpenicillin is **not** recommended.

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.
  - ▶ In adults Reduce dose—consult product literature.
  - ▶ In children Estimated glomerular filtration rate 10–50 mL/minute/1.73 m<sup>2</sup>, use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup> use normal dose every 12 hours.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in children Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
  - ▶ With intravenous use in adults For *intravenous infusion* (*Crystapen*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for injection**

ELECTROLYTES: May contain Sodium

**Benzylpenicillin sodium 600 mg** Benzylpenicillin 600mg powder for solution for injection vials | 2 vial [PoM](#) £4.67–£5.46 DT price = £5.46 | 25 vial [PoM](#) £58.37–£68.29

503

**Phenoxymethylpenicillin**

(Penicillin V)

**INDICATIONS AND DOSE**

**Oral infections | Tonsillitis | Otitis media | Erysipelas | Cellulitis**

▶ **BY MOUTH**

- ▶ Child 1–11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 1–5 years: 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 6–11 years: 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day
- ▶ Adult: 500 mg every 6 hours, increased if necessary up to 1 g every 6 hours

**Prevention of recurrence of rheumatic fever**▶ **BY MOUTH**

- ▶ Child 1 month–5 years: 125 mg twice daily
- ▶ Child 6–17 years: 250 mg twice daily
- ▶ Adult: 250 mg twice daily

**Prevention of secondary case of invasive group A streptococcal infection**▶ **BY MOUTH**

- ▶ Child 1–11 months: 62.5 mg every 6 hours for 10 days
- ▶ Child 1–5 years: 125 mg every 6 hours for 10 days
- ▶ Child 6–11 years: 250 mg every 6 hours for 10 days
- ▶ Child 12–17 years: 250–500 mg every 6 hours for 10 days
- ▶ Adult: 250–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**▶ **BY MOUTH**

- ▶ Child 1–11 months: 62.5 mg twice daily
- ▶ Child 1–4 years: 125 mg twice daily
- ▶ Child 5–17 years: 250 mg twice daily
- ▶ Adult: 250 mg twice daily

- **UNLICENSED USE** Phenoxymethylpenicillin doses in the BNF may differ from product literature.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE**

## Amoxicillin

(Amoxycillin)

## ● INDICATIONS AND DOSE

**Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)**

## ▶ BY MOUTH

- ▶ Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - ▶ Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - ▶ Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - ▶ Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
  - ▶ Adult: 500 mg every 8 hours, increased if necessary to 1 g every 8 hours, increased dose used in severe infections
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg every 8 hours
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, use increased dose in severe infections

**Lyme disease (under expert supervision)**

## ▶ BY MOUTH

- ▶ Child 5-17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)
- ▶ Adult: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

**Anthrax (treatment and post-exposure prophylaxis)**

## ▶ BY MOUTH

- ▶ Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
- ▶ Child (body-weight 20 kg and above): 500 mg 3 times a day
- ▶ Adult: 500 mg 3 times a day

**Dental abscess (short course)**

## ▶ BY MOUTH

- ▶ Adult: 3 g, then 3 g after 8 hours

**Urinary-tract infections (short course)**

## ▶ BY MOUTH

- ▶ Adult: 3 g, then 3 g after 10–12 hours

**Listerial meningitis (in combination with another antibiotic)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 2 g every 4 hours

**Endocarditis (in combination with another antibiotic if necessary)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 2 g every 4 hours

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for Haemophilus influenzae**

## ▶ BY MOUTH

- ▶ Child 1 month-4 years: 125 mg twice daily
- ▶ Child 5-11 years: 250 mg twice daily
- ▶ Child 12-17 years: 500 mg twice daily

**Helicobacter pylori eradication in combination with metronidazole and omeprazole**

## ▶ BY MOUTH

- ▶ Adult: 500 mg 3 times a day

**Helicobacter pylori eradication in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

## ▶ BY MOUTH

- ▶ Adult: 1 g twice daily

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature.

● **CAUTIONS****GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

**SPECIFIC CAUTIONS**

- ▶ With intravenous use Accumulation of sodium can occur with high parenteral doses

● **SIDE-EFFECTS**

- ▶ **Common or very common** Nausea · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Rash If rash occurs, discontinue treatment.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **RENAL IMPAIRMENT** Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy).

- ▶ With intravenous use Accumulation of sodium from injection can occur in patients with renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Amoxil<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

● **PATIENT AND CARER ADVICE**

Patient counselling is advised for Amoxicillin (Amoxil<sup>®</sup>) paediatric suspension (use of pipette). ## Co-fluampicil

### ● INDICATIONS AND DOSE

#### Mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
  - ▶ Child 1 month–9 years: 125/125 mg every 6 hours
  - ▶ Child 10–17 years: 250/250 mg every 6 hours
  - ▶ Adult: 250/250 mg every 6 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - ▶ Adult: 250/250 mg every 6 hours

#### Severe mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
  - ▶ Child 1 month–9 years: 250/250 mg every 6 hours
  - ▶ Adult: 500/500 mg every 6 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - ▶ Adult: 500/500 mg every 6 hours

### IMPORTANT SAFETY INFORMATION

#### HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

### ● CAUTIONS

#### GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

#### SPECIFIC CAUTIONS

- ▶ With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **SIDE-EFFECTS**
- ▶ **Common or very common** Gastro-intestinal disturbances · nausea · vomiting
- ▶ **Very rare** Cholestatic jaundice · hepatitis
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Rash if rash occurs, discontinue treatment.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT**
- ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>; rashes more common.
- ▶ In children Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>; rashes more common.
- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Magnapen*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes. *Via* drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

## ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR

## Co-amoxiclav

### ● INDICATIONS AND DOSE

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites**

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
- ▶ Adult: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1–2 months: 30 mg/kg every 12 hours
- ▶ Child 3 months–17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)
- ▶ Adult: 1.2 g every 8 hours

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)**

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day, dose doubled in severe infection
- ▶ Child 1–5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)**

► BY MOUTH USING ORAL SUSPENSION

- Child 6–11 years: 0.15 mL/kg/day 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)**

► BY MOUTH USING ORAL SUSPENSION

- Child 2 months–1 year: 0.15 mL/kg/day twice daily, doubled in severe infection
- Child 2–6 years (body-weight 13–21 kg): 2.5 mL twice daily, doubled in severe infection
- Child 7–12 years (body-weight 22–40 kg): 5 mL twice daily, doubled in severe infection
- Child 12–17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection
- Adult: 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

**Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial**

► BY MOUTH USING TABLETS

- Child 12–17 years: 250/125 mg every 8 hours for 5 days
- Adult: 250/125 mg every 8 hours for 5 days

**Surgical prophylaxis**

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures

**DOSE EQUIVALENCE AND CONVERSION**

- Doses are expressed as co-amoxiclav.
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form  $x/y$  where  $x$  and  $y$  are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction

• **CAUTIONS**

**GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parental therapy)

**SPECIFIC CAUTIONS**

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

**CAUTIONS, FURTHER INFORMATION**

- **Cholestatic jaundice** Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The

duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

• **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Cholestatic jaundice · hepatitis · nausea · vomiting
- **Rare** Dizziness · headache · prolongation of bleeding time
- **Frequency not known** Exfoliative dermatitis · Steven-Johnson syndrome · toxic epidermal necrolysis · vasculitis

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With intravenous use Phlebitis at injection site
  - With oral use Superficial staining of teeth with suspension
- SIDE-EFFECTS, FURTHER INFORMATION**
- Rash If rash occurs, discontinue treatment.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Monitor liver function in liver disease.

• **RENAL IMPAIRMENT**

Risk of crystalluria with high doses (particularly during parenteral therapy).

- With oral use in adults *Co-amoxiclav 250/125 tablets or 500/125 tablets*: if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>, one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>, one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours.

*Co-amoxiclav 400/57 suspension*: avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

- With intravenous use in adults *Co-amoxiclav injection* (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>, 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>, 1.2 g initially, then 600 mg every 24 hours.

- With oral use in children *Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets*: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m<sup>2</sup>. Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.

*Co-amoxiclav 400/57 suspension*: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.

- With intravenous use in children *Co-amoxiclav injection*: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m<sup>2</sup>; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.

• **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For *intravenous infusion*, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For *intravenous injection*, administer over 3–4 minutes.
- With intravenous use in adults For *intravenous infusion* (*Augmentin*®), give intermittently in Sodium chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes. For *intravenous injection*, administer over 3–4 minutes. *Via drip tubing* in Sodium chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the

trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- ▶ With oral use Flavours of oral liquid formulations may include raspberry and orange.

## ANTIBACTERIALS > PENICILLINS, MECILLINAM-TYPE

⚠ 503

### Pivmecillinam hydrochloride

#### INDICATIONS AND DOSE

##### Acute uncomplicated cystitis

###### ▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days
- ▶ Adult (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

##### Chronic or recurrent bacteriuria

###### ▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): 400 mg every 6–8 hours
- ▶ Adult (body-weight 40 kg and above): 400 mg every 6–8 hours

##### Urinary-tract infections

###### ▶ BY MOUTH

- ▶ Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

- **UNLICENSED USE** Not licensed for use in children under 3 months.

- **CONTRA-INDICATIONS** Carnitine deficiency · gastro-intestinal obstruction · infants under 3 months · oesophageal strictures

- **CAUTIONS** Avoid in acute porphyrias p. 930

#### SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · dizziness · headache · nausea · vomiting
- ▶ **Frequency not known** Mouth ulcers · oesophagitis · reduced serum and total body carnitine (especially with long-term or repeated use)

- **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9, 21, 27

- ▶ **Selexid** (LEO Pharma)

**Pivmecillinam hydrochloride 200 mg** Selexid 200mg tablets | 10 tablet [PoM] £5.40 DT price = £5.40 | 18 tablet [PoM] £9.72

PENICILLINASE-RESISTANT**

F 503

**Flucloxacillin****INDICATIONS AND DOSE**

**Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis**

## ▶ BY MOUTH

- ▶ Child 1 month–1 year: 62.5–125 mg 4 times a day
- ▶ Child 2–9 years: 125–250 mg 4 times a day
- ▶ Child 10–17 years: 250–500 mg 4 times a day
- ▶ Adult: 250–500 mg 4 times a day

## ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 250–500 mg every 6 hours

## ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.25–2 g every 6 hours

**Endocarditis (in combination with other antibacterial if necessary)**

## ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult (body-weight up to 85 kg): 8 g daily in 4 divided doses
- ▶ Adult (body-weight 85 kg and above): 12 g daily in 6 divided doses

**Osteomyelitis**

## ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Up to 8 g daily in 3–4 divided doses

**Surgical prophylaxis**

## ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–2 g, to be administered up to 30 minutes before the procedure, then (by mouth or by intramuscular injection or by slow intravenous injection or by intravenous infusion) 500 mg every 6 hours if required for up to 4 further doses in high risk procedures

**Staphylococcal lung infection in cystic fibrosis**

## ▶ BY MOUTH

- ▶ Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

**Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention**

## ▶ BY MOUTH

- ▶ Child 1 month–3 years: 125 mg twice daily

**Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention**

## ▶ BY MOUTH

- ▶ Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

- **UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION****HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has

been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

**CAUTIONS**

- ▶ With intravenous use Accumulation of electrolytes can occur with high doses

**SIDE-EFFECTS**

- ▶ **Common or very common** Gastrointestinal disturbances
- ▶ **Very rare** Cholestatic jaundice · hepatitis

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT**

- ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ With intravenous use Accumulation of electrolytes can occur in patients with renal failure.

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Fluxapen<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. *via drip tubing in Glucose 5% or Sodium chloride 0.9%*; continuous infusion not usually recommended.

## Temocillin

### ● INDICATIONS AND DOSE

**Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria**

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Adult: 1–2 g every 12 hours, give over 3–4 minutes when administered by intravenous injection

● **CAUTIONS** Accumulation of sodium from injection can occur with high doses

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Trace amounts in milk.

● **RENAL IMPAIRMENT** 1 g every 12 hours if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>. 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>. 1 g every 48 hours or 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>. Accumulation of sodium from injection can occur in patients with renal failure.

● **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Negaban<sup>®</sup>), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for injection**

ELECTROLYTES: May contain Sodium

► **Negaban** (Eumedica Pharmaceuticals)

**Temocillin (as Temocillin sodium) 1 gram** Negaban 1g powder for solution for injection vials | 1 vial [PoM] £25.45

## ANTIBACTERIALS > POLYMYXINS

### Colistimethate sodium

18-Dec-2016

(Colistin sulfomethate sodium)

● **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

### ● INDICATIONS AND DOSE

**Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii* and *Klebsiella pneumoniae***

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Adult (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

► Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day

### Adjunct to standard antibacterial therapy for

#### ***Pseudomonas aeruginosa* infection in cystic fibrosis**

► BY INHALATION OF NEBULISED SOLUTION

► Adult: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*

► BY INHALATION OF POWDER

► Adult: 1.66 million units twice daily

### PROMIXIN<sup>®</sup> INJECTION

**Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, *Klebsiella pneumoniae***

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Adult: 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection, an initial loading dose of 9 million units (up to max. 12 million units, if adequate renal function) should be used in those who are critically ill, consult product literature for details

### PROMIXIN<sup>®</sup> NEBULISER SOLUTION

**Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis**

► BY INHALATION OF NEBULISED SOLUTION

► Child 2–17 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

► Adult: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

● **CONTRA-INDICATIONS** Myasthenia gravis

### ● CAUTIONS

#### GENERAL CAUTIONS

Acute porphyrias p. 930

#### SPECIFIC CAUTIONS

► When used by inhalation Severe haemoptysis—risk of further haemorrhage

● **INTERACTIONS** → Appendix 1 (polymyxins).

### ● SIDE-EFFECTS

► **Common or very common**

► When used by inhalation Bronchospasm · cough · dysphonia · nausea · sore mouth · Sore throat · taste disturbances · vomiting

► **Uncommon**

► When used by inhalation Hypersalivation · thirst

► **Rare**

► With intravenous use Vasomotor instability

► **Frequency not known**

► With intravenous use Apnoea · confusion · headache · muscle weakness · nephrotoxicity · neurotoxicity reported especially with excessive doses · perioral paraesthesia · peripheral paraesthesia · psychosis · rash · slurred speech · vertigo · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

► Dose-related side-effects The major adverse effects are dose-related neurotoxicity and nephrotoxicity.

### ● PREGNANCY

► When used by inhalation Clinical use suggests probably safe.

► With intravenous use Use only if potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

### ● RENAL IMPAIRMENT

- ▶ With intravenous use Reduce dose. Monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

### ● MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor renal function.
- ▶ When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For *nebulisation* administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
- ▶ With intravenous use For *intravenous infusion* (Colomycin<sup>®</sup>, Promixin<sup>®</sup>), give intermittently in Sodium chloride 0.9% (or Glucose 5% for Promixin<sup>®</sup> brand only); dilute with 50 mL infusion fluid and give over 30 minutes.

**COLOMYCIN<sup>®</sup>** Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

### ● PRESCRIBING AND DISPENSING INFORMATION

Colistimethate sodium is included in some preparations for topical application.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

- ▶ When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Colistimethate sodium by dry powder inhalation for pseudomonas lung infection in cystic fibrosis (March 2013) NICE TA276  
Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA276](http://www.nice.org.uk/TA276)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## ANTIBACTERIALS > QUINOLONES

### Quinolones

#### Overview

Nalidixic acid p. 517 and norfloxacin p. 517 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin p. 514 is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin p. 517 is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin p. 515 is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections.

Although ciprofloxacin, levofloxacin, moxifloxacin p. 516, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active

against *Pseudomonas aeruginosa* or meticillin-resistant *Staphylococcus aureus* (MRSA).

## Quinolones

5 Infection

### IMPORTANT SAFETY INFORMATION

The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

### TENDON DAMAGE

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

• **CONTRA-INDICATIONS** History of tendon disorders related to quinolone use

• **CAUTIONS** Can prolong the QT interval · children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*) · conditions that predispose to seizures · exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation)

### CAUTIONS, FURTHER INFORMATION

▶ In children Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children.

• **INTERACTIONS** → Appendix 1 (quinolones).

### • SIDE-EFFECTS

▶ **Common or very common** Diarrhoea · dizziness · headache · nausea · vomiting

▶ **Uncommon** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · blood disorders · confusion · depression · disturbances in taste · disturbances in vision · dyspepsia · eosinophilia · hallucinations · leucopenia · myalgia · rash · sleep disturbances · thrombocytopenia · tremor

▶ **Rare** Antibiotic-associated colitis · convulsions · disturbances in hearing · disturbances in smell · dyspnoea · hepatic dysfunction · hepatitis · hypotension · interstitial nephritis · jaundice · photosensitivity · psychoses · renal failure · symptoms of peripheral neuropathy (sometimes irreversible) · tendon damage · tendon inflammation · vasculitis

▶ **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

### SIDE-EFFECTS, FURTHER INFORMATION

The drug should be **discontinued** if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

• **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.

• **PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in *animal* studies; safer alternatives are available.

## Ciprofloxacin

### • INDICATIONS AND DOSE

#### Fistulating Crohn's disease

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily

#### Respiratory-tract infections

- ▶ BY MOUTH
- ▶ Adult: 500–750 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

#### Pseudomonal lower respiratory-tract infection in cystic fibrosis

- ▶ BY MOUTH
- ▶ Adult: 750 mg twice daily

#### Urinary-tract infections

- ▶ BY MOUTH
- ▶ Adult: 250–750 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

#### Acute uncomplicated cystitis in women

- ▶ BY MOUTH
- ▶ Adult: 250 mg twice daily for 3 days

#### Acute or chronic prostatitis

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily for 28 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

#### Gonorrhoea

- ▶ BY MOUTH
- ▶ Adult: 500 mg for 1 dose

#### Most other infections

- ▶ BY MOUTH
- ▶ Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

#### Surgical prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 750 mg, to be taken 60 minutes before procedure

#### Anthrax (treatment and post-exposure prophylaxis)

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 12 hours, to be given over 60 minutes

#### Prevention of secondary case of meningococcal meningitis

- ▶ BY MOUTH
- ▶ Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
- ▶ Child 5–11 years: 250 mg for 1 dose
- ▶ Child 12–17 years: 500 mg for 1 dose
- ▶ Adult: 500 mg for 1 dose

### • UNLICENSED USE

▶ In children Not licensed for use in children under 1 year of age. Not licensed for use in children for prophylaxis of meningococcal meningitis.

• **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart

failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Flatulence
  - ▶ With intravenous use Pain at injection site · phlebitis at injection site
  - ▶ **Rare** Abnormal dreams · chest pain · dysphagia · dyspnoea · erythema nodosum · hot flushes · hyperglycaemia · hypoglycaemia · oedema · pancreatitis · sweating · syncope · tachycardia
  - ▶ **Very rare** Intracranial hypertension · movement disorders · tinosynovitis · tinnitus · vasculitis (in children)
  - ▶ **Frequency not known** Peripheral neuropathy · polyneuropathy
- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.
- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.
- **RENAL IMPAIRMENT**
  - ▶ With oral use in adults Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>).
  - ▶ With intravenous use in adults Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>).
  - ▶ In children Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**  
May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

## Levofloxacin

#### ● INDICATIONS AND DOSE

##### Acute sinusitis

###### ▶ BY MOUTH

▶ Adult: 500 mg once daily for 10–14 days

##### Acute exacerbation of chronic bronchitis

###### ▶ BY MOUTH

▶ Adult: 500 mg once daily for 7–10 days

##### Community-acquired pneumonia

###### ▶ BY MOUTH

▶ Adult: 500 mg 1–2 times a day for 7–14 days

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

##### Urinary-tract infections

###### ▶ BY MOUTH

▶ Adult: 500 mg once daily for 7–14 days

##### Urinary-tract infections (uncomplicated infection)

###### ▶ BY MOUTH

▶ Adult: 250 mg once daily for 3 days

##### Complicated urinary-tract infections

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult: 500 mg once daily, to be given over at least 60 minutes

##### Chronic prostatitis

###### ▶ BY MOUTH

▶ Adult: 500 mg once daily for 28 days

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult: 500 mg once daily, to be given over at least 60 minutes

##### Complicated skin infections | Complicated soft-tissue infections

###### ▶ BY MOUTH

▶ Adult: 500 mg 1–2 times a day for 7–14 days

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

continued →

**Inhalation of anthrax (treatment and post-exposure prophylaxis)**

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 8 weeks
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg once daily, to be given over at least 60 minutes

● **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of psychiatric illness · history of symptomatic arrhythmias (risk factor for QT interval prolongation) · risk factors for QT interval prolongation

● **INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.

**● SIDE-EFFECTS**

DT price = £12.52 | 10 tablet [PoM] £14.99

**Solution for infusion**▶ **Tarivid (Sanofi)**

**Ofloxacin (as Ofloxacin hydrochloride) 2 mg per 1 ml** Tarivid 200mg/100ml solution for infusion bottles | 1 bottle [PoM] £16.16

**ANTIBACTERIALS > SULFONAMIDES****Co-trimoxazole**

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

**INDICATIONS AND DOSE****Treatment of susceptible infections**

- ▶ BY MOUTH
  - ▶ Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
  - ▶ Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
  - ▶ Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
  - ▶ Child 12–17 years: 960 mg twice daily
  - ▶ Adult: 960 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
  - ▶ Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

**Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
  - ▶ Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
  - ▶ Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days

**Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections**

- ▶ BY MOUTH
  - ▶ Child: 450 mg/m<sup>2</sup> twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
  - ▶ Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Not licensed for *Burkholderia cepacia* infections in cystic fibrosis. Not licensed for *Stenotrophomonas maltophilia* infections.  
Not licensed for use in children under 6 weeks.

#### IMPORTANT SAFETY INFORMATION

##### RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiasis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · elderly (increased risk of serious side-effects) · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia (in adults)
- **INTERACTIONS** → Appendix 1 (trimethoprim, sulfamethoxazole).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
  - ▶ **Uncommon** Vomiting
  - ▶ **Rare** Agranulocytosis · bone marrow depression
  - ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · pulmonary infiltrates · renal disorders · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
- ▶ **Frequency not known** Rhabdomyolysis reported in HIV-infected patients
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Blood disorders or rash Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.
- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.

#### ● RENAL IMPAIRMENT

- ▶ In adults Use half normal dose if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup> and if plasma-sulfamethoxazole concentration cannot be monitored.
- ▶ In children Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m<sup>2</sup>. Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m<sup>2</sup> and if plasma-sulfamethoxazole concentration cannot be monitored.
- **MONITORING REQUIREMENTS**
  - ▶ In children Plasma concentration monitoring may be required with high doses; seek expert advice.
  - ▶ Monitor blood counts on prolonged treatment.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in children For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
  - ▶ With intravenous use in adults For *intravenous infusion* (*Seprin*<sup>®</sup> for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.

#### ● PRESCRIBING AND DISPENSING INFORMATION

- Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.  
Flavours of oral liquid formulations may include banana, or vanilla.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Sulfadiazine

### (Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

#### ● INDICATIONS AND DOSE

##### Prevention of rheumatic fever recurrence

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 30 kg): 500 mg daily
- ▶ Adult (body-weight 30 kg and above): 1 g daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · elderly · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia
- **INTERACTIONS** → Appendix 1 (sulfonamides).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
  - ▶ **Uncommon** Vomiting
  - ▶ **Rare** Agranulocytosis · bone marrow depression
  - ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · pulmonary infiltrates · renal disorders · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
  - ▶ **Frequency not known** Benign intracranial hypertension · hypothyroidism · optic neuropathy · rhabdomyolysis reported in HIV-infected patients
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

##### ▶ Sulfadiazine (Non-proprietary)

**Sulfadiazine 500 mg** Sulfadiazine 500mg tablets | 56 tablet [PoM]  
£139.62 DT price = £93.47

## ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

## Tetracyclines

### Overview

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 521 with either streptomycin p. 480 or rifampicin p. 535), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 497).

Tetracyclines have a role in the management of methicillin-resistant *Staphylococcus aureus* (MRSA) infection.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 522 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

## Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (tetracyclines).  
Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines.  
Use with caution in those receiving potentially hepatotoxic drugs.
- **SIDE-EFFECTS**
  - ▶ **Rare** Anaphylaxis · angioedema · blood disorders · exfoliative dermatitis · hepatotoxicity · hypersensitivity reactions · pancreatitis · pericarditis · photosensitivity (particularly with demeclocycline) · rash · Stevens-Johnson syndrome · urticaria
  - ▶ **Frequency not known** Antibiotic-associated colitis · benign intracranial hypertension · bulging fontanelles (in infants and in children) · diarrhoea · dysphagia · headache · nausea · oesophageal irritation · visual disturbances · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Benign intracranial hypertension** Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).

- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

F 520

## Demeclocycline hydrochloride

### ● INDICATIONS AND DOSE

#### Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

##### ► BY MOUTH

- Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

#### Treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable

##### ► BY MOUTH

- Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** Milk reduces absorption.
- **SIDE-EFFECTS** Acute renal failure - reversible nephrogenic diabetes insipidus
- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

- **Demeclocycline hydrochloride (Non-proprietary)**  
Demeclocycline hydrochloride 150 mg Demeclocycline 150mg tablets | 100 tablet [PoM] no price available

#### Capsule

- CAUTIONARY AND ADVISORY LABELS 7, 9, 11, 23
- **Demeclocycline hydrochloride (Non-proprietary)**  
Demeclocycline hydrochloride 150 mg Demeclocycline 150mg capsules | 28 capsule [PoM] £160.89 DT price = £160.89
- **Demeclocycline hydrochloride 300 mg** Ledermycin 300mg capsules | 16 capsule [PoM] no price available

F 520

## Doxycycline

### ● INDICATIONS AND DOSE

#### Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily
- Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

### Severe infections (including refractory urinary-tract infections)

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 200 mg daily
- Adult: 200 mg once daily

#### Acne

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg once daily
- Adult: 100 mg once daily

#### Rosacea

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 100 mg once daily

### Papulopustular facial rosacea (without ocular involvement)

##### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

### Early syphilis

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg twice daily for 14 days
- Adult: 100 mg twice daily for 14 days

### Late latent syphilis

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg twice daily for 28 days
- Adult: 100 mg twice daily for 28 days

### Neurosyphilis

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 200 mg twice daily for 28 days

### Uncomplicated genital chlamydia | Non-gonococcal urethritis

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg twice daily for 7 days
- Adult: 100 mg twice daily for 7 days

### Pelvic inflammatory disease

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg twice daily for 14 days
- Adult: 100 mg twice daily for 14 days

### Lyme disease (under expert supervision)

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)
- Adult: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

### Anthrax (treatment or post-exposure prophylaxis)

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg twice daily
- Adult: 100 mg twice daily

### Prophylaxis of malaria

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
- Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

### Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 200 mg daily for 7 days
- Adult: 200 mg daily for 7 days

### Periodontitis (as an adjunct to gingival scaling and root planing)

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: 20 mg twice daily for 3 months
- Adult: 20 mg twice daily for 3 months

- **UNLICENSED USE** Not licensed for use in children under 12 years. Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for malaria

prophylaxis during pregnancy. Not licensed for treatment or post-exposure prophylaxis of anthrax.

- ▶ In adults Immediate-release doxycycline not licensed for treatment of rosacea.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
Doxycycline Capsules 100 mg may be prescribed.  
Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.  
Tablets may be prescribed as Doxycycline Tablets 20 mg.

F 520

## Minocycline

#### ● INDICATIONS AND DOSE

##### Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

###### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily
- ▶ Adult: 100 mg twice daily

##### Acne

###### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
- ▶ Adult: 100 mg once daily, alternatively 50 mg twice daily

###### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg daily
- ▶ Adult: 100 mg daily

##### Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)

###### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

- **CAUTIONS** Systemic lupus erythematosus
- **SIDE-EFFECTS**
  - ▶ **Rare** Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
  - ▶ **Very rare** Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus
  - ▶ **Frequency not known** Dizziness (more common in women) · vertigo (more common in women)
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus

erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

## Oxytetracycline

#### • INDICATIONS AND DOSE

##### Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

###### ▶ BY MOUTH

- ▶ Child 12-17 years: 250–500 mg 4 times a day
- ▶ Adult: 250–500 mg 4 times a day

#### Rosacea

###### ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

#### Acne

###### ▶ BY MOUTH

- ▶ Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer
- ▶ Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

- **INTERACTIONS** Milk reduces absorption.

- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

#### • PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Oxytetracycline Tablets may be prescribed.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

##### ▶ **Oxytetracycline (Non-proprietary)**

**Oxytetracycline (as Oxytetracycline dihydrate)**

250 mg Oxytetracycline 250mg tablets | 28 tablet [PoM] £3.45 DT price = £1.29 | 1000 tablet [PoM] no price available

F 520

## Tetracycline

#### • INDICATIONS AND DOSE

##### Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)

###### ▶ BY MOUTH

- ▶ Child 12-17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections
- ▶ Adult: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

#### Rosacea

###### ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

#### Acne

###### ▶ BY MOUTH

- ▶ Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer
- ▶ Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

#### Diabetic diarrhoea in autonomic neuropathy

###### ▶ BY MOUTH

- ▶ Adult: 250 mg for 2 or 3 doses

#### Non-gonococcal urethritis

###### ▶ BY MOUTH

- ▶ Child 12-17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)
- ▶ Adult: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

#### **Helicobacter pylori eradication failure in combination with a proton pump inhibitor, tripotassium dicitratobismuthate, and metronidazole**

###### ▶ BY MOUTH

- ▶ Adult: 500 mg 4 times a day for 2 weeks

- **UNLICENSED USE** Not licensed for treatment of diabetic diarrhoea in *autonomic neuropathy*.
- **INTERACTIONS** Milk reduces absorption.
- **SIDE-EFFECTS** Acute renal failure · skin discoloration
- **HEPATIC IMPAIRMENT** Max. 1g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid while sitting or standing.
- **PATIENT AND CARER ADVICE** Counselling on administration advised.
- **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
Tetracycline Tablets may be prescribed.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

#### ▶ Tetracycline (Non-proprietary)

Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet (POM) £13.90 DT price = £2.05

## Tigecycline

- **DRUG ACTION** Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

#### • INDICATIONS AND DOSE

**Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibiotics cannot be used**

#### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes

- **CAUTIONS** Cholestasis
- **INTERACTIONS** → Appendix 1 (tigecycline).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anorexia · bilirubinaemia · diarrhoea · dizziness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · prolonged activated partial thromboplastin time · prolonged prothrombin time · pruritus · rash · vomiting
  - ▶ **Uncommon** Cholestatic jaundice · hypoproteinaemia · pancreatitis
- ▶ **Frequency not known** Antibiotic-associated colitis · hepatic failure · Stevens-Johnson syndrome · thrombocytopenia
- SIDE-EFFECTS, FURTHER INFORMATION**  
Side-effects similar to those of the tetracyclines can potentially occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.
- **PREGNANCY** Tetracyclines should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Manufacturer advises caution—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tygacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion

fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

#### ▶ Tygacil (Pfizer Ltd)

Tigecycline 50 mg Tygacil 50mg powder for solution for infusion vials | 10 vial (POM) £323.10 (Hospital only)

## ANTIBACTERIALS > OTHER

### Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

#### • INDICATIONS AND DOSE

**Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever**

#### ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Avoid repeated courses and prolonged treatment
- **INTERACTIONS** → Appendix 1 (chloramphenicol).
- **SIDE-EFFECTS** Blood disorders · depression · diarrhoea · dry mouth · erythema multiforme · glossitis · headache · nausea · nocturnal haemoglobinuria · optic neuritis · peripheral neuritis · reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) · stomatitis · urticaria · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**  
Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.
- **PREGNANCY** Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.
- **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'.
- **HEPATIC IMPAIRMENT** Reduce dose. Avoid if possible—increased risk of bone-marrow depression. Monitor plasma-chloramphenicol concentration in hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.
- **MONITORING REQUIREMENTS**
  - ▶ Plasma concentration monitoring preferred in the elderly.
  - ▶ Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre.
  - ▶ Blood counts required before and periodically during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Kemicetine®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**▶ **Chloramphenicol (Non-proprietary)**

**Chloramphenicol 250 mg** Chloramphenicol 250mg capsules | 60 capsule [PoM] £377.00 DT price = £37.70

**Powder for solution for injection**

ELECTROLYTES: May contain Sodium

▶ **Chloramphenicol (Non-proprietary)**

**Chloramphenicol (as Chloramphenicol sodium succinate)**  
1 gram Chloramphenicol 1g powder for solution for injection vials | 1 vial [PoM] £220.00

▶ **Kemicetine (Pfizer Ltd)**

**Chloramphenicol (as Chloramphenicol sodium succinate)**  
1 gram Kemicetine 1g powder for solution for injection vials | 1 vial [PoM] £1.39

**Daptomycin**

- **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

● **INDICATIONS AND DOSE**

**Complicated skin and soft-tissue infections caused by Gram-positive bacteria, including methicillin-resistant *Staphylococcus aureus* (MRSA)**

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg/kg once daily; increased to 6 mg/kg once daily, increase dose only if associated with *Staphylococcus aureus* bacteraemia

**Staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin (in combination with other antibacterials)**

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 6 mg/kg once daily

- **UNLICENSED USE** Not licensed for use in left-sided endocarditis.

- **INTERACTIONS** → Appendix 1 (daptomycin). Monitor creatine kinase more frequently than weekly during treatment if receiving another drug known to cause myopathy (preferably avoid concomitant use).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anaemia · anxiety · arthralgia · asthenia · constipation · diarrhoea · dizziness · flatulence · headache · hypertension · hypotension · injection-site reactions · insomnia · nausea · pruritus · rash · vomiting
- ▶ **Uncommon** Anorexia · arrhythmias · dyspepsia · electrolyte disturbances · eosinophilia · flushing · glossitis · hyperglycaemia · muscle effects · muscle weakness · myalgia · myositis · paraesthesia · renal failure · taste disturbance · thrombocythaemia · tremor
- ▶ **Rare** Jaundice · rhabdomyolysis
- ▶ **Frequently not known** Antibiotic-associated colitis · elevated creatine kinase · eosinophilic pneumonia · peripheral neuropathy · syncope · wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Muscle effects** If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT** Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. If eGFR less than 80 mL/minute/1.73 m<sup>2</sup>, monitor renal function, and monitor creatine kinase before treatment and then at least weekly during treatment.
- **MONITORING REQUIREMENTS** Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment).
- **EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Cubicin*®), give intermittently in Sodium chloride 0.9%; reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For *intravenous injection*, give over 2 minutes.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2008) that daptomycin (*Cubicin*®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**▶ **Cubicin** (Merck Sharp & Dohme Ltd)

**Daptomycin 350 mg** Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £62.00

**Daptomycin 500 mg** Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £88.57 (Hospital only)

**Fidaxomicin**

- **DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

● **INDICATIONS AND DOSE**▶ ***Clostridium difficile* infection**

▶ BY MOUTH

- ▶ Adult: 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

- **CAUTIONS** Inflammatory bowel disease · severe or life-threatening *C. difficile* infection
- **INTERACTIONS** → Appendix 1 (fidaxomicin).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation · nausea · vomiting
  - ▶ **Uncommon** Abdominal distension · decreased appetite · dizziness · dry mouth · flatulence · headache · taste disturbance
- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2012) that fidaxomicin (*Dificlir*<sup>®</sup>) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Dificlir** (Astellas Pharma Ltd)

**Fidaxomicin 200 mg** Dificlir 200mg tablets | 20 tablet PoM

£1,350.00

## Fosfomycin

12-Dec-2016

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

#### INDICATIONS AND DOSE

##### Acute uncomplicated lower urinary-tract infections

- ▶ BY MOUTH USING GRANULES

▶ Adult: 3 g for 1 dose

##### Prophylaxis of urinary-tract infections in transurethral surgical procedures

- ▶ BY MOUTH USING GRANULES

▶ Adult: 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery

##### Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

##### Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

##### Bacterial meningitis when first-line treatment ineffective or inappropriate

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

#### CAUTIONS

- ▶ With intravenous use Cardiac insufficiency · elderly (high doses) · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

- **INTERACTIONS** → Appendix 1 (fosfomycin).

#### SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances
- ▶ **Uncommon** Diarrhoea · nausea · rash · vomiting
- ▶ **Frequency not known** Abdominal pain · antibiotic-associated colitis

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Diarrhoea · dizziness · headache
- ▶ **Uncommon**
- ▶ With intravenous use Decreased appetite · dyspnoea · fatigue · headache · hypernatraemia · hypokalaemia · taste disturbances · vertigo
- ▶ **Rare**
- ▶ With intravenous use Aplastic anaemia · blood disorders · eosinophilia
- ▶ **Very rare**
- ▶ With intravenous use Fatty liver · visual impairment
- ▶ **Frequency not known**
- ▶ With intravenous use Bronchospasm · confusion · hepatitis · jaundice · tachycardia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

#### RENAL IMPAIRMENT

- ▶ With oral use Avoid oral treatment if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ With intravenous use Use intravenous treatment with caution if eGFR 40–80 mL/minute/1.73 m<sup>2</sup> and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m<sup>2</sup>.

#### MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor electrolytes and fluid balance.

#### DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous infusion (*Fomicyt*<sup>®</sup>), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.
- ▶ With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that Fosfomycin (*Fomicyt*<sup>®</sup>) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

##### Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

- ▶ **Fosfomycin (Non-proprietary)**

**Fosfomycin (as Fosfomycin trometamol) 3 gram** Monurol 3g granules sachets | 1 sachet PoM no price available  
Fosfomycin 3g granules sachets | 1 sachet PoM £75.45

- ▶ **Monuril** (Zambon S.p.A.)

**Fosfomycin (as Fosfomycin trometamol) 3 gram** Monuril 3g granules sachets | 1 sachet PoM £4.86

##### Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Fomicyt** (Nordic Pharma Ltd)

**Fosfomycin (as Fosfomycin sodium) 2 gram** Fomicyt 2g powder for solution for infusion vials | 10 vial PoM £150.00

**Fosfomycin (as Fosfomycin sodium) 4 gram** Fomicyt 4g powder for solution for infusion vials | 10 vial PoM £300.00

## Fusidic acid

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

### ● INDICATIONS AND DOSE

#### Staphylococcal skin infection

- ▶ BY MOUTH USING TABLETS
  - ▶ Child 12-17 years: 250 mg every 12 hours for 5-10 days
  - ▶ Adult: 250 mg every 12 hours for 5-10 days
- ▶ TO THE SKIN
  - ▶ Child: Apply 3-4 times a day usually for 7 days
  - ▶ Adult: Apply 3-4 times a day

#### Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

- ▶ BY MOUTH USING ORAL SUSPENSION
  - ▶ Child 1-11 months: 15 mg/kg 3 times a day
  - ▶ Child 1-4 years: 250 mg 3 times a day
  - ▶ Child 5-11 years: 500 mg 3 times a day
  - ▶ Child 12-17 years: 750 mg 3 times a day
  - ▶ Adult: 750 mg 3 times a day
- ▶ BY MOUTH USING TABLETS
  - ▶ Child 12-17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections
  - ▶ Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use
  - ▶ Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

### ● CAUTIONS

- With topical use Avoid contact of cream or ointment with eyes

### CAUTIONS, FURTHER INFORMATION

- ▶ Avoiding resistance To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.
- **INTERACTIONS** → Appendix 1 (fusidic acid).
- **SIDE-EFFECTS**
  - ▶ **Common or very common**
  - ▶ With oral use Abdominal pain · diarrhoea · dizziness · drowsiness · dyspepsia · nausea · vomiting
  - ▶ **Uncommon**
  - ▶ With oral use Anorexia · headache · malaise · pruritus · rash
  - ▶ **Rare**
  - ▶ With topical use Hypersensitivity reactions
  - ▶ **Frequency not known**
  - ▶ With oral use Acute renal failure (usually with jaundice) · blood disorders · reversible jaundice especially after high dosage (withdraw therapy if persistent)
- **PREGNANCY**
  - ▶ With oral use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING**
  - ▶ With oral use Present in milk—manufacturer advises caution.
- **HEPATIC IMPAIRMENT**
  - ▶ With oral use Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose. Elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction. Monitor liver function in hepatic impairment.
- **MONITORING REQUIREMENTS**
  - ▶ With oral use Monitor liver function with high doses or on prolonged therapy.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and orange.
- **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
May be prescribed as Sodium Fusidate ointment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Fucidin (Sodium fusidate)** (LEO Pharma)  
Sodium fusidate 250 mg Fucidin 250mg tablets | 10 tablet (PoM)  
£6.02 DT price = £6.02 | 100 tablet (PoM) £54.99

#### Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 21

- ▶ **Fucidin (Fusidic acid)** (LEO Pharma)  
Fusidic acid 50 mg per 1 ml Fucidin 250mg/5ml oral suspension | 50 ml (PoM) £6.73 DT price = £6.73

#### Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)

#### ▶ Fusidic acid (Non-proprietary)

- Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram (PoM) £1.92 DT price = £1.77 | 30 gram (PoM) £3.62 DT price = £3.54

#### ▶ Fucidin (Fusidic acid) (LEO Pharma)

- Fusidic acid 20 mg per 1 gram Fucidin 20mg/g cream | 15 gram (PoM) £1.92 DT price = £1.77 | 30 gram (PoM) £3.59 DT price = £3.54

#### Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), wool fat and related substances including lanolin

#### ▶ Fucidin (Sodium fusidate) (LEO Pharma)

- Sodium fusidate 20 mg per 1 gram Fucidin 20mg/g ointment | 15 gram (PoM) £2.68 DT price = £2.68 | 30 gram (PoM) £4.55 DT price = £4.55

## Linezolid

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

### ● INDICATIONS AND DOSE

**Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)**

- ▶ BY MOUTH
  - ▶ Adult: 600 mg every 12 hours usually for 10-14 days (maximum duration of treatment 28 days)
- ▶ BY INTRAVENOUS INFUSION
  - ▶ Adult: 600 mg every 12 hours

### IMPORTANT SAFETY INFORMATION

#### CHM ADVICE (OPTIC NEUROPATHY)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;

- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**BLOOD DISORDERS**

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · elderly (increased risk of blood disorders) · history of seizures · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION**

- ▶ Close observation Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

- **INTERACTIONS** → Appendix 1 (MAOIs).

- ▶ **Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT<sub>1</sub> agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · eosinophilia · headache · nausea · taste disturbances · vomiting
- ▶ **Uncommon** Abdominal pain · blurred vision · constipation · diaphoresis · dizziness · dry mouth · dyspepsia · electrolyte disturbances · fatigue · fever · gastritis · glossitis · hypertension · hypoaesthesia · insomnia · leucopenia · pancreatitis · paraesthesia · polyuria · pruritus · rash · stomatitis · thirst · thrombocytopenia · tinnitus · tongue discoloration
- ▶ **Rare** Renal failure · tachycardia · transient ischaemic attacks
- ▶ **Frequency not known** Anaemia · antibiotic-associated colitis · convulsions · hyponatraemia · lactic acidosis · optic neuropathy reported on prolonged therapy · pancytopenia · peripheral neuropathy reported on prolonged therapy · Stevens-Johnson syndrome · tooth discoloration · toxic epidermal necrolysis

**SPECIFIC SIDE-EFFECTS**

- ▶ **Uncommon**
- ▶ With intravenous use Injection-site reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION** Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

**Tedizolid**

26-Sep-2016

- **DRUG ACTION** Tedizolid is an oxazolidinone antibacterial, which inhibits bacterial protein synthesis.

**● INDICATIONS AND DOSE****Treatment of acute bacterial skin and skin structure infections**

- ▶ **BY INTRAVENOUS INFUSION, OR BY MOUTH**
- ▶ **Adult:** 200 mg once daily for 6 days, patients should be switched from the intravenous to the oral route when clinically appropriate

- **CAUTIONS** Neutropenia—limited clinical experience · patients aged 75 years and over—limited clinical experience
- **INTERACTIONS** → Appendix 1 (MAOIs).
- ▶ **Monoamine-oxidase inhibition** Tedizolid is a reversible, non-selective monoamine-oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, tedizolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT<sub>1</sub> agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · headache · nausea · pruritus · vomiting
- ▶ **Uncommon** Abdominal pain · abnormal urine odour · acne · alopecia · anxiety · blood in stool · blurred vision · bradycardia · constipation · cough · dehydration · dry mouth · dysgeusia · dyspepsia · flatulence · flushing · fungal infection · gastro-oesophageal reflux disease · hyperhidrosis · hyperkalaemia · hypoaesthesia · muscle spasms · musculoskeletal pain · nasal dryness · paraesthesia · pulmonary congestion · rash · retching · sleep disorders · somnolence · tremor · urticaria · vitreous floaters
- ▶ **Frequency not known** Myelosuppression (reversible on discontinuation of treatment)

● **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential; an additional method of contraception is advised in women taking hormonal contraceptives—effectiveness may be reduced.

● **PREGNANCY** Manufacturer advises avoid—fetal developmental toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Sivextro*<sup>®</sup>) give intermittently in Sodium Chloride 0.9%; reconstitute each 200 mg vial with 4 mL Water for Injections, then dilute reconstituted solution in 250 mL sodium chloride 0.9%; give over approx. 1 hour.

### ● PATIENT AND CARER ADVICE

**Optic neuropathy** Although neuropathy (peripheral and optic) has not been reported in patients treated with tedizolid, manufacturer advises patients and carers are warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately; patients should be evaluated promptly, and referred to an ophthalmologist if necessary.

#### Missed doses

Manufacturer advises that if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### Driving and skilled tasks

Patients and carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2015) that tedizolid (*Sivextro*<sup>®</sup>) is accepted for restricted use within NHS Scotland as an alternative oxazolidinone antibacterial for the treatment of acute bacterial skin and skin structure infections caused by Gram-positive *Staphylococcus aureus* (specifically methicillin-resistant *Staphylococcus aureus* [MRSA] isolates), on the specific advice of local microbiologists or specialists in infectious disease.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Sivextro** (Merck Sharp & Dohme Ltd) ▼  
Tedizolid phosphate 200 mg Sivextro 200mg tablets | 6 tablet [POM] £862.00

#### Powder for solution for infusion

Tedizolid phosphate 200 mg Sivextro 200mg powder for concentrate for solution for infusion vials | 6 vial [POM] £862.00

## Trimethoprim

### ● INDICATIONS AND DOSE

#### Urinary-tract infections | Respiratory tract infections

- ▶ **BY MOUTH**
- ▶ Child 4-5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks-5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 6 months-5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- ▶ Child 6-11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- ▶ Child 12-17 years: 200 mg twice daily
- ▶ Adult: 200 mg twice daily

#### Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

- ▶ **BY MOUTH**
- ▶ Child 4-5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
- ▶ Child 6 weeks-5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
- ▶ Child 6 months-5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
- ▶ Child 6-11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12-17 years: 100 mg once daily, dose to be taken at night
- ▶ Adult: 100 mg once daily, dose to be taken at night

#### Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

- ▶ **BY MOUTH**
- ▶ Child: 5 mg/kg every 6-8 hours
- ▶ Adult: 5 mg/kg every 6-8 hours

#### Acne resistant to other antibacterials

- ▶ **BY MOUTH**
- ▶ Adult: 300 mg twice daily

#### Prostatitis

- ▶ **BY MOUTH**
- ▶ Adult: (consult product literature)

#### Shigellosis | Invasive salmonella infection

- ▶ **BY MOUTH**
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis pneumonia. Not licensed for use in children under 6 weeks. Not licensed for treatment of acne resistant to other antibacterials.

- **CONTRA-INDICATIONS** Blood dyscrasias

- **CAUTIONS** Elderly · acute porphyrias p. 930 · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1 (trimethoprim).

### ● SIDE-EFFECTS

- ▶ **Rare** Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis
- ▶ **Frequency not known** Aseptic meningitis · depression of haematopoiesis · gastro-intestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · uveitis (in adults) · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.
- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.
- **RENAL IMPAIRMENT**
  - ▶ In adults Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>. Use half normal dose if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m<sup>2</sup>. Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m<sup>2</sup>. Monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Trimethoprim for bacterial infections [www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections](http://www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections)

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9

  - ▶ **Trimethoprim (Non-proprietary)**

**Trimethoprim 100 mg** Trimethoprim 100mg tablets | 28 tablet [PoM] £9.99 DT price = £1.27

**Trimethoprim 200 mg** Trimethoprim 200mg tablets | 6 tablet [PoM] £2.15 DT price = £0.73 | 14 tablet [PoM] £9.99 DT price = £1.71

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 9

  - ▶ **Trimethoprim (Non-proprietary)**

**Trimethoprim 10 mg per 1 ml** Trimethoprim 50mg/5ml oral suspension sugar free sugar-free | 100 ml [PoM] £2.03 DT price = £2.00
  - ▶ **Monotrim** (Chemidex Pharma Ltd)

**Trimethoprim 10 mg per 1 ml** Monotrim 50mg/5ml oral suspension sugar-free | 100 ml [PoM] £1.77 DT price = £2.00
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · blood disorders · leucopenia · myalgia · nausea · pyrexia · rash · thrombocytopenia
  - ▶ **Uncommon** Arthralgia · body secretions coloured orange-red · bronchospasm · corneal deposits · eosinophilia · hypersensitivity reactions · jaundice · raised liver enzymes · saliva coloured orange-red · skin coloured orange-red · urine coloured orange-red · uveitis (especially following high doses or concomitant use with drugs that increase plasma concentration) · vomiting
  - ▶ **Rare** Haemolysis
  - ▶ **Frequency not known** Chest pain · dyspnoea · hepatitis · influenza-like symptoms
- **SIDE-EFFECTS, FURTHER INFORMATION**

Discontinue permanently if serious side-effects develop.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION**

Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT** Use half normal dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ **Renal function** should be checked before treatment.
  - ▶ **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
  - ▶ Blood counts should be monitored on prolonged therapy.
  - ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
- **PATIENT AND CARER ADVICE**

Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

CAUTIONARY AND ADVISORY LABELS 8, 14

  - ▶ **Mycobutin** (Pfizer Ltd)

**Rifabutin 150 mg** Mycobutin 150mg capsules | 30 capsule [PoM] £90.38

## ANTIMYCOBACTERIALS > RIFAMYCINS

### Rifabutin

#### ● INDICATIONS AND DOSE

**Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count**

##### ▶ BY MOUTH

- ▶ Adult: 300 mg once daily, also consult product literature

**Treatment of non-tuberculous mycobacterial disease, in combination with other drugs**

##### ▶ BY MOUTH

- ▶ Adult: 450–600 mg once daily for up to 6 months after cultures negative

**Treatment of pulmonary tuberculosis, in combination with other drugs**

##### ▶ BY MOUTH

- ▶ Adult: 150–450 mg once daily for at least 6 months

- **CAUTIONS** Acute porphyrias p. 930 · discolours soft contact lenses
- **INTERACTIONS** → Appendix 1 (rifamycins).

## Rifaximin

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

### ● INDICATIONS AND DOSE

**Travellers' diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours**

- ▶ BY MOUTH
- ▶ Adult: 200 mg every 8 hours for 3 days

**Reduction in recurrence of hepatic encephalopathy**

- ▶ BY MOUTH
- ▶ Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction
- **INTERACTIONS** → Appendix 1 (rifaximin). Rifamycins interactions in Appendix 1 do not apply to rifaximin.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · depression · diarrhoea · dizziness · dyspnoea · flatulence · headache · muscle spasm · nausea · pruritus · rash · vomiting
  - ▶ **Uncommon** Anorexia · antibiotic-associated colitis · anxiety · blood disorders · convulsions · dry mouth · dysuria · glycosuria · hyperkalaemia · hypoaesthesia · influenza-like symptoms · memory impairment · paraesthesia · peripheral oedema · polymenorrhoea · polyuria · sleep disturbances · taste disturbances
  - ▶ **Rare** Blood pressure changes · constipation
  - ▶ **Frequency not known** Syncope
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of rifamycin hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015) NICE TA337

Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults. [www.nice.org.uk/TA337](http://www.nice.org.uk/TA337)

Rifaximin 20 mg per 1 ml Normix 100mg/5ml granules for oral suspension | 100 ml [PoM] no price available

## 2.1 Anthrax

### Anthrax

#### Treatment and post-exposure prophylaxis

*Inhalation or gastro-intestinal anthrax* should be treated initially with either ciprofloxacin p. 514 or, in patients over 12 years, doxycycline p. 521 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 506, benzylpenicillin sodium p. 504, chloramphenicol p. 524, clarithromycin p. 496, clindamycin p. 493, imipenem with cilastatin p. 482, rifampicin p. 535 [unlicensed indication], and vancomycin p. 492). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

*Cutaneous anthrax* should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

## 2.2 Leprosy

### Leprosy

#### Management

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone p. 532, rifampicin p. 535, and clofazimine p. 532. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 517, minocycline p. 522 and clarithromycin p. 496, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 622 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 856 [unlicensed] is also useful in patients who

have become corticosteroid dependent, but it should be used only under **specialist supervision**. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must **not** be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

## ANTIMYCOBACTERIALS

### Clofazimine

#### ● INDICATIONS AND DOSE

**Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)**

► BY MOUTH

- Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered

**Leprosy lepra reactions (administered on expert advice)**

► BY MOUTH

- Adult: 300 mg daily for max. 3 months

**Severe type II (erythema nodosum leprosum) reactions (administered on expert advice)**

► BY MOUTH

- Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea · may discolour soft contact lenses
- **SIDE-EFFECTS** Abdominal pain · acne-like eruptions · anorexia · bowel obstruction · brownish-black discoloration of lesions and skin including areas exposed to light · dimmed vision · dry eyes · dry skin · elevation of blood sugar · eosinophilic enteropathy · headache · lymphadenopathy · macular corneal pigmentation · nausea · photosensitivity · pruritus · rash · red discoloration of body fluids · red discoloration of faeces · red discoloration of urine · reversible hair discoloration · splenic infarction · subepithelial corneal pigmentation · tiredness · vomiting (hospitalise if persistent) · weight loss
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** May alter colour of milk; skin discoloration of infant.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

#### Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14, 21

► **Clofazimine (Non-proprietary)**

**Clofazimine 50 mg** Lamprene 50mg capsules | 100 capsule PoM  
no price available

## Dapsone

#### ● INDICATIONS AND DOSE

**Multibacillary leprosy in combination with rifampicin and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with rifampicin (2-drug regimen)**

► BY MOUTH

- Adult (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
- Adult (body-weight 35 kg and above): 100 mg daily, may be self-administered

**Dermatitis herpetiformis**

► BY MOUTH

- Adult: (consult product literature or local protocols)

**Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)**

► BY MOUTH

- Adult: 100 mg once daily

**Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia**

► BY MOUTH

- Adult: 100 mg daily

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in acute porphyrias p. 930 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis
- **INTERACTIONS** → Appendix 1 (dapsone).
- **SIDE-EFFECTS**
- **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
- **Frequency not known** Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinaemia · nausea · neuropathy · psychosis · tachycardia · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Dapsone syndrome** If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).  
Side-effects are dose-related and uncommon at doses used for leprosy.
- **PREGNANCY** Folic acid p. 898 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**  
**Blood disorders** On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 8

► **Dapsone (Non-proprietary)**

**Dapsone 50 mg** Dapsone 50mg tablets | 28 tablet PoM £58.89 DT price = £32.68

**Dapsone 100 mg** Dapsone 100mg tablets | 28 tablet PoM £117.80 DT price = £105.07

## 2.3 Lyme disease

### Lyme disease

#### Treatment

Lyme disease should generally be treated by those experienced in its management. Doxycycline p. 521, amoxicillin p. 506 [unlicensed indication] or cefuroxime p. 486 (as cefuroxime axetil) are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis*. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 496) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 489, cefotaxime p. 487, or benzylpenicillin sodium p. 504 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

## 2.4 Methicillin-resistant staphylococcus aureus

### MRSA

#### Management

Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 511 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 535 or fusidic acid p. 527 should **not** be used alone because resistance may develop rapidly. A **tetracycline** alone or a combination of rifampicin and fusidic acid can be used for *skin and soft-tissue infections* caused by MRSA; clindamycin p. 493 alone is an alternative. A **glycopeptide** (e.g. vancomycin p. 492) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 527 can be used on expert advice. As linezolid is **not** active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 524 and daptomycin p. 525 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or clindamycin can be used for *bronchiectasis* caused by MRSA. A **glycopeptide** can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A **tetracycline** can be used for *urinary-tract infections* caused by MRSA; trimethoprim p. 529 or nitrofurantoin p. 544 are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

See the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 491 (alone or in combination with another antibacterial active against

other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 1055.

## 2.5 Tuberculosis

### Tuberculosis

#### Treatment phases, overview

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success.

#### Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 541, rifampicin p. 535, pyrazinamide p. 542 and ethambutol hydrochloride p. 540. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 480 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

#### Continuation phase

After the initial phase, treatment is continued for a further 4 months with rifampicin with isoniazid p. 537 (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

#### Unsupervised treatment

The unsupervised treatment regimen should be used for patients who are likely to take antituberculous drugs reliably **without supervision**. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

**Recommended dosage for standard unsupervised 6-month treatment**

Rifampicin with isoniazid and pyrazinamide	<p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 40 kg: 3 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast;</li> <li>▶ body-weight 40–49 kg: 4 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast;</li> <li>▶ body-weight 50–64 kg: 5 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast;</li> <li>▶ body-weight 65 kg and above: 6 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast</li> </ul>
Ethambutol hydrochloride	Adult: 15 mg/kg once daily for 2 months (initial phase)
Rifampicin with isoniazid	<p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg: 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i><sup>®</sup> 150/100 Tablets, preferably taken before breakfast;</li> <li>▶ body-weight 50 kg and above: 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i><sup>®</sup> 300/150 Tablets, preferably taken before breakfast</li> </ul>
<i>or</i> (if combination preparations not appropriate):	
Isoniazid	<p>Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 300 mg daily for 6 months (initial and continuation phases)</p>
Rifampicin	<p>Child:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day;</li> <li>▶ body-weight 50 kg and above: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day</li> </ul> <p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg: 450 mg once daily for 6 months (initial and continuation phases);</li> <li>▶ body-weight 50 kg and above: 600 mg once daily for 6 months (initial and continuation phases)</li> </ul>

Ethambutol hydrochloride	<p>Child: 20 mg/kg once daily for 2 months (initial phase)</p> <p>Adult: 15 mg/kg once daily for 2 months (initial phase)</p>

**Recommended dosage for intermittent supervised 6-month treatment**

Isoniazid	<p>Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p>
Rifampicin	<p>Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)</p>
Pyrazinamide	<p>Child:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg: 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase);</li> <li>▶ body-weight 50 kg and above: 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)</li> </ul> <p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg: 2 g 3 times a week for 2 months (initial phase);</li> <li>▶ body-weight 50 kg and above: 2.5 g 3 times a week for 2 months (initial phase)</li> </ul>
Ethambutol hydrochloride	<p>Child: 30 mg/kg 3 times a week for 2 months (initial phase)</p> <p>Adult: 30 mg/kg 3 times a week for 2 months (initial phase)</p>

**Pregnancy and breast-feeding**

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

**Supervised treatment**

Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

**Immunocompromised patients**

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculous treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

**Corticosteroids**

In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

**Prevention of tuberculosis**

Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months; longer chemoprophylaxis is not recommended.

See prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive. See advice on immunisation against tuberculosis.

**Treatment failure**

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

**Antituberculosis drugs**

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with

elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifabutin p. 530, another rifamycin, is indicated for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the *treatment* of non-tuberculous mycobacterial disease and pulmonary tuberculosis.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include **aminosalicylic acid p. 538**, **amikacin p. 479**, **capreomycin p. 539**, **cycloserine p. 539**, newer macrolides (e.g. **azithromycin p. 495** and **clarithromycin p. 496**), **moxifloxacin p. 516** and protonamide (prothionamide; no longer on UK market). **Bedaquiline p. 538** and **delamanid p. 540** are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.

**Management of tuberculosis in children**

Children are given isoniazid p. 541, rifampicin below, pyrazinamide p. 542, and ethambutol hydrochloride p. 540 for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

**ANTIMYCOBACTERIALS > RIFAMYCINS****Rifampicin****● INDICATIONS AND DOSE**

**Bruceellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child 1-11 months: 5-10 mg/kg twice daily
- ▶ Child 1-17 years: 10 mg/kg twice daily (max. per dose 600 mg)
- ▶ Adult: 0.6-1.2 g daily in 2-4 divided doses

**Endocarditis in combination with other drugs**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.6-1.2 g daily in 2-4 divided doses

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 600-900 mg 3 times a week for 6 months (initial and continuation phases)

continued →

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- ▶ BY MOUTH
- ▶ Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- ▶ Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
- ▶ Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)
- ▶ Adult (body-weight 50 kg and above): 600 mg once daily for 6 months (initial and continuation phases)

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
- ▶ Adult (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Adult (body-weight 50 kg and above): 600 mg daily for 3 months

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years**

- ▶ BY MOUTH
- ▶ Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

**Prevention of secondary case of *Haemophilus influenzae* type b disease**

- ▶ BY MOUTH
- ▶ Child 1–2 months: 10 mg/kg once daily for 4 days
- ▶ Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- ▶ Child 12–17 years: 600 mg once daily for 4 days
- ▶ Adult: 600 mg once daily for 4 days

**Prevention of secondary case of meningococcal meningitis**

- ▶ BY MOUTH
- ▶ Child 1–11 months: 5 mg/kg every 12 hours for 2 days
- ▶ Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- ▶ Child 12–17 years: 600 mg every 12 hours for 2 days
- ▶ Adult: 600 mg every 12 hours for 2 days

**Multibacillary leprosy in combination with dapstone and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with dapstone (2-drug regimen)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
- ▶ Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

- **UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · jaundice
- **CAUTIONS** Discolours soft contact lenses
- **INTERACTIONS** → Appendix 1 (rifamycins). Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants.

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

Acute renal failure · adrenal insufficiency · alterations of liver function · anorexia · antibiotic-associated colitis · body secretions coloured orange-red · collapse and shock · diarrhoea · disseminated intravascular coagulation · drowsiness · eosinophilia · exfoliative dermatitis · flushing · gastro-intestinal symptoms · haemolytic anaemia · headache · influenza-like symptoms (with chills, fever, dizziness, bone pain) · jaundice · leucopenia · menstrual disturbances · muscular weakness · myopathy · nausea · oedema · pemphigoid reactions · psychoses · rashes · respiratory symptoms · saliva coloured orange-red · shortness of breath · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis · urine coloured orange-red · urticaria · vomiting

**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Thrombophlebitis reported if infusion used for prolonged period

**SIDE-EFFECTS, FURTHER INFORMATION**

- Discontinue permanently if serious side-effects develop.
- ▶ Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.
- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT**
  - ▶ In children Use with caution if doses above 10 mg/kg daily.
  - ▶ In adults Use with caution if dose above 600 mg daily.
- **MONITORING REQUIREMENTS**
  - ▶ *Renal function* should be checked before treatment.
  - ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary

if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.

- ▶ Blood counts should be monitored in patients on prolonged therapy.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in adults For *intravenous infusion* (Rifadin<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.
- ▶ With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually. Flavours of syrup may include raspberry.
- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis [www.medicinesforchildren.org.uk/rifampicin-for-meningococcal-prophylaxis](http://www.medicinesforchildren.org.uk/rifampicin-for-meningococcal-prophylaxis)  
Medicines for Children leaflet: Rifampicin for the treatment of tuberculosis [www.medicinesforchildren.org.uk/rifampicin-for-treatment-of-tuberculosis](http://www.medicinesforchildren.org.uk/rifampicin-for-treatment-of-tuberculosis)  
Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.  
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- **MEDICINAL FORMS**

## Rifampicin with isoniazid and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 535, isoniazid p. 541, pyrazinamide p. 542.

### ● INDICATIONS AND DOSE

#### Initial unsupervised treatment of tuberculosis (in combination with ethambutol)

##### ▶ BY MOUTH

- ▶ Adult (body-weight up to 40 kg): 3 tablets daily for 2 months (initial phase), use *Rifater*<sup>®</sup> Tablets, preferably taken before breakfast.
- ▶ Adult (body-weight 40–49 kg): 4 tablets daily for 2 months (initial phase), use *Rifater*<sup>®</sup> Tablets, preferably taken before breakfast.
- ▶ Adult (body-weight 50–64 kg): 5 tablets daily for 2 months (initial phase), use *Rifater*<sup>®</sup> Tablets, preferably taken before breakfast.
- ▶ Adult (body-weight 65 kg and above): 6 tablets daily for 2 months (initial phase), use *Rifater*<sup>®</sup> Tablets, preferably taken before breakfast.

### DOSE EQUIVALENCE AND CONVERSION

- ▶ Tablet quantities refer to the number of *Rifater*<sup>®</sup> Tablets which should be taken. Each *Rifater*<sup>®</sup> Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

**Isoniazid 50 mg, Rifampicin 120 mg, Pyrazinamide 300 mg** *Rifater* tablets | 100 tablet [POM] £26.34

## ANTIMYCOBACTERIALS > OTHER

### Aminosalicylic acid

### ● INDICATIONS AND DOSE

#### Multiple-drug resistant tuberculosis, in combination with other drugs

##### ▶ BY MOUTH

- ▶ Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

#### Desensitisation regimen

##### ▶ BY MOUTH

- ▶ Adult: (consult product literature)

- **CAUTIONS** Peptic ulcer

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · bloating · diarrhoea · nausea · rash · vestibular syndrome · vomiting
- ▶ **Uncommon** Anorexia
- ▶ **Rare** Gastrointestinal bleeding · hypothyroidism · jaundice · malabsorption syndrome · metallic taste · peptic ulcer · urticaria
- ▶ **Very rare** Agranulocytosis · anaemia · crystalluria · dizziness · headache · hypoglycaemia · leucopenia · methemoglobinemia · peripheral neuropathy · purpura · tendon pain · thrombocytopenia · visual abnormalities · weight loss
- ▶ **Frequency not known** Hepatitis · hypersensitivity
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies (highest risk during first trimester).
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment due to accumulation of inactive metabolites.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for hypersensitivity reaction during the first 3 months of treatment—for desensitisation dosing regimen consult product literature.
  - ▶ Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).
- **DIRECTIONS FOR ADMINISTRATION** Disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Patients should be advised that the skeletons of the granules may be seen in the stools. Counselling advised on administration.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 9, 25

#### ▶ *Granupas* (Lucane Pharma Ltd)

**Aminosalicylic acid 1 gram per 1 gram** *Granupas* gastro-resistant granules 4g sachets sugar-free | 30 sachet [POM] £331.00

## Bedaquiline

### ● INDICATIONS AND DOSE

#### Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

##### ▶ BY MOUTH

- ▶ Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · ventricular arrhythmia
- **CAUTIONS** Hypothyroidism · QTc interval (derived using Fridericia's formula) 450–500 milliseconds—discontinue if QTc interval more than 500 milliseconds · risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome)

- **INTERACTIONS** → Appendix 1 (bedaquiline). Caution with concomitant use of hepatotoxic drugs.
- **SIDE-EFFECTS** Arthralgia · diarrhoea · dizziness · headache · myalgia · nausea · QT interval prolongation · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Syncope If syncope occurs, obtain ECG.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available. Avoid concomitant use of hepatotoxic drugs unless essential.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
  - ▶ Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
  - ▶ Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

- **PATIENT AND CARER ADVICE**

- **Missed doses**

- If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

- **Driving and skilled tasks**

- Dizziness may affect performance of skilled tasks (e.g. driving)

- **MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**

- CAUTIONARY AND ADVISORY LABELS 4, 8, 21

- ▶ **Sirturo** (Janssen-Cilag Ltd) ▼

- Bedaquiline (as Bedaquiline fumarate) 100 mg Sirturo 100mg tablets | 188 tablet [PoM] £18,700.00

## Capreomycin

- **INDICATIONS AND DOSE**

- **Tuberculosis resistant to first-line drugs, in combination with other drugs**

- ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

- **CAUTIONS** Auditory impairment
- **INTERACTIONS** → Appendix 1 (capreomycin).
- **SIDE-EFFECTS** Induration at injection site · changes in liver function tests · electrolyte disturbances · hearing loss with tinnitus and vertigo · hypersensitivity reactions · leucocytosis · leucopenia · nephrotoxicity · neuromuscular block after large doses · pain at injection site · rashes · thrombocytopenia · urticaria
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Reduce dose—consult product literature. Nephrotoxic; ototoxic.
- **MONITORING REQUIREMENTS** Monitor renal, hepatic, auditory, and vestibular function and electrolytes.

- **MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**

- ▶ **Capreomycin (Non-proprietary)**

- Capreomycin (as Capreomycin sulfate) 1 g vial Capreomycin 1g powder for solution for injection vials | 1 vial [PoM] £28.61

## Cycloserine

- **INDICATIONS AND DOSE**

- **Tuberculosis resistant to first-line drugs, in combination with other drugs**

- ▶ BY MOUTH

- ▶ Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

- **PHARMACOKINETICS**

- Cycloserine penetrates the CNS.

- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety
- **INTERACTIONS** → Appendix 1 (cycloserine).
- **SIDE-EFFECTS** Allergic dermatitis · changes in liver function tests · confusion · convulsions · depression · dizziness · drowsiness · headache · heart failure at high doses · megaloblastic anaemia · psychosis · rashes · tremor · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.
  - ▶ Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.
- **RENAL IMPAIRMENT** Increase interval between doses if creatinine clearance less than 50 mL/minute. Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
  - ▶ Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre.
  - ▶ Monitor haematological, renal, and hepatic function.

- **MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**

- CAUTIONARY AND ADVISORY LABELS 2, 8

- ▶ **Cycloserine (Non-proprietary)**

- Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule [PoM] £402.63 DT price = £402.63

## Delamanid

### ● INDICATIONS AND DOSE

**Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs**

- ▶ BY MOUTH
- ▶ Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · serum albumin less than 28 g/litre
- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)
- **INTERACTIONS** → Appendix 1 (delamanid). Caution when concomitant use with other drugs known to prolong the QT interval. Contra-indicated with concomitant use of potent CYP3A4 inducers.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · acne · agitation · anxiety · chest pain · cough · decreased appetite · depression · dermatitis · dyspepsia · dyspnoea · earache · haemoptysis · headache · hyperhidrosis · hyperlipidaemia · hypertension · hypokalaemia · hypotension · insomnia · malaise · nausea · oropharyngeal pain · osteochondrosis · palpitation · peripheral neuropathy · photophobia · psychiatric disorder · QT interval prolongation · reticulocytosis · tinnitus · tremor · vomiting
  - ▶ **Uncommon** Arrhythmias · balance disorder · dehydration · dysphagia · herpes zoster · hypocalcaemia · leucopenia · nocturia · rash · thrombocytopenia · urinary retention
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
  - ▶ Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia's formula).
- **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

## Ethambutol hydrochloride

### ● INDICATIONS AND DOSE

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- ▶ BY MOUTH
- ▶ Child: 20 mg/kg once daily for 2 months (initial phase)
- ▶ Adult: 15 mg/kg once daily for 2 months (initial phase)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Child: 30 mg/kg 3 times a week for 2 months (initial phase)
- ▶ Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Optic neuritis · poor vision
- **CAUTIONS** Elderly · young children
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Understand warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.
- **INTERACTIONS** → Appendix 1 (ethambutol).
- **SIDE-EFFECTS**
  - ▶ **Rare** Pruritus · rash · thrombocytopenia · urticaria
  - ▶ **Frequency not known** Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Ocular toxicity Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.
  - ▶ In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
  - ▶ In children If creatinine clearance less than 30 mL/minute/1.73 m<sup>2</sup>, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
- **MONITORING REQUIREMENTS**
  - ▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
  - ▶ Renal function should be checked before treatment.
  - ▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.
  - ▶ In children In young children, routine ophthalmological monitoring recommended.

### ● PATIENT AND CARER ADVICE

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Medicines for Children leaflet: Ethambutol for the treatment of tuberculosis [www.medicinesforchildren.org.uk/ethambutol-for-the-treatment-of-tuberculosis](http://www.medicinesforchildren.org.uk/ethambutol-for-the-treatment-of-tuberculosis)

Combinations available: *Rifampicin with ethambutol, isoniazid and pyrazinamide*, p. 537

**Isoniazid****INDICATIONS AND DOSE**

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 300 mg daily for 6 months (initial and continuation phases)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive**

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- ▶ Child 12–17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin
- ▶ Adult: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

● **CONTRA-INDICATIONS** Drug-induced liver disease

● **CAUTIONS** Acute porphyrias p. 930 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Peripheral neuropathy** Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 950 should be given prophylactically from the start of treatment.

● **INTERACTIONS** → Appendix 1 (isoniazid).

When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

**SIDE-EFFECTS**

- ▶ **Common or very common** Peripheral neuropathy
- ▶ **Rare** Hepatitis · psychotic episodes
- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · constipation · convulsions · difficulty with

micturition · dry mouth · fever · gynaecomastia · haemolytic anaemia · hearing loss (in patients with end-stage renal impairment) · hyperglycaemia · hyperreflexia · hypersensitivity reactions · interstitial pneumonitis · nausea · optic neuritis · pancreatitis · pellagra · peripheral neuritis with high doses · purpura · Stevens-Johnson syndrome · systemic lupus erythematosus-like syndrome · tinnitus (in patients with end-stage renal impairment) · vertigo · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hepatitis** Hepatitis more common in those aged over 35 years.
- **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.
- **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.
- **HEPATIC IMPAIRMENT** Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.
- **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 950 recommended.
- **MONITORING REQUIREMENTS**
  - ▶ *Renal function* should be checked before treatment.
  - ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
  - ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet.
  - ▶ In children Doses may need to be recalculated to allow for weight gain in younger children.
- **PATIENT AND CARER ADVICE**

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**2.6 Urinary tract infections****Urinary-tract infections****Overview**

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

## Antibacterial therapy for lower urinary-tract infections

*Uncomplicated lower urinary-tract infections* often respond to trimethoprim p. 529 or nitrofurantoin p. 544, or *alternatively*, amoxicillin p. 506, ampicillin p. 507 or oral cephalosporin.

*Suggested duration of treatment* is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 508 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 510, or a quinolone.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Long-term low dose therapy may be required in selected patients to prevent *recurrence of infection*; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 485 have been recommended for long-term therapy.

Methenamine hippurate below (hexamine hippurate) should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

## Antibacterial therapy for upper urinary-tract infections

*Acute pyelonephritis* can lead to septicaemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 486) or a quinolone if the patient is severely ill; gentamicin p. 479 can also be used.

*Suggested duration of treatment* is 10–14 days (longer treatment may be necessary in complicated pyelonephritis).

*Prostatitis* can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 514 or ofloxacin p. 517), or *alternatively*, trimethoprim.

*Suggested duration of treatment* is 28 days.

Where infection is localised and associated with an indwelling *catheter*, a bladder instillation is often effective.

## Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

## Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

## Urinary-tract infections in children

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in

*children over 3 months of age* can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime p. 487 or co-amoxiclav; gentamicin is an alternative.

*Children under 3 months of age* should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

## ANTIBACTERIALS

### Methenamine hippurate

(Hexamine hippurate)

#### ● INDICATIONS AND DOSE

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections**

- ▶ BY MOUTH
- ▶ Adult: 1 g every 12 hours

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**

- ▶ BY MOUTH
- ▶ Adult: 1 g every 8–12 hours

- **CONTRA-INDICATIONS** Gout · metabolic acidosis · severe dehydration
- **INTERACTIONS** → Appendix 1 (methenamine). Caution—avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents.
- **SIDE-EFFECTS** Bladder irritation · gastro-intestinal disturbances · rash
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>—risk of hippurate crystalluria.
- **LESS SUITABLE FOR PRESCRIBING** Methenamine (hexamine) hippurate should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ **Hiprex** (Meda Pharmaceuticals Ltd)

**Methenamine hippurate 1 gram** Hiprex 1g tablets | 60 tablet P  
£19.74 DT price = £19.74

## Nitrofurantoin

### ● INDICATIONS AND DOSE

#### Acute uncomplicated urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
- ▶ Child 12–17 years: 50 mg 4 times a day for 3–7 days
- ▶ Adult: 50 mg 4 times a day for 3–7 days, dose to be taken with food
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily, dose to be taken with food
- ▶ Adult: 100 mg twice daily, dose to be taken with food

#### Severe chronic recurrent urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg 4 times a day for 3–7 days
- ▶ Adult: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

#### Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
- ▶ Child 12–17 years: 50–100 mg once daily, dose to be taken at night
- ▶ Adult: 50–100 mg once daily, dose to be taken at night

#### Genito-urinary surgical prophylaxis

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · G6PD deficiency · infants less than 3 months old
- **CAUTIONS** Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency
- **INTERACTIONS** → Appendix 1 (nitrofurantoin).
- **SIDE-EFFECTS**
  - ▶ **Rare** Agranulocytosis · aplastic anaemia · arthralgia · benign intracranial hypertension · blood disorders · cholestatic jaundice · erythema multiforme · exfoliative dermatitis · hepatitis · pancreatitis · thrombocytopenia · transient alopecia
  - ▶ **Frequency not known** Acute pulmonary reactions · anaphylaxis · angioedema · anorexia · chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) · diarrhoea · hypersensitivity reactions · nausea · peripheral neuropathy · pruritus · rash · sialadenitis · urticaria · vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.
  - ▶ In adults Avoid if eGFR less than 45 mL/minute/1.73 m<sup>2</sup>; may be used with caution if eGFR 30–44 mL/minute/1.73 m<sup>2</sup> as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

- ▶ In children Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m<sup>2</sup>; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m<sup>2</sup> as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Nitrofurantoin for urinary tract infections [www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections](http://www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections)

## 3 Fungal infection

### Antifungals, systemic use

#### Common fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

#### Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 552 is the treatment of choice for aspergillosis; liposomal amphotericin p. 547 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 546,

itraconazole p. 550, or posaconazole p. 552 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

### Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 548 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

*Oropharyngeal candidiasis* generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 554 can be used with intravenous amphotericin.

### Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

### Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

### Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1089 are used more frequently than griseofulvin p. 554 because they have a broader spectrum of activity and require a shorter duration of treatment.

*Tinea capitis* is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it

is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

*Pityriasis versicolor* may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

### Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin p. 547 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

### Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

### Imidazole antifungals

The imidazole antifungals include clotrimazole p. 758, econazole nitrate p. 759, ketoconazole p. 624, and tioconazole p. 1088. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 760 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

## Polyene antifungals

The polyene antifungals include amphotericin p. 547 and nystatin p. 1073; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*<sup>®</sup> and *Ambisome*<sup>®</sup>) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

## Echinocandin antifungals

The echinocandin antifungals include anidulafungin below, caspofungin below and micafungin p. 547. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

## Other antifungals

Flucytosine p. 554 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 554 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1089 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

## ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

### Anidulafungin

#### ● INDICATIONS AND DOSE

##### Invasive candidiasis

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Coagulopathy · convulsion · diarrhoea · flushing · headache · hypokalaemia · nausea · pruritus · raised serum creatinine · rash · vomiting
- ▶ **Uncommon** Abdominal pain · cholestasis · hyperglycaemia · hypertension · injection-site pain · urticaria
- ▶ **Frequency not known** Bronchospasm · dyspnoea · hepatitis · hypotension
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Ecalta*<sup>®</sup>), give intermittently in Glucose 5% or Sodium

chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

###### ▶ *Ecalta* (Pfizer Ltd)

**Anidulafungin 100 mg** *Ecalta* 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £299.99 (Hospital only)

## Caspofungin

#### ● INDICATIONS AND DOSE

##### Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
- ▶ Adult (body-weight 81 kg and above): 70 mg once daily

#### ● INTERACTIONS → Appendix 1 (caspofungin).

#### ● SIDE-EFFECTS

- **Common or very common** Arthralgia · diarrhoea · dyspnoea · headache · hypokalaemia · injection-site reactions · nausea · pruritus · rash · sweating · vomiting
- ▶ **Uncommon** Abdominal pain · anaemia · anorexia · anxiety · arrhythmia · ascites · blurred vision · bronchospasm · chest pain · cholestasis · constipation · cough · disorientation · dizziness · dry mouth · dyspepsia · dysphagia · erythema multiforme · fatigue · flatulence · flushing · heart failure · hepatic dysfunction · hyperglycaemia · hypertension · hypoaesthesia · hypocalcaemia · hypomagnesaemia · hypotension · leucopenia · metabolic acidosis · muscular weakness · myalgia · palpitation · paraesthesia · renal failure · sleep disturbances · taste disturbances · thrombocytopenia · thrombophlebitis · tremor
- ▶ **Frequency not known** Adult respiratory distress syndrome · anaphylaxis

#### ● PREGNANCY

Manufacturer advises avoid unless essential—toxicity in *animal* studies.

#### ● BREAST FEEDING

Present in milk in *animal* studies—manufacturer advises avoid.

#### ● HEPATIC IMPAIRMENT

70 mg on first day then 35 mg once daily in moderate impairment. No information available for severe impairment.

#### ● DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion* (*Cancidas*<sup>®</sup>), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

###### ▶ *Cancidas* (Merck Sharp & Dohme Ltd)

**Caspofungin (as Caspofungin acetate) 50 mg** *Cancidas* 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67

**Caspofungin (as Caspofungin acetate) 70 mg** *Cancidas* 70mg powder for solution for infusion vials | 1 vial [PoM] £416.78

## Micafungin

### ● INDICATIONS AND DOSE

#### Invasive candidiasis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- ▶ Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

#### Oesophageal candidiasis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 40 kg): 3 mg/kg once daily
- ▶ Adult (body-weight 40 kg and above): 150 mg once daily

#### Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- ▶ Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

- **INTERACTIONS** → Appendix 1 (micafungin). Caution with concomitant use of other hepatotoxic drugs.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · diarrhoea · fever · headache · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · nausea · phlebitis · rash · vomiting
- ▶ **Uncommon** Anorexia · anxiety · blood pressure changes · bradycardia · cholestasis · confusion · constipation · dizziness · dyspepsia · dyspnoea · eosinophilia · flushing · hepatitis · hepatomegaly · hyperhidrosis · hyperkalaemia · hyponatraemia · hypophosphataemia · palpitation · pancytopenia · pruritus · sleep disturbances · tachycardia · taste disturbances · thrombocytopenia · tremor
- ▶ **Rare** Haemolytic anaemia
- ▶ **Frequency not known** Disseminated intravascular coagulation · hepatotoxicity (potentially life-threatening) · renal failure · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor renal function.
  - ▶ Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Mycamine*<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

- ▶ **Mycamine** (Astellas Pharma Ltd)  
**Micafungin (as Micafungin sodium) 50 mg** Mycamine 50mg powder for solution for infusion vials | 1 vial [POM] £196.08
- Micafungin (as Micafungin sodium) 100 mg** Mycamine 100mg powder for solution for infusion vials | 1 vial [POM] £341.00

## ANTIFUNGALS > POLYENE ANTIFUNGALS

### Amphotericin

#### (Amphotericin B)

### ● INDICATIONS AND DOSE

#### ABELCET<sup>®</sup>

**Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

#### AMBISOME<sup>®</sup>

**Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

#### Aspergillosis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

#### Visceral leishmaniasis (unresponsive to the antimonial alone)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

#### FUNGIZONE<sup>®</sup>

#### Systemic fungal infections

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

### ● UNLICENSED USE

**AMBISOME<sup>®</sup>** Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) · when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Anaphylaxis** Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic

antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1 (amphotericin). Caution—corticosteroids (avoid except to control reactions).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abnormal liver function (discontinue treatment) · anaemia · arrhythmias · blood disorders · blood pressure changes · cardiovascular effects · chest pain · diarrhoea · disturbances in renal function · dyspnoea · electrolyte disturbances · febrile reactions · headache · hypokalaemia · hypomagnesaemia · nausea · rash · renal tubular acidosis · thrombocytopenia · vomiting
  - ▶ **Uncommon** Anaphylactoid reactions · bronchospasm · convulsions · diplopia · encephalopathy · hearing loss · neurological disorders · peripheral neuropathy · tremor
  - ▶ **Frequency not known** Anorexia · arthralgia · myalgia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.
- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.
- **DIRECTIONS FOR ADMINISTRATION**

#### ABELCET® Amphotericin (lipid complex)

For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

#### AMBISOME® Amphotericin (liposomal)

For intravenous infusion (Ambisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

#### FUNGIZONE® Amphotericin (as sodium deoxycholate complex)

For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of

1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

▶ **Ambisome** (Gilead Sciences International Ltd)

**Amphotericin B liposomal 50 mg** Ambisome 50mg powder for solution for infusion vials | 10 vial [PoM](#) E821.87

▶ **Fungizone** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Amphotericin B 50 mg** Fungizone Intravenous 50mg powder for solution for infusion vials | 1 vial [PoM](#) E3.88

##### Suspension for infusion

ELECTROLYTES: May contain Sodium

▶ **Abelcet** (Teva UK Ltd)

**Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL** Abelcet 100mg/20mL concentrate for suspension for infusion vials | 10 vial [PoM](#) E775.04 (Hospital only)

## ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

### Fluconazole

#### ● INDICATIONS AND DOSE

##### Candidal balanitis

▶ BY MOUTH

▶ Child 16–17 years: 150 mg for 1 dose

▶ Adult: 150 mg for 1 dose

##### Vaginal candidiasis

▶ BY MOUTH

▶ Child 16–17 years: 150 mg for 1 dose

▶ Adult: 150 mg for 1 dose

##### Vulvovaginal candidiasis (recurrent)

▶ BY MOUTH

▶ Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

##### Mucosal candidiasis (except genital)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)

▶ Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

▶ BY MOUTH

▶ Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive

bronchopulmonary infections; increased to 100 mg daily, increased dose only for unusually difficult infections

### **Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis**

#### ► BY MOUTH

- Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

### **Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)**

#### ► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
- Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

### **Prevention of fungal infections in immunocompromised patients**

#### ► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
- Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

### **Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)**

#### ► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

### **Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**

#### ► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Adult: 200 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Susceptibility to QT interval prolongation
- **INTERACTIONS** → Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment. Caution with concomitant use of hepatotoxic drugs.
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort · diarrhoea · flatulence · headache · nausea · rash
  - **Uncommon** Alopecia · anaphylaxis · angioedema (in children) · dizziness · dyspepsia · hepatic disorders · hyperlipidaemia · hypersensitivity reactions (in adults) · pruritus · seizures · Stevens-Johnson syndrome · taste disturbance · toxic epidermal necrolysis · vomiting
  - **Frequency not known** Hypokalaemia · leucopenia · thrombocytopenia
- SIDE-EFFECTS, FURTHER INFORMATION**  
If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.
- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Toxicity with related drugs.

### ● **RENAL IMPAIRMENT**

- In adults Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.
- In children Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

### ● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

### ● **PROFESSION SPECIFIC INFORMATION**

#### **Dental practitioners' formulary**

Fluconazole Capsules 50 mg may be prescribed.

Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

### ● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### **Capsule**

CAUTIONARY AND ADVISORY LABELS 9 (50 mg and 200 mg strengths only)

#### ► **Fluconazole (Non-proprietary)**

**Fluconazole 50 mg** Fluconazole 50mg capsules | 7 capsule [PoM](#)  
£5.00 DT price = £0.90

**Fluconazole 150 mg** Fluconazole 150mg capsules | 1 capsule [P](#) no price available DT price = £0.83 | 1 capsule [PoM](#) £8.50 DT price = £0.83

**Fluconazole 40 mg per 1 ml** Diffucan 200mg/5ml oral suspension | 35 ml [PoM](#) £66.42 DT price = £66.42

#### **Solution for infusion**

ELECTROLYTES: May contain Sodium

#### ► **Fluconazole (Non-proprietary)**

**Fluconazole 2 mg per 1 ml** Fluconazole 100mg/50ml solution for infusion bottles | 5 bottle [PoM](#) £12.60

Fluconazole 200mg/100ml solution for infusion vials | 1 vial [PoM](#) £29.28

Fluconazole 50mg/25ml solution for infusion vials | 1 vial [PoM](#) £7.31-£7.32

Fluconazole 200mg/100ml solution for infusion bottles | 5 bottle [PoM](#) £274.50

#### ► **Diffucan (Pfizer Ltd)**

**Fluconazole 2 mg per 1 ml** Diffucan 200mg/100ml solution for infusion vials | 1 vial [PoM](#) £29.28

## Isavuconazole

06-Dec-2016

- **DRUG ACTION** Isavuconazole is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

### ● INDICATIONS AND DOSE

#### **Invasive aspergillosis | Mucormycosis in patients for whom amphotericin B is inappropriate**

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6-months

- **CONTRA-INDICATIONS** Short QT syndrome

- **CAUTIONS** Elderly—limited information

- **INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with concomitant use of drugs that *shorten* the QT interval.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · chest pain · decreased appetite · delirium · diarrhoea · dyspnoea · electrolyte disturbances · headache · nausea · pruritus · rash · renal failure · somnolence · thrombophlebitis · vomiting
- ▶ **Uncommon** Abdominal distension · alopecia · arrhythmias · asthenia · back pain · blood disorders · bronchospasm · constipation · convulsion · depression · dermatitis · dizziness · dyspepsia · encephalopathy · epistaxis · haemoptysis · hepatomegaly · hypersensitivity · hypotension · insomnia · malaise · paraesthesia · peripheral neuropathy · petechiae · syncope · tachypnoea · vertigo
- ▶ **Frequency not known** Infusion-related reactions · Stevens-Johnson syndrome

### SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions have been reported, including hypotension, dyspnoea, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

- **PREGNANCY** Manufacturer advises avoid unless severe or life-threatening infection—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution and monitor for toxicity in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 200 mg with 5 mL Water for Injection; dilute dose to concentration of 0.8 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give via a 0.2–1.2 micron filter over at least 1 hour.
- **HANDLING AND STORAGE**
  - ▶ With intravenous use Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution or dilution.
- **PATIENT AND CARER ADVICE**

#### **Driving and skilled tasks**

Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of confusion, syncope and dizziness.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Capsule**

CAUTIONARY AND ADVISORY LABELS 25, 3

- ▶ **Cresemba** (Basilea Pharmaceutica International Ltd) ▼  
**Isavuconazole (as Isavuconazonium sulfate) 100 mg** Cresemba 100mg capsules | 14 capsule [PoM] £599.28 (Hospital only)

#### **Powder for solution for infusion**

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Cresemba** (Basilea Pharmaceutica International Ltd) ▼  
**Isavuconazole (as Isavuconazonium sulfate) 200 mg** Cresemba 200mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £297.84 (Hospital only)

## Itraconazole

### ● INDICATIONS AND DOSE

#### **Vulvovaginal candidiasis**

▶ BY MOUTH

- ▶ Adult: 200 mg twice daily for 1 day

#### **Vulvovaginal candidiasis (recurrent)**

▶ BY MOUTH

- ▶ Adult: 50–100 mg daily for 6 months

#### **Oral or oesophageal candidiasis that has not responded to fluconazole**

▶ BY MOUTH USING ORAL SOLUTION

- ▶ Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

#### **Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients**

▶ BY MOUTH USING ORAL SOLUTION

- ▶ Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

#### **Systemic candidiasis where other antifungal drugs inappropriate or ineffective**

▶ BY MOUTH

- ▶ Adult: 100–200 mg once daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

#### **Systemic candidiasis (invasive or disseminated) where other antifungal drugs inappropriate or ineffective**

▶ BY MOUTH

- ▶ Adult: 200 mg twice daily

#### **Pityriasis versicolor**

▶ BY MOUTH

- ▶ Adult: 200 mg once daily for 7 days

#### **Tinea pedis | Tinea manuum**

▶ BY MOUTH

- ▶ Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

#### **Tinea corporis | Tinea cruris**

▶ BY MOUTH

- ▶ Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

#### **Onychomycosis**

▶ BY MOUTH

- ▶ Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

#### **Aspergillosis**

▶ BY MOUTH

- ▶ Adult: 200 mg twice daily

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**

## ▶ BY INTRAVENOUS INFUSION

- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Histoplasmosis**

## ▶ BY MOUTH

- Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

## ▶ BY INTRAVENOUS INFUSION

- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**

## ▶ BY MOUTH

- Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

## ▶ BY INTRAVENOUS INFUSION

- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**

## ▶ BY MOUTH

- Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**

## ▶ BY MOUTH USING ORAL SOLUTION

- Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

- **UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION****HEART FAILURE**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
  - **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
  - **INTERACTIONS** → Appendix 1 (antifungals, triazole).
  - **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · diarrhoea · dyspnoea · headache · hepatitis · hypokalaemia · nausea · rash · taste disturbances · vomiting

- ▶ **Uncommon** Constipation · dizziness · dyspepsia · flatulence · menstrual disorder · myalgia · oedema · peripheral neuropathy (discontinue treatment)
- ▶ **Rare** Alopecia · deafness · erectile dysfunction · heart failure · hypertriglyceridaemia · leucopenia · pancreatitis · photosensitivity · Stevens-Johnson syndrome · tinnitus · toxic epidermal necrolysis · urinary frequency · visual disturbances
- ▶ **Frequency not known** Arthralgia · blood pressure changes · confusion · drowsiness · hepatotoxicity · renal impairment · thrombocytopenia · tremor

**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Hyperglycaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

- **RENAL IMPAIRMENT** Risk of congestive heart failure.

- ▶ With oral use Bioavailability of oral formulations possibly reduced.
- ▶ With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

**MONITORING REQUIREMENTS**

- ▶ Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).

- ▶ Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

**DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion (Sporanox<sup>®</sup>)*, give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.

- ▶ With oral use For *oral liquid*, do not take with food; swish around mouth and swallow, do not rinse afterwards.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

Patients or carers should be given advice on how to administer itraconazole oral liquid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Capsule**

CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25

▶ **Itraconazole (Non-proprietary)**

**Itraconazole 100 mg** Itraconazole 100mg capsules | 15 capsule [PoM] £13.77 DT price = £3.44 | 60 capsule [PoM] £56.21

▶ **Sporanox (Janssen-Cilag Ltd)**

**Itraconazole 100 mg** Sporanox-Pulse 100mg capsules | 28 capsule [PoM] £25.72

Sporanox 100mg capsules | 4 capsule [PoM] £3.67 | 15 capsule [PoM] £13.77 DT price = £3.44 | 60 capsule [PoM] £55.10

### Oral solution

CAUTIONARY AND ADVISORY LABELS 9, 23

#### ▶ Itraconazole (Non-proprietary)

Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £58.34 DT price = £58.34

#### ▶ Sporanox (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 ml Sporanox 50mg/5ml oral solution sugar-free | 150 ml [PoM] £58.34 DT price = £58.34

### Solution for infusion

EXCIPIENTS: May contain Propylene glycol

#### ▶ Sporanox (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 ml Sporanox I.V. 250mg/25ml solution for infusion ampoules and diluent | 1 ampoule [PoM] £79.71

## Posaconazole

### ● INDICATIONS AND DOSE

**Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin | Fusariosis either unresponsive to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole | Coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole**

#### ▶ BY MOUTH USING ORAL SUSPENSION

▶ Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, dose if food not tolerated

#### ▶ BY MOUTH USING TABLETS

▶ Adult: 300 mg twice daily on first day, then 300 mg once daily

**Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)**

#### ▶ BY MOUTH USING ORAL SUSPENSION

▶ Adult: 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

**Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole**

#### ▶ BY MOUTH USING ORAL SUSPENSION

▶ Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food

#### ▶ BY MOUTH USING TABLETS

▶ Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

### DOSE EQUIVALENCE AND CONVERSION

▶ Posaconazole oral suspension is **not** interchangeable with tablets on a milligram-for-milligram basis.

### PHARMACOKINETICS

Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

- **UNLICENSED USE** Tablets not licensed for oropharyngeal candidiasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Body-weight over 120 kg—risk of treatment failure possibly increased · body-weight under 60 kg—risk of side effects increased · bradycardia · cardiomyopathy ·

history of QT interval prolongation · symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs known to cause QT-interval prolongation.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anaemia · anorexia · blood disorders · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · electrolyte disturbances · fatigue · fever · flatulence · gastro-intestinal disturbances · headache · nausea · neutropenia · paraesthesia · pruritus · rash · thrombocytopenia · vomiting
  - ▶ **Uncommon** Alopecia · aphasia · arrhythmias · bradycardia · changes in blood pressure · convulsions · cough · gastro-oesophageal reflux · hepatic disorders · hiccups · hyperglycaemia · insomnia · menstrual disorders · mouth ulcers · musculoskeletal pain · neuropathy · oedema · palpitation · pancreatitis · renal failure · tachycardia · tremor · vasculitis · visual disturbances
  - ▶ **Rare** Adrenal insufficiency · breast pain · cardiac failure · depression · encephalopathy · hearing impairment · ileus · myocardial infarction · pneumonitis · psychosis · Stevens-Johnson syndrome · stroke · syncope · thrombosis
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor liver function in hepatic impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
  - ▶ Monitor liver function before and during therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

#### ▶ Noxafil (Merck Sharp & Dohme Ltd)

Posaconazole 40 mg per 1 ml Noxafil 40mg/ml oral suspension | 105 ml [PoM] £491.20 (Hospital only)

## Voriconazole

### ● INDICATIONS AND DOSE

**Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)**

#### ▶ BY MOUTH

▶ Adult (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours

▶ Adult (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

#### ▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

- **CONTRA-INDICATIONS** Acute porphyrias p. 930

- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs that prolong QT interval.
- **SIDE-EFFECTS**  
**GENERAL SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · acute renal failure · agitation · alopecia · altered perception · anaemia · anxiety · asthenia · blood disorders · blurred vision · cheilitis · chest pain · confusion · depression · diarrhoea · dizziness · haematuria · hallucinations · headache · hypoglycaemia · hypokalaemia · hypotension · influenza-like symptoms · jaundice · leucopenia · nausea · oedema · pancytopenia · paraesthesia · photophobia · photosensitivity · pruritus · rash · respiratory distress syndrome · sinusitis · thrombocytopenia · tremor · visual disturbances · vomiting
  - ▶ **Uncommon** Adrenocortical insufficiency · arrhythmias · arthritis · ataxia · blepharitis · cholecystitis · constipation · duodenitis · dyspepsia · flushing · fulminant hepatic failure · gingivitis · glossitis · hepatitis · hypersensitivity reactions · hyposensitivity · hyponatraemia · nystagmus · optic neuritis · pancreatitis · psoriasis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope
  - ▶ **Rare** Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hyperthyroidism · hypertension · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis
  - ▶ **Frequency not known** On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · periostitis (particularly in transplant patients)
- **SPECIFIC SIDE-EFFECTS**
  - ▶ **Common or very common**
  - ▶ With intravenous use Injection-site reactions
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Hepatotoxicity Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.
  - ▶ Phototoxicity Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** In mild to moderate hepatic cirrhosis use usual initial dose then halve maintenance dose. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

## ● MONITORING REQUIREMENTS

- ▶ Monitor renal function.
- ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to keep the alert card with them at all times.
  - ▶ Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
  - ▶ Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## ANTIFUNGALS &gt; OTHER

## Flucytosine

## ● INDICATIONS AND DOSE

**Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for extremely sensitive organisms

**Cryptococcal meningitis (adjunct to amphotericin)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 100 mg/kg daily in 4 divided doses for 2 weeks

- **UNLICENSED USE** Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

- **CAUTIONS** Blood disorders · elderly

- **INTERACTIONS** → Appendix 1 (flucytosine).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · nausea · rashes · vomiting

- ▶ **Uncommon** Alterations in liver function tests · cardiotoxicity · confusion · convulsions · hallucinations · headache · sedation · toxic epidermal necrolysis · vertigo
- ▶ **Frequency not known** Aplastic anaemia · blood disorders · hepatic necrosis · hepatitis · leucopenia · thrombocytopenia

- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

● **MONITORING REQUIREMENTS**

- ▶ For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

- ▶ Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Ancofil** (Meda Pharmaceuticals Ltd)

- ▶ **Flucytosine 10 mg per 1 ml Ancofil 2.5g/250ml solution for infusion** bottles | 5 bottle [PoM] £151.67 (Hospital only)

## Griseofulvin

● **INDICATIONS AND DOSE**

**Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate**

## ▶ BY MOUTH

- ▶ Adult: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

**Tinea capitis caused by *Trichophyton tonsurans***

## ▶ BY MOUTH

- ▶ Adult: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · systemic lupus erythematosus (risk of exacerbation)

- **INTERACTIONS** → Appendix 1 (griseofulvin).

● **SIDE-EFFECTS**

- ▶ **Rare** Erythema multiforme · toxic epidermal necrolysis
- ▶ **Very rare** Headache

- ▶ **Frequency not known** Abdominal pain · agitation · confusion · depression · diarrhoea · dizziness · dyspepsia · fatigue · glossitis · hepatotoxicity · impaired coordination · impaired hearing · leucopenia · menstrual disturbances · nausea · peripheral neuropathy · photosensitivity · rash · renal failure · sleep disturbances · systemic lupus erythematosus · taste disturbances · vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in *animals*).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

● **PATIENT AND CARER ADVICE****Driving and skilled tasks**

May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

## 3.1 Pneumocystis pneumonia

## Pneumocystis pneumonia

## Overview

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

## Treatment

**Mild to moderate disease**

Co-trimoxazole p. 518 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 555 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapson p. 532 with trimethoprim p. 529 is given by mouth for the

treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 493 and primaquine p. 571 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

#### Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate below given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

#### Adjunctive therapy

In moderate to severe infections associated with HIV infection, prednisolone p. 622 is given by mouth for 5 days (alternatively, hydrocortisone p. 620 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

#### Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsona can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

## ANTIPROTOZOALS

### Atovaquone

#### ● INDICATIONS AND DOSE

**Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole**

- ▶ BY MOUTH
- ▶ Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food

**Prophylaxis against pneumocystis pneumonia**

- ▶ BY MOUTH
- ▶ Adult: 750 mg twice daily

- **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.
- **CAUTIONS** Other causes of pulmonary disease should be sought and treated · elderly · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)

- **INTERACTIONS** → Appendix 1 (atovaquone).
- **SIDE-EFFECTS** Anaemia · diarrhoea · fever · headache · hyponatraemia · insomnia · nausea · neutropenia · pruritus · rash · Stevens-Johnson syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor more closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor more closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Wellvone** (GlaxoSmithKline UK Ltd)  
Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [PoM] £486.37

## Pentamidine isetionate

#### ● INDICATIONS AND DOSE

**Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 4 mg/kg once daily for at least 14 days

**Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)**

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

**Visceral leishmaniasis (specialist use only)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

**Cutaneous leishmaniasis (specialist use only)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3–4 mg/kg 1–2 times a week until condition resolves

**Trypanosomiasis (specialist use only)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for primary prevention of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia by inhalation of nebulised solution.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1 (pentamidine isetionate). Caution with concomitant use of other drugs that prolong the QT interval.
- **SIDE-EFFECTS**  
**GENERAL SIDE-EFFECTS**  
Abnormal liver-function tests · acute renal failure · anaemia · arrhythmias (can be severe and sometimes fatal) · azotaemia · dizziness · flushing · hyperglycaemia · hyperkalaemia · hypocalcaemia · hypoglycaemia (can be

severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · leucopenia · nausea · pancreatitis (can be severe and sometimes fatal) · rash · Stevens-Johnson syndrome · syncope · taste disturbances · thrombocytopenia · vomiting

#### SPECIFIC SIDE-EFFECTS

- ▶ When used by inhalation Bronchoconstriction (may be prevented by prior use of bronchodilators) · cough · shortness of breath
- ▶ With intramuscular use or intravenous use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
  - ▶ Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.
  - ▶ Powder for injection (dissolved in water for injection) may be used for nebulisation.
- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

- ▶ **Pentacarinat** (Sanofi)
- ▶ **Pentamidine isetionate 300 mg** Pentacarinat 300mg powder for solution for injection vials | 5 vial **PoM** £158.86

## 4 Helminth infection

### Helminth infections

#### Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local Infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

#### Drugs for threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be

combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 558 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

#### Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 558 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

#### Drugs for tapeworm infections

##### Taenicides

**Niclosamide** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 558 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

##### Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 557 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

#### Drugs for hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

#### Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and

mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (*Cysticide*<sup>®</sup>) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

### Filaricides

**Diethylcarbamazine** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

### Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical thiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (thiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

### Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

## ANTHELMINTICS

### Albendazole

#### ● INDICATIONS AND DOSE

##### Chronic *Strongyloides* infection

###### ▶ BY MOUTH

- ▶ Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

##### Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

###### ▶ BY MOUTH

- ▶ Adult: (consult product literature)

#### Hookworm infections

###### ▶ BY MOUTH

- ▶ Adult: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.
- **INTERACTIONS** → Appendix 1 (albendazole).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

##### Tablet

CAUTIONARY AND ADVISORY LABELS 9

###### ▶ Albendazole (Non-proprietary)

- ▶ **Albendazole 400 mg** Eskazole 400mg tablets | 60 tablet [PoM] no price available

## ▶ BY MOUTH

▶ Adult: 120–150 mg for 1 dose

**UNLICENSED USE** Not licensed.**CONTRA-INDICATIONS** Blood disorders**CAUTIONS** Epilepsy · Sjögren's syndrome**INTERACTIONS** → Appendix 1 (levamisole).

▶ **SIDE-EFFECTS** Arthralgia (on *prolonged treatment*) · blood disorders (on *prolonged treatment*) · convulsions (on *prolonged treatment*) · diarrhoea · dizziness · headache · influenza-like syndrome (on *prolonged treatment*) · insomnia (on *prolonged treatment*) · myalgia (on *prolonged treatment*) · nausea · rash (on *prolonged treatment*) · taste disturbances (on *prolonged treatment*) · vasculitis (on *prolonged treatment*) · vomiting

**PREGNANCY** Embryotoxic in *animal studies*, avoid if possible.**BREAST FEEDING** No information available.**HEPATIC IMPAIRMENT** Use with caution—dose adjustment may be necessary.**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

CAUTIONARY AND ADVISORY LABELS 4

▶ **Ergamisol** (Imported (Belgium))

Levamisole (as Levamisole hydrochloride) 50 mg Ergamisol 50mg tablets | 20 tablet [PoM] no price available

**Mebendazole****INDICATIONS AND DOSE****Threadworm infections**

## ▶ BY MOUTH

▶ Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

▶ Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

**Whipworm infections | Hookworm infections**

## ▶ BY MOUTH

▶ Child 1–17 years: 100 mg twice daily for 3 days

▶ Adult: 100 mg twice daily for 3 days

**Roundworm infections**

## ▶ BY MOUTH

▶ Child 1 year: 100 mg twice daily for 3 days

▶ Child 2–17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

▶ Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

**UNLICENSED USE** Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.**INTERACTIONS** → Appendix 1 (mebendazole).**SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain

▶ **Uncommon** Diarrhoea · flatulence

▶ **Rare** Alopecia · convulsions · dizziness · hepatitis · neutropenia · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

**PREGNANCY** Manufacturer advises avoid—toxicity in *animal studies*.**BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Mebendazole for worm infections [www.medicinesforchildren.org.uk/mebendazole-for-worm-infections](http://www.medicinesforchildren.org.uk/mebendazole-for-worm-infections)

▶ **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Chewable tablet**▶ **Ovex** (McNeil Products Ltd)

Mebendazole 100 mg Ovex 100mg chewable tablets sugar-free | 1 tablet [P] £2.03 sugar-free | 4 tablet [P] £4.74

▶ **Vermax** (Janssen-Cilag Ltd)

Mebendazole 100 mg Vermax 100mg chewable tablets sugar-free | 6 tablet [PoM] £1.34 DT price = £1.34

**Oral suspension**▶ **Ovex** (McNeil Products Ltd)

Mebendazole 20 mg per 1 ml Ovex 100mg/5ml oral suspension | 30 ml [P] £6.03 DT price = £1.55

▶ **Vermax** (Janssen-Cilag Ltd)

Mebendazole 20 mg per 1 ml Vermax 100mg/5ml oral suspension | 30 ml [PoM] £1.55 DT price = £1.55

**Praziquantel****INDICATIONS AND DOSE****Tapeworm infections (*Taenia solium*)**

## ▶ BY MOUTH

▶ Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

**Tapeworm infections (*Hymenolepis nana*)**

## ▶ BY MOUTH

▶ Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

**Schistosoma haematobium worm infections | Schistosoma mansoni worm infections**

## ▶ BY MOUTH

▶ Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

**Schistosoma japonicum worm infections**

## ▶ BY MOUTH

▶ Adult: 20 mg/kg 3 times a day for 1 day

**UNLICENSED USE** Praziquantel is an unlicensed drug.**INTERACTIONS** → Appendix 1 (praziquantel).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**▶ **Praziquantel (Non-proprietary)**

**Praziquantel 150 mg** Cesol 150mg tablets | 6 tablet **[PoM]** no price available

**Praziquantel 600 mg** Biltricide 600mg tablets | 6 tablet **[PoM]** no price available

▶ **Cysticide (Imported (Germany))**

**Praziquantel 500 mg** Cysticide 500mg tablets | 90 tablet **[PoM]** no price available

## 5 Protozoal infection

### Antiprotozoal drugs

**Amoebicides**

Metronidazole p. 499 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 501 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 467.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

**Trichomonacides**

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

**Antigiardial drugs**

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 467.

**Leishmaniocides**

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin p. 547 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate p. 555 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

**Trypanocides**

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

**Drugs for toxoplasmosis**

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 572 and sulfadiazine p. 520, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 493 or clarithromycin p. 496 or azithromycin p. 495. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

## 5.1 Leishmaniasis

**Other drugs used for Leishmaniasis** Amphotericin, p. 547 · Pentamidine isetionate, p. 555

**ANTIPROTOZOALS**

### Sodium stibogluconate

**INDICATIONS AND DOSE****Visceral leishmaniasis (specialist use only)**

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 20 mg/kg daily for 28 days

**Cutaneous leishmaniasis (specialist use only)**

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 20 mg/kg daily for 20 days

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) · mucocutaneous disease · predisposition to QT interval prolongation · treat intercurrent infection (e.g. pneumonia)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening)

if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS** → Appendix 1 (sodium stibogluconate). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - ▶ **Rare** Bleeding from gums · bleeding from nose · fever · flushing · jaundice · rash · substernal pain · sweating · vertigo
  - ▶ **Frequency not known** Abdominal pain · anaphylaxis · anorexia · arthralgia · coughing · diarrhoea · ECG changes · headache · lethargy · myalgia · nausea · pain on intramuscular injection · pain on intravenous administration · pancreatitis · thrombosis on intravenous administration · vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Avoid in significant impairment.
- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

▶ **Pentostam** (GlaxoSmithKline UK Ltd)

Antimony pentavalent (as Sodium stibogluconate) 100 mg per

1 ml Pentostam 10g/100ml solution for injection vials | 1 vial [PoM] £66.43

## 5.2 Malaria

### Antimalarials

#### Artemether with lumefantrine

Artemether with lumefantrine p. 567 is licensed for the treatment of acute non-complicated falciparum malaria.

#### Chloroquine

Chloroquine p. 569 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 571 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Chloroquine is **no longer recommended** for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 573, Malarone<sup>®</sup>, or Riamet<sup>®</sup>. It is still recommended for the treatment of non-falciparum malaria.

#### Mefloquine

Mefloquine p. 570 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is

rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

#### Piperazine with arteminol

Arteminol with piperazine phosphate p. 567 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperazine has a long half-life.

#### Primaquine

Primaquine p. 571 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

#### Proguanil

Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 561).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone<sup>®</sup> (a combination of atovaquone with proguanil hydrochloride p. 568) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone<sup>®</sup> is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone<sup>®</sup> is also used as an alternative to mefloquine or doxycycline p. 521. Malarone<sup>®</sup> is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

#### Pyrimethamine

Pyrimethamine p. 572 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine p. 572 is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

#### Quinine

Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of falciparum malaria or if the infective species is *not known* or if the infection is mixed (for details see Malaria, treatment p. 566).

#### Tetracyclines

Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone<sup>®</sup> (for details, see Recommended regimens for prophylaxis against malaria p. 561).

## Malaria, prophylaxis

### Prophylaxis

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

**Key to recommended regimens for prophylaxis against malaria**

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

**Specific recommendations**

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Risk below 2000 m from May–November	3
	Low risk below 2000 m from December–April	1
Algeria	Very low risk in Illizi department only	1
Andaman and Nicobar Islands (India)	Risk present	1
Angola	High risk	4
Argentina	Low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	2
	No risk in Iguacu Falls and areas other than those above	1
Armenia	No risk	1
Azerbaijan	Low to no risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Low to no risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	2
	No risk in Belize district (including Belize city and islands)	1
Benin	High risk	4
Bhutan	Risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	3
	Low to no risk in areas other than those above	1
Bolivia	High risk in Amazon basin	4
	Risk in rural areas below 2500 m (other than above)	2
	No risk above 2500 m	1
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half; low to no risk all year in southern half	1
Brazil	Risk in Amazon basin, including city of Manaus	4
	Very low risk in areas other than those above, and no risk in Iguacu Falls	1
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	High risk, with widespread chloroquine and mefloquine resistance, in western provinces bordering Thailand	5
	High risk in areas other than those above and below	4
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap; no risk in Phnom Penh	1
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	High risk in Yunnan and Hainan provinces	4
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-
Colombia	High risk in rural areas below 1600 m	4
	Low to no risk above 1600 m and in Cartagena	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Risk in Limon province (but not city of Limon)	2
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Risk in all areas except cities of Santiago and Santo Domingo	2
	Cities of Santiago and Santo Domingo	1
East Timor (Timor-Leste)	High risk	4
Ecuador	Risk in areas below 1500 m including coastal provinces and Amazon basin (no risk in Galapagos islands or city of Guayaquil)	4
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country; low to no risk in other areas	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
Ethiopia	High risk below 2000 m	4
French Guiana	High risk (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	No risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk in rural south east from June–October	1
Ghana	High risk	4
Guatemala	Low risk below 1500 m	2
	No risk in Guatemala City, Antigua, or Lake Atitlan	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	High risk in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	2
Honduras	Risk below 1000 m and in Roatán and other Bay Islands (no risk in San Pedro Sula or Tegucigalpa)	2
India	High risk in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	No risk in Lakshadweep islands	-
Indonesia	High risk in Lombok and Irian Jaya (Papua)	4
	Risk in areas other than those above or below	3
	Very low risk in Bali, and cities on islands of Java and Sumatra	1
	No risk in city of Jakarta	-
Indonesia (Borneo)	High risk	4
Iran	Risk from March–November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	3
	Low to no risk in areas other than those above	1
Iraq	Very low risk from May–November in rural northern area below 1500 m	1
Kenya	High risk below 2500 m (except city of Nairobi)	4
	Very low risk in the highlands above 2500 m and in city of Nairobi	1
Kyrgyzstan	Very low risk from June–October in southwest areas bordering Tajikistan and Uzbekistan	1

**Key to recommended regimens for prophylaxis against malaria**

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

**Specific recommendations**

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Laos	High risk along the border with Myanmar in the provinces of Bokeo and Louang Namtha, and along the border with Thailand in the province of Champasak and Saravan	5
	High risk in areas other than those above or below	4
	Low to no risk in city of Vientiane	1
Liberia	High risk	4
Libya	No risk	1
Madagascar	High risk	4
Malawi	High risk	4
Malaysia	Risk in inland forested areas of peninsular Malaysia	4
	Very low risk in rest of peninsular Malaysia, including Cameron Highlands and city of Kuala Lumpur	1
Malaysia (Borneo)	High risk in inland areas of eastern Sabah and in inland, forested areas of Sarawak	4
	Very low risk in areas other than those above, including coastal areas of Sabah and Sarawak	1
Mali	High risk	4
Mauritania	High risk all year in southern provinces, and from July–October in the northern provinces	4
	Low risk from November–June in the northern provinces	1
Mauritius	No risk	1
Mayotte	Risk present	4
Mexico	Low risk in Oaxaca and Chiapas	2
	Very low risk in areas other than those above	1
Mozambique	High risk	4
Myanmar	High risk (but not in cities of Mandalay and Yangon)	5
	No risk in cities of Mandalay and Yangon	1
Namibia	High risk all year in regions of Caprivi Strip, Kavango, and Kunene river, and from November–June in northern third of country	4
	Low to no risk in areas other than those above; low risk from July–October in northern third of country	1
Nepal	Risk below 1500 m, particularly in Terai district	3
	No risk in city of Kathmandu and on typical Himalayan treks	1
Nicaragua	Low risk (except Managua)	2
	Very low risk in Managua	1
Niger	High risk	4
Nigeria	High risk	4
North Korea	Very low risk in some southern areas	1
Pakistan	Risk below 2000 m	3
	Low to no risk above 2000 m	1
Panama	Risk east of Canal Zone	3
	Low risk west of Canal Zone	2
	No risk in Panama City or Canal Zone itself	1
Papua New Guinea	High risk below 1800 m	4
	Low to no risk above 1800 m	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Paraguay	Low risk in departments of Alto Paraná and Caaguazú	2
	Very low risk in areas other than those above	1
Peru	High risk in Amazon basin along border with Brazil, particularly in Loreto province	4
	Risk in rural areas below 2000 m (other than those above and below) including in Amazon basin along border with Bolivia	2
	No risk in city of Lima and coastal region south of Chiclayo	1
Philippines	Risk in rural areas below 600 m and on islands of Luzon, Mindanao, Mindoro, and Palawan	3
	No risk in cities or on islands of Boracay, Bohol, Catanduanes, Cebu, or Leyte	1
Rwanda	High risk	4
São Tomé and Príncipe	High risk	4
Saudi Arabia	Risk in south-western provinces along border with Yemen, including below 2000 m in Asir province	3
	No risk in cities of Jeddah, Makkah (Mecca), Medina, Riyadh, or Ta'if, or above 2000 m in Asir province	1
Senegal	High risk	4
Sierra Leone	High risk	4
Solomon Islands	High risk	4
Somalia	High risk	4
South Africa	Moderate risk from September–May in low altitude areas of Mpumalanga and Limpopo, which border Mozambique and Zimbabwe (including Kruger National Park)	4
	Low risk in north-east KwaZulu-Natal	1
	Low risk in areas bordering those above	1
South Korea	Very low risk in northern areas, in Gangwon-do and Gyeonggi-do provinces, and Incheon city (towards Demilitarized Zone)	1
South Sudan	High risk	4
Sri Lanka	Low risk north of Vavuniya	1
	Very low risk in areas other than those above and below	1
	No risk in Colombo or Kandy	-
Sudan	High risk in central and southern areas; risk also present in rest of country (except Khartoum)	4
	Very low risk in Khartoum	1
Suriname	High risk (except coastal districts or city of Paramaribo)	4
	Very low risk in coastal districts; no risk in city of Paramaribo	1
Swaziland	High risk in northern and eastern regions bordering Mozambique and South Africa, including all of Lubombo district and Big Bend, Mhlume, Simunye, and Tshaneni regions	4
	Very low risk in the areas other than those above	1
Syria	Very low risk in small, remote foci of El Hasakah	1
Tajikistan	Risk below 2000 m from June–October	3
	Low risk below 2000 m from November–May	1
Tanzania	High risk below 1800 m; risk also in Zanzibar	4
Thailand	High risk, with chloroquine and mefloquine resistance, in rural forested borders with Cambodia, Laos, and Myanmar	5
	Very low risk in areas other than those above, including Kanchanaburi (Kwai Bridge); no risk in cities of Bangkok, Chiang Mai, Chiang Rai, Koh Phangan, Koh Samui, and Pattaya	1
Togo	High risk	4
Turkey	Low risk from May–October along the border plain with Syria, around Adana and east of Adana	2
	Very low risk from November–April along the border plain with Syria, around Adana and east of Adana; very low risk all year in rest of country	1
Uganda	High risk	4
Uzbekistan	Very low risk in extreme south-east	1
Vanuatu	Risk present	4

**Key to recommended regimens for prophylaxis against malaria**

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

**Specific recommendations**

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Venezuela	High risk in all areas south of, and including, the Orinoco river and Angel Falls	4
	Risk in rural areas of Apure, Monagas, Sucre, and Zulia states	3
	No risk in city of Caracas or on Margarita Island	1
Vietnam	Risk in rural areas, and in southern provinces of Tay Ninh, Lam Dong, Dac Lac, Gia Lai, and Kon Tum	5
	Very low risk in Mekong river delta until border area with Cambodia; no risk in large cities (including Ho Chi Minh (Saigon) and Hanoi), Red river delta, and coastal areas north of Nha Trang and Phu Quoc Island	1
Western Sahara	No risk	1
Yemen	Risk below 2000 m	3
	Very low risk on Socrota Island; no risk above 2000 m, including Sana'a city	1
Zambia	High risk	4
Zimbabwe	High risk all year in Zambezi valley, and from November–June in areas below 1200 m	4
	Low risk from July–October in areas below 1200 m; very low risk all year in Harare and Bulawayo	1

**Protection against bites**

**Prophylaxis is not absolute**, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 1092 provide the most effective barrier protection against insects; mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

**Length of prophylaxis**

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 570) before travel into an endemic area; *Malarone*® or doxycycline p. 521 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 569 and proguanil hydrochloride p. 571 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria.

Specialist advice should be sought for long-term prophylaxis.

**Return from malarial region**

It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned of this** and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

**Epilepsy**

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without *chloroquine resistance* proguanil alone is recommended; in areas with *chloroquine resistance*, doxycycline or *Malarone*® may be considered.

**Asplenia**

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

**Renal impairment**

Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. *Malarone*® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m<sup>2</sup>. Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

**Pregnancy**

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 898 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*<sup>®</sup> should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

**Breast-feeding**

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

**Anticoagulants**

Travellers taking warfarin sodium p. 131 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

**Standby treatment**

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas, expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

**Specific recommendations**

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See *Recommended regimens for prophylaxis against malaria*.

**Important**

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

**Malaria, treatment****Advice for healthcare professionals**

**Treatment of malaria**

Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 573, *Malarone*<sup>®</sup> (atovaquone with proguanil hydrochloride p. 568), or *Riamet*<sup>®</sup> (artemether with lumefantrine p. 567). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

**Falciparum malaria (treatment)**

*Falciparum malaria* (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 569 which should not therefore be given for treatment.

Quinine, *Malarone*<sup>®</sup> (atovaquone with proguanil hydrochloride), or *Riamet*<sup>®</sup> (artemether with lumefantrine) can be given *by mouth* if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given *by intravenous infusion* if the patient is seriously ill or unable to take tablets. Mefloquine p. 570 is now rarely used for treatment because of concerns about resistance.

*Oral* quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 521 for 7 days or clindamycin p. 493 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 572 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*<sup>®</sup>, or *Riamet*<sup>®</sup> may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*<sup>®</sup> or *Riamet*<sup>®</sup> treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given *by intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with* or *followed by either* doxycycline or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous **artesunate** may be available for 'named-patient' use.

#### Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clindamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, **Malarone**<sup>®</sup>, and **Riamet**<sup>®</sup> are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

#### Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, **Malarone**<sup>®</sup> [unlicensed indication], quinine, or **Riamet**<sup>®</sup> [unlicensed indication] can be used; as with chloroquine, primaquine p. 571 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a **radical cure** (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

#### Parenteral

If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed], changed to oral chloroquine as soon as the patient's condition permits.

#### Pregnancy

The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued, given weekly during the pregnancy.

## ANTIPROTOZOALS > ANTIMALARIALS

### Artemether with lumefantrine

#### ● INDICATIONS AND DOSE

**Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria**

##### ▶ BY MOUTH

▶ Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant

bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction

- **CAUTIONS** Avoid in acute porphyrias p. 930 · electrolyte disturbances
- **INTERACTIONS** → Appendix 1 (artemether with lumefantrine).  
Caution if concomitant use with other drugs known to cause QT-interval prolongation.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · cough · diarrhoea · dizziness · headache · myalgia · nausea · palpitation · paraesthesia · prolonged QT interval · pruritus · rash · sleep disturbances · vomiting
  - ▶ **Uncommon** Ataxia · clonus · hypoaesthesia
- **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE**  
Driving and skilled tasks  
Dizziness may affect performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **Riamet** (Novartis Pharmaceuticals UK Ltd)

**Artemether 20 mg, Lumefantrine 120 mg** Riamet tablets | 24 tablet **[POM]** £22.50

### Artemimol with piperazine phosphate

(Piperazine tetraphosphate with dihydroartemisinin)

#### ● INDICATIONS AND DOSE

**Treatment of uncomplicated falciparum malaria**

##### ▶ BY MOUTH

- ▶ Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months-17 years (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

continued →

- ▶ Adult (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Adult (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
- **INTERACTIONS** → Appendix 1 (artemimol with piperazine). Piperazine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped. Concomitant use with other drugs known to prolong the QT interval contra-indicated.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain (in children) · anaemia · blood disorders (in children) · conjunctivitis (in children) · cough (in children) · diarrhoea (in children) · headache (in adults) · irregular heart rate (in children) · leucopenia (in children) · malaise · QT interval prolonged · rash (in children) · tachycardia (in adults) · thrombocytopenia (in children) · vomiting (in children)
  - ▶ **Uncommon** Abdominal pain (in adults) · acanthosis (in children) · anorexia (in adults) · arrhythmias · arthralgia · bradycardia (in adults) · convulsions · cough (in adults) · diarrhoea (in adults) · dizziness (in adults) · headache (in children) · heart murmur (in children) · hepatitis · hepatomegaly · influenza-like symptoms · jaundice (in children) · myalgia (in adults) · nausea · pruritus (in adults) · stomatitis (in children) · vomiting (in adults)
- **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT<sub>c</sub> interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
  - ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in females children who are vomiting, or in the elderly.
- **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperazine phosphate with artemimol.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Eurartesim** (Sigma-Tau Pharma Ltd) ▼  
Artemimol 40 mg, Piperazine phosphate 320 mg Eurartesim 320mg/40mg tablets | 12 tablet [PoM] £40.00

## Atovaquone with proguanil hydrochloride

#### ● INDICATIONS AND DOSE

##### MALARONE®

**Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected**

##### ▶ BY MOUTH

- ▶ Adult (body-weight 41 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**Treatment of acute uncomplicated falciparum malaria |**

**Treatment of non-falciparum malaria**

##### ▶ BY MOUTH

- ▶ Adult: 4 tablets once daily for 3 days

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.
- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)
- **INTERACTIONS** → Appendix 1 (proguanil, atovaquone).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abnormal dreams · anorexia · cough · depression · diarrhoea · dizziness · fever · headache · insomnia · nausea · pruritus · rash · vomiting
  - ▶ **Uncommon** Anxiety · blood disorders · hair loss · hyponatraemia · palpitation · stomatitis
  - ▶ **Frequency not known** Cholestasis · hallucinations · hepatitis · mouth ulcers · photosensitivity · seizures · Stevens-Johnson syndrome · tachycardia · vasculitis
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Use only if no suitable alternative available.
- **RENAL IMPAIRMENT** Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m<sup>2</sup>.
- **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Chloroquine

### ● INDICATIONS AND DOSE

**Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)**

#### ▶ BY MOUTH

- Adult: 150 mg daily; maximum 2.5 mg/kg per day

### Prophylaxis of malaria

#### ▶ INITIALLY BY MOUTH USING SYRUP

- Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

#### ▶ INITIALLY BY MOUTH USING TABLETS

- Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

### Treatment of non-falciparum malaria

#### ▶ BY MOUTH

- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

### ***P. vivax* or *P. ovale* infection during pregnancy while radical cure is postponed**

#### ▶ BY MOUTH

- Adult: 310 mg once weekly

### DOSE EQUIVALENCE AND CONVERSION

- Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).

### DOSES AT EXTREMES OF BODY-WEIGHT

- In adults In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

### IMPORTANT SAFETY INFORMATION

#### ▶ In adults

Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

- **CAUTIONS** Acute porphyrias p. 930 · elderly · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) · severe gastro-intestinal disorders

### CAUTIONS, FURTHER INFORMATION

- ▶ Screening for ocular toxicity
- ▶ In adults A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening* 2009). Chloroquine should be considered (for treating chronic inflammatory conditions) **only** if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist.
- **INTERACTIONS** → Appendix 1 (chloroquine). Avoid concurrent therapy with hepatotoxic drugs.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- ▶ **Uncommon** Convulsions · discoloration of mucous membranes · discoloration of nails · discoloration of skin · ECG changes · hair depigmentation · hair loss · keratopathy · ototoxicity · retinal damage · visual changes
- ▶ **Rare** Acute generalised exanthematous pustulosis · agranulocytosis · angioedema · aplastic anaemia · blood disorders · bone marrow suppression · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · hypersensitivity reactions · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia · urticaria
- ▶ **Frequency not known** Bronchospasm (in children) · diffuse parenchymal lung disease · drug rash with eosinophilia and systemic symptoms · extrapyramidal symptoms (associated with use in malaria) · hypotension · visual disturbances

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Malaria prophylaxis and treatment Serious skin reactions, ECG changes, visual effects, ototoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

### Overdose

Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.
- **MONITORING REQUIREMENTS**
  - ▶ In adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
  - ▶ In children Ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

##### Tablet

CAUTIONARY AND ADVISORY LABELS 5

##### Tablets

▶ **Paludrine/Avloclor** (Alliance Pharmaceuticals Ltd)

Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet [P] £13.50

## Mefloquine

#### ● INDICATIONS AND DOSE

##### Treatment of malaria

▶ BY MOUTH

▶ Adult: (consult product literature)

##### Prophylaxis of malaria

▶ BY MOUTH

- ▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature.
- ▶ In children Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions - avoid for standby treatment if history of convulsions - history of blackwater fever
- **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · not recommended in infants under 3 months (5 kg) · traumatic brain injury
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.
- **INTERACTIONS** → Appendix 1 (mefloquine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · neuropsychiatric reactions · pruritus · visual disturbances · vomiting
  - ▶ **Very rare** Optic neuropathy
  - ▶ **Frequency not known** Alopecia · amnesia · anorexia · arrhythmias · arthralgia · ataxia · blood disorders · bradycardia · cataract · chest pain · confusion · drowsiness · dyspepsia · dyspnoea · encephalopathy · fever · flushing · hepatic failure · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · motor neuropathies · muscle weakness · myalgia · oedema · palpitation · panic attacks · pneumonitis · rash · seizures · sensory neuropathies · speech disturbances · Stevens-Johnson syndrome · syncope · tachycardia · thrombocytopenia · tremor · vestibular disorders
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).
- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.
- **BREAST FEEDING** Present in milk but risk to infant minimal.
- **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided. Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return. **Driving and skilled tasks** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

**NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 27

##### ▶ Lariam (Roche Products Ltd)

Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet [PoM] £14.53

## Primaquine

#### ● INDICATIONS AND DOSE

**Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection**

##### ▶ BY MOUTH

▶ Adult: 30 mg daily for 14 days

**Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection**

##### ▶ BY MOUTH

▶ Adult: 15 mg daily for 14 days

**Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection in patients with mild G6PD deficiency (administered on expert advice) | Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection in patients with mild G6PD deficiency (administered on expert advice)**

##### ▶ BY MOUTH

▶ Adult: 45 mg once weekly for 8 weeks

**Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)**

##### ▶ BY MOUTH

▶ Adult: 30 mg daily, this combination is associated with considerable toxicity

- **UNLICENSED USE** Not licensed.

● **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

- **INTERACTIONS** → Appendix 1 (primaquine).

#### ● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · anorexia · nausea · vomiting

▶ **Uncommon** Haemolytic anaemia especially in G6PD deficiency · leucopenia · methaemoglobinemia

● **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

● **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.

● **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

##### ▶ Primaquine (Non-proprietary)

Primaquine (as Primaquine phosphate) 15 mg Primaquine 15mg tablets | 100 tablet [PoM] no price available

## Proguanil hydrochloride

#### ● INDICATIONS AND DOSE

**Prophylaxis of malaria**

##### ▶ BY MOUTH

▶ Child 4-11 weeks (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

▶ Child 3-11 months (body-weight 6-9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

▶ Child 1-3 years (body-weight 10-15 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

▶ Child 4-7 years (body-weight 16-24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

▶ Child 8-12 years (body-weight 25-44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

▶ Child 13-17 years (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

▶ Adult: 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

● **UNLICENSED USE** Proguanil doses in BNF Publications may differ from those in product literature.

● **INTERACTIONS** → Appendix 1 (proguanil).

#### ● SIDE-EFFECTS

▶ **Common or very common** Constipation · diarrhoea · mild gastric intolerance

▶ **Very rare** Cholestasis · hair loss · skin reactions · vasculitis

▶ **Frequency not known** Mouth ulcers · stomatitis

● **PREGNANCY** Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

● **BREAST FEEDING** Amount in milk probably too small to be harmful when used for malaria prophylaxis.

### ● RENAL IMPAIRMENT

- ▶ In children Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m<sup>2</sup>. Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m<sup>2</sup>. Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73m<sup>2</sup>; increased risk of haematological toxicity in severe impairment.
- ▶ In adults 100 mg once daily if eGFR 20–60 mL/minute/1.73m<sup>2</sup>. 50 mg on alternate days if eGFR 10–20 mL/minute/1.73m<sup>2</sup>. 50 mg once weekly if eGFR less than 10 mL/minute/1.73m<sup>2</sup>; increased risk of haematological toxicity in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.

● **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

### ● NATIONAL FUNDING/ACCESS DECISIONS

**NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **Paludrine** (Alliance Pharmaceuticals Ltd)

**Proguanil hydrochloride 100 mg** Paludrine 100mg tablets | 98 tablet  £11.95 DT price = £11.95

## Pyrimethamine

### ● INDICATIONS AND DOSE

**Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)**

- ▶ BY MOUTH
- ▶ Adult: 50 mg once daily until delivery

#### Malaria

- ▶ BY MOUTH
- ▶ Adult: No dose stated because not recommended alone

● **CAUTIONS** History of seizures—avoid large loading doses · predisposition to folate deficiency

● **INTERACTIONS** → Appendix 1 (pyrimethamine).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia (with high doses) · blood disorders (with high doses) · diarrhoea · dizziness · headache · leucopenia (with high doses) · nausea · rash · thrombocytopenia (with high doses) · vomiting
- ▶ **Uncommon** Abnormal skin pigmentation · fever
- ▶ **Very rare** Buccal ulceration · colic · convulsions

● **PREGNANCY** Theoretical teratogenic risk in *first trimester* (folate antagonist). Adequate folate supplements should be given to the mother.

● **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.

● **LESS SUITABLE FOR PRESCRIBING** Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

▶ **Daraprim** (GlaxoSmithKline UK Ltd)

**Pyrimethamine 25 mg** Daraprim 25mg tablets | 30 tablet  £13.00

## Pyrimethamine with sulfadoxine

### ● INDICATIONS AND DOSE

**Adjunct to quinine in treatment of Plasmodium falciparum malaria**

▶ BY MOUTH

- ▶ Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
- ▶ Child 5–6 years: 25/500 mg for 1 dose
- ▶ Child 7–9 years: 37.5/750 mg for 1 dose
- ▶ Child 10–13 years: 50/1000 mg for 1 dose
- ▶ Child 14–17 years: 75/1500 mg for 1 dose
- ▶ Adult: 75/1500 mg for 1 dose

#### Malaria prophylaxis

▶ BY MOUTH

- ▶ Adult: Not recommended by UK malaria experts

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

● **UNLICENSED USE** Not licensed for use in children of body-weight under 5 kg.

● **CONTRA-INDICATIONS** Acute porphyrias p. 930

● **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks · elderly · G6PD deficiency · history of seizures—avoid large loading doses · not recommended for prophylaxis (severe side-effects on long-term use) · predisposition to folate deficiency · predisposition to hyperkalaemia (in adults)

● **INTERACTIONS** → Appendix 1 (pyrimethamine, sulfonamides).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
- ▶ **Uncommon** Vomiting
- ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · renal disorders · rhabdomyolysis reported in HIV-infected patients · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
- ▶ **Frequency not known** Allergic alveolitis · eosinophilic alveolitis · pulmonary infiltrates

#### SIDE-EFFECTS, FURTHER INFORMATION

Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sulfonamide allergy.

- **PREGNANCY** Possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Also known as *Fansidar*®.
- **PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Quinine

### ● INDICATIONS AND DOSE

#### Nocturnal leg cramps

##### ► BY MOUTH

- Adult: 200–300 mg once daily, to be taken at bedtime

#### Non-falciparum malaria

##### ► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient's condition permits

#### Falciparum malaria

##### ► BY MOUTH

- Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children over 12 years), or clindamycin
- Adult: 600 mg every 8 hours for 5–7 days, the quinine should be given together with or followed by either doxycycline or clindamycin

##### ► BY INTRAVENOUS INFUSION

- Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

#### Falciparum malaria (in intensive care unit)

##### ► BY INTRAVENOUS INFUSION

- Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

### DOSE EQUIVALENCE AND CONVERSION

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg.

Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.
- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) (in adults) · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1 (quinine).
- **SIDE-EFFECTS** Agitation · tinnitus · abdominal pain · acute renal failure · angioedema · blood disorders · cardiovascular effects · cinchonism · confusion · diarrhoea · dyspnoea · flushed skin · headache · hearing impairment · hot skin · hypersensitivity reactions · hypoglycaemia (especially after parenteral administration) · intravascular coagulation · muscle weakness · nausea · photosensitivity · rashes · temporary blindness · thrombocytopenia · vertigo · visual disturbances · vomiting

#### Overdose

Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 1204.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
  - With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **RENAL IMPAIRMENT**
  - With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS**
  - With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.
  - In adults Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.
  - With intravenous use in adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

**Tablet****► Quinine (Non-proprietary)**

**Quinine sulfate 200 mg** Quinine sulfate 200mg tablets | 28 tablet **[PoM]** £2.90 DT price = £1.70

**Quinine bisulfate 300 mg** Quinine bisulfate 300mg tablets | 28 tablet **[PoM]** £4.80 DT price = £2.01

**Quinine sulfate 300 mg** Quinine sulfate 300mg tablets | 28 tablet **[PoM]** £5.05 DT price = £2.07 | 500 tablet **[PoM]** no price available

## 6 Viral infection

### 6.1 Hepatitis

#### Hepatitis

##### Overview

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alpha p. 850 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

##### Chronic hepatitis B

Peginterferon alpha p. 576 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alpha. The use of peginterferon alpha and interferon alpha is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alpha-2a and interferon alpha contra-indicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alpha is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alpha-2a may be justified in some cases.

Entecavir p. 575, or tenofovir disoproxil p. 599 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 576, lamivudine p. 598, or telbivudine p. 575.

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 598 or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alpha or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

##### Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 578 and peginterferon alpha is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alpha is less effective than the combination of peginterferon alpha and ribavirin. Peginterferon alpha alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Boceprevir p. 581 and telaprevir p. 583 are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alpha for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alpha. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

Daclatasvir p. 577 is licensed for use in combination with sofosbuvir p. 580 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alpha and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir must not be given as monotherapy.

Ombitasvir with paritaprevir and ritonavir p. 578 (*Viekira<sup>®</sup>*), is licensed for use in combination with dasabuvir p. 583, with or without ribavirin, for the treatment of chronic hepatitis C infection of genotype 1 in patients with or without compensated cirrhosis; it is also licensed for use in combination with ribavirin for the treatment of chronic hepatitis C infection of genotype 4 with or without compensated cirrhosis.

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alpha, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Ledipasvir is licensed for use in combination with sofosbuvir (sofosbuvir with ledipasvir p. 581), with or

without ribavirin, for the treatment of chronic hepatitis C infections of genotypes 1, 3, 4, 5 or 6.

Simeprevir p. 582 is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 or 4; regimens containing peginterferon alfa-2b are less effective than those containing peginterferon alfa-2a. Simeprevir may also be used in combination with sofosbuvir, with or without ribavirin, for the urgent treatment of chronic hepatitis C infection of genotypes 1 or 4 only when peginterferon alfa cannot be used because of intolerance or contra-indications. Simeprevir monotherapy is not recommended.

## 6.2 Hepatitis infections

### 6.2a Chronic hepatitis B

**Other drugs used for Chronic hepatitis B** Interferon alfa, p. 850 · Lamivudine, p. 598 · Tenofovir disoproxil, p. 599

#### ANTIVIRALS > NUCLEOSIDE ANALOGUES

### Entecavir

#### ● INDICATIONS AND DOSE

**Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues**

▶ BY MOUTH

▶ Adult: 500 micrograms once daily

**Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance**

▶ BY MOUTH

▶ Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

**Chronic hepatitis B in patients with decompensated liver disease**

▶ BY MOUTH

▶ Adult: 1 mg once daily

- **CAUTIONS** HIV infection—risk of HIV resistance in patients not receiving ‘highly active antiretroviral therapy’ · lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

#### CAUTIONS, FURTHER INFORMATION

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · dyspepsia · fatigue · headache · nausea · raised serum amylase · raised serum lipase · sleep disturbances · vomiting
- ▶ **Uncommon** Alopecia · rash · thrombocytopenia

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>. Consult product literature.

- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at

least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION** To be taken at least 2 hours before or 2 hours after food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Entecavir for chronic hepatitis B (August 2008)** NICE TA153  
Entecavir is an option for the treatment of chronic hepatitis B.  
[www.nice.org.uk/TA153](http://www.nice.org.uk/TA153)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 tablet [PoM] £363.26

Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets | 30 tablet [PoM] £363.26

##### Oral solution

- ▶ **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml Baraclude 0.05mg/ml oral solution sugar-free | 210 ml [PoM] £423.80

### Telbivudine

#### ● INDICATIONS AND DOSE

**Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate**

▶ BY MOUTH

▶ Adult: 600 mg once daily

- **CAUTIONS** Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance

#### CAUTIONS, FURTHER INFORMATION

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS** → Appendix 1 (telbivudine).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · cough · diarrhoea · dizziness · fatigue · headache · nausea · raised serum amylase · raised serum lipase · rash
- ▶ **Uncommon** Arthralgia · myalgia · myopathy (discontinue treatment) · peripheral neuropathy · taste disturbance
- ▶ **Rare** Lactic acidosis · rhabdomyolysis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m<sup>2</sup>; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **PATIENT AND CARER ADVICE**  
Muscle effects and peripheral neuropathy Patients should be advised to promptly report unexplained muscle pain,

tenderness, or weakness, or numbness, tingling or burning sensations.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Telbivudine for chronic hepatitis B (August 2008)** NICE TA154  
Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA154](http://www.nice.org.uk/TA154)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## ANTIVIRALS > NUCLEOTIDE ANALOGUES

### Adefovir dipivoxil

#### ● INDICATIONS AND DOSE

**Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir**

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily

#### ● CAUTIONS

Elderly

##### CAUTIONS, FURTHER INFORMATION

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **SIDE-EFFECTS** Abdominal pain · asthenia · diarrhoea · dyspepsia · flatulence · headache · hypophosphataemia · nausea · pancreatitis · pruritus · rash · renal failure · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>. No information available if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>. Monitor renal function more frequently in patients with renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
  - ▶ Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

## IMMUNOSTIMULANTS > INTERFERONS

### Peginterferon alfa

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood.

#### ● INDICATIONS AND DOSE

##### PEGASYS®

**Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

##### VIRAFERONPEG®

**Combined with ribavirin for chronic hepatitis C | Combined with ribavirin and boceprevir for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** For contra-indications consult product literature.
- **CAUTIONS** For cautions consult product literature.
- **INTERACTIONS** → Appendix 1 (interferons).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · diarrhoea · influenza-like symptoms · lethargy · nausea
  - ▶ **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma (usually with high doses in the elderly) · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypotension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · palpitation · psoriasisiform rash · seizures (usually with high doses in the elderly) · suicidal behaviour · thyroid abnormalities
- **SIDE-EFFECTS, FURTHER INFORMATION**  
For information on side effects consult product literature.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.
- **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200  
The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the

disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

[www.nice.org.uk/TA200](http://www.nice.org.uk/TA200)

▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200**

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

- not previously treated with interferon alfa or peginterferon alfa;
- treated previously with interferon alfa alone or in combination with ribavirin;
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk.

Patients receiving interferon alfa may be switched to peginterferon alfa.

[www.nice.org.uk/TA200](http://www.nice.org.uk/TA200)

## 6.2b Chronic hepatitis C

**Other drugs used for Chronic hepatitis C** Interferon alfa, p. 850 • Peginterferon alfa, p. 576

## ANTIVIRALS > NON-STRUCTURAL PROTEIN 5A INHIBITORS

### Daclatasvir

22-Mar-2016

- **DRUG ACTION** Daclatasvir is an inhibitor of the multifunctional protein NS5A, which is an essential component of the hepatitis C virus replication process.

● **INDICATIONS AND DOSE**

**In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis | In combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis | In combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4**

▶ **BY MOUTH**

▶ Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Reduce dose to 30 mg once daily with concomitant use of potent CYP3A4 inhibitors (e.g. atazanavir boosted with ritonavir, boceprevir, clarithromycin, cobicistat, itraconazole, ketoconazole, posaconazole, telaprevir, telithromycin, and voriconazole).

Increase dose to 90 mg once daily with concomitant use of moderate CYP3A4 inducers (e.g. efavirenz).

- **CAUTIONS** Decompensated liver disease • hepatitis B virus co-infection • human immunodeficiency virus co-infection • organ transplant patients • retreatment—efficacy not established in patients with prior exposure to a NS5A inhibitor

- **INTERACTIONS** → Appendix 1 (daclatasvir).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain • alopecia • anaemia • anxiety • arthralgia • blurred vision • constipation • cough • decreased appetite • depression • diarrhoea • disturbance in attention • dizziness • dry mouth • dry skin • dyspnoea • flatulence • gastro-oesophageal reflux • headache • hot flush • insomnia • irritability • lymphopenia • malaise • migraine • myalgia • nasal congestion • nausea • neutropenia • pruritus • pyrexia • rash • reduced visual acuity • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa.

- **CONCEPTION AND CONTRACEPTION** Highly effective contraception required during and for 5 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **PATIENT AND CARER ADVICE**

**Missed doses**

If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks**

May affect performance of skilled tasks (e.g. driving)

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Daclatasvir for treating chronic hepatitis C (November 2015)** NICE TA364  
Daclatasvir in combination with sofosbuvir or peginterferon alfa, and with/without ribavirin, is recommended as an option for the treatment of chronic hepatitis C infection of genotypes 1, 3 or 4 in adults, depending on the level of fibrosis **and** only if the manufacturer provides daclatasvir at the same price or lower than agreed with the Commercial Medicines Unit. [www.nice.org.uk/TA364](http://www.nice.org.uk/TA364)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2014) that daclatasvir (*Daklinza*®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus infection in patients with significant fibrosis (Metavir score F3–F4) or compensated cirrhosis.

### ● MEDICINAL FORMS

## Ombitasvir with paritaprevir and ritonavir

29-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, ritonavir p. 604.

### ● INDICATIONS AND DOSE

**Chronic hepatitis C of genotype 1 (in combination with dasabuvir, with or without ribavirin) Chronic hepatitis C of genotype 4 (in combination with ribavirin)**

- ▶ BY MOUTH
- ▶ Adult: 2 tablets once daily for duration of treatment consult product literature, to be taken with food

- **CONTRA-INDICATIONS** HIV co-infection without suppressive antiretroviral therapy
- **CAUTIONS** Retreatment—efficacy not established
- **INTERACTIONS** → Appendix 1 (ombitasvir, paritaprevir, ritonavir).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · asthenia · fatigue · insomnia · nausea
- ▶ **Frequency not known** Transient hyperbilirubinemia
- SIDE-EFFECTS, FURTHER INFORMATION**  
Side-effects listed are reported when ombitasvir with paritaprevir and ritonavir is used in combination with dasabuvir, with or without ribavirin.
- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, exclude pregnancy before initiation of treatment; effective contraception should be used during treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate or severe impairment.

### ● PATIENT AND CARER ADVICE

#### Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Ombitasvir with paritaprevir and ritonavir with or without dasabuvir for treating chronic hepatitis C** NICE TA365  
Ombitasvir with paritaprevir and ritonavir with or without dasabuvir is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme. [www.nice.org.uk/guidance/ta365](http://www.nice.org.uk/guidance/ta365)

## ANTIVIRALS > NUCLEOSIDE ANALOGUES

### Ribavirin

(Tribavirin)

### ● INDICATIONS AND DOSE

#### Bronchiolitis

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1–23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

#### Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

#### COPEGUS® TABLETS

#### Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 75 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- ▶ Adult (body-weight 75 kg and above): 600 mg twice daily

#### Chronic hepatitis C (in combination with peginterferon alfa 2b with or without direct acting antivirals)

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 65 kg): 400 mg twice daily
- ▶ Adult (body-weight 65–80 kg): 400 mg, to be taken in the morning and 600 mg, to be taken in the evening
- ▶ Adult (body-weight 81–105 kg): 600 mg twice daily
- ▶ Adult (body-weight 106 kg and above): 600 mg, to be taken in the morning and 800 mg, to be taken in the evening

**Chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)**

- ▶ BY MOUTH
- ▶ Adult: Usual dose 400 mg twice daily

**REBETOL® CAPSULES****Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 65 kg): 400 mg twice daily
- ▶ Adult (body-weight 65–80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- ▶ Adult (body-weight 81–104 kg): 600 mg twice daily
- ▶ Adult (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

**REBETOL® ORAL SOLUTION****Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 65 kg): 400 mg twice daily
- ▶ Adult (body-weight 65–80 kg): 400 mg daily, dose to be taken in the morning and 600 mg daily, dose to be taken in the evening
- ▶ Adult (body-weight 81–104 kg): 600 mg twice daily
- ▶ Adult (body-weight 105 kg and above): 600 mg daily, dose to be taken in the morning and 800 mg daily, dose to be taken in the evening

- **UNLICENSED USE** Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

**CONTRA-INDICATIONS**

- ▶ With systemic use Active severe psychiatric condition (in children) · autoimmune disease (in children) · autoimmune hepatitis (in children) · consult product literature for specific contra-indications when ribavirin p. 578 used in combination with other medicinal products · haemoglobinopathies · history of severe psychiatric condition (in children) · severe cardiac disease (in adults) · severe debilitating medical conditions · severe, uncontrolled cardiac disease in children with chronic hepatitis C · unstable or uncontrolled cardiac disease in previous 6 months (in adults)

**CAUTIONS**

- ▶ When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- ▶ With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin p. 578 used in combination with other medicinal products · gout (in adults) · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt · severe dental disorders (in adults) · severe ocular disorders (in adults) · severe periodontal disorders (in adults) · severe psychiatric effects (in adults)

- **INTERACTIONS** → Appendix 1 (ribavirin).

**SIDE-EFFECTS**

- ▶ When used by inhalation Bacterial pneumonia · haemolysis · non-specific anaemia · pneumothorax · worsening respiration

- ▶ With oral use Abdominal pain · abnormal dreams · acne · alopecia · angina (in adults) · anorexia (in adults) · anxiety · aplastic anaemia · arrhythmias · arthralgia · asthenia (in children) · ataxia · bipolar disorders (in adults) · breast pain · cardiomyopathy · cerebral haemorrhage (in adults) · cerebral ischaemia (in adults) · changes in blood pressure · cheilitis · chest pain · colitis · constipation · cough · dehydration · depression · diabetes (in adults) · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspepsia · dysphagia · dysphonia (in children) · dyspnoea · earache · endocarditis (in adults) · epistaxis (in children) · eye pain · flatulence · flushing · gastro-intestinal bleeding · gastroesophageal reflux (in children) · gingival bleeding (in adults) · gingivitis · glossitis · growth retardation (including decrease in height and weight) (in children) · haemolytic anaemia (anaemia may be improved by epoetin) · hallucination (in children) · headache · hearing impairment · hearing loss (in adults) · hyperaesthesia · hyperglycaemia · hyperkinesia (in children) · hypertonia · hypertriglyceridaemia · hyperuricaemia · hypoaesthesia · hypocalcaemia · impaired concentration and memory · increased sweating · influenza-like symptoms · interstitial pneumonitis · leucopenia · loose stools (in children) · lymphadenopathy · malaise (in adults) · mania (in adults) · menstrual disturbance · micturition disorders · mood disorders (in children) · mouth ulcers · musculoskeletal pain · myalgia · myocardial infarction · myositis (in adults) · nasal congestion · nausea · neutropenia · optic neuropathy · oral candidiasis · pallor (in children) · palpitation · pancreatitis · panic attack (in children) · paraesthesia · peptic ulcer · pericarditis · peripheral ischaemia (in children) · peripheral neuropathy · peripheral oedema · photosensitivity · prostatitis (in adults) · pruritus · psoriasis · psychotic disorders · pulmonary embolism · rash · renal failure · respiratory infections · retinal detachment (in adults) · retinal haemorrhage · rhabdomyolysis (in adults) · rheumatoid arthritis · sarcoidosis · seizures · sexual dysfunction · sinus congestion · skin discoloration · sleep disturbances · sore throat · Stevens-Johnson syndrome · stomatitis · stroke (in children) · suicidal ideation (more frequent in children) · syncope · systemic lupus erythematosus · tachycardia · tachypnoea (in children) · taste disturbance · testicular pain (in children) · thrombocytopenia · thrombocytopenia purpura (in adults) · thyroid disorders · tinnitus · tongue pigmentation (in adults) · tooth disorder (in children) · toxic epidermal necrolysis · tremor (in adults) · urinary tract infections · vaculitis (in adults) · vertigo (in children) · virilism (in children) · vision loss (in adults) · visual disturbances · vomiting · weight loss · wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ With oral use Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.
- **CONCEPTION AND CONTRACEPTION**
- ▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- ▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.
- **PREGNANCY** Avoid; teratogenicity in *animal* studies.
- ▶ When used by inhalation Pregnant women should avoid exposure to aerosol.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.

- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased.
- ▶ In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>—monitor haemoglobin concentration closely.
- ▶ In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m<sup>2</sup>—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
  - ▶ With systemic use Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
  - ▶ With systemic use in children Test thyroid function before treatment and then every 3 months. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200  
The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). [www.nice.org.uk/TA200](http://www.nice.org.uk/TA200)
  - ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)** NICE TA200  
The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
    - not previously treated with interferon alfa or peginterferon alfa;
    - treated previously with interferon alfa alone or in combination with ribavirin;
    - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
    - co-infected with HIV.
 Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. [www.nice.org.uk/TA200](http://www.nice.org.uk/TA200)
- **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

- ▶ **Sofosbuvir for treating chronic hepatitis C (February 2015)** NICE TA330

Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
  - of genotype 3 with cirrhosis (treatment naive patients)
  - of genotype 3 that has not adequately responded to interferon-based treatment
  - of genotype 4, 5, or 6 with cirrhosis
- Sofosbuvir in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:
- of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
  - of genotype 2 that has not adequately responded to interferon-based treatment
  - of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
  - of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment

▶ **Sofosbuvir for treating chronic hepatitis C (February 2015)** NICE TA330

Sofosbuvir in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6.

[www.nice.org.uk/TA330](http://www.nice.org.uk/TA330)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2014) that sofosbuvir (*Sovaldi*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## Sofosbuvir with ledipasvir

25-Apr-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 580.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

● **INDICATIONS AND DOSE**

**Chronic hepatitis C of genotypes 1, 4, 5 or 6 in patients with or without compensated cirrhosis (with or without ribavirin) | Chronic hepatitis C of genotypes 1, 4, 5 or 6 in post-liver transplant patients, with or without compensated cirrhosis (with or without ribavirin) | Chronic hepatitis C of genotypes 1, 4, 5 or 6 in patients with decompensated cirrhosis, irrespective of transplant status (with or without ribavirin) | In combination with ribavirin for chronic hepatitis C infection of genotype 3 in patients with compensated cirrhosis or prior treatment failure**

▶ BY MOUTH

▶ Adult: 1 tablet once daily, for duration of treatment consult product literature

- **CAUTIONS** Retreatment following treatment failure—efficacy not established
- **INTERACTIONS** → Appendix 1 (sofosbuvir, ledipasvir)
- **SIDE-EFFECTS**
  - ▶ Common or very common Headache · malaise
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● **PATIENT AND CARER ADVICE**

**Missed doses**

If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Vomiting If vomiting occurs within 5 hours of administration, an additional dose should be taken.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

▶ **Ledipasvir with sofosbuvir for the treatment of chronic hepatitis C (November 2015)** NICE TA363

Ledipasvir with sofosbuvir is recommended as an option for treating adults with chronic hepatitis C infection:

- of genotype 1 without cirrhosis (treatment naive patients)—8 weeks' treatment
- of genotype 1 or 4 with cirrhosis (treatment naive patients)—12 weeks' treatment
- of genotype 1 or 4 without cirrhosis (or with cirrhosis but only if the person has a low risk of the disease getting worse) that has not responded adequately to previous treatment—12 weeks' treatment

In addition, ledipasvir with sofosbuvir is only recommended in patients with cirrhosis for the durations mentioned above if the following criteria are met:

- Child-Pugh class A
  - platelet count of 75 000/mm<sup>3</sup> or more
  - no features of portal hypertension
  - no history of an HCV-associated decompensation episode
  - not previously treated with an NS5A inhibitor
- Patients whose treatment with ledipasvir with sofosbuvir is not recommended in this NICE guidance, but was started within the NHS before this guidance was published, should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA363](http://www.nice.org.uk/TA363)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (March and September 2015) that *Harvoni*<sup>®</sup> (ledipasvir with sofosbuvir) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1, 3 and 4 only, in patients who are ineligible for, or unable to tolerate, interferon.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## ANTIVIRALS > PROTEASE INHIBITORS

### Boceprevir

● **INDICATIONS AND DOSE**

**Chronic hepatitis C infection of genotype 1 in patients with compensated liver disease (in combination with ribavirin and peginterferon alfa)**

▶ BY MOUTH

▶ Adult: 800 mg 3 times a day, for duration of treatment consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Appendix 1 (boceprevir).

Caution with concomitant use of other drugs known to prolong QT interval.

- **CONTRA-INDICATIONS** Autoimmune hepatitis

- **CAUTIONS** Coagulopathy · hypoalbuminaemia · low platelets · predisposition to QT interval prolongation

#### CAUTIONS, FURTHER INFORMATION

- ▶ Low platelets, hypoalbuminaemia, or coagulopathy Not recommended in patients with low platelets, hypoalbuminaemia, or coagulopathy—if initiated in these patients monitor closely for signs of infection, worsening liver impairment and anaemia (increased risk of severe morbidity and mortality).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · agitation · alopecia · amnesia · anaemia · anxiety · arthralgia · asthenia · blood pressure changes · changes in libido · constipation · cough · decreased appetite · depression · diarrhoea · disturbances in smell · disturbances in taste · dizziness · dry eyes · dry mouth · dyspnoea · erectile dysfunction · flatulence · gastro-oesophageal reflux · haemorrhoids · headache · hyperglycaemia · hyperhidrosis · hypertriglyceridaemia · hyperuricaemia · hypoaesthesia · hypothyroidism · influenza-like symptoms · insomnia · leucopenia · mouth ulcers · muscle spasms · myalgia · nausea · palpitation · pancytopenia · paraesthesia · peripheral oedema · polyuria · pruritus · psoriasis · rash · stomatitis · syncope · thrombocytopenia · tinnitus · tooth disorder · tremor · visual disturbances · vomiting · weight loss
- ▶ **Uncommon** Amenorrhoea · arrhythmias · colitis · conjunctival haemorrhage · dysphagia · dysphonia · dysuria · eye pain · flushing · gingivitis · gout · hearing impairment · homicidal ideation · hyperaesthesia · hyperbilirubinaemia · hypercalcaemia · hypersalivation · hyperthyroidism · hypokalaemia · increased lacrimation · menorrhagia · pallor · pancreatitis · photophobia · photosensitivity · retinal ischaemia · retinopathy · skin ulceration · suicidal ideation · tongue discoloration · venous thromboembolism
- ▶ **Rare** Acute myocardial infarction · aspermia · bipolar disorder · cholecystitis · coronary artery disease · encephalopathy · hallucinations · pericarditis · pleural fibrosis · respiratory failure · sarcoidosis · thyroid neoplasms
- ▶ **Frequency not known** Rash with eosinophilia and systemic symptoms · Stevens-Johnson syndrome

#### SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when boceprevir is used in combination with ribavirin and peginterferon alfa.

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid; present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Monitor full blood count before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.

#### ● PATIENT AND CARER ADVICE

##### Missed doses

If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012)** NICE TA253  
Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
  - who have not been treated previously;
  - in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

[www.nice.org.uk/TA253](http://www.nice.org.uk/TA253)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Simeprevir

#### ● INDICATIONS AND DOSE

**In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4 | In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications**

##### ▶ BY MOUTH

- ▶ **Adult:** 150 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS** Consider alternative treatment in presence of NS3 Q80K polymorphism—efficacy of simeprevir is reduced · patients of East Asian origin
- **INTERACTIONS** → Appendix 1 (simeprevir).
- **SIDE-EFFECTS** Constipation · dyspnoea · fatigue (in combination with sofosbuvir) · headache (in combination with sofosbuvir) · insomnia (in combination with sofosbuvir) · nausea · photosensitivity · pruritus · raised bilirubin concentration · rash
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Rash** Monitor for deterioration if mild or moderate; discontinue if severe.
- **CONCEPTION AND CONTRACEPTION** Effective contraception essential during treatment.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in plasma of breast-fed *animals*.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—elimination reduced in severe impairment. Manufacturer advises caution in decompensated cirrhosis—elimination reduced in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—elimination may be reduced.
- **PRE-TREATMENT SCREENING** Test for NS3 Q80K polymorphism before combination treatment with ribavirin and peginterferon alfa in patients with chronic hepatitis C infection of genotype 1a. Consider testing for NS3 Q80K polymorphism before combination treatment with sofosbuvir (with or without ribavirin) in patients with chronic hepatitis C infection of genotype 1a.
- **PATIENT AND CARER ADVICE**
  - Missed doses**  
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

| 7 capsule [PoM] £1,866.50

**Telaprevir****INDICATIONS AND DOSE**

**In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease**

## ▶ BY MOUTH

- ▶ Adult: 1.125 g every 12 hours, alternatively 750 mg every 8 hours, for duration of treatment consult product literature

- **CAUTIONS** Bradycardia · congenital or family history of QT interval prolongation · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · hypoalbuminaemia · low platelets · prolongation of QT interval

**CAUTIONS, FURTHER INFORMATION**

- ▶ Low platelets or hypoalbuminaemia Not recommended in patients with low platelets or hypoalbuminaemia—if initiated in these patients monitor closely for signs of infection, worsening liver impairment, and anaemia (increased risk of severe morbidity and mortality).

- **INTERACTIONS** → Appendix 1 (telaprevir).  
Caution in concomitant use with other drugs known to prolong QT interval.

**SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · anal fissure · diarrhoea · eczema · haemorrhoids · hyperbilirubinaemia · hyperuricaemia · hypokalaemia · hypothyroidism · lymphopenia · nausea · peripheral oedema · pruritus · rash · syncope · taste disturbances · thrombocytopenia · vomiting
- ▶ **Uncommon** Gout · proctitis · retinopathy · urticaria
- ▶ **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects listed are reported when telaprevir is used in combination with ribavirin and peginterferon alfa.

- ▶ **Rash** Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistering or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.
- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE****Missed doses**

If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens.

**NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ Telaprevir for chronic hepatitis C infection of genotype 1 (April 2012) NICE TA252

Telaprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:

- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

## 6.3 Herpesvirus infections

### Herpesvirus infections

#### Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

#### Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

#### Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g.

because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

#### Choice

Aciclovir p. 585 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir p. 587, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 587 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 589 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex p. 585 has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

#### Cytomegalovirus infection

Ganciclovir p. 588 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 601; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir p. 589 is an ester of ganciclovir which is licensed for the *initial treatment and maintenance treatment* of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment.

See local treatment of CMV retinitis.

## ANTIVIRALS &gt; INOSINE COMPLEXES

## Inosine pranobex

(Inosine acedoben dimepranol)

## ● INDICATIONS AND DOSE

**Mucocutaneous herpes simplex**

- ▶ BY MOUTH
- ▶ Adult: 1 g 4 times a day for 7–14 days

**Adjunctive treatment of genital warts**

- ▶ BY MOUTH
- ▶ Adult: 1 g 3 times a day for 14–28 days

**Subacute sclerosing panencephalitis**

- ▶ BY MOUTH
- ▶ Adult: 50–100 mg/kg daily in 6 divided doses

- **CAUTIONS** History of gout · history of hyperuricaemia

● **SIDE-EFFECTS**

- ▶ **Common or very common** Reversible increase in serum uric acid · reversible increase in urinary uric acid
- ▶ **Uncommon** Arthralgia · epigastric discomfort · fatigue · headache · itching · nausea · rashes · vertigo · vomiting
- ▶ **Rare** Anxiety · constipation · diarrhoea · polyuria · sleep disturbances

- **PREGNANCY** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises caution; metabolised to uric acid.

- **LESS SUITABLE FOR PRESCRIBING** Inosine pranobex is less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- ▶ Child 6-11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 12-17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions
- ▶ Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions

**Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours given for 10-14 days in encephalitis, possibly longer if also immunocompromised or if severe infection

**Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated**

## ▶ BY MOUTH

- ▶ Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
- ▶ Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

- **UNLICENSED USE** Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children. Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.
- **CAUTIONS** Elderly (risk of neurological reactions) · maintain adequate hydration (especially with infusion or high doses)
- **INTERACTIONS** → Appendix 1 (aciclovir).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting
  - ▶ **Very rare** Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia
  - ▶ With intravenous use Agitation · fever · psychosis · severe local inflammation (sometimes leading to ulceration) · tremors
- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **RENAL IMPAIRMENT**
  - ▶ With systemic use Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).
  - ▶ With intravenous use Use normal intravenous dose every 12 hours if eGFR 25-50 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR 10-25 mL/minute/1.73 m<sup>2</sup>). Consult product

literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- ▶ With oral use in adults For *herpes zoster*, use normal oral dose every 8 hours if eGFR 10-25 mL/minute/1.73 m<sup>2</sup> (every 12 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>). For *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ With oral use in children For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10-25 mL/minute/1.73 m<sup>2</sup> (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>). For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.

**● DIRECTIONS FOR ADMINISTRATION**

For *intravenous infusion Zovirax IV*<sup>®</sup>, *Aciclovir IV* (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

**● PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Aciclovir (oral) for viral infections [www.medicinesforchildren.org.uk/aciclovir-for-viral-infections](http://www.medicinesforchildren.org.uk/aciclovir-for-viral-infections)

**● PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

**● MEDICINAL FORMS**

## 6.3a Cytomegalovirus infections

## ANTIVIRALS &gt; NUCLEOSIDE ANALOGUES

**Ganciclovir**● **INDICATIONS AND DOSE****Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 5 mg/kg every 12 hours for 7–14 days

**Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) · ensure adequate hydration · history of cytopenia · potential carcinogen · potential teratogen · radiotherapy · vesicant
- **INTERACTIONS** → Appendix 1 (ganciclovir). Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · abnormal thinking · anaemia · anorexia · anxiety · arthralgia · chest pain · confusion · constipation · convulsions · cough · depression · dermatitis · diarrhoea · dizziness · dyspepsia · dysphagia · dyspnoea · ear pain · eye pain · fatigue ·

flatulence · headache · hepatic dysfunction · infection · injection-site reactions · insomnia · leucopenia · macular oedema · myalgia · nausea · night sweats · pancytopenia · peripheral neuropathy · pruritus · pyrexia · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss

► **Uncommon** Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing and vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

● **PREGNANCY** Avoid—teratogenic risk.

● **BREAST FEEDING** Avoid—no information available.

● **RENAL IMPAIRMENT** Reduce dose if eGFR less than 70 mL/minute/1.73 m<sup>2</sup>; consult product literature.

● **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

● **DIRECTIONS FOR ADMINISTRATION** Infuse into vein with adequate flow preferably using plastic cannula. For intravenous infusion (Cymevene<sup>®</sup>) give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially in water for injections (500 mg/10 mL then dilute to not more than 10 mg/m<sup>2</sup> with infusion fluid (usually 100 mL); give over 1 hour.

#### ● HANDLING AND STORAGE

Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

► **Cymevene** (Roche Products Ltd)

Ganciclovir (as Ganciclovir sodium) 500 mg Cymevene 500mg powder for solution for infusion vials | 5 vial [PoM] £148.83

## Valganciclovir

#### ● INDICATIONS AND DOSE

##### **Cytomegalovirus retinitis, induction and maintenance treatment in patients with AIDS**

► BY MOUTH

► **Adult:** Initially 900 mg twice daily for 21 days, then 900 mg daily, induction regimen may be repeated if retinitis progresses

##### **Prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus positive donor**

► BY MOUTH

► **Adult:** 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

#### DOSE EQUIVALENCE AND CONVERSION

► Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

● **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

● **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) · history of cytopenia · potential carcinogen · potential teratogen · radiotherapy

● **INTERACTIONS** → Appendix 1 (valganciclovir).

#### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · abnormal thinking · anaemia · anorexia · anxiety · arthralgia · chest pain · confusion · constipation · convulsions · cough · depression · dermatitis · diarrhoea · dizziness · dyspepsia · dysphagia · dyspnoea · ear pain · eye pain · fatigue · flatulence · headache · hepatic dysfunction · infection · insomnia · leucopenia · macular oedema · myalgia · nausea · night sweats · pancytopenia · peripheral neuropathy · pruritus · pyrexia · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss

► **Uncommon** Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing · disturbances in vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

● **PREGNANCY** Avoid—teratogenic risk.

● **BREAST FEEDING** Avoid—no information available.

● **RENAL IMPAIRMENT** Reduce dose, consult product literature.

● **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

#### ● PRESCRIBING AND DISPENSING INFORMATION

Valganciclovir is a pro-drug of ganciclovir.

Flavours of oral liquid formulations may include tutti-frutti.

#### ● HANDLING AND STORAGE

Caution in handling Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### **Tablet**

CAUTIONARY AND ADVISORY LABELS 21

► **Valcyte** (Roche Products Ltd)

Valganciclovir (as Valganciclovir hydrochloride) 450 mg Valcyte 450mg tablets | 60 tablet [PoM] £1,081.46

##### **Oral solution**

CAUTIONARY AND ADVISORY LABELS 21

► **Valcyte** (Roche Products Ltd)

Valganciclovir (as Valganciclovir hydrochloride) 50 mg per 1 mL Valcyte 50mg/ml oral solution sugar-free | 100 mL [PoM] £230.32

## ANTIVIRALS > OTHER

## Foscarnet sodium

#### ● INDICATIONS AND DOSE

##### **Cytomegalovirus disease**

► BY INTRAVENOUS INFUSION

► **Adult:** Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance

continued →

60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

#### Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

► BY INTRAVENOUS INFUSION

► Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.
- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1 (foscarnet).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · acute renal failure · aggression · agitation · anaemia · anorexia · anxiety · changes in blood pressure · changes in ECG · confusion · constipation · convulsions · depression · diarrhoea · dizziness · dyspepsia · dysuria · electrolyte disturbances · genital irritation and ulceration (due to high concentrations excreted in urine) · granulocytopenia · headache · hepatic dysfunction · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · malaise · myalgia · nausea (reduce infusion rate) · neurological disorders · oedema · palpitation · pancreatitis · paraesthesia (reduce infusion rate) · polyuria · pruritus · rash · renal impairment · thrombocytopenia · thrombophlebitis if given undiluted by peripheral vein · tremor · vomiting
  - **Uncommon** Acidosis
  - **Frequency not known** Diabetes insipidus · myasthenia · myositis · oesophageal ulceration · rhabdomyolysis · ventricular arrhythmias
- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Reduce dose; consult product literature.
- **MONITORING REQUIREMENTS**
  - Monitor electrolytes, particularly calcium and magnesium.
  - Monitor serum creatinine every second day during induction and every week during maintenance.
- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For *intravenous infusion* (Foscavir<sup>®</sup>), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution *via* central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

ELECTROLYTES: May contain Sodium

► **Foscavir** (Clinigen Healthcare Ltd)

**Foscarnet sodium 24 mg per 1 ml** Foscavir 6g/250ml solution for infusion bottles | 1 bottle [PoM](#) £119.85 (Hospital only)

(antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

### Principles of treatment

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

### Initiation of treatment

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and *either* a non-nucleoside reverse transcriptase inhibitor, *or* a boosted protease inhibitor, *or* an integrase inhibitor; the regimens of choice contain tenofovir disoproxil p. 599 and emtricitabine p. 598 with *either* efavirenz p. 593 *or* ritonavir-boosted atazanavir p. 602, *or* ritonavir-boosted darunavir p. 602, *or* raltegravir p. 593. Alternative regimens contain abacavir p. 596 and lamivudine p. 598 with *either* lopinavir with ritonavir p. 604, *or* ritonavir-boosted fosamprenavir p. 603, *or* nevirapine p. 594, *or* rilpivirine p. 595. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases.

### Switching therapy

Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

### Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at [www.ucl.ac.uk/nshpc/](http://www.ucl.ac.uk/nshpc/)

## 6.4 HIV infection

### HIV infection

#### Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection

and to the Antiretroviral Pregnancy Registry at [www.apregistry.com](http://www.apregistry.com).

### Breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

### Post-exposure prophylaxis

Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS), [www.gov.uk/dh](http://www.gov.uk/dh) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, [www.bashh.org](http://www.bashh.org).

### Drugs for HIV infection

Zidovudine p. 601, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 597, emtricitabine, lamivudine, stavudine p. 598, and tenofovir disoproxil.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), indinavir p. 603, lopinavir (available as lopinavir with ritonavir), ritonavir, saquinavir p. 605, and tipranavir p. 605. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 594, nevirapine, and rilpivirine are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 606 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 592, elvitegravir p. 592 and raltegravir are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Cobicistat p. 606 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

### Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

### Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

### HIV infection in children

HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

## ANTIVIRALS > HIV-FUSION INHIBITORS

### Enfuvirtide

● **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 90 mg twice daily

● **INTERACTIONS** → Appendix 1 (enfuvirtide).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Acne · anorexia · anxiety · asthenia · conjunctivitis · diabetes mellitus · dry skin · erythema · gastro-oesophageal reflux disease · haematuria · hypertriglyceridaemia · impaired concentration · influenza-like illness · injection-site reactions · irritability · lymphadenopathy · myalgia · nightmares · pancreatitis · peripheral neuropathy · pneumonia · renal calculi · sinusitis · skin papilloma · tremor · vertigo · weight loss
- ▶ **Uncommon** Hypersensitivity reactions
- ▶ **Frequency not known** Osteonecrosis

#### ● SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.
- ▶ **Osteonecrosis** For further information see HIV infection p. 590.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to

discontinue treatment and seek immediate medical attention if symptoms develop.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► **Fuzeon** (Roche Products Ltd)

**Enfuvirtide 108 mg** Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial **[PoM]** £1,081.57

## ANTIVIRALS > HIV-INTEGRASE INHIBITORS

### Dolutegravir

20-Nov-2015

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

#### INDICATIONS AND DOSE

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs**

► BY MOUTH

► Adult: 50 mg once daily

**HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs**

► BY MOUTH

► Adult: 50 mg twice daily, dose to be taken with food

**HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)**

► BY MOUTH

► Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

- **INTERACTIONS** → Appendix 1 (dolutegravir). Caution—avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir.

#### SIDE-EFFECTS

- **Common or very common** Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting
  - **Uncommon** Hepatitis · hypersensitivity reactions
  - **Frequency not known** Osteonecrosis
- SIDE-EFFECTS, FURTHER INFORMATION**
- Hypersensitivity reactions Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.
  - Osteonecrosis For further information see HIV infection p. 590.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

#### PATIENT AND CARER ADVICE

**Missed doses**  
If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily

regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

Patients or carers should be given advice on how to administer dolutegravir tablets.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

► **Tivicay** (ViiV Healthcare UK Ltd) ▼

**Dolutegravir (as Dolutegravir sodium) 50 mg** Tivicay 50mg tablets | 30 tablet **[PoM]** £498.75

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 596

### Elvitegravir

30-Nov-2016

- **DRUG ACTION** Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

#### INDICATIONS AND DOSE

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir**

► BY MOUTH

► Adult: 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir**

► BY MOUTH

► Adult: 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

- **CAUTIONS** Elderly—limited information available
  - **INTERACTIONS** → Appendix 1 (elvitegravir).
  - **SIDE-EFFECTS**
    - **Common or very common** Diarrhoea · fatigue · headache · nausea · rash · vomiting
    - **Uncommon** Abdominal distension · depression · dizziness · dysgeusia · dyspepsia · flatulence · insomnia · paraesthesia · somnolence · suicidal ideation (in patients with history of depression or psychiatric illness)
    - **Frequency not known** Hyperglycaemia · increased blood lipids · osteonecrosis · weight gain
- SIDE-EFFECTS, FURTHER INFORMATION**
- Osteonecrosis For further information see HIV infection p. 590.
  - **PREGNANCY** Manufacturer advises avoid unless essential—limited data available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).
  - **PATIENT AND CARER ADVICE**

#### Missed doses

Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

► **Vitekta** (Gilead Sciences International Ltd) ▼

**Elvitegravir 85 mg** Vitekta 85mg tablets | 30 tablet **[PoM]** £523.79  
**Elvitegravir 150 mg** Vitekta 150mg tablets | 30 tablet **[PoM]** £523.79

## Raltegravir

● **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 400 mg twice daily

### DOSE EQUIVALENCE AND CONVERSION

- ▶ The bioavailability of *Isentress*<sup>®</sup> chewable tablets is higher than that of the 'standard' 400 mg tablets; the chewable tablets are **not** interchangeable with the 'standard' tablets on a milligram-for-milligram basis.

● **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

● **INTERACTIONS** → Appendix 1 (raltegravir).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · abnormal dreams · asthenia · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hyperactivity · hypertriglyceridaemia · insomnia · nausea · rash · vomiting
- ▶ **Uncommon** Acne · alopecia · anaemia · anxiety · appetite changes · arthralgia · bradycardia · carpal tunnel syndrome · chest pain · chills · confusion · constipation · drowsiness · dry mouth · dry skin · dysphonia · epistaxis · erectile dysfunction · flushing · gastritis · gingivitis · glossitis · gynaecomastia · hepatitis · hyperhidrosis · hypertension · impaired memory and attention · lipodystrophy · Lipodystrophy Syndrome · menopausal symptoms · myalgia · nasal congestion · neutropenia · nocturia · oedema · osteopenia · pain on swallowing · palpitation · pancreatitis · peptic ulcer · peripheral neuropathy · polydipsia · pruritus · pyrexia · rash with eosinophilia and systemic symptoms · rectal bleeding · renal failure · rhabdomyolysis · skin papilloma · Stevens-Johnson syndrome · suicidal ideation · taste disturbances · thrombocytopenia · tinnitus · tremor · ventricular extrasystoles · visual disturbances
- ▶ **Frequency not known** Osteonecrosis

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.
- ▶ **Lipodystrophy syndrome** For further information see HIV infection p. 590.
- ▶ **Osteonecrosis** For further information see HIV infection p. 590.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2010) that raltegravir (*Isentress*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Isentress** (Merck Sharp & Dohme Ltd)

Raltegravir 400 mg Isentress 400mg tablets | 60 tablet POM £471.41

## ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

## Efavirenz

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- ▶ BY MOUTH USING CAPSULES
- ▶ Adult: 600 mg once daily
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 600 mg once daily
- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Adult: 720 mg once daily

### DOSE EQUIVALENCE AND CONVERSION

- ▶ The bioavailability of *Sustiva*<sup>®</sup> oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis.

● **UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.

● **CAUTIONS** Acute porphyrias p. 930 · elderly · history of psychiatric disorders · history of seizures

● **INTERACTIONS** → Appendix 1 (efavirenz).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting
- ▶ **Uncommon** Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · hypersensitivity · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor · vertigo
- ▶ **Rare** Hepatic failure · photosensitivity · suicide
- ▶ **Frequency not known** Lipodystrophy syndrome · osteonecrosis · raised serum cholesterol

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.
- ▶ **CNS effects** Administration at bedtime especially in first 2–4 weeks reduces CNS effects.
- ▶ **Lipodystrophy syndrome** For further information see HIV infection p. 590.
- ▶ **Osteonecrosis** For further information see HIV infection p. 590.
- ▶ **Immune Reconstitution Syndrome** For further information see HIV infection p. 590.

● **PREGNANCY** Reports of neural tube defects when used in first trimester.

● **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment. In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.

- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and contents added to food (contents have a peppery taste).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry and mint.
- **PATIENT AND CARER ADVICE**  
Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

£301.27

## Etravirine

#### ● INDICATIONS AND DOSE

**HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)**

##### ▶ BY MOUTH

- ▶ Adult: 200 mg twice daily, to be taken after food

- **CONTRA-INDICATIONS** Acute porphyrias p. 930

- **INTERACTIONS** → Appendix 1 (etravirine).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · diabetes · flatulence · gastritis · gastro-oesophageal reflux · hyperlipidaemia · hypertension · Lipodystrophy Syndrome · myocardial infarction · nausea · peripheral neuropathy · rash · renal failure
- ▶ **Uncommon** Angina · blurred vision · bronchospasm · drowsiness · dry mouth · gynaecomastia · haematemesis · hepatitis · malaise · pancreatitis · sweating
- ▶ **Rare** Stevens-Johnson syndrome
- ▶ **Very rare** Toxic epidermal necrolysis
- ▶ **Frequency not known** Haemorrhagic stroke · hypersensitivity reactions · osteonecrosis

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate

## Nevirapine

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs (initial dose)**

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

**HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)**

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 200 mg twice daily
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 400 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · post-exposure prophylaxis

- **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm<sup>3</sup> or in men with CD4 cell count greater than 400 cells/mm<sup>3</sup> unless potential benefit outweighs risk.

- **INTERACTIONS** → Appendix 1 (nevirapine).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · diarrhoea · fatigue · fever · granulocytopenia · headache · hepatitis · hypersensitivity reactions (may involve hepatic reactions and rash) · nausea · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting
- ▶ **Uncommon** Anaemia · arthralgia · myalgia
- ▶ **Frequency not known** Osteonecrosis

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatic effects** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.
- ▶ **Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.
- ▶ **Osteonecrosis** For more information see HIV infection p. 590.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

- **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.

#### ● MONITORING REQUIREMENTS

- ▶ **Hepatic disease** Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
- ▶ **Rash** Monitor closely for skin reactions during first 18 weeks.
- **PATIENT AND CARER ADVICE**  
Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

#### Missed doses

If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ Nevirapine (Non-proprietary)

**Nevirapine 200 mg** Nevirapine 200mg tablets | 14 tablet [PoM] £33.69 | 60 tablet [PoM] £21.45-£170.00

##### ▶ Viramune (Boehringer Ingelheim Ltd)

**Nevirapine 200 mg** Viramune 200mg tablets | 14 tablet [PoM] £39.67 | 60 tablet [PoM] £170.00

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

##### ▶ Nevirapine (Non-proprietary)

**Nevirapine 400 mg** Nevirapine 400mg modified-release tablets | 30 tablet [PoM] £52.13-£161.50

##### ▶ Viramune (Boehringer Ingelheim Ltd)

**Nevirapine 100 mg** Viramune 100mg modified-release tablets | 90 tablet [PoM] £127.50 (Hospital only)

##### ▶ Viramune (Boehringer Ingelheim Ltd)

**Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml** Viramune 50mg/5ml oral suspension | 240 ml [PoM] £50.40

## Rilpivirine

28-Sep-2016

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL**

- ▶ **BY MOUTH**
- ▶ **Adult:** 25 mg once daily

- **INTERACTIONS** → Appendix 1 (rilpivirine).  
Caution if concomitant use with drugs that prolong QT interval.
- **SIDE-EFFECTS** Abdominal pain · abnormal dreams · anorexia · depression · dizziness · dry mouth · headache · hyperlipidaemia · Lipodystrophy Syndrome · malaise · nausea · osteonecrosis · raised serum amylase · raised serum lipase · rash · sleep disturbances · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ **Lipodystrophy** For further information see HIV infection p. 590.
- ▶ **Osteonecrosis** For further information see HIV infection p. 590.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 2 hours before or 4 hours after taking rilpivirine.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer rilpivirine tablets.
- Missed doses**  
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

##### ▶ Edurant (Janssen-Cilag Ltd)

**Rilpivirine (as Rilpivirine hydrochloride) 25 mg** Edurant 25mg tablets | 30 tablet [PoM] £200.27

**Combinations available:** *Tenofovir with emtricitabine and rilpivirine*, p. 601

## ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

### Nucleoside reverse transcriptase inhibitors

Infection

5

- **SIDE-EFFECTS** Abdominal pain · anaemia · anorexia · arthralgia · blood disorders · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · flatulence · gastro-intestinal disturbances · headache · insomnia · liver damage · metabolic effects · myalgia · nausea · neutropenia · osteonecrosis · pancreatitis · rash · thrombocytopenia · urticaria · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Osteonecrosis** For further information see HIV infection p. 590.
- **PREGNANCY** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

above

## Abacavir

### INDICATIONS AND DOSE

#### HIV infection in combination with other antiretroviral drugs

- ▶ **BY MOUTH**
- ▶ **Adult:** 600 mg daily in 1–2 divided doses

- **CAUTIONS** HIV load greater than 100 000 copies/mL · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)
- **INTERACTIONS** → Appendix 1 (abacavir).

#### SIDE-EFFECTS

- ▶ **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

- ▶ **Frequency not known** Hypersensitivity reactions

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time.

Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

- ▶ **Gastro-intestinal disturbances** More common in children.
- ▶ **Rash** More common in children.

- **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B\*5701 allele.
- **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **PRE-TREATMENT SCREENING** Test for HLA-B\*5701 allele before treatment or if restarting treatment and HLA-B\*5701 status not known.
- **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.  
Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 300 mg Ziagen 300mg tablets | 60 tablet **[PoM]** £177.60

#### Oral solution

EXCIPIENTS: May contain Propylene glycol

- ▶ **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 20 mg per 1 ml Ziagen 20mg/ml oral solution sugar-free | 240 ml **[PoM]** £47.36

## Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir above, lamivudine p. 598, dolutegravir p. 592.

### INDICATIONS AND DOSE

#### HIV infection

- ▶ **BY MOUTH**
- ▶ **Adult** (body-weight 40 kg and above): 1 tablet once daily

- **RENAL IMPAIRMENT** Avoid *Triumeq*<sup>®</sup> if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> (consult product literature).

#### PATIENT AND CARER ADVICE

##### Missed doses

If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Triumeq** (ViiV Healthcare UK Ltd) ▼

Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg Triumeq 50mg/600mg/300mg tablets | 30 tablet **[PoM]** £798.16

## Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 596, lamivudine p. 598.

### ● INDICATIONS AND DOSE

#### HIV infection in combination with other antiretroviral drugs

##### ► BY MOUTH

- Adult (body-weight 40 kg and above): 1 tablet once daily

- **RENAL IMPAIRMENT** Avoid *Kivexa*® if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> (consult product literature).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### ► Abacavir with lamivudine (Non-proprietary)

Lamivudine 300 mg, Abacavir (as Abacavir sulfate)

600 mg Abacavir 600mg / Lamivudine 300mg tablets | 30 tablet [PoM] £194.62-£284.44 | 30 tablet [PoM] £224.56 (Hospital only)

##### ► Kivexa (ViiV Healthcare UK Ltd)

Lamivudine 300 mg, Abacavir (as Abacavir sulfate)

600 mg Kivexa 600mg/300mg tablets | 30 tablet [PoM] £299.41

## Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 596, lamivudine p. 598, zidovudine p. 601.

### ● INDICATIONS AND DOSE

#### HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

##### ► BY MOUTH

- Adult: 1 tablet twice daily

- **RENAL IMPAIRMENT** Avoid *Trizivir*® if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> (consult product literature).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► Trizivir (ViiV Healthcare UK Ltd)

Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet [PoM] £432.70

F 596

01-Sep-2016

## Didanosine

(ddi; DDI)

### ● INDICATIONS AND DOSE

#### HIV infection in combination with other antiretroviral drugs

##### ► BY MOUTH

- Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
- Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

- **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · lactic acidosis · peripheral neuropathy

#### CAUTIONS, FURTHER INFORMATION

- Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis,

or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1 (didanosine).

Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

- **SIDE-EFFECTS** Acute renal failure · alopecia · anaphylactic reactions · diabetes mellitus · dry eyes · dry mouth · hyperuricaemia (suspend if raised significantly) · hypoglycaemia · lactic acidosis · lipodystrophy · liver failure · non-cirrhotic portal hypertension · optic nerve changes · pancreatitis (less common in children) · parotid gland enlargement · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · retinal changes · rhabdomyolysis · sialadenitis

#### SIDE-EFFECTS, FURTHER INFORMATION

- Pancreatitis Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.
- Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing didanosine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Insufficient information. In hepatic impairment, monitor for toxicity.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; consult product literature.
- **MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.
- **DIRECTIONS FOR ADMINISTRATION** Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.  
With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

01-Sep-2016

● **INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food

- Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

● **CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

**CAUTIONS, FURTHER INFORMATION**

● Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

● **INTERACTIONS** → Appendix 1 (stavudine). Caution with concomitant use of isoniazid—risk of peripheral neuropathy. Caution with concomitant use with other drugs associated with pancreatitis.

● **SIDE-EFFECTS**

● **Common or very common** Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus

▶ **Uncommon** Anxiety · gynaecomastia

▶ **Frequency not known** Lactic acidosis · lipodystrophy

**SIDE-EFFECTS, FURTHER INFORMATION**

● Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing stavudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **RENAL IMPAIRMENT** Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m<sup>2</sup>. Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>. Risk of peripheral neuropathy.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

● **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## Tenofovir disoproxil

● **INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs | Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease**

▶ **BY MOUTH**

▶ Adult: 245 mg once daily

● **DOSE EQUIVALENCE AND CONVERSION**

▶ 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

● **INTERACTIONS** → Appendix 1 (tenofovir).

Use with caution if concomitant or recent use of nephrotoxic drugs.

● **SIDE-EFFECTS**

▶ **Rare** Nephrogenic diabetes insipidus · proximal renal tubulopathy · renal failure

▶ **Frequency not known** Hypophosphataemia · reduced bone density

● **RENAL IMPAIRMENT** *Granules*: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m<sup>2</sup>; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m<sup>2</sup>. *Tablets*: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>.

Monitor renal function—interrupt treatment if further deterioration.

● **MONITORING REQUIREMENTS**

▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.

▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

● **DIRECTIONS FOR ADMINISTRATION** *Granules*: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do **not** mix granules with liquids.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules.

**Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

● **NICE technology appraisals (TAs)**

▶ **Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009) NICE TA173**

Tenofovir is an option for the treatment of chronic hepatitis B.

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 599, emtricitabine p. 598, rilpivirine p. 595.

### ● INDICATIONS AND DOSE

#### HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL

- ▶ BY MOUTH
- Adult: 1 tablet once daily

● **HEPATIC IMPAIRMENT** Manufacturer of *Eviplera*® advises caution in moderate impairment; avoid *Eviplera*® in severe impairment.

● **RENAL IMPAIRMENT** Avoid *Eviplera*® if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

● **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 2 hours before or 4 hours after taking *Eviplera*®.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer *Eviplera*®.

#### Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ *Eviplera* (Gilead Sciences International Ltd)

Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg. *Eviplera* 200mg/25mg/245mg tablets | 30 tablet [PoM] £525.95

596

## Zidovudine

01-Sep-2016

### (Azidothymidine; AZT)

### ● INDICATIONS AND DOSE

#### HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- Adult: 250–300 mg twice daily

#### Prevention of maternal-fetal HIV transmission

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

#### HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

- ▶ BY INTRAVENOUS INFUSION
- Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

● **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature) · Acute porphyrias p. 930

● **CAUTIONS** Elderly · lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B<sub>12</sub> deficiency (increased risk of neutropenia)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis,

or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1 (zidovudine). Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature.
- **SIDE-EFFECTS** Anaemia (may require transfusion) · anxiety · chest pain · convulsions · depression · dizziness · drowsiness · gynaecomastia · influenza-like symptoms · lactic acidosis · lipodystrophy · loss of mental acuity · myopathy · neuropathy · paraesthesia · pigmentation of nails · pigmentation of oral mucosa · pigmentation of skin · pruritus · sweating · taste disturbance · urinary frequency

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.
- ▶ Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing zidovudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.
- **HEPATIC IMPAIRMENT** Accumulation may occur.
- **RENAL IMPAIRMENT** Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

##### ▶ Zidovudine (Non-proprietary)

**Zidovudine 100 mg** Zidovudine 100mg capsules | 60 capsule [PoM] no price available

**Zidovudine 250 mg** Zidovudine 250mg capsules | 60 capsule [PoM] £96.36

##### ▶ Retrovir (ViiV Healthcare UK Ltd)

**Zidovudine 100 mg** Retrovir 100mg capsules | 100 capsule [PoM] £88.86

**Zidovudine 250 mg** Retrovir 250mg capsules | 40 capsule [PoM] £88.86

#### Oral solution

##### ▶ Retrovir (ViiV Healthcare UK Ltd)

**Zidovudine 10 mg per 1 ml** Retrovir 50mg/5ml oral solution sugar-free | 200 ml [PoM] £17.78

#### Solution for infusion

##### ▶ Retrovir (ViiV Healthcare UK Ltd)

**Zidovudine 10 mg per 1 ml** Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial [PoM] £44.61

## Zidovudine with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 601, lamivudine p. 598.

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily

● **RENAL IMPAIRMENT** Avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> (consult product literature).

### ● DIRECTIONS FOR ADMINISTRATION

**COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

▶ **Zidovudine with lamivudine (Non-proprietary)**

Lamivudine 150 mg, Zidovudine 300 mg Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet [PoM](#) £240.10-£285.11

▶ **Combivir** (ViiV Healthcare UK Ltd)

Lamivudine 150 mg, Zidovudine 300 mg Combivir 150mg/300mg tablets | 60 tablet [PoM](#) £255.10

## ANTIVIRALS > PROTEASE INHIBITORS, HIV

## Protease inhibitors

● **CONTRA-INDICATIONS** Acute porphyrias p. 930

● **CAUTIONS** Haemophilia (increased risk of bleeding)

● **SIDE-EFFECTS** Abdominal pain · anaemia · anaphylaxis · anorexia · blood disorders · diarrhoea · dizziness · fatigue · flatulence · gastro-intestinal disturbances · headache · hepatic dysfunction · hypersensitivity reactions · metabolic effects · myalgia · myositis · nausea · neutropenia · osteonecrosis · pancreatitis · paraesthesia · pruritus · rash · rhabdomyolysis · sleep disturbances · Stevens-Johnson syndrome · taste disturbances · thrombocytopenia · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Osteonecrosis For further information see HIV infection p. 590.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

[f](#) above

## Atazanavir

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- ▶ BY MOUTH
- ▶ Adult: 300 mg once daily

**HIV infection in combination with other antiretroviral drugs—with cobicistat**

- ▶ BY MOUTH
- ▶ Adult: 300 mg daily

● **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation

● **INTERACTIONS** → Appendix 1 (atazanavir). Caution if concomitant use with drugs that prolong PR interval. Caution with concomitant use of drugs that prolong QT interval.

### ● SIDE-EFFECTS

▶ **Uncommon** Abnormal dreams · alopecia · amnesia · anxiety · arthralgia · chest pain · cholelithiasis · depression · disorientation · dry mouth · dyspnoea · gynaecomastia · haematuria · hypertension · increased appetite · mouth ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · torsade de pointes · urinary frequency · weight changes

▶ **Rare** Abnormal gait · cholecystitis · hepatosplenomegaly · oedema · palpitation

### SIDE-EFFECTS, FURTHER INFORMATION

▶ **Rash** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

● **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term.

In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 5, 21

▶ **Reyataz** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Atazanavir (as Atazanavir sulfate) 150 mg Reyataz 150mg capsules | 60 capsule [PoM](#) £303.38 (Hospital only)

Atazanavir (as Atazanavir sulfate) 300 mg Reyataz 300mg capsules | 30 capsule [PoM](#) £303.38 (Hospital only)

[f](#) above

## Darunavir

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir**

▶ BY MOUTH

▶ Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10<sup>9</sup>/litre

**HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat**

▶ BY MOUTH

▶ Adult: 800 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10<sup>9</sup>/litre

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir**

▶ BY MOUTH

▶ Adult: 800 mg once daily

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with cobicistat**

▶ BY MOUTH

▶ Adult: 800 mg once daily

● **INTERACTIONS** → Appendix 1 (darunavir).

### ● SIDE-EFFECTS

▶ **Common or very common** Peripheral neuropathy · rash

▶ **Uncommon** Abnormal dreams · acne · alopecia · angina · anxiety · arthralgia · conjunctival hyperaemia · cough ·

depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

- ▶ **Rare** Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhoea · seborrhoeic dermatitis · syncope · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**  
**Missed doses**  
If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Prezista** (Janssen-Cilag Ltd)

**Darunavir (as Darunavir ethanolate) 75 mg** Prezista 75mg tablets | 480 tablet [PoM] £446.70

**Darunavir (as Darunavir ethanolate) 150 mg** Prezista 150mg tablets | 240 tablet [PoM] £446.70

**Darunavir (as Darunavir ethanolate) 400 mg** Prezista 400mg tablets | 60 tablet [PoM] £297.80

**Darunavir (as Darunavir ethanolate) 600 mg** Prezista 600mg tablets | 60 tablet [PoM] £446.70

**Darunavir (as Darunavir ethanolate) 800 mg** Prezista 800mg tablets | 30 tablet [PoM] £297.80

##### Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Prezista** (Janssen-Cilag Ltd)

**Darunavir (as Darunavir ethanolate) 100 mg per 1 ml** Prezista 100mg/ml oral suspension sugar-free | 200 ml [PoM] £248.17

## Fosamprenavir

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

#### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- ▶ **BY MOUTH**
- ▶ **Adult:** 700 mg twice daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1 (fosamprenavir).

#### SIDE-EFFECTS

- **Rare** Stevens-Johnson syndrome
- ▶ **Frequency not known** Rash

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.
- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment. Manufacturer advises caution in mild impairment.
- **DIRECTIONS FOR ADMINISTRATION** In adults, oral suspension should be taken on an empty stomach.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Telzir** (ViiV Healthcare UK Ltd)

**Fosamprenavir (as Fosamprenavir calcium) 700 mg** Telzir 700mg tablets | 60 tablet [PoM] £220.13

##### Oral suspension

EXCIPIENTS: May contain Propylene glycol

- ▶ **Telzir** (ViiV Healthcare UK Ltd)

**Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml** Telzir 50mg/ml oral suspension | 225 ml [PoM] £58.70

## Indinavir

#### INDICATIONS AND DOSE

**HIV infection in combination with nucleoside reverse transcriptase inhibitors**

- ▶ **BY MOUTH**
- ▶ **Adult:** Seek specialist advice

- **CAUTIONS** Ensure adequate hydration (risk of nephrolithiasis) · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · patients at risk of nephrolithiasis (monitor for nephrolithiasis)
- **INTERACTIONS** → Appendix 1 (indinavir).
- **SIDE-EFFECTS** Alopecia · crystalluria · dry mouth · dry skin · dysuria · haematuria · haemolytic anaemia · hyperpigmentation · hypoesthesia · interstitial nephritis (with medullary calcification and cortical atrophy in

asymptomatic severe leucocyturia) · nephrolithiasis (may require interruption or discontinuation) · paronychia · proteinuria · pyelonephritis

- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Not studied in severe impairment. Increased risk of nephrolithiasis.
- **RENAL IMPAIRMENT** Use with caution. In patients with renal impairment, monitor for nephrolithiasis.
- **DIRECTIONS FOR ADMINISTRATION** Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer indinavir capsules.
- **LESS SUITABLE FOR PRESCRIBING** Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis; it is considered to be less suitable for prescribing.

## Lopinavir with ritonavir

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

▶ BY MOUTH USING TABLETS

▶ **Adult:** 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors

▶ BY MOUTH USING ORAL SOLUTION

▶ **Adult:** 5 mL twice daily, to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · structural heart disease
- **INTERACTIONS** → Appendix 1 (lopinavir, ritonavir). Caution if concomitant use with drugs that prolong QT or PR interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Amenorrhoea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight changes
  - ▶ **Uncommon** Abnormal dreams · alopecia · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastro-intestinal ulcer · haematuria · myocardial infarction · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed
- **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in *animal* studies).
- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.
- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

#### ● MEDICINAL FORMS

**Ritonavir 20 mg per 1 ml, Lopinavir 80 mg per 1 ml** Kaletra 80mg/20mg/1ml oral solution | 300 ml [PoM] £307.39

602

## Ritonavir

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)**

▶ BY MOUTH

▶ **Adult:** Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

**Low-dose booster to increase effect of other protease inhibitors**

▶ BY MOUTH

▶ **Adult:** 100–200 mg 1–2 times a day

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1 (ritonavir). Caution if concomitant use with drugs that prolong PR interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Acne · anxiety · arthralgia · blood pressure changes · blurred vision · confusion · cough · decreased blood thyroxine concentration · fever · flushing · gastro-intestinal haemorrhage · menorrhagia · mouth ulcers · oedema · peripheral neuropathy · pharyngitis · renal impairment · seizures · syncope
  - ▶ **Uncommon** Electrolyte disturbances · myocardial infarction
  - ▶ **Rare** Toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.
  - **PREGNANCY** Only use low-dose booster to increase the effect of other protease inhibitors.

- **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses).
- **DIRECTIONS FOR ADMINISTRATION** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ritonavir oral solution.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

Ritonavir **80 mg per 1 ml** Norvir 80mg/ml oral solution sugar-free | 450 ml Ⓜ £403.20

F 602

## Saquinavir

#### INDICATIONS AND DOSE

**HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—with low-dose ritonavir**

▶ BY MOUTH

- ▶ Adult: 1 g every 12 hours

**HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—with low-dose ritonavir**

▶ BY MOUTH

- ▶ Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

- **CONTRA-INDICATIONS** Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias
- **INTERACTIONS** → Appendix 1 (saquinavir).  
Caution with concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration).  
Contra-indicated if concomitant use of drugs that prolong QT or PR interval.  
Contra-indicated if concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available).

#### SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · changes in libido · dry mouth · dyspnoea · increased appetite · peripheral neuropathy
- ▶ **Uncommon** Convulsions · mucosal ulceration · renal impairment · visual impairment
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in decompensated liver disease.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds); if baseline QT interval less than 450 milliseconds, monitor ECG during treatment (particularly 10 days after starting treatment in patients not previously treated with antiretroviral therapy)—discontinue if QT interval increases over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, if prolongation of PR interval, or if arrhythmias occur.

#### PATIENT AND CARER ADVICE

Arrhythmias Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Saquinavir (as Saquinavir mesilate) **500 mg** Invirase 500mg tablets | 120 tablet Ⓜ £251.26

F 602

## Tipranavir

#### INDICATIONS AND DOSE

**HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir**

▶ BY MOUTH USING CAPSULES

- ▶ Adult: 500 mg twice daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS** Patients at risk of increased bleeding from trauma, surgery or other pathological conditions
- **INTERACTIONS** → Appendix 1 (tipranavir).  
Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Rare** Dehydration
  - ▶ **Frequency not known** Anorexia · dyspnoea · influenza-like symptoms · peripheral neuropathy · photosensitivity · renal impairment
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.
- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

Tipranavir **250 mg** Aptivus 250mg capsules | 120 capsule Ⓜ £441.00

## ANTIVIRALS &gt; OTHER

## Maraviroc

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

● **INDICATIONS AND DOSE**

**CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals**

- ▶ BY MOUTH
- ▶ Adult: 300 mg twice daily

- **CAUTIONS** Cardiovascular disease
- **INTERACTIONS** → Appendix 1 (maraviroc).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anaemia · anorexia · depression · diarrhoea · flatulence · headache · insomnia · malaise · nausea · rash
  - ▶ **Uncommon** Myositis · proteinuria · renal failure · seizures
  - ▶ **Rare** Angina · granulocytopenia · hepatitis · pancytopenia · Stevens-Johnson syndrome · toxic epidermal necrolysis
  - ▶ **Frequency not known** Eosinophilia · fever · hepatic reactions · hypersensitivity reactions · osteonecrosis · rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Osteonecrosis** For further information see HIV infection p. 590.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.
- **RENAL IMPAIRMENT** If eGFR less than 80 mL/minute/1.73 m<sup>2</sup>, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (March 2008) that maraviroc (*Celsentri*<sup>®</sup>) is **not** recommended for use within NHS Scotland.

## PHARMACOKINETIC ENHANCERS

## Cobicistat

● **INDICATIONS AND DOSE**

**Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir**

- ▶ BY MOUTH
- ▶ Adult: 150 mg once daily

- **INTERACTIONS** → Appendix 1 (cobicistat).
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m<sup>2</sup>.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● **PATIENT AND CARER ADVICE****Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Tyboost** (Gilead Sciences International Ltd) ▼  
**Cobicistat 150 mg** Tyboost 150mg tablets | 30 tablet [PoM] £21.38

**Combinations available: *Tenofovir with cobicistat, elvitegravir and emtricitabine*, p. 600**

## 6.5 Influenza

## Influenza

**Management**

Oseltamivir p. 607 and zanamivir p. 608 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Amantadine hydrochloride p. 390 is licensed for prophylaxis and treatment of influenza A but it is no longer recommended.

Information on pandemic influenza, avian influenza, and swine influenza may be found at [www.gov.uk/phi](http://www.gov.uk/phi).

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

**Oseltamivir in children under 1 year of age**

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be

overseen by healthcare professionals experienced in assessing children.

## ANTIVIRALS > NEURAMINIDASE INHIBITORS

### Oseltamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

#### ● INDICATIONS AND DOSE

##### Prevention of influenza

###### ▶ BY MOUTH

- ▶ Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- ▶ Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 13-17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

##### Treatment of influenza

###### ▶ BY MOUTH

- ▶ Child 1-11 months: 3 mg/kg twice daily for 5 days
- ▶ Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days
- ▶ Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days
- ▶ Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days
- ▶ Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- ▶ Child 13-17 years: 75 mg twice daily for 5 days
- ▶ Adult: 75 mg twice daily for 5 days

- **UNLICENSED USE** Not licensed for use in premature infants.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · dyspepsia · headache · nausea · vomiting
- ▶ **Uncommon** Altered consciousness (usually in children and adolescents) · arrhythmias · convulsions · eczema · rash
- ▶ **Rare** Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders (usually in children and adolescents) · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

#### ● RENAL IMPAIRMENT

- ▶ In adults For *treatment*, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> (30 mg once daily if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>). For *prevention*, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>). Avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m<sup>2</sup> (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m<sup>2</sup>). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m<sup>2</sup> (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m<sup>2</sup>). Avoid for *treatment* and *prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.

- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

#### ● PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Oseltamivir for influenza (lu) [www.medicinesforchildren.org.uk/oseltamivir-for-influenza](http://www.medicinesforchildren.org.uk/oseltamivir-for-influenza)

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
- Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
  - Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
  - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
  - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

[www.nice.org.uk/TA158](http://www.nice.org.uk/TA158)

- ▶ **Osetamivir, zanamivir, and amantadine for treatment of influenza (February 2009)** NICE TA168  
Osetamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- When influenza is circulating in the community, osetamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, osetamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

[www.nice.org.uk/TA168](http://www.nice.org.uk/TA168)

**NHS restrictions** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Capsule

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Tamiflu** (Roche Products Ltd)

**Osetamivir (as Osetamivir phosphate) 30 mg** Tamiflu 30mg capsules | 10 capsule [PoM] £7.71

**Osetamivir (as Osetamivir phosphate) 45 mg** Tamiflu 45mg capsules | 10 capsule [PoM] £15.41

**Osetamivir (as Osetamivir phosphate) 75 mg** Tamiflu 75mg capsules | 10 capsule [PoM] £15.41

##### Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

EXCIPIENTS: May contain Sorbitol

- ▶ **Tamiflu** (Roche Products Ltd)

**Osetamivir (as Osetamivir phosphate) 6 mg per 1 ml** Tamiflu 6mg/ml oral suspension sugar-free | 65 ml [PoM] £10.27

##### Oral solution

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Osetamivir (Non-proprietary)**

**Osetamivir (as Osetamivir phosphate) 15 mg per 1 ml** Osetamivir 15mg/ml oral solution sugar free sugar-free | 20 ml [PoM] £10.00

## Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

#### • INDICATIONS AND DOSE

##### Post-exposure prophylaxis of influenza

- ▶ BY INHALATION OF POWDER
- ▶ Child 5-17 years: 10 mg once daily for 10 days
- ▶ Adult: 10 mg once daily for 10 days

##### Prevention of influenza during an epidemic

- ▶ BY INHALATION OF POWDER
- ▶ Child 5-17 years: 10 mg once daily for up to 28 days
- ▶ Adult: 10 mg once daily for up to 28 days

##### Treatment of influenza

- ▶ BY INHALATION OF POWDER
- ▶ Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to osetamivir suspected)
- ▶ Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to osetamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to osetamivir suspected is an unlicensed duration.
- **CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness

#### CAUTIONS, FURTHER INFORMATION

- ▶ Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available.  
Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Rash
- ▶ **Uncommon** Angioedema · bronchospasm · dyspnoea · urticaria
- ▶ **Rare** Neuropsychiatric disorders (especially in children and adolescents) · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Osetamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)** NICE TA158

**Zanamivir 5 mg** Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister (PoM) £16.36

## 6.6 Respiratory syncytial virus

### Respiratory syncytial virus

#### Management in adults

Ribavirin p. 578 inhibits a wide range of DNA and RNA viruses. It is given by mouth for the treatment of chronic hepatitis C infection, in double therapy with peginterferon alfa p. 576, interferon alfa p. 850, or sofosbuvir p. 580, or in triple therapy with peginterferon alfa and one protease inhibitor (i.e. boceprevir p. 581, telaprevir p. 583 or simeprevir p. 582) or sofosbuvir. Ribavirin is also effective in Lassa fever [unlicensed indication].

#### Management in children

Ribavirin is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at [www.gov.uk/dh](http://www.gov.uk/dh).

## 1 Antidiuretic hormone disorders

### Posterior pituitary hormones and antagonists

#### Posterior pituitary hormones

##### Diabetes insipidus

Vasopressin p. 613 (antidiuretic hormone, ADH) is used in the treatment of *pituitary* ('cranial') *diabetes insipidus* as is its analogue desmopressin p. 611. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 291 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

#### Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 753, another posterior pituitary hormone, is indicated in obstetrics.

#### Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 521 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 613 is a vasopressin V<sub>2</sub>-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

## 1.1 Diabetes insipidus

**Other drugs used for Diabetes insipidus** Chlorthalidone, p. 219

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

### Desmopressin

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

#### ● INDICATIONS AND DOSE

##### Diabetes insipidus, treatment

- ▶ BY MOUTH
  - ▶ Child 1-23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
  - ▶ Child 2-11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
  - ▶ Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
  - ▶ Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily
- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
  - ▶ Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Child 1-23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
  - ▶ Child 2-11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
  - ▶ Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
  - ▶ Adult: 10–40 micrograms daily in 1–2 divided doses
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Adult: 1–4 micrograms daily

##### Primary nocturnal enuresis

- ▶ BY MOUTH
  - ▶ Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
  - ▶ Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
  - ▶ Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

##### Postoperative polyuria or polydipsia

- ▶ BY MOUTH
  - ▶ Adult: Dose to be adjusted according to urine osmolality

##### Polyuria or polydipsia after hypophysectomy

- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Adult: Dose to be adjusted according to urine osmolality

##### Idiopathic nocturnal polyuria in females

- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Adult: 25 micrograms daily, to be taken 1 hour before bedtime

##### Idiopathic nocturnal polyuria in males

- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Adult: 50 micrograms daily, to be taken 1 hour before bedtime

##### Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
  - ▶ Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

##### Nocturia associated with multiple sclerosis (when other treatments have failed)

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult 18-65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

##### Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

##### Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
  - ▶ Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

##### Fibrinolytic response testing

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
  - ▶ Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

##### Lumbar-puncture-associated headache

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
  - ▶ Adult: (consult product literature)

● **UNLICENSED USE** Consult product literature for individual preparations. Oral use of *DDAVP* intravenous injection is not licensed.

● **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia · syndrome of inappropriate ADH secretion (in adults)

● **CAUTIONS**

**GENERAL CAUTIONS**

Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

**SPECIFIC CAUTIONS**

▶ With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

**CAUTIONS, FURTHER INFORMATION**

Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.

● **INTERACTIONS** → Appendix 1 (desmopressin).

● **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

▶ **Common or very common** Hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake · nausea

▶ **Frequency not known** Allergic reactions · emotional disturbance in children · epistaxis · fluid retention · headache · nasal congestion · stomach pain · vomiting

**SPECIFIC SIDE-EFFECTS**

▶ With intranasal use Rhinitis

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ Hyponatraemic convulsions The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).

● **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.

● **BREAST FEEDING** Amount too small to be harmful.

● **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.

● **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.

● **DIRECTIONS FOR ADMINISTRATION**

*DDVAP*<sup>®</sup> and *Desmotabs*<sup>®</sup> tablets may be crushed.

*DDAVP*<sup>®</sup> intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.

*DDAVP*<sup>®</sup> injection may be administered orally.

Desmopressin oral lyophilisates are for sublingual administration.

For *intravenous infusion* (*DDVAP*<sup>®</sup>, *Octim*<sup>®</sup>), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular

doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*<sup>®</sup> intranasal solution.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Desmopressin for bedwetting [www.medicinesforchildren.org.uk/desmopressin-bedwetting-0](http://www.medicinesforchildren.org.uk/desmopressin-bedwetting-0)  
Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

**Tablet**

- **DRUG ACTION** Tolvaptan is a vasopressin V<sub>2</sub>-receptor antagonist.

**● INDICATIONS AND DOSE****JINARC®**

**Autosomal dominant polycystic kidney disease in adults with CKD stage 1 to 3 at initiation of treatment with evidence of rapidly progressing disease (initiated by a specialist)**

▶ **BY MOUTH**

- ▶ Adult: Initially 60 mg daily in 2 divided doses for at least a week, 45 mg in the morning before breakfast, and then 15 mg taken 8 hours later; increased to 90 mg daily in 2 divided doses for at least a week, 60 mg in the morning before breakfast, and then 30 mg taken 8 hours later, then increased if tolerated to 120 mg daily in 2 divided doses, 90 mg in the morning before breakfast, and then 30 mg taken 8 hours later, dose titration should be performed cautiously; patients may down-titrate to lower doses based on tolerability

**SAMSCA®**

**Treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion**

▶ **BY MOUTH**

- ▶ Adult: 15 mg once daily, increased if necessary up to 60 mg daily; treatment duration is determined by the underlying disease and its treatment

- **CONTRA-INDICATIONS** Anuria · hypernatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion
- **CAUTIONS** Alcoholism (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · diabetes mellitus · ensure adequate fluid intake · hypoxia (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · malnutrition (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · pseudohyponatraemia associated with diabetes mellitus (exclude before treatment)
- **INTERACTIONS** → Appendix 1 (tolvaptan). Avoid concomitant drugs that increase serum-sodium concentration.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Constipation · decreased appetite · dehydration · dry mouth · ecchymosis · fever · hyperglycaemia · hyperkalaemia · increased blood creatinine · malaise · nausea · neurological disturbance (following rapid correction of hyponatraemia) · postural hypotension · pruritus · thirst · urinary frequency
- ▶ **Uncommon** Renal impairment · taste disturbance
- ▶ **Frequency not known** Dizziness · hepatic impairment (discontinue) · hypernatraemia · hyperuricaemia · hypoglycaemia · syncope

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hepatic impairment** Discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus).
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** No information available in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for dehydration in patients who are fluid-restricted.
  - ▶ Monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised. Discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours).
- **PATIENT AND CARER ADVICE** For *Jinarc*<sup>®</sup>, morning dose to be taken 30 minutes before food, second dose can be taken with or without food.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - ▶ **Tolvaptan for treating autosomal dominant polycystic kidney disease (October 2015) NICE TA358**  
Tolvaptan (*Jinarc*<sup>®</sup>) is recommended as an option for the treatment of autosomal dominant polycystic kidney disease in adults if:
      - the patient has chronic kidney disease stage 2 or 3 at the start of treatment **and**
      - there is evidence of rapidly progressing disease
      - **and** the manufacturer provides tolvaptan with the discount agreed in the patient access scheme
 Patients currently receiving tolvaptan (*Jinarc*<sup>®</sup>) whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

## 2 Corticosteroid responsive conditions

**CORTICOSTEROIDS****Corticosteroids, general use****Overview**

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 619 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 620 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 618 and betamethasone p. 618 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 22); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 211. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

Corticosteroids are preferably used by inhalation in the management of asthma but systemic therapy in association

with bronchodilators is required for the emergency treatment of severe acute asthma.

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa allergic rhinitis, and aphthous ulcers.

### Side-effects

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

#### Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

#### Glucocorticoid side effects

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae;
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

#### Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with

recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

## Corticosteroids, replacement therapy

### Overview

The adrenal cortex normally secretes hydrocortisone p. 620 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 619; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 914.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 708 and sex hormones should be given as indicated by the pattern of hormone deficiency.

## Glucocorticoid therapy

### Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 619 is so high that its anti-inflammatory activity is of no clinical relevance.

### Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg

≡ Betamethasone 750 micrograms

≡ Deflazacort 6 mg

≡ Dexamethasone 750 micrograms

≡ Hydrocortisone 20 mg

≡ Methylprednisolone 4 mg

≡ Prednisone 5 mg

≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of hydrocortisone p. 620, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 626 and prednisone p. 623 have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 618 and dexamethasone p. 618 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotrophin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclomethasone dipropionate p. 40 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 618 has a high glucocorticoid activity; it is derived from prednisolone.

## Corticosteroids (systemic)

**CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

### CONTRA-INDICATIONS, FURTHER INFORMATION

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

**CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (in children) · osteoporosis (post-menopausal women and the elderly at special risk) · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · should not be used long-term · thromboembolic disorders · ulcerative colitis

### CAUTIONS, FURTHER INFORMATION

▶ With intra-articular use or intradermal use or intralesional use For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

● **INTERACTIONS** → Appendix 1 (corticosteroids).

## ● SIDE-EFFECTS

### GENERAL SIDE-EFFECTS

Abdominal distension · acute pancreatitis · aggravation of epilepsy · aggravation of schizophrenia · amenorrhoea · anaphylaxis (in children) · bruising · candidiasis · congestive heart failure · corneal thinning · Cushing's syndrome (with moon face, striae and acne) · dyspepsia · ecchymoses · exacerbation of ophthalmic fungal disease · exacerbation of ophthalmic viral disease · exophthalmos · facial erythema · glaucoma · headache · hiccups · hirsutism · hypercholesterolaemia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersensitivity reactions (in children) · impaired healing · increased appetite · increased intra-ocular pressure · increased intracranial pressure with papilloedema (usually after withdrawal) (in children) · increased susceptibility to and severity of infection · insomnia · leucocytosis · long bone fractures · malaise · menstrual irregularities · muscle weakness · myocardial rupture following recent myocardial infarction · nausea · negative calcium balance · negative nitrogen balance · oesophageal ulceration · papilloedema (in adults) · petechiae · posterior subcapsular cataracts · potassium loss · psychological dependence · reactivation of dormant tuberculosis · scleral thinning · skin atrophy · sodium retention · suppression of growth (in children) · telangiectasia · tendon rupture · thromboembolism · urticaria · vertebral fractures · vertigo · water retention · weight gain

### SPECIFIC SIDE-EFFECTS

▶ With intra-articular use Flushing · may affect the hyaline cartilage

### SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects associated with intra-articular, intradermal and intralesional preparations, consult product literature.

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 614

▶ Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.
  - Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.
- Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

- **Infections** Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated.
- **Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.
  - Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.
  - Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.
- **Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.
- **Psychiatric reactions** Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.
  - Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.
- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.
  - Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.
- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
  - **HEPATIC IMPAIRMENT** The plasma-drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.
  - **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
  - **MONITORING REQUIREMENTS**
    - The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
  - **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
  - **TREATMENT CESSATION**
    - In adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
      - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
      - been given repeat doses in the evening;
      - received more than 3 weeks' treatment;
      - recently received repeated courses (particularly if taken for longer than 3 weeks);
      - taken a short course within 1 year of stopping long-term therapy;
      - other possible causes of adrenal suppression.
    - Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.
      - During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.
    - In children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
      - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
      - been given repeat doses in the evening;
      - received more than 3 weeks' treatment;
      - recently received repeated courses (particularly if taken for longer than 3 weeks);
      - taken a short course within 1 year of stopping long-term therapy;
      - other possible causes of adrenal suppression.
    - Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.
      - During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m<sup>2</sup> daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

### ● PATIENT AND CARER ADVICE

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal [www.nhsforms.co.uk](http://www.nhsforms.co.uk)

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing [stockorders.dppas@apsgroup.co.uk](mailto:stockorders.dppas@apsgroup.co.uk) or by fax on 0131 629 9967.

## Betamethasone

F 616

### ● INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia**

- ▶ BY MOUTH
  - ▶ Adult: Usual dose 0.5–5 mg daily
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - ▶ Adult: 4–20 mg, repeated up to 4 times in 24 hours

- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (as sodium phosphate) (*Betnesol*<sup>®</sup>), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (steroid card).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Soluble tablet**

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

#### ▶ **Betamethasone (Non-proprietary)**

**Betamethasone (as Betamethasone sodium phosphate) 500 microgram** Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet (PoM) £42.60 DT price = £42.57

#### **Solution for injection**

CAUTIONARY AND ADVISORY LABELS 10

#### ▶ **Betamethasone (Non-proprietary)**

**Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml** Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule (PoM) £13.06-£15.68

F 616

## Deflazacort

### ● INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- ▶ BY MOUTH
  - ▶ Adult: Maintenance 3–18 mg daily

**Suppression of inflammatory and allergic disorders (acute disorders)**

- ▶ BY MOUTH
  - ▶ Adult: Initially up to 120 mg daily

**Inflammatory and allergic disorders**

- ▶ BY MOUTH
  - ▶ Child 1 month-11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
  - ▶ Child 12-17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

#### **Tablet**

CAUTIONARY AND ADVISORY LABELS 5, 10

#### ▶ **Calcart (Sanofi)**

**Deflazacort 6 mg** Calcort 6mg tablets | 60 tablet (PoM) £15.82

F 616

## Dexamethasone

06-Jun-2016

### ● INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- ▶ BY MOUTH
  - ▶ Adult: 0.5–10 mg daily

**Mild croup**

- ▶ BY MOUTH
  - ▶ Child: 150 micrograms/kg for 1 dose

**Severe croup (or mild croup that might cause complications)**

- ▶ INITIALLY BY MOUTH
  - ▶ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

**Congenital adrenal hyperplasia (under expert supervision)**

- ▶ BY MOUTH
  - ▶ Adult: Consult specialist for advice on dosing

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Consult specialist for advice on dosing

#### Overnight dexamethasone suppression test

- ▶ BY MOUTH

▶ Adult: 1 mg for 1 dose, to be given at night

#### Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibiogram)

- ▶ BY INTRAVENOUS INJECTION

▶ Adult: 8.3 mg every 6 hours for 4 days

#### Symptom control of anorexia (in palliative care)

▶ Adult: 2–4 mg daily

#### Obstruction due to tumour (dysphagia in palliative care)

▶ Adult: 8 mg daily

#### Bronchospasm or partial obstruction (dyspnoea in palliative care)

▶ Adult: 4–8 mg daily

#### Nausea and vomiting (adjunct in palliative care)

- ▶ BY MOUTH

▶ Adult: 8–16 mg daily

#### Headaches due to raised intracranial pressure (in palliative care)

▶ Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

#### Pain due to nerve compression (in palliative care)

▶ Adult: 8 mg daily

#### Cerebral oedema associated with malignancy

- ▶ BY MOUTH

▶ Adult: 0.5–10 mg daily

#### Cerebral oedema

- ▶ INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Initially 8–16 mg for 1 dose, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually, use the 3.8 mg/mL injection preparation for this dose

#### Cerebral oedema associated with malignancy

- ▶ INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days, use the 3.3 mg/mL injection preparation for this dose

#### ● UNLICENSED USE

▶ With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

#### ● SIDE-EFFECTS

▶ With intravenous use Perineal irritation may follow intravenous administration of the phosphate ester

● **PREGNANCY** Dexamethasone readily crosses the placenta.

#### ● DIRECTIONS FOR ADMINISTRATION

▶ With oral use in children For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.

▶ With intravenous use in adults For *intravenous infusion* (Dexamethasone, Hospira) give continuously or intermittently or *via* drip tubing in Glucose 5% or Sodium Chloride 0.9%.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intra-articular use or local infiltration are given in units of dexamethasone base.

#### ● PATIENT AND CARER ADVICE

Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

## Fludrocortisone acetate

616

#### ● INDICATIONS AND DOSE

##### Neuropathic postural hypotension

- ▶ BY MOUTH

▶ Adult: 100–400 micrograms daily

##### Mineralocorticoid replacement in adrenocortical insufficiency

- ▶ BY MOUTH

▶ Adult: 50–300 micrograms once daily

continued →

**Adrenocortical insufficiency resulting from septic shock (in combination with hydrocortisone)**

- ▶ BY MOUTH
- ▶ Adult: 50 micrograms daily

- **UNLICENSED USE** Not licensed for use in neuropathic postural hypotension.
- **HEPATIC IMPAIRMENT** Monitor patient closely in hepatic impairment.
- **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 10

▶ **Fludrocortisone acetate (Non-proprietary)**

Fludrocortisone acetate 100 microgram Fludrocortisone 100microgram tablets | 30 tablet **[PoM]** £30.00 DT price = £30.00

F 616

**Hydrocortisone**● **INDICATIONS AND DOSE****Thyrototoxic crisis (thyroid storm)**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 100 mg every 6 hours, to be administered as sodium succinate

**Adrenocortical insufficiency resulting from septic shock**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 50 mg every 6 hours, given in combination with fludrocortisone

**Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 100–300 mg, to be administered as sodium succinate

**Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient's usual oral corticosteroid dose is recommenced after surgery

**Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

**Adrenocortical insufficiency in Addison's disease or following adrenalectomy**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

**Adrenocortical insufficiency**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 100–500 mg 3–4 times a day or when required

**Severe inflammatory bowel disease**

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 100–500 mg 3–4 times a day or when required

**Replacement in adrenocortical insufficiency**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning
- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 20–30 mg daily in divided doses, adjusted according to response

**Ulcerative colitis | Proctitis | Proctosigmoiditis**

- ▶ BY RECTUM USING RECTAL FOAM
- ▶ Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

**Acute hypersensitivity reactions | Angioedema**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1-5 months: Initially 25 mg 3 times a day, adjusted according to response
- ▶ Child 6 months-5 years: Initially 50 mg 3 times a day, adjusted according to response
- ▶ Child 6-11 years: Initially 100 mg 3 times a day, adjusted according to response
- ▶ Child 12-17 years: Initially 200 mg 3 times a day, adjusted according to response

**Severe acute asthma | Life-threatening acute asthma**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1 month-1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 2-4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 5-11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 12-17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

**DOSE EQUIVALENCE AND CONVERSION**

When switching from immediate-release hydrocortisone tablets to modified release *Plenadren*<sup>®</sup> use same total daily dose. Bioavailability of *Plenadren*<sup>®</sup> lower than immediate release tablets—monitor clinical response.

● **CONTRA-INDICATIONS**

- ▶ With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● **CAUTIONS**

- ▶ With rectal use Systemic absorption may occur

● **SIDE-EFFECTS**

- ▶ With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
- ▶ With rectal use Local irritation

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- ▶ With intravenous use in adults For *intravenous infusion (SoluCorte*<sup>®</sup>), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).
- **LESS SUITABLE FOR PRESCRIBING**
  - ▶ With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

## Methylprednisolone

#### ● INDICATIONS AND DOSE

##### Suppression of inflammatory and allergic disorders |

##### Cerebral oedema associated with malignancy

###### ▶ BY MOUTH

▶ Adult: Usual dose 2–40 mg daily

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 10–500 mg

##### Treatment of graft rejection reactions

###### ▶ BY INTRAVENOUS INFUSION

▶ Adult: Up to 1 g daily for up to 3 days

#### DEPO-MEDRONE®

##### Suppression of inflammatory and allergic disorders

###### ▶ BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

#### ● CAUTIONS

▶ With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (as sodium succinate) (*Solu-Medrone*®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## Prednisolone

### ● INDICATIONS AND DOSE

**Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)**

- ▶ BY MOUTH
- ▶ Adult: 30 mg daily for 7–14 days

**Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)**

- ▶ BY MOUTH
- ▶ Child: 1–2 mg/kg

**Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

**Mild to moderate acute asthma | Severe or life-threatening acute asthma**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- ▶ Child 12–17 years: 40–50 mg daily for at least 5 days
- ▶ Adult: 40–50 mg daily for at least 5 days

**Suppression of inflammatory and allergic disorders**

- ▶ BY MOUTH
- ▶ Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg 1–2 times a week, as prednisolone acetate

**Suppression of inflammatory and allergic disorders (initial dose in severe disease)**

- ▶ BY MOUTH
- ▶ Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

**Idiopathic thrombocytopenic purpura**

- ▶ BY MOUTH
- ▶ Adult: 1 mg/kg daily, gradually reduce dose over several weeks

**Ulcerative colitis | Crohn's disease**

- ▶ BY MOUTH
- ▶ Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

**Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)**

- ▶ BY MOUTH
- ▶ Adult: Initially 40–60 mg daily, dose to be instituted at once

**Generalised myasthenia gravis (when given on alternate days)**

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis in ventilated patients (when given on alternate days)**

- ▶ BY MOUTH
- ▶ Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis (when giving daily)**

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

**Ocular myasthenia**

- ▶ BY MOUTH
- ▶ Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

**Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration**

- ▶ BY MOUTH
- ▶ Adult: 7.5 mg daily

**Polymyalgia rheumatica**

- ▶ BY MOUTH
- ▶ Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

**Giant cell (temporal) arteritis**

- ▶ BY MOUTH
- ▶ Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

**Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus**

- ▶ BY MOUTH
- ▶ Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

**Anorexia (symptom control in palliative care)**

- ▶ BY MOUTH
- ▶ Adult: 15–30 mg daily

**Pneumocystis pneumonia in moderate to severe infections associated with HIV infection**

- ▶ BY MOUTH
- ▶ Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

**Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration**

- ▶ BY MOUTH
- ▶ Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

**Proctitis**

- ▶ BY RECTUM USING RECTAL FOAM
- ▶ Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

## ► BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

**Distal ulcerative colitis**

## ► BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Rectal complications of Crohn's disease**

## ► BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

**Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease**

## ► BY RECTUM USING ENEMA

- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

● **CONTRA-INDICATIONS**

- With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● **CAUTIONS**

- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

- PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

- With systemic use Pregnant women with fluid retention should be monitored closely.

- BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

- With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

● **PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Prednisolone for asthma [www.medicinesforchildren.org.uk/prednisolone-for-asthma](http://www.medicinesforchildren.org.uk/prednisolone-for-asthma)
- With oral use Patient counselling is advised for prednisolone tablets (steroid card).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution enema

## Triamcinolone acetonide

### ● INDICATIONS AND DOSE

#### Suppression of inflammatory and allergic disorders

► BY DEEP INTRAMUSCULAR INJECTION

► Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient's response

- **CAUTIONS** High dosage (may cause proximal myopathy), avoid in chronic therapy
- **PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Supension for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol

► **Kenalog** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Triamcinolone acetonide 40 mg per 1 ml** Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial **PoM**  
£7.45 DT price = £7.45

400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

### IMPORTANT SAFETY INFORMATION

#### CHMP ADVICE: KETOCONAZOLE (JULY 2013)

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

- **CONTRA-INDICATIONS** Acquired QTc prolongation · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation
- **CAUTIONS** Risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · adrenal insufficiency · diarrhoea · hepatic enzymes increased · nausea · pruritus · rash · vomiting
  - **Uncommon** Alopecia · dizziness · headache · malaise · somnolence · thrombocytopenia · urticaria
  - **Rare** Hepatic failure · hepatitis · jaundice · liver damage
  - **Very rare** Pyrexia
  - **Frequency not known** Alcohol intolerance · anorexia · arthralgia · azoospermia · dermatitis · dry mouth · dysgeusia · dyspepsia · epistaxis · erectile dysfunction · erythema · flatulence · gynaecomastia · hot flush · increased appetite · insomnia · menstrual disorder · myalgia · nervousness · paraesthesia · peripheral oedema · photophobia · photosensitivity · raised intracranial pressure · reduced testosterone concentrations · tongue discoloration · xeroderma
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hepatotoxicity Potentially life-threatening hepatotoxicity reported rarely.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- **MONITORING REQUIREMENTS**
  - Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
  - Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and

## 2.1 Cushing's syndrome and disease

### Cushing's Syndrome

#### Management

Most types of *Cushing's syndrome* are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 625 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotropin tumour cells in patients with Cushing's disease. It is used under specialist supervision for treatment of endogenous Cushing's syndrome.

**Other drugs used for Cushing's syndrome and disease;**  
Pasireotide, p. 847

### ENZYME INHIBITORS

#### Ketoconazole

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 $\alpha$ -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropin tumour cells in patients with Cushing's disease.

### ● INDICATIONS AND DOSE

#### Endogenous Cushing's syndrome (specialist use only)

► BY MOUTH

► Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance

discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

- ▶ **Hepatotoxicity** Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

#### ● PATIENT AND CARER ADVICE

Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop.

Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

#### Driving and skilled tasks

Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- ▶ **Ketoconazole (non-proprietary)** ▼  
**Ketoconazole 200 mg** Ketoconazole 200mg tablets | 400 tablet **[PoM]** £480.00

## Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 $\beta$ -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

#### ● INDICATIONS AND DOSE

**Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)**

- ▶ BY MOUTH
- ▶ Adult: 750 mg every 4 hours for 6 doses

**Management of Cushing's syndrome (specialist supervision in hospital)**

- ▶ BY MOUTH
- ▶ Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

**Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)**

- ▶ BY MOUTH
- ▶ Adult: 3 g daily in divided doses

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in acute porphyrias p. 930 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** Many drugs interfere with diagnostic estimation of steroids.
- **SIDE-EFFECTS**
- ▶ **Rare** Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism

- ▶ **Frequency not known** Dizziness · headache · hypotension · nausea · sedation · vomiting

- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).
- **PATIENT AND CARER ADVICE**

#### Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 21

## 3 Diabetes mellitus and hypoglycaemia

### 3.1 Diabetes mellitus

## Diabetes

### Overview

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

*Type 1 diabetes*, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

*Type 2 diabetes*, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat p. 86 may be considered in obese patients.

### Treatment of diabetes

Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications; tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 114 and a lipid-regulating drug.

### Prevention of diabetic complications

Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy

may occur when normalising blood-glucose concentration (ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy).

A measure of the total glycosylated (or glycated) haemoglobin (HbA<sub>1c</sub>) or a specific fraction (HbA<sub>1c</sub>) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA<sub>1c</sub> (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA<sub>1c</sub> concentration at 48 mmol/mol or less. HbA<sub>1c</sub> should be measured every 3–6 months.

#### Measurement of HbA<sub>1c</sub>

HbA<sub>1c</sub> values are expressed in *mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA<sub>1c</sub>, created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA<sub>1c</sub> values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA <sub>1c</sub> (mmol/mol)	DCCT-HbA <sub>1c</sub> (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
75	9.0

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA<sub>1c</sub> and can be used to assess control over short periods of time, particularly when HbA<sub>1c</sub> monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

### Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA ([www.gov.uk/government/publications/at-a-glance](http://www.gov.uk/government/publications/at-a-glance)).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 640, repaglinide p. 640). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver's seat;
- eat or drink a suitable source of sugar;

- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

### Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using *Albustix*<sup>®</sup>) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*<sup>®</sup> or *Microalbumintest*<sup>®</sup>) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contraindications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes.

### Diabetic neuropathy

Optimal diabetic control is beneficial for the management of *painful neuropathy* in patients with type 1 diabetes. Paracetamol p. 414 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 999 may relieve *mild to moderate pain*.

Duloxetine p. 345 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 349 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 355 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 304 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 435, morphine p. 429, and oxycodone hydrochloride p. 431; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin p. 295 and carbamazepine p. 291 are sometimes used for the treatment of neuropathic pain. Capsaicin cream 0.075% p. 446 is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In *autonomic neuropathy* diabetic diarrhoea can often be managed by **tetracycline** [unlicensed use], otherwise codeine phosphate p. 421 is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin p. 497 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation.

In *neuropathic postural hypotension* increased salt intake and the use of the mineralcorticoid fludrocortisone acetate p. 619 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 998 and ephedrine hydrochloride p. 254 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

*Gustatory sweating* can be treated with an antimuscarinic such as propantheline bromide p. 81; side-effects are common. See also, the management of hyperhidrosis (Antiperspirants p. 1116).

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] offers effective relief.

See also the management of Erectile dysfunction p. 743.

## Diabetic ketoacidosis

### Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group (available at [www.diabetes.org.uk/Documents/About%20Us/What%20we%20say/Management-of-DKA-241013.pdf](http://www.diabetes.org.uk/Documents/About%20Us/What%20we%20say/Management-of-DKA-241013.pdf)), should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride 0.9%** by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride 0.9%** should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 651 or insulin glargine p. 651) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose 10%** should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride 0.9% infusion**.
- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

## Insulins and anti-diabetic drugs

### Insulins

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid

sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. Antidiabetic drugs have a role in the management of diabetes in pregnancy.

### Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications. Insulin preparations can be divided into 3 types:

- those of **short** duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart p. 653, insulin glulisine p. 653, and insulin lispro p. 654;
- those with an **intermediate** action, e.g. isophane insulin p. 649; and
- those whose action is slower in onset and lasts for **long** periods, e.g. protamine zinc insulin p. 652, insulin detemir p. 651, and insulin glargine p. 651.

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid-acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is

increased gradually according to the patient's individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty.

Requirements may be decreased in those with certain endocrine disorders (e.g. Addison's disease, hypopituitarism), or in coeliac disease.

#### Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily. With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion.

#### Hypoglycaemia

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

#### Diabetes and surgery

Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- give an injection of the patient's usual insulin on the night before the operation;
- early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient's fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- the rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion

include the patient's volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose p. 915 and potassium chloride p. 929 (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient's fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) *or*
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory *or*
- complete reversion to the intravenous regimen (especially if the patient is unwell).

#### Short-acting insulins

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (see Diabetic ketoacidosis p. 627) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, insulin aspart p. 653, insulin glulisine p. 653, and insulin lispro p. 654 have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion. Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

#### Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting

insulins (except insulin detemir p. 651, insulin glargine p. 651, and insulin degludec p. 650) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin p. 652).

Isothane insulin p. 649 is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin p. 649, biphasic insulin aspart p. 650, or biphasic insulin lispro p. 650).

Insulin zinc suspension p. 652 (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin glargine and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin *or*
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia *or*
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs *or*
- who cannot use the device needed to inject isophane insulin.

Insulin detemir is also licensed as add-on therapy in patients receiving treatment with liraglutide p. 639.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

#### Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

**Lancets, needles, syringes, and accessories** are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)
- Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)
- Scottish Drug Tariff: [www.isds.scotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isds.scotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)

#### Antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months' restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 649 mixed with

soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 631.

#### Pregnancy and breast-feeding

During pregnancy, women with *pre-existing diabetes* can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin. Metformin hydrochloride can be continued, or glibenclamide p. 645 resumed, during breast-feeding for those with pre-existing diabetes. Women with *gestational diabetes* may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

#### Sulfonylureas

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin hydrochloride is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient's age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as gliclazide p. 645 or tolbutamide p. 647, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin;
- combining with pioglitazone;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, liraglutide, or lixisenatide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;
- combining with bedtime isophane insulin but weight gain and hypoglycaemia can occur.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

#### Biguanides

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.

Metformin hydrochloride is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin hydrochloride treatment fails, other options include:

- combining with a sulfonylurea;
- combining with pioglitazone p. 647;
- combining with repaglinide p. 640 or nateglinide p. 640;
- combining with alogliptin p. 633, linagliptin p. 633, saxagliptin p. 634, sitagliptin p. 635, or vildagliptin p. 636;

- combining with canagliflozin p. 641, dapagliflozin p. 642 or empagliflozin p. 643;
- combining with exenatide p. 638, liraglutide p. 639, or lixisenatide p. 639;
- combining with acarbose p. 631, which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin hydrochloride on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin hydrochloride; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Metformin hydrochloride is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin hydrochloride improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

#### Other antidiabetic drugs

Use of acarbose is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide and repaglinide stimulate insulin secretion. Both drugs have a rapid onset of action and short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin hydrochloride is contra-indicated or not tolerated, or it may be given in combination with metformin hydrochloride. Nateglinide is licensed only for use with metformin hydrochloride.

Pioglitazone can be used alone or in combination with metformin hydrochloride or with a sulfonylurea (if metformin hydrochloride inappropriate), or with both; the combination of pioglitazone plus metformin hydrochloride is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin hydrochloride and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin hydrochloride is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin hydrochloride is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contra-indicated or not tolerated;
- a combination of metformin hydrochloride and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA<sub>1c</sub> concentration is reduced by at

least 0.5 percentage points within 6 months of starting treatment.

Linagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride (when treatment with metformin hydrochloride alone fails to achieve adequate glycaemic control), or both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin hydrochloride) when a stable dose of insulin has not provided adequate glycaemic control.

Saxagliptin and vildagliptin are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride or a sulfonylurea (if metformin hydrochloride inappropriate), or pioglitazone p. 647 (when treatment with either metformin hydrochloride p. 631 or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin p. 634 or vildagliptin p. 636, and insulin (with or without metformin hydrochloride) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control.

Alogliptin p. 633 is also licensed for use as triple therapy in combination with metformin hydrochloride and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin p. 635 or vildagliptin is continued only if HbA<sub>1c</sub> concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Treatment with exenatide p. 638, liraglutide p. 639, and lixisenatide p. 639 is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin hydrochloride or a sulfonylurea, or both, or with pioglitazone, or with both metformin hydrochloride and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin hydrochloride or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin hydrochloride and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:

- a body mass index of 35 kg/m<sup>2</sup> or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m<sup>2</sup>, and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard release exenatide is continued only if HbA<sub>1c</sub> concentration is

reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Albiglutide p. 636 is licensed for the treatment of type 2 diabetes mellitus, either alone (if metformin hydrochloride inappropriate) or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control).

Dulaglutide p. 637 is licensed for the treatment of type 2 diabetes mellitus, alone (if metformin is inappropriate) or in combination with other antidiabetic drugs in patients who have not achieved adequate glycaemic control with these drugs.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin hydrochloride or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with basal insulin or both metformin hydrochloride and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

Lixisenatide is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin hydrochloride, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs; lixisenatide should not be used in combination with both basal insulin and a sulfonylurea because of an increased risk of hypoglycaemia.

Canagliflozin p. 641 and dapagliflozin p. 642, and empagliflozin p. 643 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.

## BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS

### Acarbose

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

#### ● INDICATIONS AND DOSE

**Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs**

##### ► BY MOUTH

- **Adult:** Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- **CONTRA-INDICATIONS** Hernia · inflammatory bowel disease · predisposition to partial intestinal obstruction · previous abdominal surgery

- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)

- **INTERACTIONS** → Appendix 1 (antidiabetics).

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal distention and pain · diarrhoea (may need to reduce dose or withdraw) · flatulence · soft stools
- **Rare** Abnormal liver function tests · nausea · skin reactions
- **Very rare** Hepatitis · ileus · jaundice · oedema

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Antacids** Antacids unlikely to be beneficial for treating side effects.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor liver function.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.
- **PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose – acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► Acarbose (Non-proprietary)

**Acarbose 50 mg** Acarbose 50mg tablets | 90 tablet **[PoM]** £11.53  
DT price = £11.51

**Acarbose 100 mg** Acarbose 100mg tablets | 90 tablet **[PoM]** £19.06  
DT price = £19.03

##### ► Glucobay (Bayer Plc)

**Acarbose 50 mg** Glucobay 50mg tablets | 90 tablet **[PoM]** £7.35 DT  
price = £11.51

**Acarbose 100 mg** Glucobay 100mg tablets | 90 tablet **[PoM]** £13.50  
DT price = £19.03

## BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

### Metformin hydrochloride

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Child 10–17 years** (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- **Adult:** Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

##### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- **Adult:** Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

##### Polycystic ovary syndrome

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

### ● UNLICENSED USE

- ▶ In adults Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.
- ▶ In children Not licensed for use in children under 10 years.

● **CONTRA-INDICATIONS** Ketoacidosis · use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

● **CAUTIONS** Can provoke lactic acidosis

● **INTERACTIONS** → Appendix 1 (antidiabetics).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting
- ▶ **Rare** Decreased vitamin-B<sub>12</sub> absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria
- ▶ **Frequency not known** Hepatitis

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Gastro-intestinal side-effects Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

● **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

● **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

● **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

● **RENAL IMPAIRMENT** Use with caution in renal impairment— increased risk of lactic acidosis. Lactic acidosis Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

- ▶ In adults NICE (clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes) recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m<sup>2</sup> and to avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- ▶ In children Avoid in significant renal impairment.

● **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ In adults Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Metformin for diabetes [www.medicinesforchildren.org.uk/metformin-diabetes](http://www.medicinesforchildren.org.uk/metformin-diabetes)

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### GLUCOPHAGE® SR

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2009) that *Glucophage® SR* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-

release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

## BLOOD GLUCOSE LOWERING DRUGS >

### DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

**Alogliptin**

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● **INDICATIONS AND DOSE**

**Type 2 diabetes mellitus as dual therapy in combination with either metformin, pioglitazone, a sulfonyleurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin**

▶ **BY MOUTH**

- ▶ Adult: 25 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonyleurea or insulin may need to be reduced.

Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** History of pancreatitis • not recommended in moderate to severe heart failure (limited experience)
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain • gastro-oesophageal reflux • headache • nasopharyngitis • pruritus • rash • upper respiratory-tract infection
  - ▶ **Frequency not known** Angioedema • hepatic impairment • pancreatitis • Stevens-Johnson syndrome • urticaria
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## Sitagliptin

● **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) |**

**Type 2 diabetes mellitus in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control, and may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control**

► BY MOUTH

► Adult: 100 mg once daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

● **CONTRA-INDICATIONS** Ketoacidosis

● **INTERACTIONS** → Appendix 1 (antidiabetics).

### ● SIDE-EFFECTS

► **Common or very common** Gastro-intestinal disturbances · nasopharyngitis · pain · peripheral oedema · upper respiratory tract infection

► **Uncommon** Anorexia · dizziness · drowsiness · dry mouth · headache · hypoglycaemia · osteoarthritis

## Vildagliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with metformin or pioglitazone (when treatment with either metformin or pioglitazone fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control**

► BY MOUTH

► Adult: 50 mg twice daily

**Type 2 diabetes mellitus in combination with sulfonylurea (if metformin inappropriate)**

► BY MOUTH

► Adult: 50 mg daily, dose to be taken in the morning

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** Manufacturer advises avoid in severe heart failure—no information available
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
  - **Common or very common** Asthenia · dizziness · headache · nausea · peripheral oedema · tremor
  - **Uncommon** Arthralgia · constipation · hypoglycaemia
  - **Rare** Hepatic dysfunction
  - **Very rare** Nasopharyngitis · upper respiratory tract infection
  - **Frequency not known** Bullous skin reactions · exfoliative skin reactions · pancreatitis

### SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **Liver toxicity** Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment and every 3 months for first year and periodically thereafter.
- **PATIENT AND CARER ADVICE** Liver toxicity Patients should be advised to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised that vildagliptin (*Galvus*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inappropriate (December 2012), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors,

when treatment with metformin and a sulfonylurea is inadequate (November 2013).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

► **Galvus** (Novartis Pharmaceuticals UK Ltd)

Vildagliptin 50 mg Galvus 50mg tablets | 56 tablet [PoM] £33.35 DT price = £33.35

## Vildagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, vildagliptin above, metformin hydrochloride p. 631.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin**

► BY MOUTH

► Adult: 1 tablet twice daily, based on patient's current metformin dose

- **INTERACTIONS** Dose of concomitant sulfonylurea or insulin may need to be reduced.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2008) that *Eucreas*<sup>®</sup> is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

► **Eucreas** (Novartis Pharmaceuticals UK Ltd)

Metformin hydrochloride 1 gram, Vildagliptin 50 mg Eucreas 50mg/1000mg tablets | 60 tablet [PoM] £35.68 DT price = £35.68  
Vildagliptin 50 mg, Metformin hydrochloride 850 mg Eucreas 50mg/850mg tablets | 60 tablet [PoM] £35.68 DT price = £35.68

## BLOOD GLUCOSE LOWERING DRUGS > GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

### Albiglutide

01-Jun-2016

- **DRUG ACTION** Albiglutide is a GLP-1 (glucagon-like peptide-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy when treatment with metformin is considered inappropriate | Type 2 diabetes mellitus in combination with basal insulin and other oral glucose lowering agents**

► BY SUBCUTANEOUS INJECTION

► Adult: 30 mg once weekly, increased if necessary up to 50 mg once weekly, to be administered on the same day each week

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastrointestinal disease—no information available

- **CAUTIONS** History of pancreatitis · moderate to severe heart failure—no information available
- **INTERACTIONS** → Appendix 1 (antidiabetics)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Atrial fibrillation · constipation · diarrhoea · dyspepsia · gastro-oesophageal reflux disease · hypoglycaemia · injection site reactions · nausea · vomiting
  - ▶ **Uncommon** Intestinal obstruction · pancreatitis (discontinue treatment)
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential. Discontinue treatment at least one month before a planned pregnancy.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **HANDLING AND STORAGE** Store at 2–8°C. May be stored at temperatures up to 30°C for up to 4 weeks.
- **PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer albiglutide injection.

Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Missed doses**

If a dose is missed it should be administered as soon as possible within 3 days; if more than 3 days have passed, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2016) that albiglutide (*Eperzan*<sup>®</sup>) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control in combination with other glucose-lowering medicines when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as an alternative once weekly GLP-1 mimetic for use in combination with oral anti-diabetic agents as a third-line pre-insulin treatment option.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**▶ **Eperzan** (GlaxoSmithKline UK Ltd) ▼

**Albiglutide 30 mg** Eperzan 30mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £71.00

**Albiglutide 50 mg** Eperzan 50mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £71.00

**Dulaglutide**

14-Jun-2016

- **DRUG ACTION** Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

● **INDICATIONS AND DOSE****Type 2 diabetes mellitus as monotherapy if metformin inappropriate**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 0.75 mg once weekly

**Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1.5 mg once weekly

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastro-intestinal disease—no information available
- **CAUTIONS** Congestive heart failure—no information available
- **INTERACTIONS** → Appendix 1 (antidiabetics)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distention, · abdominal pain · atrioventricular block · constipation · decreased appetite · diarrhoea · dyspepsia · fatigue · flatulence · gastro-oesophageal reflux disease · nausea · sinus tachycardia · vomiting
  - ▶ **Rare** Acute pancreatitis (discontinue treatment)
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment and end stage renal disease—no information available.
- **HANDLING AND STORAGE** **Refrigerated storage** is usually necessary (2°C–8°C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30°C.
- **PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer dulaglutide injection.

Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Missed doses**

If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2016) that dulaglutide (*Trulicity*<sup>®</sup>) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicines, when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as part of a triple therapy in people with inadequate glycaemic control on 2 oral anti-diabetic medicines, as an alternative GLP-1 mimetic option.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**▶ **Trulicity** (Eli Lilly and Company Ltd) ▼

**Dulaglutide 1.5 mg per 1 ml** Trulicity 0.75mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.25

**Dulaglutide 3 mg per 1 ml** Trulicity 1.5mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.25

## Exenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination**

▶ BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

▶ BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES

▶ **Adult:** 2 mg once weekly

**Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)**

▶ BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea may need to be reduced.

### PHARMACOKINETICS

Effect of *modified-release* exenatide injection (*Bydureon*<sup>®</sup>) may persist for 10 weeks after discontinuation.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease
- **CAUTIONS** Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
- **INTERACTIONS** → Appendix 1 (antidiabetics). Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain and distension · agitation · antibody formation · asthenia · decreased appetite · diarrhoea · dizziness · dyspepsia · gastrointestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · increased sweating · injection-site reactions · nausea · vomiting · weight loss
  - ▶ **Uncommon** Pancreatitis
  - ▶ **Rare** Alopecia
  - ▶ **Very rare** Anaphylactic reactions
  - ▶ **Frequency not known** Angioedema · constipation · dehydration · drowsiness · eructation · flatulence · pruritus · rash · renal impairment · taste disturbance · urticaria
- **SIDE-EFFECTS, FURTHER INFORMATION** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if pancreatitis is diagnosed.
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.

- **RENAL IMPAIRMENT** For *standard-release* injection, use with caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. For *standard-release* injection, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. For *modified-release* injection, avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

### ● PATIENT AND CARER ADVICE

Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose.

Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details.

Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

### Missed doses

If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer *after* a meal.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2007) that standard-release exenatide (*Byetta*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The *Scottish Medicines Consortium* has also advised (February 2011) that standard-release exenatide (*Byetta*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

The *Scottish Medicines Consortium* has advised (December 2011) that modified-release exenatide (*Bydureon*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

▶ **Byetta** (AstraZeneca UK Ltd)

**Exenatide 250 microgram per 1 ml** Byetta 10micrograms/0.04ml solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £68.24 DT price = £68.24

Byetta 5micrograms/0.02ml solution for injection 1.2ml pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £68.24 DT price = £68.24

#### Powder and solvent for suspension for injection

CAUTIONARY AND ADVISORY LABELS 10

**Exenatide 2 mg** Bydureon 2mg powder and solvent for prolonged-release suspension for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.36

Bydureon 2mg powder and solvent for suspension for prolonged-release injection vials | 4 vials [PoM] £73.36

## Liraglutide

01-Jun-2016

- **DRUG ACTION** Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination | Type 2 diabetes mellitus in combination with basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control**

#### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary up to 1.8 mg once daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or sulfonylurea may need to be reduced.

- **CONTRA-INDICATIONS** Diabetic gastroparesis · inflammatory bowel disease · ketoacidosis · moderate to severe congestive heart failure—no information available
- **CAUTIONS** History of pancreatitis · mild congestive heart failure—limited experience · thyroid disease
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain and distension · bronchitis · constipation · decreased appetite · diarrhoea · dizziness · dyspepsia · flatulence · gastritis · gastro-intestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · injection site reactions · malaise · nasopharyngitis · nausea · tachycardia · vomiting
  - ▶ **Uncommon** Acute renal failure · dehydration · renal impairment
  - ▶ **Very rare** Acute pancreatitis
  - ▶ **Frequency not known** Goitre · increased blood calcitonin · thyroid neoplasm
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies (recommendation also supported by primary literature).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—limited experience.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—limited experience.
- **HANDLING AND STORAGE** Store in a refrigerator (2°C–8°C); after first use can be stored below 30°C, discard 1 month after first use.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer liraglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms such as persistent, severe abdominal pain develop.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Liraglutide (Non-proprietary)

#### ▶ Victoza (Novo Nordisk Ltd)

Liraglutide 6 mg per 1 ml Victoza 6mg/ml solution for injection 3ml pre-filled pen | 2 pre-filled disposable injection [PoM] £78.48 DT price = £78.48 | 3 pre-filled disposable injection [PoM] £117.72

Combinations available: *Insulin degludec with liraglutide*, p. 651

## Lixisenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs**

#### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastro-intestinal disease
- **INTERACTIONS** → Appendix 1 (antidiabetics). Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · dizziness · drowsiness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · palpitation · vomiting
  - ▶ **Uncommon** Tachycardia · urticaria
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—no information available.
- **PATIENT AND CARER ADVICE** Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.
  - Missed doses
  - If a dose is missed, inject within 1 hour before the next meal—do not administer **after** a meal.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions**
  - The *Scottish Medicines Consortium* has advised (August 2013) that lixisenatide (*Lyxumia*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

## BLOOD GLUCOSE LOWERING DRUGS > SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

### Canagliflozin

29-Jun-2016

● **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

##### ► BY MOUTH

► **Adult:** 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (JUNE 2016): SIGNAL OF INCREASED RISK OF LOWER EXTREMITY AMPUTATIONS OBSERVED IN TRIAL IN HIGH CARDIOVASCULAR RISK PATIENTS**

A signal of increased lower limb amputation (mostly affecting toes) has been reported in an ongoing clinical trial in high cardiovascular risk patients. The MHRA has issued the following advice while this report is under investigation:

- consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene), at least until the condition has resolved, and continue to monitor the patient closely
- carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer's recommendations
- advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
- continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

**MHRA/CHM ADVICE (JUNE 2015): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

Serious and potentially life-threatening cases of diabetic ketoacidosis (DKA) have been reported in patients taking the SGLT2 inhibitor canagliflozin for type 2 diabetes. To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Test for raised ketones in patients presenting with symptoms of DKA, even if plasma glucose levels are near-normal; omitting this test could delay diagnosis of DKA.
- Discontinue treatment if DKA is suspected.
- If DKA is confirmed, take appropriate measures to correct the DKA and monitor glucose levels.
- Patients should be advised on how to recognise the signs and symptoms of DKA such as nausea, vomiting,

anorexia, abdominal pain, excessive thirst, difficulty breathing, confusion, unusual fatigue, or sleepiness, and to seek prompt medical attention if symptoms of DKA develop.

● **CONTRA-INDICATIONS** Ketoacidosis

● **CAUTIONS** Cardiovascular disease (risk of hypotension) · elderly (risk of hypotension) · elevated haematocrit · history of hypotension

#### CAUTIONS, FURTHER INFORMATION

► **Volume depletion** Correct hypovolaemia before starting treatment.

● **INTERACTIONS** → Appendix 1 (antidiabetics).

#### ● SIDE-EFFECTS

► **Common or very common** Constipation · dyslipidaemia · genital infection · hypoglycaemia (in combination with insulin or sulfonylurea) · nausea · polyuria · raised haematocrit · thirst · urinary frequency · urinary-tract infection

► **Uncommon** Dehydration · dizziness · hypovolaemia · postural hypotension · raised serum creatinine · raised serum urea · rash · syncope

#### SIDE-EFFECTS, FURTHER INFORMATION

► **Volume depletion** Consider interrupting treatment if volume depletion occurs.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● **RENAL IMPAIRMENT** Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m<sup>2</sup> and existing canagliflozin treatment tolerated. Avoid initiation if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 45 mL/minute/1.73 m<sup>2</sup>. Monitor renal function at least twice a year in moderate impairment.

● **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.

● **PATIENT AND CARER ADVICE** Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

► **Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)**

NICE TA390

Canagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed **and** a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA390](http://www.nice.org.uk/TA390)

► **Canagliflozin in combination therapy for treating type 2 diabetes (June 2014)** NICE TA315

Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated *or* the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with

metformin and a sulfonylurea *or* metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

Canagliflozin (as Canagliflozin hemihydrate) 50 mg, Metformin hydrochloride 850 mg Vokanamet 50mg/850mg tablets | 60 tablet [PoM](#) £39.20 DT price = £39.20

## Dapagliflozin

29-Jun-2016

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

#### • INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

##### ▶ BY MOUTH

- ▶ Adult 18-74 years: 10 mg once daily
- ▶ Adult 75 years and over: Initiation not recommended

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (JUNE 2015): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

Serious and potentially life-threatening cases of diabetic ketoacidosis (DKA) have been reported in patients taking the SGLT2 inhibitor dapagliflozin for type 2 diabetes. To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Test for raised ketones in patients presenting with symptoms of DKA, even if plasma glucose levels are near-normal; omitting this test could delay diagnosis of DKA.
- Discontinue treatment if DKA is suspected.
- If DKA is confirmed, take appropriate measures to correct the DKA and monitor glucose levels.
- Patients should be advised on how to recognise the signs and symptoms of DKA such as nausea, vomiting, anorexia, abdominal pain, excessive thirst, difficulty breathing, confusion, unusual fatigue, or sleepiness, and to seek prompt medical attention if symptoms of DKA develop.

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Cardiovascular disease (risk of hypotension) · elderly (risk of hypotension) · electrolyte disturbances · hypotension · raised haematocrit

#### CAUTIONS, FURTHER INFORMATION

- ▶ Volume depletion Correct hypovolaemia before starting treatment.

- **INTERACTIONS** → Appendix 1 (antidiabetics).

#### • SIDE-EFFECTS

- ▶ **Common or very common** Back pain · constipation · dyslipidaemia · dysuria · genital infection · hypoglycaemia (in combination with insulin or sulphonylurea) · polyuria · sweating · thirst · urinary-tract infection
- ▶ **Uncommon** Dehydration · dizziness · hypotension · hypovolaemia · nausea · nocturia · raised serum creatinine · raised serum urea · rash

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Volume depletion Consider interrupting treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Initial dose 5 mg daily in severe impairment, increased according to response.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup> (ineffective).

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter.
- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ **Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)** NICE TA390  
Dapagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed **and** a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving dapagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA390](http://www.nice.org.uk/TA390)

- ▶ **Dapagliflozin in combination therapy for treating type 2 diabetes (June 2013)** NICE TA288

Dapagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if glycaemic control is inadequate, and the patient has a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated.

Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Dapagliflozin in combination with metformin and a sulfonylurea as triple therapy is not recommended for the treatment of type 2 diabetes except as part of a clinical trial.

Patients currently receiving dapagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA288](http://www.nice.org.uk/TA288)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that dapagliflozin (*Forxiga*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin, when treatment with metformin alone is inadequate and a sulfonylurea is inappropriate (December 2012), or in combination with insulin when treatment with insulin alone is inadequate (February 2014).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

## Dapagliflozin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dapagliflozin p. 642, metformin hydrochloride p. 631.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 1 tablet twice daily, based on patient's current metformin dose
- ▶ Adult 75 years and over: Initiation not recommended

● **INTERACTIONS** Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

● **HEPATIC IMPAIRMENT** Avoid.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2014) that dapagliflozin plus metformin (*Xigduo*®) is accepted for restricted use within NHS Scotland in patients for whom a combination of dapagliflozin and metformin is an appropriate choice of therapy i.e. when metformin alone does not provide adequate glycaemic control and a sulfonylurea is inappropriate, or in combination with insulin, when insulin and metformin does not provide adequate control, or in combination with a sulphonylurea, when a sulfonylurea and metformin does not provide adequate control.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Xigduo** (AstraZeneca UK Ltd) ▼

**Dapagliflozin 5 mg, Metformin hydrochloride 1 gram** Xigduo 5mg/1000mg tablets | 56 tablet [PoM] £36.59 DT price = £36.59

**Dapagliflozin 5 mg, Metformin hydrochloride 850 mg** Xigduo 5mg/850mg tablets | 56 tablet [PoM] £36.59 DT price = £36.59

## Empagliflozin

29-Jun-2016

● **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

- ▶ BY MOUTH
- ▶ Adult 18-84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
- ▶ Adult 85 years and over: Initiation not recommended

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

Serious and potentially life-threatening cases of diabetic ketoacidosis (DKA) have been reported in patients taking the SGLT2 inhibitor empagliflozin for type 2 diabetes. To

minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Test for raised ketones in patients presenting with symptoms of DKA, even if plasma glucose levels are near-normal; omitting this test could delay diagnosis of DKA.
- Discontinue treatment if DKA is suspected.
- If DKA is confirmed, take appropriate measures to correct the DKA and monitor glucose levels.
- Patients should be advised on how to recognise the signs and symptoms of DKA such as nausea, vomiting, anorexia, abdominal pain, excessive thirst, difficulty breathing, confusion, unusual fatigue, or sleepiness, and to seek prompt medical attention if symptoms of DKA develop.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Cardiovascular disease (increased risk of volume depletion) · complicated urinary tract infections—consider temporarily interrupting treatment · concomitant antihypertensive therapy (increased risk of volume depletion) · elderly patients aged over 75 years (increased risk of volume depletion) · heart failure · history of hypotension (increased risk of volume depletion) · patients at increased risk of volume depletion · predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Genital infection · hypoglycaemia (in combination with insulin or sulfonylurea) · polyuria · pruritus · urinary tract infection
- ▶ **Uncommon** Dysuria · volume depletion
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m<sup>2</sup>. Avoid initiation if eGFR below 60 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR is persistently below 45 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE technology appraisals (TAs)**
- ▶ Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Empagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should be able to

continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA390](http://www.nice.org.uk/TA390)

#### ▶ Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336

Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:

- a sulfonylurea is contra-indicated or not tolerated, or
- the patient is at significant risk of hypoglycaemia or its consequences.

Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:

- metformin and a sulfonylurea or
- metformin and a thiazolidinedione.

Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

## BLOOD GLUCOSE LOWERING DRUGS >

### SULFONYLUREAS

## Sulfonylureas

● **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

● **CONTRA-INDICATIONS** Presence of ketoacidosis

● **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · elderly · G6PD deficiency

**SIDE-EFFECTS**

▶ **Uncommon** Hypoglycaemia

- ▶ **Rare** Agranulocytosis · aplastic anaemia · blood disorders · cholestatic jaundice · haemolytic anaemia · hepatic failure · hepatitis · leucopenia · pancytopenia · thrombocytopenia
- ▶ **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) · constipation · diarrhoea · disturbance in liver function · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · gastro-intestinal disturbances · hypersensitivity reactions (usually in the first 6–8 weeks of therapy) · jaundice (usually in the first 6–8 weeks of therapy) · nausea · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ **Hypoglycaemia** This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

● **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

● **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

**PATIENT AND CARER ADVICE**

The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

**Driving and skilled tasks**

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

## Glibenclamide

**INDICATIONS AND DOSE****Type 2 diabetes mellitus**

▶ **BY MOUTH**

▶ **Adult:** Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

▶ **Glibenclamide (Non-proprietary)**

**Glibenclamide 2.5 mg** Glibenclamide 2.5mg tablets | 28 tablet [PoM] £11.46 DT price = £7.13

**Glibenclamide 5 mg** Glibenclamide 5mg tablets | 28 tablet [PoM] £1.40 DT price = £0.82

## Gliclazide

**INDICATIONS AND DOSE****Type 2 diabetes mellitus**

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ **Adult:** Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ **Adult:** Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

**DOSE EQUIVALENCE AND CONVERSION**

▶ Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

¶ 645

## Glimepiride

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

► **Adult:** Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day

### ● CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

- **Porphyria** Sulfonylureas should be avoided where possible in acute porphyrias p. 930 but glimepiride is thought to be safe.
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Hyponatraemia
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.

- **MONITORING REQUIREMENTS** Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ► **Glimepiride (Non-proprietary)**

**Glimepiride 1 mg** Glimepiride 1mg tablets | 30 tablet **[PoM]** £4.33 DT price = £0.89

**Glimepiride 2 mg** Glimepiride 2mg tablets | 30 tablet **[PoM]** £7.13 DT price = £0.96

**Glimepiride 3 mg** Glimepiride 3mg tablets | 30 tablet **[PoM]** £10.75 DT price = £1.00

**Glimepiride 4 mg** Glimepiride 4mg tablets | 30 tablet **[PoM]** £14.24 DT price = £0.97

##### ► **Amaryl** (Zentiva)

**Glimepiride 3 mg** Amaryl 3mg tablets | 30 tablet **[PoM]** £10.75 DT price = £1.00

¶ 645

## Glipizide

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

► **Adult:** Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

### ● CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

- **Porphyria** Sulfonylureas should be avoided where possible in acute porphyrias p. 930 but glipizide is thought to be safe.
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
- **Rare** Photosensitivity
- **Frequency not known** Dizziness · drowsiness · hyponatraemia
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **HEPATIC IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.
- **RENAL IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► **Glipizide (Non-proprietary)**

**Glipizide 5 mg** Glipizide 5mg tablets | 28 tablet **[PoM]** £2.48 DT price = £2.20 | 56 tablet **[PoM]** £6.96

##### ► **Minodiab** (Pfizer Ltd)

**Glipizide 5 mg** Minodiab 5mg tablets | 28 tablet **[PoM]** £1.26 DT price = £2.20

## Tolbutamide

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

- Adult: 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Headache · tinnitus
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

##### ► Tolbutamide (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet (POM) £34.88 DT price = £8.14 | 112 tablet (POM) £39.44

## BLOOD GLUCOSE LOWERING DRUGS > THIAZOLIDINEDIONES

## Pioglitazone

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

##### ► BY MOUTH

- Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

### PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria
- **CAUTIONS** Avoid in acute porphyrias p. 930 · cardiovascular disease or in combination with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer

#### CAUTIONS, FURTHER INFORMATION

Substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally).

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
  - **Common or very common** Anaemia · arthralgia · dizziness · gastro-intestinal disturbances · haematuria · headache · hypoaesthesia · impotence · oedema · vertigo · visual disturbances · weight gain
  - **Uncommon** Altered blood lipids · bladder cancer · fatigue · hypoglycaemia · insomnia · proteinuria · sweating
  - **Rare** Liver dysfunction
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Liver toxicity** Rare reports of liver dysfunction; discontinue if jaundice occurs.
  - **PREGNANCY** Avoid—toxicity in *animal* studies.
  - **BREAST FEEDING** Avoid—present in milk in *animal* studies.
  - **HEPATIC IMPAIRMENT** Avoid.
  - **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.
  - **PATIENT AND CARER EDUCATION**
    - **Liver toxicity** Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.
  - **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to

take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

#### ▶ Pioglitazone (Non-proprietary)

**Pioglitazone (as Pioglitazone hydrochloride) 15 mg** Pioglitazone 15mg tablets | 28 tablet [PoM] £25.83 DT price = £8.23

## Pioglitazone with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, pioglitazone p. 647, metformin hydrochloride p. 631.

#### • INDICATIONS AND DOSE

##### Type 2 diabetes not controlled by metformin alone

###### ▶ BY MOUTH

▶ Adult: 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

###### CAUTIONARY AND ADVISORY LABELS 21

#### ▶ Competact (Takeda UK Ltd)

**Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin hydrochloride 850 mg** Competact 15mg/850mg tablets | 56 tablet [PoM] £35.89 DT price = £35.89

## INSULINS

## Insulins

#### IMPORTANT SAFETY INFORMATION

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)**

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not

considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

#### • SIDE-EFFECTS

▶ **Common or very common** Fat hypertrophy at injection site · local reactions at injection site · transient oedema

▶ **Rare** Hypersensitivity reactions · rash · urticaria

##### Overdose

Overdose causes hypoglycaemia.

▶ **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

#### • BREAST FEEDING

During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

▶ **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

▶ **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

#### • MONITORING REQUIREMENTS

▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.

▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.

▶ In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).

▶ In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).

▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

▶ **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

#### • PRESCRIBING AND DISPENSING INFORMATION

Units The word 'unit' should **not** be abbreviated.

Show container to patient or carer and confirm the expected version is dispensed.

#### • PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham  
OL9 9QH  
Tel: 0845 610 1112  
GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from [www.nhsforms.co.uk/](http://www.nhsforms.co.uk/) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com). Further information is available at [www.npsa.nhs.uk](http://www.npsa.nhs.uk).

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

## INSULINS > INTERMEDIATE-ACTING

F 648

### Biphasic isophane insulin

(Biphasic Isophane Insulin Injection—intermediate acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

● **INTERACTIONS** → Appendix 1 (antidiabetics).

● **SIDE-EFFECTS** Protamine may cause allergic reactions

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

- ▶ **Humulin M3** (Eli Lilly and Company Ltd)  
Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT price = £19.08  
Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68
- ▶ **Humulin M3 KwikPen** (Eli Lilly and Company Ltd)  
Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT price = £21.70
- ▶ **Hypurin Porcine 30/70 Mix** (Wockhardt UK Ltd)  
Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £37.80
