# Access the BNF *your way*

The **British National Formulary (BNF)** and **BNF for Children** are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

## ONLINE

### **BNF on MedicinesComplete**

Access BNF and *BNF for Children* on MedicinesComplete and receive the very latest drug information through monthly online updates.

**FormularyComplete** Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and *BNF for Children*.

### **BNF on Evidence Search**

Search the BNF and *BNF for Children* alongside other authoritative clinical and non-clinical evidence and best practice at <http://evidence.nhs.uk> from NICE.

## PRINT

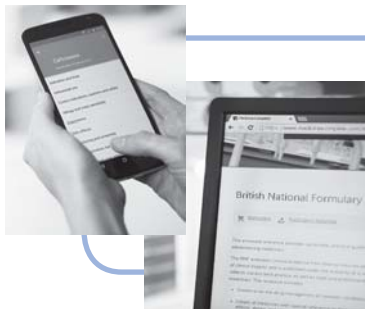

Eligible health professionals will now receive one print copy a year – the September issue – to supplement online access. If you are entitled to an NHS copy please refer to page ii for full details on distribution, call 01268 495 609 or email [bnf@binleys.com](mailto:bnf@binleys.com).

*Turn the page for more details...*

## PRINT SUBSCRIPTION

**BNF subscription** – Take advantage of our print subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNFC) are available. Discounted pricing is also available on bulk sales.

## MOBILE

**BNF app** – Stay up to date anywhere with the BNF app available for iOS, Android and Blackberry.

**BNF eBook** – Available as an ePDF via a range of suppliers. See [www.pharmpress.com/bnf](http://www.pharmpress.com/bnf).

**BNF on MedicinesComplete** – Now mobile responsive.

## How to purchase

www

**Buy direct from Pharmaceutical Press** by visiting [www.pharmpress.com/bnf](http://www.pharmpress.com/bnf)

@

For enquiries about the BNF or BNFC in print, contact [direct@macmillan.co.uk](mailto:direct@macmillan.co.uk)  
Tel: +44 (0) 1256 302 699

Material published in the *British National Formulary* may not be used for any form of advertising, sales or publicity without prior written permission. Each of the classification and the text are protected by copyright and/or database right.

### Requesting copies of BNF publications

Paper copies may be obtained through any bookseller or direct from:

#### Pharmaceutical Press

c/o Macmillan Distribution (MDL)

Brunel Rd

Houndmills

Basingstoke

Hampshire

RG21 6XS

Tel: +44 (0) 1256 302 699

Fax: +44 (0) 1256 812 521

direct@macmillan.co.uk

or via our website [www.pharmpress.com](http://www.pharmpress.com)

For all bulk orders of more than 20 copies:

Tel: +44 (0) 207 572 2266

[pharmpress-support@rpharms.com](mailto:pharmpress-support@rpharms.com)

The BNF is available online through MedicinesComplete and as mobile apps; a PDA version is also available.

In addition, BNF content can be integrated into a local formulary by using BNF on FormularyComplete; see [www.bnf.org](http://www.bnf.org) for details.

The BNF is also available on [www.evidence.nhs.uk](http://www.evidence.nhs.uk) and eligible users can download smartphone apps from the relevant app stores.

### Distribution of printed BNFs

In **England**, NICE purchases print editions of the BNF (September editions only) for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: [www.nice.org.uk/mpc/BritishNationalFormulary.jsp](http://www.nice.org.uk/mpc/BritishNationalFormulary.jsp). If you are entitled to an NHS copy of BNF, please call (0) 1268 495 609 or email: [bnf@binleys.com](mailto:bnf@binleys.com).

In **Scotland**, email:

[nss.psd-bnf@nhs.net](mailto:nss.psd-bnf@nhs.net)

In **Wales**, contact NHS Wales Shared Services Partnership—Contractor Services:

Tel: 01792 607420

In **Northern Ireland**, email:

[ni.bnf@hscni.net](mailto:ni.bnf@hscni.net)

### About BNF content

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from Medicines Information Services.

Please refer to digital versions of BNF for the most up-to-date content. BNF is published in print but interim updates are issued and published in the digital versions of BNF. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. BNF's accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to check [www.bnf.org](http://www.bnf.org) for information about key updates and corrections.

### Pharmaid

Numerous requests have been received from lower income countries for BNFs. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old BNFs to certain Commonwealth countries. For more information on this scheme see <http://commonwealthpharmacy.org/what-we-do/pharmaid/>. If you would like to donate your copy email: [admin@commonwealthpharmacy.org](mailto:admin@commonwealthpharmacy.org)

# Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers' Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers' product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF's recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services (see inside front cover).

It is **important** to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website ([www.bnf.org](http://www.bnf.org)) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

## Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this update were:

K.W. Ah-See, M.N. Badminton, A.K. Bahl, P.R.J. Barnes, D. Bilton, S.L. Bloom, M.F. Bultitude, I.F. Burgess, D.J. Burn, C.E. Dearden, D.W. Denning, P.N. Durrington, D.A.C. Elliman, P. Emery, M.D. Feher, A. Freyer, B.G. Gazzard, A.M. Geretti, N.J.L. Gittoes, P.J. Goadsby, M. Gupta, T.L. Hawkins, B.G. Higgins, S.P. Higgins, S.H.D. Jackson, A. Jones, D.M. Keeling, J.R. Kirwan, P.G. Kopelman, T.H. Lee, A. Lekkas, D.N.J. Lockwood, A.M. Lovering, M.G. Lucas, L. Luzzatto, P.D. Mason, D.A. McArthur, K.E.L. McColl, L.M. Melvin, E. Miller, R.M. Mirakian, P. Morrison, S.M.S. Nasser, C. Nelson-Piercy, J.M. Neuberger, D.J. Nutt, L.P. Ormerod, R. Patel, W.J. Penny, A.B. Provan, A.S.C. Rice, D.J. Rowbotham, J.W. Sander, J.A.T. Sandoe, M. Schacter, S.E. Slater, J. Soar, S.C.E. Sporton, M.D. Stewart, S. Thomas, J.P. Thompson, A.D. Weeks, A. Wilcock, A.P.R. Wilson, M.M. Yaqoob.

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists' Therapy & Guidelines Subcommittee, D.A. Buckley, N. Chiang, M. Cork, K. Gibbon, R.Y.P. Hunasehally, G.A. Johnston, T.A. Leslie, E.C. Mallon, P.M. McHenry,, J. Natkunarajah, C. Saunders, S. Ungureanu, S. Wakelin, F.S. Worsnop, A.G. Brain (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Lalloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNF interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNF has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

Valuable technical assistance provided by J. Macdonald, H. Benson, R. Calle, J. Cater, D. Granger, N. Judd, M. Mebrate, K. Parsons, B. Stephenson, J. Stott and I. White.

S. Frau, M. Lynn, J. Martin, J. Smith, and A. Sparshatt provided considerable assistance during the production of this update of the BNF.

# How BNF Publications are constructed

## Overview

The BNF is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in a number of digital formats. The most clinically significant updates are listed under Changes p. xix.

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information. Validation of information follows a standardised process, reviewing emerging evidence, best-practice guidelines, and advice from a network of clinical experts. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

## Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes pharmacy, medical, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

## Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

## Nurse Prescribers' Advisory Group

The Nurse Prescribers' Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers' Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

## Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and assimilation into the BNF.

## Editorial team

BNF clinical writers have all worked as pharmacists or possess a pharmacy degree and a further, relevant post-graduate qualification, and have a sound understanding of

how drugs are used in clinical practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNF content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNF over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production process.

## Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

### Summaries of product characteristics

The BNF reviews summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicine Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

### Literature

Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify 'triggers' for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

### Consensus guidelines

The advice in the BNF is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

### Reference sources

Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. The BNF has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

### Peer review

Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Joint Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on [bnf.org](http://bnf.org) and interested parties are notified via a number of channels, including the BNF e-newsletter.

### Statutory information

The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

### Medicines and devices

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

### Comments from readers

Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

### Comments from industry

Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF's presentation of the role of various drugs; this is yet another check on the balance of BNF's advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

### Market research

Market research is conducted at regular intervals to gather feedback on specific areas of development.

### Assessing the evidence

From January 2016, recommendations made in BNF publications have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNF aims to revalidate all content over a rolling 3- to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

### Grading system

The BNF has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

### Levels of evidence

- **Level 1++**  
High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**  
Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1-**  
Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**  
High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**  
Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2-**  
Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**  
Non-analytic studies, e.g. case reports, case series.
- **Level 4**  
Expert advice or clinical experience from respected authorities.

### Grades of recommendation

- **Grade A: High strength**  
NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.

- **Grade B: Moderate strength**  
A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.
- **Grade C: Low strength**  
A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.
- **Grade D: Very low strength**  
Evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.
- **Grade E: Practice point**  
Evidence level 4.

# How to use BNF Publications in print

## How to use the BNF

This edition of the BNF continues to display the fundamental change to the structure of the content that was first shown in BNF 70. The changes were made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 494), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF *for Children*, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 16.

## Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This *How to Use the BNF* is key in reinforcing the details of the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

### Structure of the BNF

This BNF edition continues to broadly follow the high-level structure of earlier editions of the BNF (i.e. those published before BNF 70):

**Front matter**, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

**Chapters**, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment

of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta 2-agonist bronchodilators) and then alphabetically within each classification (e.g. Acclidinium bromide, Glycopyrronium bromide, Ipratropium bromide).

**Appendices**, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

**Back matter**, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers' contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

### Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the *thumbnail*), alongside the chapter title. The top of the page includes the therapeutic use (the *running head*) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

## Content types

### Treatment summaries

Treatment summaries are of three main types;

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 1074)
- a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 139)
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 132, or Malaria, prophylaxis p. 560).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient's medical and drug history.

### Monographs

#### Overview

In earlier editions (i.e. before BNF 70), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 421 was found in chapter 1, for its antitoxicity effects and chapter 4 for its analgesic effects. However, the monograph in chapter

1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 421 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol p. 524, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

#### *Nomenclature*

Monograph titles follow the convention of recommended international non-proprietary names (iNNS), or, in the absence of a iNNS, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 59) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

#### *Indication and dose*

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation, that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In earlier editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65<sup>th</sup> birthday, meaning that an age

range of adult 18 to 64 is applicable to a patient from the day of their 18<sup>th</sup> birthday until the day before their 65<sup>th</sup> birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a patient up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a patient as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

#### *Other information relevant to Indication and dose*

The dose panel also contains, where known, an indication of **pharmacokinetic considerations** that may affect the choice of dose, and **dose equivalence** information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes **unlicensed use** of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the 'off-label' use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

#### *Minimising harm and drug safety*

The drug chosen to treat a particular condition should minimise the patient's susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient's other diseases. To achieve this, the *Contra-indications*, *Cautions* and *Side-effects* of the relevant drug should be reviewed.

The information under *Cautions* can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the *Cautions* for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. *Contra-indications* are far more restrictive than *Cautions* and mean that the drug should be avoided in a patient with a condition that is *contra-indicated*.

The impact that potential side-effects may have on a patient's quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

Clinically relevant *Side-effects* for drugs are included in the monographs or class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions,

## Typical layout of a monograph and associated medicinal forms

### 1 Class Monographs and drug monographs

In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle: 

Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol: 

The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

### 2 Drug classifications

Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

### 3 Review date

The date of last review of the content

### 4 Specific preparation name

If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

### 5 Evidence grading

Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades  are displayed next to the recommendations within the text, and are preceded by the symbol: 

For further information, see How BNF Publications are constructed

## Class monograph 1

### CLASSIFICATION 2

 1234

### Drug monograph 1

 01-Jun-2016

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

#### ● INDICATIONS AND DOSE

Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

#### Indication

- ▶ ROUTE
- ▶ Age groups: [Child/Adult/Elderly]  
Dose and frequency of administration (max. dose)

#### SPECIFIC PREPARATION NAME 4

#### Indication

- ▶ ROUTE
- ▶ Age groups: [Child/Adult/Elderly]  
Dose and frequency of administration (max. dose)

**DOSE EQUIVALENCE AND CONVERSION** information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

**PHARMACOKINETICS** how the body affects a drug (absorption, distribution, metabolism, and excretion)

**POTENCY** a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

**DOSES AT EXTREMES OF BODY-WEIGHT** dosing information for patients who are overweight or underweight

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

#### IMPORTANT SAFETY INFORMATION

Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided
- **CAUTIONS** details of precautions required
- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1
- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically
- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms
- **PREGNANCY** advice on the use of a drug during pregnancy
- **BREAST FEEDING**  advice on the use of a drug during breast feeding 

- **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment
- **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment
- **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug
- **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index
- **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests
- **TREATMENT CESSATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn
- **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration
- **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary
- **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions
- **PARENT AND CARER ADVICE** for drugs with a special need for counselling
- **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS
- **NATIONAL FUNDING/ACCESS DECISIONS** details of NICE Technology Appraisals and SMC advice
- **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing
- **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

#### ● **MEDICINAL FORMS**

##### **Form**

**CAUTIONARY AND ADVISORY LABELS** if applicable  
**EXCIPIENTS** clinically important but not comprehensive [consult manufacturer information for full details]

**ELECTROLYTES** if clinically significant quantities occur

▶ **Preparation name** (Manufacturer/*Non-proprietary*)

Drug name and strength pack sizes **[POM]** **Ⓢ** Prices

**Combinations available** this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation

#### Ⓢ **Legal categories**

**[POM]** This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

**[CD1]** **[CD2]** **[CD3]** **[CD4-1]** **[CD4-2]** **[CD5]** These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence

**Not all monographs include all possible sections; sections are only included when relevant information has been identified**

when the information is included under *Allergy and cross sensitivity*.

The *Important safety advice* section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

#### *Use of drugs in specific patient populations*

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under *Prescribing in hepatic impairment* p. 19, and *Prescribing in renal impairment* p. 19. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under *Hepatic impairment* and *Renal impairment* (e.g. fluconazole p. 548).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during *pregnancy or breast-feeding*. The general principles for prescribing are outlined under *Prescribing in pregnancy* p. 21 and *Prescribing in breast-feeding* p. 21. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma p. 225). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under *Pregnancy*, and *Breast-feeding* (e.g. fluconazole p. 548).

A section, *Conception and contraception*, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1122) has been included.

#### *Administration and monitoring*

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called *Pre-treatment screening* (e.g. abacavir p. 596). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A *Directions for administration* section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 424).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The *Monitoring* section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 256). Monitoring may, in certain cases, be affected by the impact of a drug on

laboratory tests (e.g. hydroxocobalamin p. 899), and this information is included in *Effects on laboratory tests*.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 136): these are covered under *Treatment cessation*.

#### *Choice and supply*

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see *Taking Medicines to Best Effect*). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 521); this is shown in *Patient and carer advice*.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeable (e.g. diltiazem hydrochloride p. 148), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 744), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 63).

#### *Medicinal forms*

In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient.

In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 43).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of "Medicinal Forms" that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of "Modified release capsule" will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNF, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in previous BNF versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a

sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

In earlier editions, the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1383. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

#### *Prices in the BNF*

Basic NHS **net prices** are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, [www.dmd.nhs.uk](http://www.dmd.nhs.uk)). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority ([apps.nhsbsa.nhs.uk/DMDBrowser/DMDBrowser.do](http://apps.nhsbsa.nhs.uk/DMDBrowser/DMDBrowser.do)). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 4, prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales ([www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)), Scotland ([www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)), and Northern Ireland ([www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)); prices in the different tariffs may vary.

#### **Drug class monographs**

In earlier editions of the BNF, information relating to a class of drugs sharing the same properties (e.g. tetracyclines p. 520), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag  (e.g. beta-adrenoceptor blockers (systemic) p. 139). If a drug monograph has a corresponding class monograph, that

needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag  1234 (e.g. metoprolol tartrate p. 145). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 102).

#### **Evidence grading**

The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. ix). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

#### **Other content**

##### *Nutrition*

Appendix 2, Borderline substances p. 1348, includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

##### *Wound dressings*

A table on wound dressings in Appendix 4, Wound management products and elasticated garments p. 1386, allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

Advanced wound contact dressings have been classified in order of increasing absorbency.

#### **Other useful information**

##### **Finding significant changes in the BNF**

- **Changes**, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the *Changes* section. We encourage healthcare professionals to regularly review the prescribing information on drugs that they encounter frequently;
- **Changes to the Dental Practitioners' Formulary**, are located at the end of the Dental List;
- **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to [www.bnf.org](http://www.bnf.org).
- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at [www.cppe.ac.uk](http://www.cppe.ac.uk).

##### **Using other sources for medicines information**

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to

specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.

## Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

### Significant changes

Significant changes that will appear in the print edition of BNF 73 (March–September 2017):

- Alirocumab p. 195: for treating primary hypercholesterolaemia and mixed dyslipidaemia [NICE guidance].
- Anal fissure p. 87: updated guidance on management.
- Azacitidine p. 811 for treating acute myeloid leukaemia with more than 30% bone marrow blasts [NICE guidance].
- BCR-ABL tyrosine kinase inhibitors ( bosutinib p. 859, imatinib p. 869, dasatinib p. 863, nilotinib p. 871 and ponatinib p. 873): risk of hepatitis B reactivation [MHRA/CHM advice].
- Belimumab p. 773: for treating active autoantibody-positive systemic lupus erythematosus [NICE guidance].
- Biological medicines: new guidance, see Guidance on prescribing p. 1.
- Biosimilar medicines: new guidance, see Guidance on prescribing p. 1.
- Bosutinib p. 859 for previously treated chronic myeloid leukaemia [NICE guidance].
- Cabazitaxel p. 825: for hormone-relapsed metastatic prostate cancer treated with docetaxel [NICE guidance].
- Canagliflozin p. 641: increased risk of lower extremity amputations in high cardiovascular risk patients [MHRA/CHM advice].
- Canagliflozin p. 641, dapagliflozin p. 642, and empagliflozin p. 643 as monotherapies for treating type 2 diabetes [NICE guidance].
- Ceritinib p. 861 for previously treated anaplastic lymphoma kinase-positive non-small cell lung cancer [NICE guidance].
- Cyclosporin p. 766 for treating dry eye disease that has not improved despite treatment with artificial tears [NICE guidance].
- Coeliac disease p. 34: new guidance on management.
- Dementia p. 281: updated guidance on management.
- Donepezil hydrochloride p. 282, galantamine p. 283, rivastigmine p. 284 and memantine hydrochloride p. 285 for the treatment of Alzheimer's disease [NICE guidance update].
- Etonogestrel p. 740 (*Nexplanon*<sup>®</sup>) contraceptive implants: reports of device in vasculature and lung [MHRA/CHM advice].
- Exocrine pancreatic insufficiency p. 83: updated guidance on management.
- Idelalisib p. 868: updated indications and advice on minimising the risk of infection [MHRA/CHM advice].
- Lumacaftor with ivacaftor p. 275 for treating cystic fibrosis homozygous for F508del mutation [NICE guidance].
- Naloxegol p. 61 for treating opioid-induced constipation [NICE guidance].
- Nivolumab p. 787: (as monotherapy) for treating advanced (unresectable or metastatic) melanoma [NICE guidance] and nivolumab in combination with ipilimumab p. 786 for treating advanced melanoma [NICE guidance].
- Oral progestogen-only contraceptives: updated guidance on starting routine, see desogestrel p. 737, norethisterone p. 699 and levonorgestrel p. 737.
- Panobinostat p. 834 for treating multiple myeloma after at least 2 previous treatments [NICE guidance].
- Paraffin-based skin emollients on dressings or clothing: fire risk [MHRA/CHM advice].
- Pemetrexed p. 819: maintenance treatment for non-squamous non-small-cell lung cancer after pemetrexed and cisplatin [NICE guidance].

- Pomalidomide p. 855: risk of hepatitis B reactivation [MHRA/CHM advice].
- Ramucirumab p. 791: for previously treated locally advanced or metastatic non-small-cell lung cancer [NICE guidance].
- Riociguat p. 176: not for use in pulmonary hypertension associated with idiopathic interstitial pneumonias [MHRA/CHM advice].
- Risk of death and severe harm from error with injectable phenytoin [NHS Improvement Patient Safety Alert], see phenytoin p. 302.
- Risk of severe harm and death due to withdrawing insulin from pen devices [NHS Improvement Patient Safety Alert], see insulin p. 648.
- Short bowel syndrome p. 44: new guidance on management.
- Warfarin sodium p. 131: reports of calciphylaxis [MHRA/CHM advice].

### Dose changes

Changes in dose statements made since the publication of the print edition of BNF 72 (September 2016–March 2017):

- Etoricoxib p. 996 [rheumatoid arthritis and ankylosing spondylitis].
- Metronidazole p. 499 [acute ulcerative gingivitis and acute oral infections].
- Olaparib p. 881 [with concomitant use of potent or moderate CYP3A4 inhibitors].

### Classification changes

Classification changes made since the publication of the print edition of BNF 72 (September 2016–March 2017):

### New names

Name changes made since the publication of the print edition of BNF 72 (September 2016–March 2017):

### Deleted preparations

Preparations discontinued since the publication of the print edition of BNF 72 (September 2016–March 2017):

- *Ketek*<sup>®</sup>.

### New preparations

New preparations included since the publication of the print edition of BNF 72 (September 2016–March 2017):

- *Briviact*<sup>®</sup> [brivaracetam p. 290].
- *Cresamba*<sup>®</sup> [sivacuonazole p. 550].
- *Farydak*<sup>®</sup> [panobinostat p. 834].
- *Ikeris*<sup>®</sup> eye drops [cyclosporin p. 1022].
- *Monuril*<sup>®</sup> [fosfomycin p. 526].
- *Moventig*<sup>®</sup> tablets [naloxegol p. 61].
- *Noqdima*<sup>®</sup> [desmopressin p. 611].
- *Opdivo*<sup>®</sup> solution for infusion [nivolumab p. 787].
- *Orkambi*<sup>®</sup> [lumacaftor with ivacaftor p. 275].
- *Praluent*<sup>®</sup> pre-filled pen [alirocumab p. 195].
- *Revestro*<sup>®</sup> [teduglutide p. 45].
- *Simbrinza*<sup>®</sup> [brinzolamide with brimonidine p. 1038]
- *Sivextro*<sup>®</sup> [tedizolid p. 528]
- *Valios*<sup>®</sup> orodispersible tablets [memantine hydrochloride p. 285].
- *Vantobra*<sup>®</sup> nebuliser solution [tobramycin p. 481].
- *Vimizim*<sup>®</sup> [elosulfate alfa p. 935].
- *Vitekta*<sup>®</sup> [elvitegravir p. 592].
- *Zevtera*<sup>®</sup> [ceftibiprole p. 490].
- *Zykadia*<sup>®</sup> [ceritinib p. 861].

# Guidance on prescribing

## General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

## Taking medicines to best effect

Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- patients' perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them ('concordance'). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient's acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician's instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

## Biological medicines

**Biological medicines** are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies. **EvGr** Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. **⚠**

## Biosimilar medicines

A **biosimilar medicine** is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

**Therapeutic equivalence** **EvGr** Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. **⚠** Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

**Prescribing and dispensing** The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. **EvGr** Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. **⚠**

**Safety monitoring** Biosimilar medicines are subject to a black triangle status (**▼**) at the time of initial authorisation.

**EvGr** It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 12). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine. **⚠**

UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These 'in-use product safety assessment reports' will be published for new biosimilar medicines as they become available, see [www.ukmi.nhs.uk/activities/patientSafety/default.asp?pageRef=20](http://www.ukmi.nhs.uk/activities/patientSafety/default.asp?pageRef=20).

**National funding/access decisions** The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see *Evidence summary: new medicines*, [www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines](http://www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines)).

**National information** In England, see [www.nice.org.uk/Media/Default/About/what-we-do/NICE-guidance/NICE-technology-appraisals/biosimilars-statement.pdf](http://www.nice.org.uk/Media/Default/About/what-we-do/NICE-guidance/NICE-technology-appraisals/biosimilars-statement.pdf).

In Northern Ireland, see [niformulary.hscni.net/ManagedEntry/bios/Pages/default.aspx](http://niformulary.hscni.net/ManagedEntry/bios/Pages/default.aspx).

In Scotland, see [www.scotishmedicines.org.uk/About\\_SMC/Policy\\_statements/Biosimilar\\_Medicines](http://www.scotishmedicines.org.uk/About_SMC/Policy_statements/Biosimilar_Medicines).

In Wales, see [www.wales.nhs.uk/sites3/Documents/814/BIOSIMILARS-ABUHBpositionStatement%5BNov2015%5D.pdf](http://www.wales.nhs.uk/sites3/Documents/814/BIOSIMILARS-ABUHBpositionStatement%5BNov2015%5D.pdf).

## 2 Guidance on prescribing

**Availability** The following drugs are available as a biosimilar medicine:

- Epoetin alfa p. 887
- Epoetin zeta p. 890
- Etanercept p. 973
- Filgrastim p. 903
- Follitropin alfa p. 682
- Infliximab p. 976
- Insulin glargine p. 651
- Somatropin p. 685

### Complementary and alternative medicine

An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort). Further information on herbal medicines is available at [www.mhra.gov.uk](http://www.mhra.gov.uk).

### Abbreviation of titles

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

### Non-proprietary titles

Where non-proprietary ('generic') titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer's version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations. Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

### Proprietary titles

Names followed by the symbol<sup>®</sup> are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

### Marketing authorisation and BNF advice

In general the *doses, indications, cautions, contra-indications, and side-effects* in the BNF reflect those in the manufacturers' data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF

suggests a use (or route) that is outside the licensed indication of a product ('off-label' use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

### Prescribing unlicensed medicines

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient's carer that the prescribed medicine is unlicensed.

### Oral syringes

An **oral syringe** is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The *5-mL spoon* is used for doses of 5 mL (or multiples thereof).

**Important** To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled 'Oral' or 'Enteral' in a large font size; it is the healthcare practitioner's responsibility to label the syringe with this information if the manufacturer has not done so.

### Excipients

Branded oral liquid preparations that do not contain *fructose, glucose, or sucrose* are described as 'sugar-free' in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of *aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil* is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on *selected preservatives and excipients* in eye drops and injections.

The presence of *benzyl alcohol* and *polyoxyl castor oil* (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 459 and metronidazole p. 499.

The *lactose* content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be

determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

**Important** In the absence of information on excipients in the BNF and in the product literature (available at [www.medicines.org.uk/emc](http://www.medicines.org.uk/emc)), contact the manufacturer (see Index of Proprietary Manufacturers) if it is essential to check details.

### Extemporaneous preparation

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term **water used** without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

### Drugs and driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amfetamines, cannabis, cocaine, and ketamine p. 1189, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 390) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 399. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, *if their driving was not impaired*—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine's patient information leaflet). Further information is available from the Department for Transport at [www.gov.uk/government/collections/drug-driving](http://www.gov.uk/government/collections/drug-driving).

### Patents

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

### Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as

corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

### Safety in the home

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable *child-resistant container* unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of *unwanted medicines* by returning them to a supplier for destruction.

### Labelling of prescribed medicines

There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

### Non-proprietary names of compound preparations

Non-proprietary names of **compound preparations** which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained.

Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different lengths of action.

### EEA and Swiss prescriptions

Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

### Security and validity of prescriptions

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

### Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

### NICE and Scottish Medicines Consortium

Advice issued by the National Institute for Health and Care Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from [www.nice.org.uk](http://www.nice.org.uk) and from [www.scottishmedicines.org.uk](http://www.scottishmedicines.org.uk).

## Prescription writing

### Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

### Requirements

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for **prescription-only medicines**. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m<sup>2</sup> body-surface area e.g. mg/m<sup>2</sup> where this would reduce error. The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- 'Micrograms' and 'nanograms' should **not** be abbreviated. Similarly 'units' should **not** be abbreviated.
- The term 'millilitre' (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm<sup>3</sup> should not be used. (The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a **minimum dose interval** should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
  - Adult Mixtures (10 mL dose), 200 or 300 mL
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer's pack)
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and **not** abbreviated, using approved titles **only**;

avoid creating generic titles for modified-release preparations).

- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in **English without abbreviation**, it is recognised that some Latin abbreviations are used.

### Sample prescription

Pharmacy Stamp	Age 1yr 3mths	Title, Forename, Surname & Address Master Peter Patient
	D.o.B 2/4/2010	Flat 1 50 Stanhope Street Newtown TE22 1ST
Please don't stamp over age box		
Number of days' treatment N.B. Ensure dose is stated	5	
Endorsements	Amoxicillin oral suspension 125mg/5ml sugar-free 125mg three times daily Supply 100ml (No more items on this prescription)	
Signature of prescriber 		Date 02/07/11
For dispenser No. of Prescrip. on form	Anyborough Health Authority Dr D O Good 345543 7 High Street Anytown KB1 CD2 Tel: 0111 222 333	
NHS		FP10NC0105

### Prescribing by dentists

Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners' Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical situation. There is no statutory requirement for the dentist to communicate with a patient's medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient's interest and such communication is to be encouraged. For legal requirements relating to prescriptions

of Controlled Drugs, see Controlled drugs and drug dependence p. 8.

### Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

- 1 The computer must print out the date, the patient's surname, one forename, other initials, and address, and may also print out the patient's title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.
- 2 The doctor's name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor's surgery address, reference number, and Primary Care Trust (PCT), Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.
- 3 When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.
- 4 Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.
- 5 The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.
- 6 The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.
- 7 The BNF recommendations should be followed as listed above.
- 8 Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as 'as directed' and 'when required', the maximum daily dose should normally be specified.
- 9 Numbers and codes used in the system for organising and retrieving data must never appear on the form.
- 10 Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.
- 11 A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as 'no more items on this prescription' may be added after the last item. Otherwise the doctor should delete the space manually.
- 12 To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.
- 13 Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor's own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ♀, (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).
- 14 Prescriptions for controlled drugs can be printed from the computer, but the prescriber's signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).
- 15 The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient's name to appear at the top, but this should be preceded by 'confidential'.
- 16 In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.
- 17 Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

## Emergency supply of medicines

### Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

- a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
  - i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
  - ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
  - iii) as to the dose that it would be appropriate for the person to take;
- b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 313, *phenobarbital sodium*, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
  - i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
  - ii) an oral contraceptive when a full cycle may be supplied;
  - iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
- c) that an entry shall be made by the pharmacist in the prescription book stating:
  - i) the date of supply;
  - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
  - iii) the name and address of the patient;
  - iv) the nature of the emergency;
- d) that the container or package must be labelled to show:
  - i) the date of supply;
  - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
  - iii) the name of the patient;
  - iv) the name and address of the pharmacy;
  - v) the words 'Emergency supply';
  - vi) the words 'Keep out of the reach of children' (or similar warning);
- e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 313 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition). Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation.

### Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

- a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
- b) that the prescriber has undertaken to furnish a prescription within 72 hours;
- c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
- d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 313 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).
- e) that an entry shall be made in the prescription book stating:
  - i) the date of supply;
  - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
  - iii) the name and address of the practitioner requesting the emergency supply;
  - iv) the name and address of the patient;
  - v) the date on the prescription;
  - vi) when the prescription is received the entry should be amended to include the date on which it is received.

### Royal Pharmaceutical Society's guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see *Medicines, Ethics and Practice*, London Pharmaceutical Press, (always consult latest edition).

# Controlled drugs and drug dependence

## Regulations and classification

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the *harmfulness attributable to a drug when it is misused* and for this purpose the drugs are defined in the following three classes:

- **Class A** includes: alfentanil p. 1187, cocaine, diamorphine hydrochloride (heroin) p. 423, dipipanone hydrochloride, lysergide (LSD), methadone hydrochloride p. 464, methylenedioxymethamphetamine (MDMA, 'ecstasy'), morphine, opium, pethidine hydrochloride p. 434, phencyclidine, remifentanil p. 1188, and class B substances when prepared for injection.
- **Class B** includes: oral amfetamines, barbiturates, cannabis, cannabis resin, codeine phosphate p. 421, ethylmorphine, glutethimide, ketamine p. 1189, nabilone p. 402, pentazocine p. 434, phenmetrazine, and pholcodine p. 277.
- **Class C** includes: certain drugs related to the amfetamines such as benzphetamine and chlorphentermine, buprenorphine p. 417, mazindol, meprobamate p. 324, pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 435, zaleplon p. 453, zolpidem tartrate p. 454, zopiclone p. 454, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 685.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs such as lysergide which is not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.
- **Schedule 2** includes drugs such as diamorphine hydrochloride (heroin) p. 423, morphine p. 429, nabilone p. 402, remifentanil p. 1188, pethidine hydrochloride p. 434, secobarbital, glutethimide, the amfetamines, sodium oxybate and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).
- **Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 417, mazindol, meprobamate p. 324, midazolam p. 318, pentazocine p. 434, phentermine, temazepam p. 451, and tramadol hydrochloride p. 435. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate p. 324, midazolam p. 318, pentazocine p. 434, phentermine, tramadol hydrochloride p. 435, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).
- **Schedule 4** includes in Part I benzodiazepines (except temazepam p. 451 and midazolam p. 318, which are in Schedule 3), zaleplon p. 453, zolpidem tartrate p. 454, and zopiclone p. 454 which are subject to minimal control. Part II includes androgenic and anabolic

steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 685. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

- **Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

## Prescriptions

Preparations in Schedules 1, 2, 3, 4, and 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and *BNF for children* using the following symbols:

CD1	for preparations in Schedule 1
CD2	for preparations in Schedule 2
CD3	for preparations in Schedule 3
CD4-1	for preparations in Schedule 4 (Part I)
CD4-2	for preparations in Schedule 4 (Part II)
CD5	for preparations in Schedule 5

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance).

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible and must be *signed* by the prescriber, be *dated*, and specify the prescriber's *address*. A machine-written prescription is acceptable, but the prescriber's signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient;
- in the case of a preparation, the form, (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. *MST Continus* or whether only one form is available), and where appropriate the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose (the instruction 'one as directed' constitutes a dose but 'as directed' does not);
- the words 'for dental treatment only' if issued by a dentist.

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (implementation date for *N. Ireland* not confirmed). Failure to comply with the regulations concerning the writing of prescriptions will

result in inconvenience to patients and carers and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription).

### Instalments and 'repeats'

A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified. A total of 14 days' treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 417, and diazepam p. 321 may be prescribed in England. In *England*, forms FP10 (MDA) (blue) and FP10H (MDA) (blue) should be used. In *Scotland*, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In *Wales* a total of 14 days' treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In *Wales*, form WP10 (MDA) or form WP10HP (AD) should be used. Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition) or see *Drug Misuse and Dependence: UK Guidelines on Clinical Management* (2007), available at [www.nta.nhs.uk/uploads/clinical\\_guidelines\\_2007.pdf](http://www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf). Prescriptions ordering 'repeats' on the same form are **not** permitted for Controlled Drugs in Schedules 2 or 3.

### Private prescriptions

Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the *prescriber's identification number*. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

### Department of Health guidance

Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days' treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes;
- the patient's identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at [www.gov.uk/dh](http://www.gov.uk/dh).

See sample prescription:

Pharmacy Stamp	Age 70yrs 1mth	Title, Forename, Surname & Address SMITH John D.o.B 2/6/1941 22 Bridge Street Anytown KB1 5SX

NHS	FP10NC0105	

### Dependence and misuse

The most serious drugs of addiction are **cocaine**, **diamorphine hydrochloride** (heroin) p. 423, **morphine p. 429**, and the **synthetic opioids**. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts.

Despite marked reduction in the prescribing of **amfetamines**, there is concern that abuse of illicit amphetamine and related compounds is widespread.

**Benzodiazepines** are commonly misused. However, the misuse of **barbiturates** is now uncommon, in line with declining medicinal use and consequent availability.

**Cannabis** (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product. **Lysergide** (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 1189 and gamma-hydroxybutyrate (sodium oxybate, GHB).

### Supervised consumption

Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of

instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.

### Prescribing drugs likely to cause dependence or misuse

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

### Travelling abroad

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at [www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns](http://www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns) or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone (020) 7035 6330.

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient's name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF.

Alternatively, completed application forms can be emailed to [dlucummsofficer@homeoffice.gsi.gov.uk](mailto:dlucummsofficer@homeoffice.gsi.gov.uk) with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application. Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting. Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country's consulate in the UK.

### Notification of patients receiving structured drug treatment for substance dependence

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at [www.nta.nhs.uk/ndtms.aspx](http://www.nta.nhs.uk/ndtms.aspx). Enquiries about NDTMS, and how to submit data, should initially be directed to:

- [EvidenceApplicationTeam@phe.gov.uk](mailto:EvidenceApplicationTeam@phe.gov.uk)

In **Scotland**, doctors should report cases to the Substance Misuse Programme (SMP).

Tel: (0131) 275 6348

In **Northern Ireland**, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:

Dr Ian McMaster, C3 Castle Buildings, Belfast, BT4 3FQ  
Tel: (028) 9052 2421, Fax: (028) 9052 0718  
[ian.mcmaster@dhsspsni.gov.uk](mailto:ian.mcmaster@dhsspsni.gov.uk)

Administrative contact:

Public Health Information & Research Branch,  
Department of Health,  
Annexe 2,  
Castle Building,  
Stormont,  
Belfast  
BT4 3SQ  
Tel: (028) 9052 2504

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In **Wales**, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: [substance.misuse-queries@wales.nhs.uk](mailto:substance.misuse-queries@wales.nhs.uk).

### **Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts**

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine hydrochloride p. 423, dipipanone (*Diconal*<sup>®</sup>), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine hydrochloride p. 423, dipipanone, and cocaine for patients (including addicts) for *relieving pain* from organic disease or injury.

## Adverse reactions to drugs

### Yellow card scheme

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard). Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the *BNF*.

Send Yellow Cards to:

FREEPOST YELLOW CARD

(No other address details required).

Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (*self-medication* as well as those *prescribed*), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard). Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

#### Yellow Card Centre Northwest

2nd Floor, 70 Pembroke Place, Liverpool, L69 3GF

Tel: (0151) 794 8122

#### Yellow Card Centre Wales

All Wales Therapeutics and Toxicology Centre, Academic Building, University Hospital Llandough, Penlan Road, Penarth, Vale of Glamorgan, CF64 2XX

Tel: (029) 2074 5831

#### Yellow Card Centre Northern & Yorkshire

Regional Drug and Therapeutics Centre, 16/17 Framlington Place, Newcastle upon Tyne, NE2 4AB

Tel: (0191) 213 7855

#### Yellow Card Centre West Midlands

City Hospital, Dudley Road, Birmingham, B18 7QH

Tel: (0121) 507 5672

### Yellow Card Centre Scotland

CARDS, Royal Infirmary of Edinburgh, 51 Little France Crescent, Old Dalkeith Road, Edinburgh, EH16 4SA

Tel: (0131) 242 2919

YCCScotland@luht.scot.nhs.uk

The MHRA's database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: [www.mhra.gov.uk](http://www.mhra.gov.uk).

**MHRA Drug Safety Update** *Drug Safety Update* is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at [www.gov.uk/drug-safety-update](http://www.gov.uk/drug-safety-update).

### Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard), by telephone on 0800 100 3352, or by downloading the Yellow Card form from [www.mhra.gov.uk](http://www.mhra.gov.uk). Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard).

### Prescription-event monitoring

In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from [www.dsru.org](http://www.dsru.org).

### Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that **all** suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

### Established drugs and vaccines

Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are **serious, medically significant, or result in harm**. Serious reactions include those that are fatal, life-threatening, disabling,

incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

### Medication errors

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

### Adverse reactions to medical devices

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: [www.mhra.gov.uk](http://www.mhra.gov.uk).

### Side-effects in the BNF

The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions.

The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness. In the product literature the frequency of side-effects is generally described as follows:

Description of the frequency of side-effects	
Very common	greater than 1 in 10
Common	1 in 100 to 1 in 10
Uncommon [formerly 'less commonly' in BNF publications]	1 in 1000 to 1 in 100
Rare	1 in 10 000 to 1 in 1000
Very rare	less than 1 in 10 000

### Special problems

**Delayed drug effects** Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

**The elderly** Particular vigilance is required to identify adverse reactions in the elderly.

**Congenital abnormalities** When an infant is born with a congenital abnormality or there is a malformed aborted fetus

doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

**Children** Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; **all** suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

### Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 541 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.

### Drug allergy (suspected or confirmed)

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the patient was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The patient has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present.

The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

**Immediate, rapidly-evolving reactions** (onset usually less than 1 hour after drug exposure)

- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 259
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

**Non-immediate reactions, without systemic involvement** (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

*Non-immediate reactions, with systemic involvement* (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythroderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

**EvGr** Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Patients should be given information about which drugs and drug-classes to avoid and encouraged to share their drug allergy status. **⚠**

**EvGr** If a drug allergy is suspected, consider stopping the suspected drug and advising the patient or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Patients presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Patients presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Patients presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient patients). **⚠** For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) [www.nice.org.uk/guidance/cg183](http://www.nice.org.uk/guidance/cg183).

### Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient's medical practitioner may be necessary.

**Oral mucosa** Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind.

Aspirin tablets p. 114 allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly **essential oils**, may sensitise the skin, but mucosal swelling is not usually prominent. The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 817. Other drugs capable of causing oral ulceration include **ACE inhibitors, gold, nicorandil p. 201, NSAIDs, pancreatin p. 90, penicillamine p. 964, proguanil hydrochloride p. 571, and protease inhibitors**.

Erythema multiforme or Stevens–Johnson syndrome may follow the use of a wide range of drugs including **antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants**; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

Lichenoid eruptions are associated with **ACE inhibitors, NSAIDs methyl dopa p. 136, chloroquine p. 569, oral antidiabetics, thiazide diuretics, and gold**.

Candidiasis can complicate treatment with **antibacterials and immunosuppressants** and is an occasional side-effect of **corticosteroid inhalers**.

**Teeth and jaw** *Brown staining* of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel p. 1064, but can readily be removed by polishing. **Iron** salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension p. 508. *Intrinsic staining* of the teeth is most commonly caused by **tetracyclines**. They will affect the teeth if given at any time from about the fourth month *in utero* until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey. Excessive ingestion of **fluoride** leads to *dental fluorosis* with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child's age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of *osteonecrosis of the jaw* is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving bevacizumab p. 783 or sunitinib p. 876 may also be at risk of osteonecrosis of the jaw.

**Periodontium** *Gingival overgrowth* (gingival hyperplasia) is a side-effect of phenytoin p. 302 and sometimes of ciclosporin p. 766 or of nifedipine p. 153 (and some other calcium-channel blockers).

*Thrombocytopenia* may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

**Salivary glands** The most common effect that drugs have on the salivary glands is to *reduce flow* (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly **antimuscarinics** (anticholinergics), **antidepressants** (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), **alpha-blockers, antihistamines, antipsychotics, baclofen p. 985, bupropion hydrochloride p. 461, clonidine hydrochloride p. 136, 5HT<sub>2</sub> agonists, opioids, and tizanidine p. 986**. Excessive use of **diuretics** can also result in xerostomia.

Some drugs (e.g. clozapine p. 371, neostigmine p. 983) can *increase saliva production* but this is rarely a problem unless the patient has associated difficulty in swallowing.

Pain in the salivary glands has been reported with some **antihypertensives** (e.g. clonidine hydrochloride p. 136, methyl dopa p. 136) and with **vinca alkaloids**.

Swelling of the salivary glands can occur with **iodides, antihypertoid drugs, phenothiazines, and sulfonamides**.

**Taste** There can be *decreased taste acuity* or *alteration* in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 99, **calcitonin, ACE inhibitors, carbimazole p. 706, clarithromycin p. 496, gold, griseofulvin p. 554, lithium salts, metformin hydrochloride p. 631, metronidazole p. 499, penicillamine p. 964, phenindione p. 131, propafenone hydrochloride p. 98, protease inhibitors, terbinafine p. 1089, and zopiclone p. 454**.

### Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could

adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre  
Medicines and Healthcare products Regulatory Agency,  
151 Buckingham Palace Road, London, SW1W 9SZ  
Tel: (020) 3080 6574  
dmrc@mhra.gsi.gov.uk

## Guidance on intravenous infusions

### Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

### Guidelines

- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient's name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer's label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

### Problems

**Microbial contamination** The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

**Incompatibility** Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

**Common incompatibilities** Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis

(e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

**Blood** Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

**Intravenous fat emulsions** These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*<sup>®</sup> may be added to appropriate intravenous fat emulsions.

**Other infusions** Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

**Bactericides** Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

### Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5). When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to

differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

### Information provided in the BNF

The BNF gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion.

Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

**Addition via the drip tubing** is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

**Drugs given by intravenous infusion** The BNF includes information on addition to *Glucose intravenous infusion* 5 and 10%, and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

## Prescribing in children

### Overview

For detailed advice on medicines used for children, consult *BNF for Children*.

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

### Adverse drug reactions in children

Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

**Report all suspected adverse drug reactions that are:**

- **serious, medically significant or result in harm.** Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with **newer drugs and vaccines**; the most up to date list of black triangle medicines is available at:

[www.mhra.gov.uk/blacktriangle](http://www.mhra.gov.uk/blacktriangle)

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit's Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National

Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

### Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for **all** prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an **oral syringe** will be supplied. Parents should be advised not to add any medicines to the infant's feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep **all** medicines out of reach of children.

### Rare paediatric conditions

Information on substances such as *biotin* and *sodium benzoate* used in rare metabolic conditions is included in *BNF for Children*; further information can be obtained from:

Alder Hey Children's Hospital  
Drug Information Centre, Liverpool, L12 2AP  
Tel: (0151) 252 5381

Great Ormond Street Hospital for Children  
Pharmacy, Great Ormond St, London, WC1N 3JH  
Tel: (020) 7405 9200

### Dosage in children

Children's doses in the BNF are stated in the individual drug entries.

Doses are generally based on body-weight (in kilograms) or specific age ranges. In the BNF and *BNF for Children*, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

### Dose calculation

Many children's doses are standardised by **weight** (and therefore require multiplying by the body-weight in kilograms to determine the child's dose); occasionally, the doses have been standardised by **body surface area** (in m<sup>2</sup>). These methods should be used rather than attempting to calculate a child's dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such

cases, dose should be calculated from an ideal weight, related to height and age.

**Body surface area (BSA) estimates** are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*. Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

## Prescribing in hepatic impairment

### Overview

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

### Impaired drug metabolism

Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired. A few drugs, e.g. rifampicin p. 535 and fusidic acid p. 527, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

### Hypoproteinaemia

The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 302 and prednisolone p. 622.

### Reduced clotting

Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the

### Dose frequency

Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's bedtime.

Where new or potentially toxic drugs are used, the manufacturers' recommended doses should be carefully followed.

sensitivity to oral anticoagulants such as warfarin sodium p. 131 and phenindione p. 131.

### Hepatic encephalopathy

In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

### Fluid overload

Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

### Hepatotoxic drugs

Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

## Prescribing in renal impairment

### Issues encountered in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

### Principles of dose adjustment in renal impairment

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be

adjusted according to clinical response and plasma-drug concentration.

Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

**Nephrotoxic drugs** should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced.

Dose recommendations are based on the severity of renal impairment.

Renal function is measured either in terms of estimated **glomerular filtration rate** (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study ('MDRD formula' that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as **creatinine clearance** (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG)).

### Cockcroft and Gault Formula

$$\text{Estimated Creatinine Clearance} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}}$$

in mL/minute

Age in years

Weight in kilograms; use ideal body-weight

Serum creatinine in micromol/litre

Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a **rough guide** to drug dosing.

**Important** Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m<sup>2</sup> and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).

The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (exceptions include toxic drugs and patients at extremes of weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD 'formula') can be used to determine dosage adjustments in place of creatinine clearance. An individual's absolute glomerular filtration rate can be calculated from the eGFR as follows:  $\text{GFR}_{\text{Absolute}} = \text{eGFR} \times (\text{individual's body surface area}/1.73)$

**Toxic drugs** For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

**Patients at extremes of weight** In patients at both extremes of weight (BMI of less than 18.5 kg/m<sup>2</sup> or greater than 30 kg/m<sup>2</sup>) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages.

In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

### Degrees of renal impairment defined using estimated glomerular filtration rate (eGFR)

*Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:*

Degree of impairment	eGFR mL/minute/1.73 m <sup>2</sup>
Normal - Stage 1	More than 90 (with other evidence of kidney damage)
Mild - Stage 2	60-89 (with other evidence of kidney damage)
Moderate <sup>1</sup> - Stage 3	30-59
Severe - Stage 4	15-29
Established renal failure - Stage 5	Less than 15

1. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR 45-59, Stage 3B eGFR 30-44

Drug prescribing should be kept to the minimum in all patients with severe renal disease.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing **any** drug which requires dose modification. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

### Dialysis

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

## Prescribing in pregnancy

### Overview

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of *childbearing age* or for men *trying to father* a child.

During the *first trimester* drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the *second and third trimesters* drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development. The BNF and *BNF for Children* identifies drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from *animal* studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in

maternal physiology but this is beyond the scope of the *BNF* and *BNF for Children*.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and *BNF for Children*.

### Important

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

**Absence of information does not imply safety.** It should be noted that the BNF and *BNF for Children* provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. [www.uktis.org](http://www.uktis.org). Tel: 0344 892 0909 (09.00–17:00 Monday to Friday; urgent enquiries only outside these hours).

## Prescribing in breast-feeding

### Overview

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 192), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital p. 313) while others can affect lactation (e.g. bromocriptine p. 391).

The BNF identifies drugs:

- that should be used with caution or are contra-indicated in breast-feeding;
- that can be given to the mother during breastfeeding because they are present in milk in amounts which are too small to be harmful to the infant;
- that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

### Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.

## Prescribing in palliative care

### Overview

Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

**Drug treatment** The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

### Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 414, NSAID), opioid (e.g. codeine phosphate p. 421 'weak', morphine p. 429 'strong') and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol p. 414 or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate p. 421 or tramadol hydrochloride p. 435 can be considered for moderate pain. If these preparations do not control the pain then morphine p. 429 is the most useful opioid analgesic. Alternatives to morphine p. 429, including transdermal buprenorphine p. 417, transdermal fentanyl p. 424, hydromorphone hydrochloride p. 428, methadone hydrochloride p. 464, or oxycodone hydrochloride p. 431, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

**Bone metastases** In addition to the above approach, radiotherapy, **bisphosphonates**, and radioactive isotopes of strontium ranelate p. 669 (*Metastron*<sup>®</sup> available from GE Healthcare) may be useful for pain due to bone metastases.

**Neuropathic pain** Patients with **neuropathic pain** may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 295 and pregabalin p. 304 are licensed for neuropathic pain. Ketamine p. 1189 is sometimes used under

specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 618, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

### Pain management with opioids

**Oral route** Treatment with morphine p. 429 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses. If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 424 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Morphine immediate-release 30mg 4-hourly (or modified-release 100 mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600 mg 12-hourly), occasionally more is needed.

Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 429. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 431 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

### Equivalent doses of opioid analgesics.

This table is only an **approximate** guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required.

Analgesic/Route	Dose
Codeine: PO	100 mg
Diamorphine: IM, IV, SC	3 mg
Dihydrocodeine: PO	100 mg
Hydromorphone: PO	2 mg
Morphine: PO	10 mg
Morphine: IM, IV, SC	5 mg
Oxycodone: PO	6.6 mg
Tramadol: PO	100 mg

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

**Parenteral route** The equivalent parenteral dose of morphine p. 429 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 423 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride p. 423, see table above of approximate equivalent doses of morphine and diamorphine hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

**Rectal route** Morphine p. 429 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride p. 431 suppositories can be obtained on special order.

**Transdermal route** Transdermal preparations of fentanyl p. 424 and buprenorphine p. 417 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 417 and fentanyl p. 424 (inappropriate use has caused fatalities). Immediate-release morphine p. 429 can be given for breakthrough pain. The following 24-hour oral doses of morphine are considered to be *approximately* equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

### Buprenorphine patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 12 mg daily	≡ BuTrans® '5' patch: 7-day patches
morphine salt 24 mg daily	≡ BuTrans® '10' patch: 7-day patches
morphine salt 48 mg daily	≡ BuTrans® '20' patch: 7-day patches
morphine salt 84 mg daily	≡ Transtec® '35' patch: 4-day patches
morphine salt 126 mg daily	≡ Transtec® '52.5' patch: 4-day patches
morphine salt 168 mg daily	≡ Transtec® '70' patch: 4-day patches

Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### 72-hour Fentanyl patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 30 mg daily	≡ fentanyl '12' patch
morphine salt 60 mg daily	≡ fentanyl '25' patch
morphine salt 120 mg daily	≡ fentanyl '50' patch
morphine salt 180 mg daily	≡ fentanyl '75' patch
morphine salt 240 mg daily	≡ fentanyl '100' patch

Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### Symptom control

Several recommendations in this section involve unlicensed indications or routes.

**Anorexia** Anorexia may be helped by prednisolone p. 622 or dexamethasone p. 618.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 409, hyoscine butylbromide p. 81, or glycopyrronium bromide p. 233. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

**Capillary bleeding** Capillary bleeding can be treated with tranexamic acid p. 104 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 211 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K

(see phytomenadione p. 958 and menadiol sodium phosphate p. 957) should be considered.

**Constipation** Constipation is a common cause of distress and is almost invariably after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 58) or lactulose solution p. 52 with a senna preparation p. 59 should be used. Methylalnaltrexone bromide p. 60 is licensed for the treatment of opioid-induced constipation.

**Convulsions** Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 302 or carbamazepine p. 291 should be considered. When oral medication is no longer possible, diazepam p. 321 given rectally, or phenobarbital p. 313 by injection is continued as prophylaxis. For the use of midazolam p. 318 by subcutaneous infusion using a continuous infusion device see below.

**Dry mouth** Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1073 or miconazole p. 760, alternatively, fluconazole p. 548 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

**Dysphagia** A corticosteroid such as dexamethasone p. 618 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

**Dyspnoea** Breathlessness at rest may be relieved by regular oral morphine p. 429 in carefully titrated doses. Diazepam p. 321 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 618, may also be helpful if there is bronchospasm or partial obstruction.

**Fungating tumours** Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 499 is often required to reduce malodour but topical metronidazole p. 1084 is also used.

**Gastro-intestinal pain** The pain of bowel colic may be reduced by loperamide hydrochloride p. 63. Hyoscine hydrobromide p. 409 may also be helpful, given sublingually as *Kwells*<sup>®</sup> tablets. Subcutaneous injections of hyoscine butylbromide p. 81, hyoscine hydrobromide, and glycopyrronium bromide p. 233 can also be used to treat bowel colic.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antilflatulent and a prokinetic such as domperidone p. 402 before meals.

**Hiccup** Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antilflatulent. If this fails, metoclopramide hydrochloride p. 403 by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen p. 985, or nifedipine p. 153, or chlorpromazine hydrochloride p. 361 can be tried.

**Insomnia** Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 451, may be useful.

**Intractable cough** Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 429. Methadone hydrochloride linctus p. 464 should be avoided because it has a long duration of action and tends to accumulate.

**Muscle spasm** The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 321 or baclofen p. 985.

**Nausea and vomiting** Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A prokinetic antiemetic may be a preferred choice for first-line therapy.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 363 or metoclopramide hydrochloride p. 403. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently. Haloperidol is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure).

Cyclizine p. 401 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness. Levomepromazine p. 411 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 618 by mouth can be used as an adjunct.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy see Cytotoxic drugs p. 797.

**Pruritus** Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 186.

**Raised intracranial pressure** Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 618 and should be given before 6 p.m. to reduce the risk of insomnia.

**Restlessness and confusion** Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 363 or levomepromazine p. 411, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device. Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

### Continuous subcutaneous infusions

Although drugs can usually be administered by *mouth* to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of *intramuscular injections* can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a *continuous subcutaneous infusion*, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the **parenteral route** are:

- the patient is unable to take medicines by mouth owing to *nausea and vomiting, dysphagia, severe weakness, or coma*
- there is *malignant bowel obstruction* in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube)
- occasionally when the patient *does not wish* to take regular medication by mouth.

**Syringe driver rate settings** Staff using syringe drivers should be **adequately trained** and different rate settings should be **clearly identified** and **differentiated**; incorrect use of syringe drivers is a common cause of medication errors.

**Bowel colic and excessive respiratory secretions** Hyoscine hydrobromide p. 409 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation).

Hyoscine butylbromide p. 81 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide.

Glycopyrronium bromide p. 233 may also be used to treat bowel colic or excessive respiratory secretions.

**Confusion and restlessness** Haloperidol p. 363 has little sedative effect.

Levomepromazine p. 411 has a sedative effect.

Midazolam p. 318 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

**Convulsions** If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 318 is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

**Nausea and vomiting** Haloperidol p. 363 and levomepromazine p. 411 can both be given as a *subcutaneous infusion* but sedation can limit the dose of levomepromazine. Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under *Mixing and Compatibility*, below)

Metoclopramide hydrochloride p. 403 can cause skin reactions.

Octreotide p. 846, which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion to reduce intestinal secretions and to reduce vomiting due to bowel obstruction.

**Pain control** Diamorphine hydrochloride p. 423 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under *Mixing and Compatibility*, below). The table shows approximate equivalent doses of morphine and diamorphine hydrochloride.

**Mixing and compatibility** The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 361, prochlorperazine p. 365, and diazepam p. 321 are **contra-indicated** as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 401 and levomepromazine p. 411 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 914) however increases the likelihood of precipitation when more than one drug is used; moreover

subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

**Compatibility with diamorphine** Diamorphine can be given by *subcutaneous infusion* in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with *diamorphine*:

- **Cyclizine**, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **Dexamethasone**, special care is needed to avoid precipitation of dexamethasone when preparing it.
- **Haloperidol**, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- **Hyoscine butylbromide**
- **Hyoscine hydrobromide**
- **Levomepromazine**
- **Metoclopramide**, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- **Midazolam**

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

**Problems encountered with syringe drivers** The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs *too slowly* check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an *injection site reaction* make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

**Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours**

These equivalences are *approximate only* and should be adjusted according to response

ORAL MORPHINE	PARENTERAL MORPHINE	PARENTERAL DIAMORPHINE
Oral morphine sulfate over 24 hours	Subcutaneous infusion of morphine sulfate over 24 hours	Subcutaneous infusion of diamorphine hydrochloride over 24 hours
30 mg	15 mg	10 mg
60 mg	30 mg	20 mg
90 mg	45 mg	30 mg
120 mg	60 mg	40 mg
180 mg	90 mg	60 mg
240 mg	120 mg	80 mg
360 mg	180 mg	120 mg
480 mg	240 mg	160 mg
600 mg	300 mg	200 mg
780 mg	390 mg	260 mg
960 mg	480 mg	320 mg
1200 mg	600 mg	400 mg

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection *subcutaneously*—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

# Prescribing in the elderly

## Overview

Old people, especially the very old, require special care and consideration from prescribers. *Medicines for Older People*, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

## Appropriate prescribing

Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients' medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

## Form of medicine

Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

## Manifestations of ageing

In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

## Sensitivity

The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

## Pharmacokinetics

Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients.

The most important effect of age is reduced renal clearance. Many aged patients thus *excrete drugs slowly*, and are *highly susceptible to nephrotoxic drugs*. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 103) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-

tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

## Adverse reactions

Adverse reactions often present in the elderly in a vague and non-specific fashion. *Confusion* is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are *constipation* (with antimuscarinics and many tranquilisers) and postural *hypotension and falls* (with diuretics and many psychotropics).

## Hypnotics

Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

## Diuretics

Diuretics are overprescribed in old age and should **not** be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

## NSAIDs

Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the *increased susceptibility of the elderly to the side-effects of NSAIDs* the following recommendations are made:

- for *osteoarthritis, soft-tissue lesions, and back pain*, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for *osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis*, paracetamol p. 414 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 999 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary see, *NSAID-associated ulcers* under Peptic ulceration p. 68.

## Other drugs

Other drugs which commonly cause adverse reactions are *antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin* p. 103. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 518, mianserin

hydrochloride p. 348) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of warfarin sodium p. 131 than younger adults; once again, the outcome of bleeding tends to be more serious.

### Guidelines

Always consider whether a drug is indicated at all.

**Limit range** It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

**Reduce dose** Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 645) should be avoided altogether.

**Review regularly** Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

**Simplify regimens** Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

**Explain clearly** Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like 'as directed'. Child-resistant containers may be unsuitable.

**Repeats and disposal** Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

## Drugs and sport

### Anti-doping

UK Anti-Doping, the national body responsible for the UK's anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:

UK Anti-doping  
Fleetbank House  
2-6 Salisbury Square  
London  
EC4Y 8AE  
(020) 7842 3450  
ukad@ukad.org.uk  
[www.ukad.org.uk](http://www.ukad.org.uk)

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: [www.globaldro.com/UK/search](http://www.globaldro.com/UK/search)

### General Medical Council's advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

# Prescribing in dental practice

## General guidance

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF. The following is a list of topics of particular relevance to dentists.

- Prescribing by dentists, see Prescription writing p. 5
- Oral side-effects of drugs, see Adverse reactions to drugs p. 12
- Medical emergencies in dental practice, see below
- Medical problems in dental practice, see below

## Drug management of dental and oral conditions

### Dental and orofacial pain

- Neuropathic pain p. 446
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 412
- Opioid analgesics, see Analgesics p. 412
- Non-steroidal anti-inflammatory drugs p. 987

### Oral infections

Bacterial infections, see Antibacterials, principles of therapy p. 467

- Phenoxymethylpenicillin p. 505
- Broad-spectrum penicillins (amoxicillin p. 506 and ampicillin p. 507)
- Cephalosporins (cefalexin p. 485 and cefradine p. 485)
- Tetracyclines p. 520
- Macrolides (clarithromycin p. 496, erythromycin p. 497 and azithromycin p. 495)
- Clindamycin p. 493
- Metronidazole p. 499
- Fusidic acid p. 527

### Fungal infections

- Local treatment, see Oropharyngeal fungal infections p. 1071
- Systemic treatment, see Antifungals, systemic use p. 544

### Viral infections

- Herpetic gingivostomatitis, local treatment, see Oropharyngeal viral infections p. 1073
- Herpetic gingivostomatitis, systemic treatment, see Oropharyngeal viral infections p. 1073 and Herpesvirus infections p. 584
- Herpes labialis, see Skin infections p. 1082

## Anaesthetics, anxiolytics and hypnotics

- Sedation, anaesthesia, and resuscitation in dental practice p. 1174
- Hypnotics, see Hypnotics and anxiolytics p. 447
- Sedation for dental procedures, see Hypnotics and anxiolytics p. 447
- Local anaesthesia p. 1191

## Minerals

- Fluorides p. 942

## Oral ulceration and inflammation p. 1067

## Mouthwashes, gargles and dentifrices, see

## Mouthwashes and other preparations for oropharyngeal use p. 1064

## Dry mouth, see Treatment of dry mouth p. 1062

## Aromatic inhalations, see Aromatic inhalations, cough

## preparations and systemic nasal decongestants p. 277

## Nasal decongestants, see Aromatic inhalations, cough

## preparations and systemic nasal decongestants p. 277

## Dental Practitioners' Formulary p. 1411

## Medical emergencies in dental practice

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 1465.

### The drugs referred to in this section include:

- Adrenaline/epinephrine Injection p. 211, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amps
- Aspirin Dispersible Tablets 300 mg p. 114
- Glucagon Injection p. 660, glucagon (as hydrochloride), 1- unit vial (with solvent) p. 660
- Glucose (for administration by mouth) p. 915
- Glyceryl trinitrate Spray p. 207
- Midazolam Oromucosal Solution p. 318, midazolam 5 mg/mL
- Oxygen
- Salbutamol Aerosol Inhalation p. 239, salbutamol 100 micrograms/metered inhalation p. 239

## Adrenal insufficiency

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see individual monographs for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

### Management

- Lay the patient flat
- Give **oxygen**
- Transfer patient urgently to hospital

## Anaphylaxis

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with *additives* and *excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

### Symptoms and signs

- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

### Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 211. This is given **intramuscularly** in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if

necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. **Oxygen** administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

### Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient's short-acting beta<sub>2</sub> agonist inhaler such as salbutamol 100 micrograms/puff p. 239; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, **oxygen** should be given with salbutamol 5 mg or terbutaline sulfate 10 mg p. 241 by nebuliser; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 211 (as detailed under Anaphylaxis) should be given.

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient's medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

### Cardiac emergencies

If there is a history of *angina* the patient will probably carry glyceryl trinitrate spray or tablets p. 207 (or isosorbide dinitrate tablets p. 208) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient's own medication. See also Coronary Artery Disease below.

*Arrhythmias* may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers below.

The pain of *myocardial infarction* is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease below.

#### Symptoms and signs of myocardial infarction:

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

#### Initial management of myocardial infarction:

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncope patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. **Oxygen** may be administered.

Sublingual glyceryl trinitrate p. 207 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 114 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 1465.

### Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

#### Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remains unconscious. After a variable time the patient regains consciousness but may remain confused for a while

#### Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give **oxygen** to support respiration if necessary.

Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused ('post-ictal confusion') and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred. Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Midazolam oromucosal solution p. 318 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see Drugs used in status epilepticus (Epilepsy p. 286).

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

### Hypoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

#### Symptoms and signs

- Shaking and trembling

- Sweating
- 'Pins and needles' in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

### Management

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade® Energy Original* 55 mL, *Coca-Cola®* 100 mL, *Ribena® Blackcurrant* 19 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps. (Proprietary products of quick-acting carbohydrate (e.g. *GlucoGel®*, *DextroGel®*, *GSF-Syrup®*, *Rapilose® gel*) are available on prescription for the patient to keep to hand in case of hypoglycaemia). If necessary this may be repeated in 10–15 minutes. If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, **glucagon** 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

### Syncope

Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

### Symptoms and signs

- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

### Management

- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

**Other possible causes** Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope.

### Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If

the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient's general practitioner or hospital consultant.

### Allergy

Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis above.

### Arrhythmias

Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient's medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 451) may be useful in some instances for very anxious patients. See also Cardiac emergencies above, and Dental Anaesthesia (Local anaesthesia p. 1191).

### Cardiac prostheses

For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis below. For advice on patients receiving anticoagulants, see Thromboembolic disease below.

### Coronary artery disease

Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient's medical practitioner before commencing treatment. See also Cardiac Emergencies above. Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 115, or dipyridamol p. 116 should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

### Cyanotic heart disease

Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

### Hypertension

Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Local anaesthesia p. 1191).

### Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

### Infective endocarditis

While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash p. 1064 are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

### Reduction of oral bacteraemia

Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of 'spontaneous' bacteraemia.

### Postoperative care

Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

### Patients on anticoagulant therapy

For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease below.

### Joint prostheses

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

### Pacemakers

Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer's literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

A Working Party of the British Society for Antimicrobial Chemotherapy does not recommend antibacterial prophylaxis for patients with pacemakers.

### Thromboembolic disease

Patients receiving a **heparin** or an oral anticoagulant such as warfarin sodium p. 131, acenocoumarol (nicoumalone) p. 131, phenindione p. 131, apixaban p. 117, dabigatran etexilate p. 128 or rivaroxaban p. 120 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin sodium p. 131, the patient's medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium, the advice of the clinician responsible for the patient's anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are *contra-indicated* in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs,

carbamazepine, imidazole and triazole antifungals (including miconazole), erythromycin, clarithromycin, and metronidazole; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins). Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin or amoxicillin. Information on the treatment of patients who take anticoagulants is available at [www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant](http://www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant).

### **Liver disease**

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with *jaundice*, *ascites*, or evidence of *encephalopathy*. For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 19. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

### **Renal impairment**

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists. For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 19. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

### **Pregnancy**

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 21. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

### **Breast-feeding**

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 21. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

## 1 Chronic bowel disorders

### Chronic bowel disorders

#### Overview

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

#### *Clostridium difficile* infection

*Clostridium difficile* infection is caused by colonisation of the colon with *Clostridium difficile* and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin p. 507, amoxicillin p. 506, co-amoxiclav p. 508, second- and third-generation cephalosporins, clindamycin p. 493, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 499, vancomycin p. 492, and fidaxomicin p. 525.

### 1.1 Coeliac disease

#### Coeliac disease

25-Jul-2016

##### Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

##### Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

#### Non-drug treatment

**EvGr** The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see *Borderline substances*). 

#### Drug treatment

**EvGr** Patients who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Their risk of osteoporosis and the need for active treatment of bone disease should form part of the ongoing management of coeliac disease. Supplementation of key nutrients may be required if dietary intake is insufficient.

Patients who have coeliac disease should be advised **not** to self-medicate with over-the-counter vitamins or mineral supplements. Initiation of supplementation should involve a discussion with a member of the patient's healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Confirmed cases of refractory coeliac disease should be referred to a specialist centre. Treatment with prednisolone p. 622 can be considered for initial management while awaiting specialist advice. 

#### Useful Resources

Coeliac disease: recognition, assessment and management. National Institute for Health and Care Excellence. Clinical guideline 20. September 2015. [www.nice.org.uk/guidance/ng20](http://www.nice.org.uk/guidance/ng20)

## 1.2 Diverticular disease and diverticulitis

### Diverticular disease and diverticulitis

24-Feb-2016

#### Description of condition

**Diverticular disease** is a condition where diverticula (sac-like protrusions of mucosa through the muscular colonic

wall) cause intermittent lower abdominal pain in the absence of inflammation or infection. The prevalence of diverticula increases with age, with the majority of patients older than 50 years.

**Diverticulitis** occurs when the diverticula become inflamed and infected, causing marked lower abdominal pain usually accompanied by fever and general malaise, and occasionally, with large rectal bleeds. Complicated diverticulitis includes episodes associated with an abscess, free perforation, fistula, obstruction, or stricture.

To ensure that an accurate diagnosis of diverticular disease and diverticulitis is made, consider and exclude all other causes of lower abdominal pain prior to treatment.

### Aims of treatment

The aim of treatment is to relieve symptoms of diverticular disease, cure episodes of diverticulitis, and reduce the risk of recurrences and complications.

### Drug treatment

**EVGr** A high-fibre diet is recommended for the treatment of symptomatic diverticular disease, although evidence supporting this is inconsistent and of low quality. Bulk-forming drugs have also been used, but evidence of their effectiveness is lacking.

Treatment of uncomplicated diverticulitis includes a low residue diet and bowel rest. Antibacterials are recommended only when the patient presents with signs of infection or is immunocompromised, as there is no evidence to support routine administration.

Patients with complicated diverticulitis or with severe presentation, require hospital admission, treatment with intravenous antibacterials (covering Gram-negative organisms and anaerobes), and bowel rest.

There is insufficient evidence to justify the role of fibre, rifaximin p. 531, antispasmodics, mesalazine p. 37, and probiotics in the prevention or treatment of diverticulitis.

Elective surgery to provide symptomatic relief or prevent recurrence, should be considered for patients following recovery from an episode of complicated diverticulitis. This includes episodes associated with free perforation, abscess, fistula, obstruction, or stricture. Urgent sigmoid colectomy is required for patients with diffuse peritonitis or for those in whom non-operative management of acute diverticulitis fails. 

## 1.3 Inflammatory bowel disease

### Inflammatory bowel disease

#### Management of acute ulcerative colitis and Crohn's disease

Chronic inflammatory bowel diseases include *ulcerative colitis* and *Crohn's disease*. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

**Aminosalicylates** (balsalazide sodium p. 36, mesalazine p. 37, olsalazine sodium p. 39, and sulfasalazine p. 39), **corticosteroids** (hydrocortisone p. 620, beclometasone dipropionate p. 40, budesonide p. 41, and prednisolone p. 622), and **drugs that affect the immune response** are used in the treatment of inflammatory bowel disease.

**Treatment of acute ulcerative colitis and Crohn's disease**  
Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid is treated initially with local application of an aminosalicylate; alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local corticosteroid can be used for proctitis that does not respond

to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone for 4–8 weeks. Modified-release budesonide is licensed for Crohn's disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone or methylprednisolone p. 621); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin p. 766 [unlicensed indication]. Patients with unresponsive or chronically active Crohn's disease may benefit from azathioprine p. 765, mercaptopurine p. 816 [unlicensed indication], or once-weekly methotrexate p. 817 [unlicensed indication]; these drugs have a slower onset of action.

Infliximab p. 976 is licensed for the management of severe active Crohn's disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. Adalimumab p. 969 is licensed for the treatment of severe active Crohn's disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. For inducing remission, adalimumab can be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated.

Adalimumab may also be used for Crohn's disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

Golimumab p. 974 is licensed for the treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it.

Vedolizumab p. 41 is licensed for the treatment of moderate to severe active Crohn's disease and ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor.

#### Maintenance of remission of acute ulcerative colitis and Crohn's disease

Smoking cessation reduces the risk of relapse in Crohn's disease and should be encouraged. **Aminosalicylates** are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn's disease. Corticosteroids are **not** suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine or mercaptopurine [unlicensed indication], given under close supervision may be helpful. Methotrexate is tried in Crohn's disease if azathioprine or mercaptopurine cannot be used [unlicensed

indication]. Maintenance therapy with infliximab should be considered for patients with Crohn's disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. Adalimumab is licensed for maintenance therapy in Crohn's disease and ulcerative colitis. Golimumab is licensed for maintenance therapy in ulcerative colitis.

#### Fistulating Crohn's disease

Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole p. 499 or ciprofloxacin p. 514 can improve symptoms of fistulating Crohn's disease but complete healing occurs rarely [unlicensed indication]. Metronidazole is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine or mercaptopurine is used as a second-line treatment for fistulating Crohn's disease and continued for maintenance [unlicensed indication]. Infliximab is used for fistulating Crohn's disease refractory to conventional treatments; fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. Adalimumab can be used if there is intolerance to infliximab [unlicensed indication].

#### Adjunctive treatment of inflammatory bowel disease

Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate.

Antimotility drugs such as codeine phosphate p. 421 and loperamide hydrochloride p. 63, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. An osmotic laxative, such as a macrogol, may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine p. 186, which binds bile salts.

### Drugs used in chronic bowel disorders

#### Aminosalicylates

Sulfasalazine is a combination of 5-aminosalicylic acid ('5-ASA') and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine (5-aminosalicylic acid), balsalazide sodium (a pro-drug of 5-aminosalicylic acid) and olsalazine sodium (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine p. 39.

#### Drugs affecting the immune response

Azathioprine p. 765, ciclosporin p. 766, mercaptopurine p. 816, and methotrexate p. 817 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 898 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

#### Cytokine modulators

Infliximab p. 976, adalimumab p. 969, and golimumab p. 974 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

### AMINOSALICYLATES

## Aminosalicylates

#### ● SIDE-EFFECTS

- ▶ **Rare** Acute pancreatitis · agranulocytosis · alopecia · aplastic anaemia · arthralgia · blood disorders · eosinophilia · fibrosing alveolitis · hepatitis · interstitial nephritis · leucopenia · lung disorders · lupus erythematosus-like syndrome · methaemoglobinemia · myalgia · myocarditis · nephrotic syndrome · neutropenia · pericarditis · peripheral neuropathy · renal dysfunction · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
- ▶ **Frequency not known** Abdominal pain · diarrhoea · exacerbation of symptoms of colitis · headache · hypersensitivity reactions · nausea · rash · urticaria · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Blood Disorders** A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in salicylate hypersensitivity.
- **RENAL IMPAIRMENT** Renal function should be monitored more frequently in renal impairment.
- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.
- **PATIENT AND CARER ADVICE** Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

▶ above

## Balsalazide sodium

#### ● INDICATIONS AND DOSE

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Adult: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

##### Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

- **CAUTIONS** History of asthma
- **SIDE-EFFECTS** Cholelithiasis
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Diarrhoea may develop in the infant. Monitor breast-fed infants for diarrhoea.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Colazide** (Almirall Ltd)

**Balsalazide disodium 750 mg** Colazide 750mg capsules | 130 capsule (POM) £30.42 DT price = £30.42

## Mesalazine

#### ASACOL<sup>®</sup> MR 400MG TABLETS

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Child 12-17 years: 800 mg 3 times a day
- ▶ Adult: 2.4 g daily in divided doses

##### Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- ▶ BY MOUTH
- ▶ Child 12-17 years: 400–800 mg 2–3 times a day
- ▶ Adult: 1.2–2.4 g daily in divided doses

#### ASACOL<sup>®</sup> MR 800MG TABLETS

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Adult: 2.4–4.8 g daily in divided doses

##### Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses

##### Maintenance of remission of Crohn's ileo-colitis

- ▶ BY MOUTH
- ▶ Adult: Up to 2.4 g daily in divided doses

#### ASACOL<sup>®</sup> FOAM ENEMA

##### Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- ▶ BY RECTUM
- ▶ Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

##### Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

- ▶ BY RECTUM
- ▶ Adult: 2 g once daily for 4–6 weeks, to be administered into the rectum

#### ASACOL<sup>®</sup> SUPPOSITORIES

##### Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission

- ▶ BY RECTUM
- ▶ Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

#### IPOCOL<sup>®</sup>

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Adult: 2.4 g daily in divided doses

##### Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 1.2–2.4 g daily in divided doses

#### MEZAVANT<sup>®</sup> XL

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Adult: 2.4 g once daily, increased if necessary to 4.8 g once daily, review treatment at 8 weeks

##### Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 2.4 g once daily

#### OCTASA<sup>®</sup>

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only

##### Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- ▶ BY MOUTH
- ▶ Adult: 1.2–2.4 g once daily, alternatively daily in divided doses

#### PENTASA<sup>®</sup> GRANULES

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- ▶ Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
- ▶ Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

##### Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- ▶ Child 5-17 years (body-weight 40 kg and above): 2 g once daily
- ▶ Adult: 2 g once daily

#### PENTASA<sup>®</sup> RETENTION ENEMA

##### Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

- ▶ BY RECTUM
- ▶ Adult: 1 g once daily, dose to be administered at bedtime

##### Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- ▶ BY RECTUM
- ▶ Child 12-17 years: 1 g once daily, dose to be administered at bedtime

#### PENTASA<sup>®</sup> SUPPOSITORIES

##### Treatment of acute attack, ulcerative proctitis

- ▶ BY RECTUM
- ▶ Child 15-17 years: 1 g daily for 2–4 weeks
- ▶ Adult: 1 g daily for 2–4 weeks

##### Maintenance, ulcerative proctitis

- ▶ BY RECTUM
- ▶ Child 15-17 years: 1 g daily
- ▶ Adult: 1 g daily

#### PENTASA<sup>®</sup> TABLETS

##### Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ BY MOUTH
- ▶ Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–3 divided doses

##### Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 2 g once daily

#### SALOFALK<sup>®</sup> ENEMA

##### Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

- ▶ BY RECTUM
- ▶ Adult: 2 g once daily, dose to be administered at bedtime

**SALOFALK® GRANULES****Treatment of mild to moderate ulcerative colitis, acute attack**

## ▶ BY MOUTH

- ▶ Child 5-17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
- ▶ Child 5-17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
- ▶ Adult: 1.5–3 g once daily, dose preferably taken in the morning, alternatively 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**

## ▶ BY MOUTH

- ▶ Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- ▶ Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day
- ▶ Adult: 500 mg 3 times a day

**SALOFALK® RECTAL FOAM****Treatment of mild ulcerative colitis affecting sigmoid colon and rectum**

## ▶ BY RECTUM

- ▶ Child 12-17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
- ▶ Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

**SALOFALK® SUPPOSITORIES****Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon**

## ▶ BY RECTUM

- ▶ Adult: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

**Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum**

## ▶ BY RECTUM

- ▶ Adult: 1 g daily, preferably at bedtime, dose to be given using 1 g suppositories

**SALOFALK® TABLETS****Treatment of mild to moderate ulcerative colitis, acute attack**

## ▶ BY MOUTH

- ▶ Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- ▶ Child 5-17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
- ▶ Adult: 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**

## ▶ BY MOUTH

- ▶ Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- ▶ Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day
- ▶ Adult: 500 mg 3 times a day

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

- ▶ With rectal use in children *Pentasa*® suppositories not licensed for use in children under 15 years. *Pentasa*® enema not licensed for use in children. *Salofalk*® rectal foam no dose recommendations for children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Blood clotting abnormalities (in children)

- **CAUTIONS** Elderly · pulmonary disease

- **INTERACTIONS** The manufacturers of some mesalazine gastro-resistant and modified-release medicines (*Asacol*® MR tablets, *Ippocol*®, *Salofalk*® granules) suggest that preparations that lower stool pH (e.g. lactulose) may prevent the release of mesalazine.

● **SIDE-EFFECTS**

- ▶ **Rare** Dizziness

- ▶ **Very rare** Oligospermia (reversible)

- **PREGNANCY** Negligible quantities cross placenta.

- **BREAST FEEDING** Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.

Monitor breast-fed infant for diarrhoea.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

● **RENAL IMPAIRMENT**

- ▶ In adults Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>.

- ▶ In children Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m<sup>2</sup>.

● **DIRECTIONS FOR ADMINISTRATION**

- **PENTASA® TABLETS** Tablets may be halved, quartered, or dispersed in water, but should not be chewed.

- **SALOFALK® GRANULES** Granules should be placed on tongue and washed down with water without chewing.

- **PENTASA® GRANULES** Granules should be placed on tongue and washed down with water or orange juice without chewing.

- ▶ In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

- **PRESCRIBING AND DISPENSING INFORMATION** There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Flavours of granule formulations of *Salofalk*® may include vanilla.

- **PATIENT AND CARER ADVICE** If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms.

Some products may require special administration advice; patients and carers should be informed.

F 36

**Osalazine sodium****INDICATIONS AND DOSE****Treatment of acute attack of mild ulcerative colitis**

## ▶ BY MOUTH

▶ Adult: 1 g daily in divided doses, doses to be taken after meals, then increased if necessary up to 3 g daily in divided doses (max. per dose 1 g), dose to be increased over 1 week

**Maintenance of remission of mild ulcerative colitis**

## ▶ BY MOUTH

▶ Adult: Maintenance 500 mg twice daily, dose to be taken after food

**SIDE-EFFECTS**

▶ **Common or very common** Watery diarrhoea

▶ **Frequency not known** Blurred vision · palpitation · photosensitivity · pyrexia · tachycardia

▶ **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

▶ **BREAST FEEDING** Monitor breast-fed infants for diarrhoea.

▶ **RENAL IMPAIRMENT** Use with caution; manufacturer advises avoid in significant impairment.

▶ **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and contents sprinkled on food.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**Sulfasalazine****(Sulphasalazine)****INDICATIONS AND DOSE****Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn's disease**

## ▶ BY MOUTH

▶ Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary

## ▶ BY RECTUM

▶ Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

continued →

**Maintenance of remission of mild to moderate and severe ulcerative colitis**

- ▶ BY MOUTH
- ▶ Adult: 500 mg 4 times a day
- ▶ BY RECTUM
- ▶ Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Active rheumatoid arthritis (administered on expert advice)**

- ▶ BY MOUTH
- ▶ Adult: Initially 500 mg daily, increased in steps of 500 mg every week, increased to 2–3 g daily in divided doses, enteric coated tablets to be administered

- **CAUTIONS** Acute porphyrias p. 930 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status
- **INTERACTIONS** → Appendix 1 (aminosalicylates).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Blood disorders · cough · dizziness · fever · Heinz body anaemia · insomnia · megaloblastic anaemia · proteinuria · pruritus · stomatitis · taste disturbances · tinnitus
  - ▶ **Uncommon** Alopecia · convulsions · depression · dyspnoea · vasculitis
  - ▶ **Frequency not known** Anaphylaxis · aseptic meningitis · ataxia · crystalluria · disturbances of smell · epidermal necrolysis · exfoliative dermatitis · gastro-intestinal intolerance · hallucinations · hypersensitivity reactions · leucopenia (especially in patients with rheumatoid arthritis) · loss of appetite · neutropenia (especially in patients with rheumatoid arthritis) · oligospermia · proctitis · photosensitivity · rashes · serum sickness · some soft contact lenses may be stained · thrombocytopenia (especially in patients with rheumatoid arthritis) · yellow-orange discoloration of other body fluids · yellow-orange discoloration of skin · yellow-orange discoloration of urine
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Gastro-intestinal side effects Upper gastro-intestinal side-effects common over 4 g daily.
  - ▶ Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.
- **PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.
- **BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
  - ▶ Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
  - ▶ Liver function Liver function tests should be performed at monthly intervals for first 3 months.
- **PATIENT AND CARER ADVICE**  
Contact lenses Some soft contact lenses may be stained.

## Budesonide

F 616

### ● INDICATIONS AND DOSE

#### BUDENOFALK® CAPSULES

**Mild to moderate Crohn's disease affecting the ileum or ascending colon | Chronic diarrhoea due to collagenous colitis**

- ▶ BY MOUTH
- ▶ Adult: 3 mg 3 times a day for up to 8 weeks, reduce dose for the last 2 weeks of treatment

**Autoimmune hepatitis, induction of remission**

- ▶ BY MOUTH
- ▶ Adult: 3 mg 3 times a day

**Autoimmune hepatitis, maintenance**

- ▶ BY MOUTH
- ▶ Adult: 3 mg twice daily

#### BUDENOFALK® GRANULES

**Mild to moderate Crohn's disease affecting the ileum or ascending colon | Collagenous colitis**

- ▶ BY MOUTH
- ▶ Adult: 9 mg daily for up to 8 weeks, to be taken in the morning, dose to be reduced for the last two weeks of treatment

#### BUDENOFALK® RECTAL FOAM

**Ulcerative colitis affecting sigmoid colon and rectum**

- ▶ BY RECTUM
- ▶ Adult: 1 metered application once daily for up to 8 weeks

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Budenofalk*® rectal foam: 1 metered application is equivalent to budesonide 2 mg.

#### ENTOCORT® CAPSULES

**Mild to moderate Crohn's disease affecting the ileum or ascending colon**

- ▶ BY MOUTH
- ▶ Adult: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning

#### ENTOCORT® ENEMA

**Ulcerative colitis involving rectal and recto-sigmoid disease**

- ▶ BY RECTUM
- ▶ Adult: 1 enema daily for 4 weeks, to be administered at bedtime

- **CAUTIONS** Autoimmune hepatitis
- **HEPATIC IMPAIRMENT**
- ▶ With systemic use When used in autoimmune hepatitis liver function tests should be monitored every 2 weeks for 1 month, then at least every 3 months.
- **DIRECTIONS FOR ADMINISTRATION** Granules should be placed on tongue and washed down with water without chewing.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of granule formulations may include lemon.

#### ENTOCORT® CAPSULES

Dispense modified-release capsules in original container (contains desiccant).

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer budesonide granules.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### BUDENOFALK® CAPSULES

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2015) that *Budenofalk*® gastro-resistant capsules are accepted for restricted use within NHS Scotland for the treatment of

autoimmune hepatitis in non-cirrhotic patients who are intolerant of conventional oral corticosteroids (prednisolone) with severe corticosteroid-related side effects (actual or anticipated) such as psychosis, poorly controlled diabetes or osteoporosis.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release capsule

#### Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 5, 10, 22, 25

- ▶ **Budenofalk** (Dr. Falk Pharma UK Ltd)

**Budesonide 9 mg** Budenofalk 9mg gastro-resistant granules sachets | 60 sachet [PoM] £135.00

#### Foam

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, propylene glycol, sorbic acid

- ▶ **Budenofalk** (Dr. Falk Pharma UK Ltd)

**Budesonide 2 mg per 1 actuation** Budenofalk 2mg foam enema | 14 dose [PoM] £57.11

#### Enema

- ▶ **Entocort** (Tillotts Pharma Ltd)

**Budesonide 20 microgram per 1 ml** Entocort 2mg/100ml enema | 7 enema [PoM] £39.60

## IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

### Vedolizumab

04-Apr-2016

- **DRUG ACTION** Vedolizumab is a monoclonal antibody that binds specifically to the  $\alpha_4\beta_7$  integrin, which is expressed on gut homing T helper lymphocytes and causes a reduction in gastrointestinal inflammation.

### ● INDICATIONS AND DOSE

**Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

**Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

- **CONTRA-INDICATIONS** Severe active infection
- **CAUTIONS** Controlled chronic severe infection · history of recurring severe infection · previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk) · previous treatment with rituximab
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Risk of infection Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.
 

Patients should be brought up to date with current immunisation schedule before initiating treatment.
- **INTERACTIONS** → Appendix 1 (vedolizumab).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Acne · arthralgia · back pain · constipation · cough · dyspepsia · eczema · erythema · flatulence · gastroenteritis · headache · hypertension · infection (increased susceptibility to viral, fungal and bacterial infections) · malaise · muscle spasms · muscular weakness · nasal congestion · nasopharyngitis · nausea · night sweats · oropharyngeal pain · paraesthesia · pharyngitis · pruritus · pyrexia · rash · sinusitis
  - ▶ **Uncommon** Folliculitis · infusion-related reactions
  - ▶ **Frequency not known** Dizziness
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Infusion-related reactions Infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each infusion for signs and symptoms of acute hypersensitivity reactions; they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during and for at least 18 weeks after treatment.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor closely for infection before, during and after treatment—potential increased risk of opportunistic infection.
  - ▶ Manufacturer advises monitor for new onset or worsening neurological signs and symptoms (withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Entyvio®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21–25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21–25 gauge needle), and

add to 250 mL of infusion fluid; gently mix and give over 30 minutes.

- **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ Vedolizumab for treating moderately to severely active Crohn's disease after prior therapy (August 2015) NICE TA352 Vedolizumab is recommended as an option for the treatment of moderate to severe active Crohn's disease in adults if:
  - a tumour necrosis factor- $\alpha$  inhibitor has failed (that is, the disease has responded inadequately or has lost response to treatment) **or**
  - a tumour necrosis factor- $\alpha$  inhibitor cannot be tolerated or is contra-indicated,
  - **and** the manufacturer provides vedolizumab with the discount agreed in the patient access scheme.
 Vedolizumab should be given as a planned course of treatment until treatment fails, or surgery is needed, or until 12 months after starting treatment, whichever is the shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Patients currently receiving vedolizumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA352](http://www.nice.org.uk/TA352)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2015) that vedolizumab (Entyvio®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to a TNF $\alpha$  antagonist; it is also accepted for use in NHS Scotland for the treatment of adult patients with moderately to severely active ulcerative colitis who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF $\alpha$  antagonist.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

## 1.4 Irritable bowel syndrome

### Irritable bowel syndrome

24-Feb-2016

**Description of condition**

**Irritable bowel syndrome** (IBS) is a common, chronic, relapsing, and often life-long condition, mainly affecting people aged between 20 and 30 years. It is more common in women. Symptoms include abdominal pain or discomfort, disordered defaecation (either diarrhoea, or constipation with straining, urgency, and incomplete evacuation), passage of mucus, and bloating. Symptoms are usually relieved by defaecation. Obtaining an accurate clinical diagnosis of IBS prior to treatment is crucial.

**Aims of treatment**

The treatment of IBS is focused on symptom control, in order to improve quality of life.

## Non-drug treatment

**[EvGr]** Diet and lifestyle changes are important for effective self-management of IBS. Patients should be encouraged to increase physical activity, and advised to eat regularly, without missing meals or leaving long gaps between meals. Dietary advice should also include, limiting fresh fruit consumption to no more than 3 portions per day. The fibre intake of patients with IBS should be reviewed. If an increase in dietary fibre is required, soluble fibre such as ispaghula husk p. 50, or foods high in soluble fibre such as oats, are recommended. Intake of insoluble fibre (e.g. bran) and 'resistant starch' should be reduced or discouraged as they may exacerbate symptoms. Fluid intake (mostly water) should be increased to at least 8 cups each day and the intake of caffeine, alcohol and fizzy drinks reduced. The artificial sweetener sorbitol should be avoided in patients with diarrhoea. Where probiotics are being used, continue for at least 4 weeks while monitoring the effect.

If a patient's symptoms persist following lifestyle and dietary advice, single food avoidance and exclusion diets may be an option under the supervision of a dietician or medical specialist. **[A]**

## Drug treatment

**[EvGr]** The choice of drug treatment depends on the nature and severity of the symptoms. Many drug treatment options for IBS are available over-the-counter. **[A]**

**[EvGr]** Antispasmodic drugs (such as alverine citrate p. 82, mebeverine hydrochloride p. 82 and peppermint oil below) can be taken in addition to dietary and lifestyle changes. A laxative (excluding lactulose p. 52 as it may cause bloating) can be used to treat constipation. Patients who have not responded to laxatives from the different classes and who have had constipation for at least 12 months, can be treated with linaclotide p. 44. Loperamide hydrochloride p. 63 is the first-line choice of anti-motility drug for relief of diarrhoea. Patients with IBS should be advised how on to adjust their dose of laxative or anti-motility drug according to stool consistency, with the aim of achieving a soft, well-formed stool. **[A]** See Constipation p. 48, for information on other drugs used for chronic constipation.

**[EvGr]** A low-dose tricyclic antidepressant, such as amitriptyline hydrochloride p. 349 [unlicensed indication], can be used for abdominal pain or discomfort as a second-line option in patients who have not responded to antispasmodics, anti-motility drugs, or laxatives. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Psychological intervention can be offered to patients who have no relief of IBS symptoms after 12 months of drug treatment. **[A]**

Irritable bowel syndrome in adults: diagnosis and management. Clinical guideline 61. February 2015 [www.nice.org.uk/guidance/cg61](http://www.nice.org.uk/guidance/cg61)

## ANTISPASMODICS

### Mebeverine with ispaghula husk

04-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 82, ispaghula husk p. 50.

#### ● INDICATIONS AND DOSE

##### Irritable bowel syndrome

- ▶ BY MOUTH
- ▶ Child 12-17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal
- ▶ Adult: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

● **DIRECTIONS FOR ADMINISTRATION** Contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ispaghula husk with mebeverine granules.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 22

EXCIPIENTS: May contain Aspartame

ELECTROLYTES: May contain Potassium

- ▶ **Fybogel Mebeverine** (Reckitt Benckiser Healthcare (UK) Ltd)  
**Ispaghula husk 3.5 gram, Mebeverine hydrochloride 135 mg** Fybogel Mebeverine effervescent granules sachets orange sugar-free | 10 sachet **[P]** £4.64 DT price = £4.22

### Peppermint oil

#### ● INDICATIONS AND DOSE

##### COLPERMIN®

##### Relief of abdominal colic and distension, particularly in irritable bowel syndrome

- ▶ BY MOUTH
- ▶ Child 15-17 years: 1-2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water
- ▶ Adult: 1-2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

##### MINTEC®

##### Relief of abdominal colic and distension, particularly in irritable bowel syndrome

- ▶ BY MOUTH
- ▶ Adult: 1-2 capsules 3 times a day for up to 2-3 months if necessary, dose to be taken before meals, swallowed whole with water

● **CAUTIONS** Sensitivity to menthol

● **SIDE-EFFECTS**

- ▶ **Rare** Allergic reactions · ataxia · bradycardia · headache · muscle tremor · rash
- ▶ **Frequency not known** Heartburn · perianal irritation

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Significant levels of menthol in breast milk unlikely.

● **DIRECTIONS FOR ADMINISTRATION** Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 5, 22, 25

EXCIPIENTS: May contain Arachis (peanut) oil

▶ **Colpermin** (McNeil Products Ltd)

**Peppermint oil 200 microlitre** Colpermin gastro-resistant modified-release capsules | 20 capsule [GSL] £3.33 | 100 capsule [GSL] £12.18 DT price = £12.18

**Gastro-resistant capsule**

CAUTIONARY AND ADVISORY LABELS 5, 22, 25

▶ **Mintec** (Almirall Ltd)

**Peppermint oil 200 microlitre** Mintec 0.2ml gastro-resistant capsules | 84 capsule [GSL] £7.04 DT price = £7.04

**LAXATIVES** > GUANYLATE CYCLASE-C RECEPTOR AGONISTS**Linaclootide**

24-Feb-2016

**INDICATIONS AND DOSE****Moderate to severe irritable bowel syndrome with constipation**

## ▶ BY MOUTH

▶ **Adult:** 290 micrograms once daily, dose to be taken at least 30 minutes before meals, review treatment if no response after 4 weeks

● **CONTRA-INDICATIONS** Gastro-intestinal obstruction · inflammatory bowel disease

● **CAUTIONS** Predisposition to fluid and electrolyte disturbances

**SIDE-EFFECTS**

▶ **Common or very common** Abdominal distension · abdominal pain · diarrhoea · dizziness · flatulence  
▶ **Uncommon** Decreased appetite · dehydration · faecal incontinence · hypokalaemia · orthostatic hypotension

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ **Diarrhoea** Manufacturer advises if diarrhoea severe or prolonged, consider suspending treatment.

● **PREGNANCY** Manufacturer advises avoid.

● **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense capsules in original container (contains desiccant); discard any capsules remaining 18 weeks after opening.

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (May 2013) that linaclootide (*Constella*<sup>®</sup>) is accepted for restricted use within NHS Scotland for moderate to severe irritable bowel syndrome in patients whose condition has not responded adequately to all other treatments, or who are intolerant of them.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 22

**1.5 Short bowel syndrome****Short bowel syndrome**

31-Aug-2016

**Description of condition**

Patients with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

**Aims of treatment**

The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

**Drug treatment****Nutritional deficiencies**

[EvGr] Patients with a short bowel may require replacement of vitamins and minerals depending on the extent and position of the bowel resection. Deficiencies in vitamins A, B<sub>12</sub>, D, E, and K, essential fatty acids, zinc, and selenium can occur.

Hypomagnesaemia is common and is treated with oral or intravenous magnesium supplementation (see under *Magnesium*, in *Minerals* p. 923), though administration of oral magnesium may cause diarrhoea. Occasionally the use of oral alfacalcidol p. 952 and correction of sodium depletion may be useful. Nutritional support can range from oral supplements to parenteral nutrition, depending on the severity of intestinal failure. ◀

**Diarrhoea and high output stomas**

Diarrhoea is common in short bowel syndrome and can be due to multiple factors. [EvGr] The use of oral rehydration salts can be considered in order to promote adequate hydration. Oral intake influences the volume of stool passed, so reducing food intake will lessen diarrhoea, but will also exacerbate the problems of undernutrition. A patient may require parenteral nutrition to allow them to eat less, if the extent of diarrhoea is unacceptable.

Pharmacological treatment may be necessary, with the choice of drug depending on the potential for side-effects and the degree of resection. ◀

**Antimotility drugs**

[EvGr] Loperamide hydrochloride p. 63 and codeine phosphate p. 421 reduce intestinal motility and thus exert antidiarrhoeal actions. Loperamide hydrochloride is preferred as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in patients with a short bowel due to disrupted enterohepatic circulation and rapid gastrointestinal transit time. If the desired response is not obtained with loperamide hydrochloride, codeine phosphate may be added to therapy.

Co-phenotrope p. 62 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenotrope crosses the blood-brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use. ◀

**Colestyramine**

[EvGr] In patients with an intact colon and less than 100 cm of ileum resected, colestyramine p. 186 can be used to bind the unabsorbed bile salts and reduce diarrhoea. When colestyramine is given to these patients, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies. ◀

**Antisecretory drugs**

**EvGr** Drugs that reduce gastric acid secretion reduce jejunostomy output. Omeprazole p. 76 is readily absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunum remains, it may need to be given intravenously. Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimotility agents, intravenous fluids, or oral rehydration salts).

Octreotide [unlicensed indication] reduces ileostomy diarrhoea and large volume jejunostomy output by inhibiting multiple pro-secretory substances. There is insufficient evidence to establish its role in the management of short bowel syndrome. **A**

**Growth factors**

Growth factors can be used to facilitate intestinal adaptation after surgery in patients with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.

Teduglutide below is an analogue of endogenous human glucagon-like peptide 2 (GLP-2) which is licensed for use in the management of short bowel syndrome. It may be considered after a period of stabilisation following surgery, during which intravenous fluids and nutritional support should have been optimised.

**Drug absorption**

For *Prescribing in patients with stoma*, see Stoma care p. 91.

**EvGr** Many drugs are incompletely absorbed by patients with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) and may need to be given intravenously. **A**

Several factors can alter the absorption of drugs taken by mouth in patients with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section has been removed. The small intestine, with its large surface area and high blood flow, is the most important site of drug absorption. The larger the amount of the small intestine that has been removed, the higher the possibility that drug absorption will be affected. Other factors, such as gastric emptying and gastric transit time, also affect drug handling.

**EvGr** Enteric-coated and modified-release preparations are unsuitable for use in patients with short bowel syndrome, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Dosage forms with quick dissolution (soluble tablets) should be used. Uncoated tablets and liquid formulations may also be suitable. **A** **EvGr** Before prescribing liquid formulations, prescribers should consider the osmolarity, excipient content and volume required. Hyperosmolar liquids and some excipients (such as sorbitol) can result in fluid loss. The calorie density of oral supplements should also be considered, as it will influence the volume to be taken. **E**

**Other drugs used for Short bowel syndrome** Cimetidine, p. 71

**AMINO ACIDS AND DERIVATIVES****Teduglutide**

01-Sep-2016

• **DRUG ACTION** Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

**INDICATIONS AND DOSE****Short bowel syndrome (initiated under specialist supervision)****BY SUBCUTANEOUS INJECTION**

▶ **Adult:** 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 6 months

• **CONTRA-INDICATIONS** Active or suspected malignancy · history of gastro-intestinal malignancy (in previous 5 years)

• **CAUTIONS** Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) · cardiac insufficiency · cardiovascular disease · colo-rectal polyps · hypertension

**SIDE-EFFECTS**

▶ **Common or very common** Abdominal distension · abdominal pain · allergic dermatitis · anxiety · arthralgia · chest pain · cholecystitis · cholestasis · congestive heart failure · cough · decreased appetite · dyspnoea · flushing · headache · intestinal obstruction · nausea · night sweats · pancreatitis · paraesthesia · peripheral oedema · rash · renal colic · sleep disorder · vomiting

**Uncommon** Syncope

▶ **Frequency not known** Gastro-intestinal neoplasia · pancreatic duct stenosis · pancreatic infection

• **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises caution in patients with tetracycline hypersensitivity.

• **PREGNANCY** **EvGr** Specialist sources indicate use if necessary—no human data available. **D**

• **BREAST FEEDING** Manufacturer advises avoid—toxicity in animal studies.

• **RENAL IMPAIRMENT** Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.

• **MONITORING REQUIREMENTS** Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.

• **TREATMENT CESSATION** Caution when discontinuing treatment—risk of dehydration.

• **PATIENT AND CARER ADVICE** Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

▶ **Revestive** (Shire Pharmaceuticals Ltd) ▼

**Teduglutide 5 mg** Revestive 5mg powder and solvent for solution for injection vials | 28 vial **PoM** no price available

## 2 Constipation and bowel cleansing

### 2.1 Bowel cleansing

**Other drugs used for Bowel cleansing** Bisacodyl, p. 57 · Docusate sodium, p. 56 · Magnesium sulfate, p. 924

#### LAXATIVES > OSMOTIC LAXATIVES

### Citric acid with magnesium carbonate (Formulated as a bowel cleansing preparation)

#### ● INDICATIONS AND DOSE

##### Bowel evacuation for surgery, colonoscopy or radiological examination

###### ▶ BY MOUTH

- ▶ Child 5–9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
- ▶ Child 10–17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure
- ▶ Adult: 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients

- **CONTRA-INDICATIONS** Acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon

- **CAUTIONS** Children · colitis (avoid if acute severe colitis) · debilitated · elderly (in adults) · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration · patients with fluid and electrolyte disturbances

#### CAUTIONS, FURTHER INFORMATION

Adequate hydration should be maintained during treatment.

- **INTERACTIONS** Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired.
- ▶ In adults Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distention · abdominal pain · nausea · vomiting
- ▶ **Uncommon** Dehydration · dizziness · electrolyte disturbances · headache

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Abdominal pain Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT**
  - ▶ In adults Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> – risk of hypermagnesaemia.
  - ▶ In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup> – risk of hypermagnesaemia.

- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION** One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg<sup>2+</sup>.

Flavours of oral powders may include lemon and lime.

- **PATIENT AND CARER ADVICE** Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber's advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Effervescent powder

CAUTIONARY AND ADVISORY LABELS 13, 10

ELECTROLYTES: May contain Magnesium

▶ **Citramag** (Sanochemia Diagnostics UK Ltd)

**Magnesium carbonate heavy 11.57 gram, Citric acid anhydrous 17.79 gram** Citramag effervescent powder sachets sugar-free | 10 sachet [P] £18.92

### Macrogol 3350 with anhydrous sodium sulfate, ascorbic acid, potassium chloride, sodium ascorbate and sodium chloride

#### (Polyethylene glycols)

#### ● INDICATIONS AND DOSE

##### MOVIPREP®

##### Bowel evacuation for surgery, colonoscopy or radiological examination

###### ▶ BY MOUTH

- ▶ Adult: 1 litre daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 2 litres daily for 1 dose; reconstituted solution to be taken on the evening before the procedure, treatment should be completed at least 1 hour before colonoscopy

- **CONTRA-INDICATIONS** Acute severe colitis · G6PD deficiency · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon

- **CAUTIONS** Colitis (avoid if acute severe colitis) · debilitated patients · elderly · fluid and electrolyte disturbances · heart failure · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration

- **INTERACTIONS** Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distention · abdominal pain · nausea · vomiting
- ▶ **Uncommon** Dehydration · dizziness · electrolyte disturbances · headache

- ▶ **Frequency not known** Anal discomfort · fatigue · sleep disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Abdominal pain** Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
- **PREGNANCY** Manufacturers advise use only if essential—no information available.
- **BREAST FEEDING** Manufacturers advise use only if essential—no information available.
- **RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION**  
**MOVIPREP<sup>®</sup>** One pair of sachets (A and B) should be reconstituted in 1 litre of water and taken over 1–2 hours. 1 litre of other clear fluid should also be taken during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon or orange.  
**MOVIPREP<sup>®</sup>** 1 pair of sachets (A+B) when reconstituted with 1 litre of water provides Na<sup>+</sup> 181.6 mmol (Na<sup>+</sup> 56.2 mmol absorbable), K<sup>+</sup> 14.2 mmol, Cl<sup>-</sup> 59.8 mmol.
- **PATIENT AND CARER ADVICE** Patient information leaflet. Solid food should not be taken during treatment until procedure completed. Treatment can be stopped if bowel motions become watery and clear.

#### MEDICINAL FORMS

## LAXATIVES > STIMULANT LAXATIVES

### Magnesium citrate with sodium picosulfate

(Formulated as a bowel cleansing preparation)

#### ● INDICATIONS AND DOSE

##### CITRAFLEET<sup>®</sup> SACHETS

**Bowel evacuation on day before radiological examination, endoscopy, or surgery**

▶ BY MOUTH

- ▶ **Adult:** 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours

##### PHARMACOKINETICS

For *CitraFleet<sup>®</sup>*: Acts within 3 hours of first dose.

continued →

**PICOLAX<sup>®</sup> SACHETS****Bowel evacuation on day before radiological procedure, endoscopy, or surgery****► BY MOUTH**

- Child 1 year: 0.25 sachet taken before 8 a.m., then 0.25 sachet after 6–8 hours
- Child 2–3 years: 0.5 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
- Child 4–8 years: 1 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
- Child 9–17 years: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours
- Adult: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours

**PHARMACOKINETICS**

For *Picolax*<sup>®</sup>: Acts within 3 hours of first dose.

- **CONTRA-INDICATIONS** Acute severe colitis · ascites · congestive cardiac failure · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · gastro-intestinal ulceration · toxic megacolon
- **CAUTIONS** Cardiac disease (avoid in congestive cardiac failure) · children · colitis (avoid if acute severe colitis) · debilitated patients · elderly · fluid and electrolyte disturbances · hypovolaemia (should be corrected before administration) · impaired gag reflex or possibility of regurgitation or aspiration · recent gastro-intestinal surgery
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distention · abdominal pain (usually transient—reduced by taking more slowly) · nausea · vomiting
  - **Uncommon** Dehydration · dizziness · electrolyte disturbances · headache
  - **Frequency not known** Anal discomfort · fatigue · rash · sleep disturbances
- **PREGNANCY** Caution.
- **BREAST FEEDING** Caution.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT**
  - In adults Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—risk of hypermagnesaemia.
  - In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>—risk of hypermagnesaemia.
- **DIRECTIONS FOR ADMINISTRATION** One sachet of sodium picosulfate with magnesium citrate powder should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.
- **PICOLAX<sup>®</sup> SACHETS AND CITRAFLEET<sup>®</sup> SACHETS** One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon.
- **PICOLAX<sup>®</sup> SACHETS** One reconstituted sachet contains K<sup>+</sup> 5 mmol and Mg<sup>2+</sup> 87 mmol.
- **CITRAFLEET<sup>®</sup> SACHETS** One reconstituted sachet contains K<sup>+</sup> 5 mmol and Mg<sup>2+</sup> 86 mmol.
- **PATIENT AND CARER ADVICE** Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients or carers should be given advice on how to administer sodium picosulfate with magnesium citrate oral powder.
- **PICOLAX<sup>®</sup> SACHETS AND CITRAFLEET<sup>®</sup> SACHETS** Low residue diet recommended on the day before procedure

and copious intake of water or other clear fluids recommended during treatment.

Patients and carers should be given advice on how to administer oral powder; they should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

## 2.2 Constipation

### Constipation

**Overview**

Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is *not* secondary to an underlying undiagnosed complaint.

It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement each day. A useful definition of constipation is the passage of hard stools less frequently than the patient's own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia.

Thus, laxatives should generally be **avoided** except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in *drug-induced constipation*, for the expulsion of *parasites* after anthelmintic treatment, and to clear the alimentary tract *before surgery and radiological procedures*. Prolonged treatment of constipation is sometimes necessary.

Laxatives also have a role in the treatment of irritable bowel syndrome.

Also see the prevention of opioid-induced constipation in palliative care.

The laxatives that follow have been divided into 5 main groups. This simple classification disguises the fact that some laxatives have a complex action.

**Bulk-forming laxatives**

Bulk-forming laxatives are of value if the diet is deficient in fibre. Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives can be used in the management of patients with *colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome*, and as adjuncts in *ulcerative colitis*. Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or

biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose p. 50, ispaghula husk p. 50, and sterculia p. 51 are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

### Stimulant laxatives

Stimulant laxatives include bisacodyl p. 57, sodium picosulfate p. 60, and members of the **anthraquinone** group, senna p. 59, co-danthramer p. 58 and co-danthrusate p. 58. The indications for co-danthramer and co-danthrusate are limited by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as **cascara** (an anthraquinone) and **castor oil** are obsolete. Docusate sodium p. 56 probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances.

Glycerol suppositories p. 59 act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be **avoided** as their laxative action is unpredictable. Aloes, colocynth, and jalap should be **avoided** as they have a drastic purgative action.

The **parasympathomimetics** bethanechol chloride p. 720, neostigmine p. 983, and pyridostigmine bromide p. 984 enhance parasympathetic activity in the gut and increase intestinal motility. They are rarely used for their gastro-intestinal effects. Organic obstruction of the gut must first be excluded and they should not be used shortly after bowel anastomosis.

### Other stimulant laxatives

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be **avoided** as their laxative action is unpredictable. Aloes, colocynth, and jalap should be **avoided** as they have a drastic purgative action.

### Faecal softeners

Liquid paraffin p. 57, the traditional lubricant, has disadvantages. Bulk laxatives and non-ionic surfactant 'wetting' agents e.g. docusate sodium also have softening properties. Such drugs are useful for oral administration in the management of haemorrhoids; glycerol is useful for rectal use.

Enemas containing arachis oil p. 56 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.

### Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

Lactulose p. 52 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of *hepatic encephalopathy*.

**Macrogols** are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Saline purgatives such as magnesium hydroxide p. 54 are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. Magnesium salts, such as magnesium sulfate p. 924 are useful where rapid bowel evacuation is required. **Sodium salts** should be avoided as they may give rise to sodium and water retention

in susceptible individuals. **Phosphate enemas** are useful in bowel clearance before radiology, endoscopy, and surgery.

### Other drugs used in constipation

Linaclotide p. 44 is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain. It is metabolised within the gastro-intestinal tract and is virtually undetectable in the plasma after therapeutic doses.

Lubiprostone p. 51 is a chloride-channel activator that is licensed for the treatment of chronic idiopathic constipation in adults whose condition has not responded adequately to lifestyle changes (including dietary changes).

Prucalopride p. 55 is a selective serotonin 5HT<sub>4</sub>-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in women, when other laxatives have failed to provide an adequate response.

### Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

### Pregnancy

If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

### Constipation in children

Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In *infants*, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose p. 52 can be used to soften the stool; either an oral preparation containing macrogols or, rarely, glycerol p. 59 suppositories can be used to clear faecal impaction. The infant should be referred to a hospital paediatric specialist if these measures fail.

The diet of *children over 1 year of age* should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols can also be used, particularly in children with chronic constipation; lactulose is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a **stimulant laxative** can be added.

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogols is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a **stimulant laxative** can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A **phosphate enema** may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a **bowel cleansing preparation** is an alternative. Manual evacuation

under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

### Chronic constipation

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child's toilet routine.

**Other drugs used for Constipation** Sodium citrate, p. 721

## LAXATIVES > BULK-FORMING LAXATIVES

### Ispaghula husk

24-Feb-2016

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

#### ● INDICATIONS AND DOSE

##### Constipation

###### ► BY MOUTH

- Child 1 month-5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
- Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening
- Adult: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening

#### DOSE EQUIVALENCE AND CONVERSION

- 1 sachet equivalent to 2 level 5 ml spoonfuls.

- **CONTRA-INDICATIONS** Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility
- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction
- **SIDE-EFFECTS** Abdominal distension · flatulence · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity
- **DIRECTIONS FOR ADMINISTRATION** Dose to be taken with at least 150 mL liquid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble granules formulations may include plain, lemon, or orange.
- **HANDLING AND STORAGE** Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.
- **PATIENT AND CARER ADVICE** Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take

some days to develop and should be given advice on how to administer ispaghula husk.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**LAXATIVES > CHLORIDE-CHANNEL AGONISTS****Lubiprostone**

23-Mar-2016

- **DRUG ACTION** Lubiprostone is a chloride-channel activator that acts locally in the gut to increase intestinal fluid secretion and intestinal motility, resulting in a laxative effect.

**INDICATIONS AND DOSE****Chronic idiopathic constipation when response to lifestyle changes (including diet) inadequate**

## ▶ BY MOUTH

- ▶ Adult: 24 micrograms twice daily for 2-4 weeks, discontinue if no response after initial 2 weeks

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction
- **SIDE-EFFECTS**  
▶ **Common or very common** Abdominal discomfort · abdominal distension · abdominal pain · diarrhoea · dizziness · dyspepsia · dyspnoea · flatulence · headache · hot flush · hyperhidrosis · nausea · oedema · palpitation  
▶ **Uncommon** Chest pain · muscle spasm · syncope · vomiting  
▶ **Frequency not known** Influenza-like symptoms · rash · tachycardia
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Unknown if excreted in milk. [EvGr] If benefits of use outweigh the risk, monitor infant for side effects (e.g. diarrhoea). ⚠
- **HEPATIC IMPAIRMENT** In moderate to severe impairment initially 24 micrograms once daily; if tolerated, and if necessary, increased to 24 micrograms twice daily.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense capsules in original container; discard any capsules remaining 4 weeks after opening.

### ● NICE FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Lubiprostone for treating chronic idiopathic constipation (July 2014)** NICE TA318

Lubiprostone is recommended as an option for treating chronic idiopathic constipation for adults in whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and for whom invasive treatment for constipation is being considered. If treatment with lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Lubiprostone should only be prescribed by a clinician with experience of treating chronic idiopathic constipation, after careful review of the patient's previous courses of laxative treatments.

[www.nice.org.uk/TA318](http://www.nice.org.uk/TA318)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2014) that lubiprostone (*Amitiza*)<sup>®</sup> is **not** recommended for use within NHS Scotland.

## LAXATIVES > OSMOTIC LAXATIVES

### Lactulose

#### ● INDICATIONS AND DOSE

##### Constipation

- ▶ BY MOUTH
- ▶ Child 1-11 months: 2.5 mL twice daily, adjusted according to response
- ▶ Child 1-4 years: 2.5-10 mL twice daily, adjusted according to response
- ▶ Child 5-17 years: 5-20 mL twice daily, adjusted according to response
- ▶ Adult: Initially 15 mL twice daily, adjusted according to response

##### Hepatic encephalopathy (portal systemic encephalopathy)

- ▶ BY MOUTH
- ▶ Adult: Adjusted according to response to 30-50 mL 3 times a day, subsequently adjusted to produce 2-3 soft stools per day

#### PHARMACOKINETICS

Lactulose may take up to 48 hours to act.

#### ● UNLICENSED USE

- ▶ In adults Lactulose doses in the BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Galactosaemia · intestinal obstruction

- **CAUTIONS** Lactose intolerance

- **INTERACTIONS** → Appendix 1 (lactulose).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal discomfort · cramps · flatulence · nausea · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Nausea Nausea can be reduced by administration with water, fruit juice or meals.

- **PREGNANCY** Not known to be harmful.

## Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride

### ● INDICATIONS AND DOSE

#### Chronic constipation (dose for non-proprietary 'full-strength' sachets)

- ▶ BY MOUTH
- ▶ Child 12-17 years: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily
- ▶ Adult: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily

#### Faecal impaction (dose for non-proprietary 'full-strength' sachets)

- ▶ BY MOUTH
- ▶ Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- ▶ Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

#### MOVICOL-HALF<sup>®</sup>

##### Chronic constipation

- ▶ BY MOUTH
- ▶ Child 12-17 years: 2-6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2-4 sachets daily
- ▶ Adult: 2-6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2-4 sachets daily

##### Faecal impaction

- ▶ BY MOUTH
- ▶ Child 12-17 years: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day
- ▶ Adult: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day

**MOVICOL-PAEDIATRIC®****Chronic constipation | Prevention of faecal impaction**

## ► BY MOUTH

- Child 2-5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 6-11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

**Faecal impaction**

## ► BY MOUTH

- Child 5-11 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

**MOVICOL® LIQUID****Chronic constipation**

## ► BY MOUTH

- Child 12-17 years: 25 mL 1-3 times a day usually for up to 2 weeks; maintenance 25 mL 1-2 times a day
- Adult: 25 mL 1-3 times a day usually for up to 2 weeks; maintenance 25 mL 1-2 times a day

**MOVICOL® ORAL POWDER****Chronic constipation**

## ► BY MOUTH

- Child 12-17 years: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily
- Adult: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily

**Faecal impaction**

## ► BY MOUTH

- Child 12-17 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- Adult: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

● **UNLICENSED USE**

**MOVICOL-PAEDIATRIC®** *Movicol® Paediatric* not licensed for use in faecal impaction in children under 5 years, or for chronic constipation in children under 2 years.

- **CONTRA-INDICATIONS** Crohn's disease · intestinal obstruction · intestinal perforation · paralytic ileus · severe inflammatory conditions of the intestinal tract · toxic megacolon · ulcerative colitis

**MOVICOL-PAEDIATRIC®** Cardiovascular impairment · renal impairment

- **CAUTIONS** Cardiovascular impairment (should not take more than 2 'full-strength' sachets or 4 'half-strength' sachets in any one hour) · discontinue if symptoms of fluid and electrolyte disturbance

**MOVICOL-PAEDIATRIC®** Impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)

- **INTERACTIONS** → Appendix 1 (macrogols).
- **SIDE-EFFECTS** Abdominal distention · abdominal pain · flatulence · nausea
- **PREGNANCY** Limited data, but manufacturer advises that it can be used.
- **BREAST FEEDING** Manufacturer advises that it can be used.

● **RENAL IMPAIRMENT**

**MOVICOL-PAEDIATRIC®** Contra-indicated in renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Contents of each 'full strength' sachet of oral powder to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL® LIQUID** 25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL) of water. After dilution the solution should be discarded if unused after 24 hours.

**MOVICOL-PAEDIATRIC®** Contents of each sachet to be dissolved in quarter of a glass (approx. 60-65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

**MOVICOL® ORAL POWDER** Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL-HALF®** Contents of each sachet to be dissolved in quarter of a glass (approx. 60-65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

Flavours of oral powder formulations may include chocolate, lime and lemon, or plain.

**MOVICOL® LIQUID** 25 mL of oral concentrate when diluted with 100 mL water provides K<sup>+</sup> 5.4 mmol/litre.

**MOVICOL® ORAL POWDER** Amount of potassium chloride varies according to flavour of *Movicol®* as follows:  
plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K<sup>+</sup> 5.4 mmol/litre.

- **PATIENT AND CARER ADVICE**

Patients or carers should be counselled on how to take the oral powder and oral solution.

Medicines for Children leaflet: *Movicol* for constipation  
[www.medicinesforchildren.org.uk/movicol-for-constipation](http://www.medicinesforchildren.org.uk/movicol-for-constipation)

**MOVICOL® LIQUID** Patients or carers should be counselled on how to take *Movicol®* oral solution.

**MOVICOL® ORAL POWDER** Patients or carers should be counselled on how to take *Movicol®* oral powder.

**MOVICOL-HALF®** Patients or carers should be given advice on how to administer *Movicol-Half®* oral powder.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

## Magnesium hydroxide

### • INDICATIONS AND DOSE

#### Constipation

##### ► BY MOUTH

- Adult: 30–45 mL as required, dose to be given mixed with water at bedtime

- **CONTRA-INDICATIONS** Acute gastro-intestinal conditions
- **CAUTIONS** Debilitated patients - elderly
- **INTERACTIONS** → Appendix 1 (antacids).
- **SIDE-EFFECTS** Colic
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Oral suspension

##### ► Magnesium hydroxide (Non-proprietary)

Magnesium hydroxide 83 mg per 1 ml Phillips' Milk of Magnesia 415mg/5ml oral suspension sugar-free | 200 ml [GSU] £3.22 DT price = £3.22

Combinations available: *Liquid paraffin with magnesium hydroxide*, p. 57

## Sodium acid phosphate with sodium phosphate

### • INDICATIONS AND DOSE

**Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)**

##### ► BY RECTUM

- Child 3–6 years: 45–65 mL once daily
- Child 7–11 years: 65–100 mL once daily
- Child 12–17 years: 100–128 mL once daily
- Adult: 128 mL daily

#### FLEET® READY-TO-USE ENEMA

**Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery**

##### ► BY RECTUM

- Adult: 118 mL

#### FLEET® PHOSPHO-SODA

**Bowel evacuation before colonic surgery | Bowel evacuation before colonoscopy | Bowel evacuation before radiological examination**

##### ► BY MOUTH

- Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water, timing of doses is dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure.; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

#### PHARMACOKINETICS

For *Fleet® phospho-soda*: Onset of action is within half to 6 hours of first dose.

**● CONTRA-INDICATIONS**

- ▶ With oral use Acute severe colitis (in adults) · ascites (in adults) · congestive cardiac failure (in adults) · gastric retention (in adults) · gastro-intestinal obstruction · gastro-intestinal perforation (in adults) · toxic megacolon (in adults)
- ▶ With rectal use conditions associated with increased colonic absorption · gastro-intestinal obstruction · inflammatory bowel disease

**● CAUTIONS**

- ▶ With oral use cardiac disease (avoid in congestive cardiac failure) (in adults) · colitis (avoid if acute severe colitis) (in adults) · elderly and debilitated patients (in adults) · fluid and electrolyte disturbances (in adults) · hypovolaemia (should be corrected before administration) (in adults) · impaired gag reflex or possibility of regurgitation or aspiration (in adults)
- ▶ With rectal use Ascites · congestive heart failure · elderly and debilitated patients (in adults) · electrolyte disturbances · uncontrolled hypertension

**● INTERACTIONS**

- ▶ With oral use in adults Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

**● SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With oral use Abdominal distention (in adults) · abdominal pain (usually transient—reduced by taking more slowly) (in adults) · nausea (in adults) · vomiting (in adults)
- ▶ **Uncommon**
- ▶ With oral use Dehydration (in adults) · dizziness (in adults) · headache (in adults)
- ▶ **Frequency not known**
- ▶ With oral use Arrhythmias (in adults) · asthenia (in adults) · chest pain (in adults) · electrolyte disturbances · renal failure (in adults)
- ▶ With rectal use Electrolyte disturbances · local irritation

**● PREGNANCY**

- ▶ With oral use in adults Caution.

**● BREAST FEEDING**

- ▶ With oral use in adults Caution.

**● HEPATIC IMPAIRMENT** Use with caution in cirrhosis.**● RENAL IMPAIRMENT**

- ▶ With oral use in adults Avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>.

**▶ With rectal use** Use with caution.**● MONITORING REQUIREMENTS**

- ▶ With oral use in adults Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

**● DIRECTIONS FOR ADMINISTRATION**

**FLEET® PHOSPHO-SODA** Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. before afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.

- ▶ **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

**● PATIENT AND CARER ADVICE**

**FLEET® PHOSPHO-SODA** Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed.

Patients or carers should be advised that adequate hydration should be maintained during treatment.

Patients or carers should be given advice on administration of *Fleet Phospho-soda*® oral solution.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

CAUTIONARY AND ADVISORY LABELS 10  
ELECTROLYTES: May contain Phosphate, sodium

**LAXATIVES > SELECTIVE 5-HT<sub>4</sub> RECEPTOR AGONISTS****Prucalopride**

24-Feb-2016

- **DRUG ACTION** A selective serotonin 5HT<sub>4</sub>-receptor agonist with prokinetic properties.

**● INDICATIONS AND DOSE**

**Chronic constipation when other laxatives fail to provide an adequate response**

▶ **BY MOUTH**

- ▶ Adult: 2 mg once daily, review treatment if no response after 4 weeks
- ▶ Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

- **CONTRA-INDICATIONS** Crohn's disease · intestinal obstruction · intestinal perforation · toxic megacolon · ulcerative colitis

- **CAUTIONS** History of arrhythmias · history of ischaemic heart disease

**● SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · decreased appetite · diarrhoea · dizziness · dyspepsia · fatigue · flatulence · headache · nausea · polyuria · rectal bleeding · vomiting
- ▶ **Uncommon** Fever · malaise · palpitation · tremor

**SIDE-EFFECTS, FURTHER INFORMATION**

Manufacturer advises that side-effects generally occur at the start of treatment and are usually transient.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.

- **PREGNANCY** Manufacturer advises avoid—limited data available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT** In severe impairment, manufacturer advises reduced dose of 1 mg once daily; increased if necessary to 2 mg once daily.
- **RENAL IMPAIRMENT** Manufacturer recommends a reduced dose of 1 mg daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
Manufacturer advises that dizziness and fatigue may initially affect ability to drive or operate machinery.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**  
▶ **Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211**  
Prucalopride is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.  
Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient's previous courses of laxative treatments.  
[www.nice.org.uk/TA211](http://www.nice.org.uk/TA211)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2011) that prucalopride (*Resolor*<sup>®</sup>) is not recommended for use within NHS Scotland for the symptomatic treatment of chronic constipation of women in whom laxatives fail to provide adequate relief.

- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
**Tablet**  
▶ **Resolor** (Shire Pharmaceuticals Ltd)  
**Prucalopride (as Prucalopride succinate) 1 mg** Resolor 1mg tablets | 28 tablet (PoM) £38.69 DT price = £38.69  
**Prucalopride (as Prucalopride succinate) 2 mg** Resolor 2mg tablets | 28 tablet (PoM) £59.52 DT price = £59.52

**LAXATIVES > SOFTENING LAXATIVES****Arachis oil****INDICATIONS AND DOSE****To soften impacted faeces**

- ▶ BY RECTUM
- ▶ Adult: 130 mL as required

- **CAUTIONS** Hypersensitivity to soya · intestinal obstruction
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to arachis oil or peanuts.
- **DIRECTIONS FOR ADMINISTRATION** Warm enema in warm water before use.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
**Enema**  
▶ **Arachis oil (Non-proprietary)**  
Arachis oil 1 ml per 1 ml Arachis oil 130ml enema | 1 enema (P) £37.50 DT price = £37.50

**Docusate sodium**

20-Apr-2016

**(Diocetyl sodium sulphosuccinate)****INDICATIONS AND DOSE****Chronic constipation**

- ▶ BY MOUTH
- ▶ Child 6 months-1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
- ▶ Child 2-11 years: 12.5-25 mg 3 times a day, adjusted according to response, use paediatric oral solution
- ▶ Child 12-17 years: Up to 500 mg daily in divided doses, adjusted according to response
- ▶ Adult: Up to 500 mg daily in divided doses, adjusted according to response
- ▶ BY RECTUM
- ▶ Adult: 120 mg for 1 dose

**Adjunct in abdominal radiological procedures**

- ▶ BY MOUTH
- ▶ Adult: 400 mg, to be administered with barium meal
- ▶ BY RECTUM
- ▶ Adult: 120 mg for 1 dose

**PHARMACOKINETICS**

Oral preparations act within 1-2 days; response to rectal administration usually occurs within 20 minutes.

- **UNLICENSED USE** *Adult oral solution and capsules* not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** Avoid in intestinal obstruction
- **CAUTIONS** Do not give with liquid paraffin · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · rectal preparations not indicated if haemorrhoids or anal fissure
- **SIDE-EFFECTS** Abdominal cramp · diarrhoea (excessive use) · hypokalaemia · rash
- **PREGNANCY** Not known to be harmful—manufacturer advises caution.
- **BREAST FEEDING**  
▶ With oral use Present in milk following oral administration— manufacturer advises caution.  
▶ With rectal use Rectal administration not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**  
▶ With oral use In children For administration *by mouth*, solution may be mixed with milk or squash.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- ▶ **Diocetyl** (UCB Pharma Ltd)

## Liquid paraffin

12-Apr-2016

### ● INDICATIONS AND DOSE

#### Constipation

- ▶ BY MOUTH
- ▶ Adult: 10–30 mL daily if required, to be administered at night

- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Anal irritation after prolonged use · anal seepage of paraffin after prolonged use · granulomatous reactions caused by absorption of small quantities of liquid paraffin (especially from the emulsion) · interference with the absorption of fat-soluble vitamins · lipoid pneumonia
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Liquid Paraffin Oral Emulsion, BP consists of liquid paraffin 5 mL, vanillin 5 mg, chloroform 0.025 mL, benzoic acid solution 0.2 mL, methylcellulose-20 200 mg, saccharin sodium 500 micrograms, water to 10 mL.
- **PATIENT AND CARER ADVICE** Oral emulsion should not be taken immediately before going to bed.
- **LESS SUITABLE FOR PRESCRIBING** Liquid Paraffin Oral Emulsion BP is less suitable for prescribing.

### ● MEDICINAL FORMS

Combinations available: *Liquid paraffin with magnesium hydroxide*, below

## Liquid paraffin with magnesium hydroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, liquid paraffin above, magnesium hydroxide p. 54.

### ● INDICATIONS AND DOSE

#### Constipation

- ▶ BY MOUTH
- ▶ Adult: 5–20 mL as required

- **PRESCRIBING AND DISPENSING INFORMATION** Liquid paraffin and magnesium hydroxide preparations are on sale to the public.  
When prepared extemporaneously, the BP states Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP consists of 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide.
- **LESS SUITABLE FOR PRESCRIBING** Liquid paraffin with magnesium hydroxide is less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## LAXATIVES > STIMULANT LAXATIVES

### Bisacodyl

#### ● INDICATIONS AND DOSE

##### Constipation

- ▶ BY MOUTH
- ▶ Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
- ▶ Adult: 5–10 mg once daily/increased if necessary up to 20 mg once daily, dose to be taken at night
- ▶ BY RECTUM
- ▶ Child 2–17 years: 5–10 mg once daily, adjusted according to response
- ▶ Adult: 10 mg once daily, dose to be taken in the morning

##### Bowel clearance before radiological procedures and surgery

- ▶ INITIALLY BY MOUTH
- ▶ Adult: 10 mg twice daily, does to be taken in the morning and evening on the day before procedure and (by rectum) 10 mg, to be administered 1–2 hours before procedure the following day

#### PHARMACOKINETICS

Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

- **CONTRA-INDICATIONS** Acute abdominal conditions (in children) · acute inflammatory bowel disease · acute surgical abdominal conditions (in adults) · intestinal obstruction · severe dehydration
- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · risk of electrolyte imbalance with prolonged use (in children)
- **SIDE-EFFECTS**  
**GENERAL SIDE-EFFECTS**  
Abdominal cramp · colitis · nausea · vomiting  
**SPECIFIC SIDE-EFFECTS**  
▶ With rectal use Local irritation
- **PREGNANCY** May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository, enema

#### Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25

##### ▶ Bisacodyl (Non-proprietary)

**Bisacodyl 5 mg** Bisacodyl 5mg gastro-resistant tablets | 60 tablet [P] £3.25 DT price = £1.94 | 100 tablet [P] £5.40 | 500 tablet [P] £25.73 | 1000 tablet [P] £51.45

##### ▶ Dulco-Lax (bisacodyl) (Boehringer Ingelheim Self-Medication Division)

**Bisacodyl 5 mg** Dulcolax 5mg gastro-resistant tablets | 40 tablet [P] £2.44 | 100 tablet [P] £3.60

#### Suppository

##### ▶ Bisacodyl (Non-proprietary)

**Bisacodyl 10 mg** Bisacodyl 10mg suppositories | 12 suppository [P] £3.53 DT price = £3.53

##### ▶ Dulco-Lax (bisacodyl) (Boehringer Ingelheim Self-Medication Division)

**Bisacodyl 5 mg** Dulcolax 5mg suppositories for children | 5 suppository [P] £1.04 DT price = £1.04

**Bisacodyl 10 mg** Dulcolax 10mg suppositories | 12 suppository [P] £2.35 DT price = £3.53

#### Enema

##### ▶ Bisacodyl (Non-proprietary)

**Bisacodyl 333.333 microgram per 1 ml** Fleet Bisacodyl 10mg/30ml enema | 1 enema [PoM] no price available

## Co-danthramer

### • INDICATIONS AND DOSE

#### Constipation in terminally ill patients (standard strength capsules)

- ▶ BY MOUTH USING CAPSULES
- ▶ Child 6-11 years: 1 capsule once daily, dose should be taken at night
- ▶ Child 12-17 years: 1-2 capsules once daily, dose should be taken at night
- ▶ Adult: 1-2 capsules once daily, dose should be taken at night

#### Constipation in terminally ill patients (strong capsules)

- ▶ BY MOUTH USING CAPSULES
- ▶ Child 12-17 years: 1-2 capsules once daily, dose should be given at night
- ▶ Adult: 1-2 capsules once daily, dose should be given at night

#### Constipation in terminally ill patients (standard strength suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 2-11 years: 2.5-5 mL once daily, dose should be taken at night
- ▶ Child 12-17 years: 5-10 mL once daily, dose should be taken at night
- ▶ Adult: 5-10 mL once daily, dose should be taken at night

#### Constipation in terminally ill patients (strong suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 12-17 years: 5 mL once daily, dose should be taken at night
- ▶ Adult: 5 mL once daily, dose should be taken at night

### DOSE EQUIVALENCE AND CONVERSION

- ▶ Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer '188' 200 mg per capsule.
- ▶ Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer '188' 200 mg per 5 mL.
- ▶ Co-danthramer **strong** capsules contain dantron 37.5 mg with poloxamer '188' 500 mg.
- ▶ Co-danthramer **strong** oral suspension contains dantron 75 mg with poloxamer '188' 1 g per 5 mL.
- ▶ Co-danthramer suspension 5 mL = one co-danthramer capsule, **but** strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.

- **CONTRA-INDICATIONS** Acute abdominal conditions (in children) · acute inflammatory bowel disease · acute surgical abdominal conditions (in adults) · intestinal obstruction · severe dehydration

- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation · *rodent* studies indicate potential carcinogenic risk

### CAUTIONS, FURTHER INFORMATION

- ▶ Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).

- **SIDE-EFFECTS** Abdominal cramp · urine may be coloured red
- **PREGNANCY** Manufacturers advise avoid—limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed capsule preparations identified.

#### Oral suspension

CAUTIONARY AND ADVISORY LABELS 14 (urine red)

#### ▶ Co-danthramer (Non-proprietary)

**Dantron 5 mg per 1 ml, Poloxamer 188 40 mg per 1 ml** Co-danthramer 25mg/200mg/5ml oral suspension sugar free sugar-free | 300 ml [PoM] £146.39 DT price = £146.39

**Dantron 15 mg per 1 ml, Poloxamer 188 200 mg per 1 ml** Co-danthramer 75mg/1000mg/5ml oral suspension sugar free sugar-free | 300 ml [PoM] £293.63 DT price = £293.63

## Co-danthrusate

20-Apr-2016

### • INDICATIONS AND DOSE

#### Constipation in terminally ill patients

- ▶ BY MOUTH USING CAPSULES
- ▶ Child 6-11 years: 1 capsule once daily, to be taken at night
- ▶ Child 12-17 years: 1-3 capsules once daily, to be taken at night
- ▶ Adult: 1-3 capsules once daily, to be taken at night
- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6-11 years: 5 mL once daily, to be taken at night
- ▶ Child 12-17 years: 5-15 mL once daily, to be taken at night
- ▶ Adult: 5-15 mL once daily, to be taken at night

### DOSE EQUIVALENCE AND CONVERSION

- ▶ Co-danthrusate suspension contains dantron 50 mg and docusate 60 mg per 5 mL.
- ▶ Co-danthrusate capsules contain dantron 50 mg and docusate 60 mg per capsule.

- **CONTRA-INDICATIONS** Acute abdominal conditions (in children) · acute inflammatory bowel disease · acute surgical abdominal conditions (in adults) · intestinal obstruction · severe dehydration

- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation · *rodent* studies indicate potential carcinogenic risk

### CAUTIONS, FURTHER INFORMATION

- ▶ Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).
- **SIDE-EFFECTS** Abdominal cramp · urine may be coloured red
- **PREGNANCY** Manufacturers advise avoid—limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.

**Dantron 50 mg, Docusate sodium 60 mg** Co-danthrusate 50mg/60mg capsules | 63 capsule [PoM] £52.50 DT price = £52.50

#### Oral suspension

CAUTIONARY AND ADVISORY LABELS 14 (urine red)

#### ▶ Co-danthrusate (Non-proprietary)

**Dantron 10 mg per 1 ml, Docusate sodium 12 mg per 1 ml** Co-danthrusate 50mg/60mg/5ml oral suspension sugar free sugar-free | 200 ml [PoM] £89.92 DT price = £89.92

## Glycerol

### (Glycerin)

#### ● INDICATIONS AND DOSE

##### Constipation

###### ► BY RECTUM

- Child 1-11 months: 1 g as required
- Child 1-11 years: 2 g as required
- Child 12-17 years: 4 g as required
- Adult: 4 g as required

- **DIRECTIONS FOR ADMINISTRATION** Moisten suppositories with water before insertion.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Glycerol Suppositories, BP consists of gelatin 140 mg, glycerol 700 mg, purified water to 1 g.

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Glycerin (glycerol) suppositories for constipation [www.medicinesforchildren.org.uk/glycerin-glycerol-suppositories-for-constipation](http://www.medicinesforchildren.org.uk/glycerin-glycerol-suppositories-for-constipation)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository

##### Suppository

###### ► Glycerol (Non-proprietary)

- Gelatin 140 mg per 1 gram, Glycerol 700 mg per 1 gram Glycerol 2g suppositories | 12 suppository [GSL] £1.73 DT price = £1.67
- Glycerol 1g suppositories | 12 suppository [GSL] £1.69 DT price = £1.04
- Glycerol 4g suppositories | 12 suppository [GSL] £1.39 DT price = £1.15

## Senna

13-Jun-2016

- **DRUG ACTION** Senna is a stimulant laxative. After metabolism of sennosides in the gut the anthrone component stimulates peristalsis thereby increasing the motility of the large intestine.

#### ● INDICATIONS AND DOSE

##### Constipation

###### ► BY MOUTH USING TABLETS

- Child 6-17 years: 7.5-30 mg once daily, adjusted according to response
- Adult: 7.5-15 mg daily (max. per dose 30 mg daily), dose usually taken at bedtime; initial dose should be low then gradually increased, higher doses may be prescribed under medical supervision

###### ► BY MOUTH USING SYRUP

- Child 1 month-3 years: 3.75-15 mg once daily, adjusted according to response
- Child 4-17 years: 3.75-30 mg once daily, adjusted according to response
- Adult: 7.5-15 mg once daily (max. per dose 30 mg daily), dose usually taken at bedtime, higher doses may be prescribed under medical supervision

##### PHARMACOKINETICS

Onset of action 8-12 hours.

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.

Doses in BNF adhere to national guidelines and may differ from those in product literature.

- **CONTRA-INDICATIONS** Intestinal obstruction · undiagnosed abdominal pain

- **SIDE-EFFECTS** Abdominal spasm · discoloration of urine · pruritus

#### SIDE-EFFECTS, FURTHER INFORMATION

Prolonged or excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia.

- **PREGNANCY** [EvGr] Specialist sources indicate suitable for use in pregnancy. ◊
- **BREAST FEEDING** [EvGr] Specialist sources indicate suitable for use in breast-feeding in infants over 1 month. ◊
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Senna for constipation [www.medicinesforchildren.org.uk/senna-for-constipation](http://www.medicinesforchildren.org.uk/senna-for-constipation)
- **NATIONAL FUNDING/ACCESS DECISIONS** NHS restrictions Senokot® tablets.
- **EXCEPTIONS TO LEGAL CATEGORY** Senna is on sale to the public for use in children over 12 years; doses on packs may vary from those in BNF Publications.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

###### ► Senna (Non-proprietary)

Senoside B (as Sennosides) 7.5 mg Senna 7.5mg tablets | 20 tablet [P] £0.99 | 60 tablet [P] £2.99 DT price = £2.98 | 100 tablet [P] £2.10

###### ► Ex-Lax Senna (Novartis Consumer Health UK Ltd)

Senoside B (as Sennosides) 12 mg Ex-Lax Senna 12mg pills | 20 tablet [GSL] £1.54

##### Oral solution

► Senokot (Forum Health Products Ltd, Reckitt Benckiser Healthcare (UK) Ltd)

Senoside B (as Sennosides) 1.5 mg per 1 ml Senokot 7.5mg/5ml Syrup Pharmacy sugar free sugar-free | 500 ml [P] £4.76 DT price = £3.99  
Senokot 7.5mg/5ml syrup sugar free sugar-free | 150 ml [GSL] £3.49

## Senna with ispaghula husk

24-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna above, ispaghula husk p. 50.

#### ● INDICATIONS AND DOSE

##### Constipation

###### ► BY MOUTH

- Child 12-17 years: 5-10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules
- Adult: 5-10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules

- **SIDE-EFFECTS** Urine coloured yellow or red-brown

- **PREGNANCY** Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.

- **DIRECTIONS FOR ADMINISTRATION** Take at night with at least 150 mL liquid..

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Granules

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Sucrose

###### ► Manevac (Meda Pharmaceuticals Ltd)

Senna fruit 124 mg per 1 gram, Ispaghula 542 mg per 1 gram Manevac granules | 400 gram [P] £9.50 DT price = £9.50

## Sodium picosulfate

06-May-2016

### (Sodium picosulphate)

- **DRUG ACTION** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

#### ● INDICATIONS AND DOSE

##### Constipation

- ▶ BY MOUTH
  - ▶ Child 1 month–3 years: 2.5–10 mg once daily, adjusted according to response
  - ▶ Child 4–17 years: 2.5–20 mg once daily, adjusted according to response
  - ▶ Adult: 5–10 mg once daily, dose to be taken at bedtime
- PHARMACOKINETICS**  
Onset of action 6–12 hours.

- **UNLICENSED USE** Sodium picosulfate doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

- **CONTRA-INDICATIONS** Intestinal obstruction · undiagnosed abdominal pain

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal cramp
- ▶ **Uncommon** Dizziness · nausea · vomiting
- ▶ **Frequency not known** Angioedema · pruritus · rash · syncope

#### SIDE-EFFECTS, FURTHER INFORMATION

Prolonged or excessive use can cause diarrhoea and related effects such as hypokalaemia.

- **PREGNANCY** Manufacturer states evidence limited but not known to be harmful.
- **BREAST FEEDING** [EvoGr](#) Specialist sources indicate suitable for use in breast-feeding in infants over 1 month—not known to be present in milk. [D](#)
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Sodium picosulfate for constipation [www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation](http://www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral solution

EXCIPIENTS: May contain Alcohol

##### ▶ Sodium picosulfate (Non-proprietary)

**Sodium picosulfate 1 mg per 1 ml** Sodium picosulfate 5mg/5ml oral solution sugar free sugar-free | 100 ml [P](#) £2.37 sugar-free | 300 ml [P](#) £7.10 DT price = £7.10

##### ▶ Dulco-Lax (sodium picosulfate) (Boehringer Ingelheim Self-Medication Division)

**Sodium picosulfate 1 mg per 1 ml** Dulcolax Pico 5mg/5ml liquid sugar-free | 100 ml [P](#) £1.94 sugar-free | 300 ml [P](#) £4.62 DT price = £7.10

## OPIOID RECEPTOR ANTAGONISTS

### Methylnaltrexone bromide

12-Dec-2016

- **DRUG ACTION** Methylnaltrexone bromide is a peripherally acting opioid-receptor antagonist. It therefore blocks the gastro-intestinal (constipating) effects of opioids without altering their central analgesic effects.

#### ● INDICATIONS AND DOSE

##### Opioid-induced constipation in patients with chronic pain (except palliative care patients with advanced illness)

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 12 mg once daily if required, to be given as 4–7 doses weekly

### Adjunct to other laxatives in opioid-induced constipation in advanced illness (palliative care patients)

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 38 kg): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- ▶ Adult (body-weight 38–61 kg): 8 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- ▶ Adult (body-weight 62–114 kg): 12 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- ▶ Adult (body-weight 115 kg and above): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

##### PHARMACOKINETICS

May act within 30–60 minutes.

- **CONTRA-INDICATIONS** Acute surgical abdominal conditions · gastro-intestinal obstruction
- **CAUTIONS** Diverticular disease (when active) · faecal impaction · gastro-intestinal tract lesions (known or suspected) · patients with colostomy · patients with peritoneal catheter
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · flatulence · injection site reactions · nausea · opioid withdrawal symptoms (usually mild to moderate) · vomiting
  - ▶ **Frequency not known** Gastro-intestinal perforation
- **Overdose**  
Symptoms of overdose include orthostatic hypotension.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity at high doses in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** If eGFR less than 30 mL/minute/1.73 m<sup>2</sup>, reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site.
- **PRESCRIBING AND DISPENSING INFORMATION**  
**Palliative care**  
For further information on the use of methylnaltrexone in palliative care, see [www.palliativedrugs.com/formulary/en/opioid-antagonists.html](http://www.palliativedrugs.com/formulary/en/opioid-antagonists.html).
- **HANDLING AND STORAGE** Protect from light.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

##### ▶ Relistor (Swedish Orphan Biovitrum Ltd)

**Methylnaltrexone bromide 20 mg per 1 ml** Relistor 12mg/0.6ml solution for injection vials | 1 vial [PoM](#) £21.05 | 7 vial [PoM](#) £147.35

## Naloxegol

20-Jun-2016

- **DRUG ACTION** Naloxegol is a peripherally acting opioid receptor antagonist. It therefore decreases the constipating effects of opioids without altering their central analgesic effects.

### ● INDICATIONS AND DOSE

#### Opioid-induced constipation when response to laxatives inadequate

##### ► BY MOUTH

- Adult: 25 mg once daily, to be taken in the morning

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Use a lower starting dose of 12.5 mg once daily in patients taking concomitant moderate inhibitors of CYP3A4 (such as diltiazem and verapamil), increasing to 25 mg if well tolerated.

- **CONTRA-INDICATIONS** Gastro-intestinal or peritoneum malignancy (risk of gastro-intestinal perforation) · known or suspected gastro-intestinal obstruction · patients at risk of recurrent gastro-intestinal obstruction · recurrent or advanced ovarian cancer (risk of gastro-intestinal perforation) · vascular endothelial growth factor (VEGF) inhibitor treatment (risk of gastro-intestinal perforation)

- **CAUTIONS** Alzheimer's disease (advanced) · cardiovascular disease · CNS metastases · congestive heart failure (symptomatic) · Crohn's disease · diverticulitis (active or recurrent) · multiple sclerosis (active) · peptic ulcer disease (severe) · primary brain malignancies · QT interval over 500 milliseconds · recent history of myocardial infarction (within 6 months)

### CAUTIONS, FURTHER INFORMATION

- Disruptions to blood-brain barrier Manufacturer advises caution in patients with clinically important disruptions to the blood-brain barrier (e.g. advanced Alzheimer's disease, active multiple sclerosis, primary brain malignancies)—risk of uptake into the CNS.
- Cardiovascular disorders Safety and efficacy has not been established in patients with these conditions.
- **INTERACTIONS** → Appendix 1 (naloxegol).
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain (discontinue treatment if severe or persistent) · flatulence · headache · nausea · sweating · vomiting
- **Uncommon** Opioid withdrawal syndrome (discontinue treatment)

### SIDE-EFFECTS, FURTHER INFORMATION

- Gastro-intestinal effects Manufacturer advises that gastro-intestinal side-effects typically occur shortly after initiation of treatment—consider reducing the dose.
- **PREGNANCY** Manufacturer advises avoid—limited data available but toxicity at high doses in *animal* studies; theoretical risk of opioid withdrawal in foetus.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies and theoretical risk of opioid withdrawal in breast-fed infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—safety and efficacy not established.
- **RENAL IMPAIRMENT** Manufacturer advises lower initial dose in moderate to severe impairment—initially 12.5 mg daily, increase to 25 mg if well tolerated.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets can be crushed, mixed with 120 mL of water and taken immediately if patients are unable to swallow tablets whole. The mixture may be administered via a nasogastric tube, if required.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients report severe, persistent or worsening gastro-

intestinal effects (such as abdominal pain) to their prescriber.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Naloxegol for treating opioid induced constipation (July 2015) NICE TA345

Naloxegol is recommended as a possible treatment for opioid induced constipation in patients whose response to laxatives is inadequate.

[www.nice.org.uk/TA345](http://www.nice.org.uk/TA345)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 23

- **Moventig** (Kyowa Kirin Ltd) ▼

Naloxegol (as Naloxegol oxalate) 12.5 mg Moventig 12.5mg tablets | 30 tablet [POM] £55.20 DT price = £55.20

Naloxegol (as Naloxegol oxalate) 25 mg Moventig 25mg tablets | 30 tablet [POM] £55.20 DT price = £55.20

## 3 Diarrhoea

### Acute diarrhoea

#### Management of acute diarrhoea

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. **Oral rehydration preparations** are used in the prevention or reversal of fluid and electrolyte depletion. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

#### Antimotility drugs

**Antimotility drugs** relieve symptoms of acute diarrhoea by binding to opioid receptors in the gastrointestinal tract and thereby prolonging the duration of intestinal transit. They are used in the management of uncomplicated acute diarrhoea in adults, however, are **not** recommended for acute diarrhoea in young children; fluid and electrolyte replacement are of primary importance in severe cases of acute diarrhoea and may also be necessary in cases of dehydration.

Loperamide hydrochloride p. 63 is used due to its action on opioid receptors in the gastrointestinal tract and because it does not readily cross the blood-brain barrier. Loperamide hydrochloride can also be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

Antimotility drugs have a role in Inflammatory bowel disease p. 35 and in Stoma care p. 91.

#### Antispasmodics

Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should **not** be used for primary treatment. Antispasmodics and antiemetics should be **avoided** in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

#### Antibacterial drugs

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment. Ciprofloxacin p. 514 is occasionally used for prophylaxis against travellers' diarrhoea, but routine use is **not** recommended. Lactobacillus preparations have not been shown to be effective.

**Adsorbents and bulk-forming drugs**

Adsorbents such as kaolin p. 64 are **not** recommended for *acute diarrhoeas*. Bulk-forming drugs, such as ispaghula husk p. 50, methylcellulose p. 50, and sterculia p. 51 are useful in controlling diarrhoea associated with diverticular disease.

Colestyramine p. 186 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

**Enkephalinase inhibitors**

Racecadotril p. 64 is a pro-drug of thiorphan. Thiorphan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racecadotril does not affect the duration of intestinal transit.

**Other drugs used for Diarrhoea** Codeine phosphate, p. 421

**ANTIARRHEALS > ANTIPROPULSIVES**

F 416

**Co-phenotrope****● INDICATIONS AND DOSE****Adjunct to rehydration in acute diarrhoea****▶ BY MOUTH**

- ▶ Child 4-8 years: 1 tablet 3 times a day
- ▶ Child 9-11 years: 1 tablet 4 times a day
- ▶ Child 12-15 years: 2 tablets 3 times a day
- ▶ Child 16-17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled
- ▶ Adult: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

**Control of faecal consistency after colostomy or ileostomy****▶ BY MOUTH**

- ▶ Child 4-8 years: 1 tablet 3 times a day
- ▶ Child 9-11 years: 1 tablet 4 times a day
- ▶ Child 12-15 years: 2 tablets 3 times a day
- ▶ Child 16-17 years: Initially 4 tablets, then 2 tablets 4 times a day
- ▶ Adult: Initially 4 tablets, then 2 tablets 4 times a day

- **UNLICENSED USE** Not licensed for use in children under 4 years.
- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement (in adults) · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage · young children are particularly susceptible to **overdosage**; symptoms may be delayed and observation is needed for at least 48 hours after ingestion
- **INTERACTIONS** → Appendix 1 (antimuscarinics, opioid analgesics).
- **SIDE-EFFECTS**
  - ▶ **Very rare** Angle-closure glaucoma
  - ▶ **Frequency not known** Abdominal pain · anorexia · confusion (particularly in the elderly)(in adults) · constipation · dilation of the pupils with loss of accommodation · dry mouth · dryness of the skin · fever · flushing · giddiness · nausea · photophobia · reduced bronchial secretions · transient bradycardia (followed by tachycardia, palpitation and arrhythmias) · urinary retention · urinary urgency · vomiting

- **PREGNANCY** Manufacturer advises caution.
- **BREAST FEEDING** May be present in milk.
- **HEPATIC IMPAIRMENT** Avoid in jaundice.
- **DIRECTIONS FOR ADMINISTRATION** For administration by *mouth* tablets may be crushed.
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.
- **EXCEPTIONS TO LEGAL CATEGORY** Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet****▶ Co-phenotrope (Non-proprietary)**

Atropine sulfate 25 microgram, Diphenoxylate hydrochloride 2.5 mg Lomotil 2.5mg/25microgram tablets | 100 tablet [Pm] no price available [CD5]

**Kaolin with morphine**

F 416

**● INDICATIONS AND DOSE****Acute diarrhoea****▶ BY MOUTH**

- ▶ Adult: 10 mL every 6 hours, dose to be given in water

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma
- **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale
- **SIDE-EFFECTS** Abdominal pain · agitation · amenorrhoea · anorexia · asthenia · bronchospasm · delirium · disorientation · dyspepsia · exacerbation of pancreatitis · excitation · hypertension · hypothermia · inhibition of cough reflex · malaise · muscle fasciculation · myoclonus · nystagmus · paraesthesia · paralytic ileus · raised intracranial pressure · restlessness · rhabdomyolysis · seizures · syncope · taste disturbance
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Kaolin and Morphine Mixture, BP consists of light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550-800 micrograms/10 mL.
- **LESS SUITABLE FOR PRESCRIBING** Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension) is less suitable for prescribing.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension****▶ Kaolin with morphine (Non-proprietary)**

Chloroform 5 ml per 1 litre, Kaolin light 200 mg per 1 ml, Morphine hydrochloride 91.6 microgram per 1 ml, Sodium bicarbonate 50 mg per 1 ml Kaolin and Morphine mixture | 200 ml [P] £1.50 DT price = £1.50 [CD5]

## Loperamide hydrochloride

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of acute diarrhoea

- ▶ BY MOUTH
- ▶ Child 4–7 years: 1 mg 3–4 times a day for up to 3 days only
- ▶ Child 8–11 years: 2 mg 4 times a day for up to 5 days
- ▶ Child 12–17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day
- ▶ Adult: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

#### Chronic diarrhoea

- ▶ BY MOUTH
- ▶ Adult: Initially 4–8 mg daily in divided doses, adjusted according to response; maintenance up to 16 mg daily in 2 divided doses

#### Faecal incontinence

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms daily, adjusted according to response, maximum daily dose to be given in divided doses; maximum 16 mg per day

#### Pain of bowel colic in palliative care

- ▶ BY MOUTH
- ▶ Adult: 2–4 mg 4 times a day

- **UNLICENSED USE** Not licensed for use in children for chronic diarrhoea. *Capsules* not licensed for use in children under 8 years. *Syrup* not licensed for use in children under 4 years.

- ▶ In adults Use for faecal incontinence is an unlicensed indication.

- **CONTRA-INDICATIONS** Active ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided

- **CAUTIONS** Not recommended for children under 12 years

- **INTERACTIONS** → Appendix 1 (loperamide).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · flatulence · headache · nausea
- ▶ **Uncommon** Abdominal pain · drowsiness · dry mouth · dyspepsia · rash · vomiting
- ▶ **Rare** Fatigue · hypertonia · paralytic ileus · Stevens-Johnson syndrome · toxic epidermal necrolysis · urinary retention

- **PREGNANCY** Manufacturers advise avoid—no information available.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Risk of accumulation—manufacturer advises caution.

#### ● PRESCRIBING AND DISPENSING INFORMATION

##### Palliative care

For further information on the use of loperamide in palliative care, see [www.palliativedrugs.com/formulary/en/loperamide.html](http://www.palliativedrugs.com/formulary/en/loperamide.html).

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Loperamide for diarrhoea [www.medicinesforchildren.org.uk/loperamide-for-diarrhoea](http://www.medicinesforchildren.org.uk/loperamide-for-diarrhoea)

- **EXCEPTIONS TO LEGAL CATEGORY** Loperamide can be sold to the public, for use in adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.

- ▶ In adults Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute

diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults over 18 years of age.

### ● MEDICINAL FORMS

● **INTERACTIONS** → Appendix 1 (kaolin).● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include peppermint.

When prepared extemporaneously, the BP states Kaolin Mixture, BP consists of light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.

● **LESS SUITABLE FOR PRESCRIBING** Kaolin Mixture BP is less suitable for prescribing.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines identified.

**4 Disorders of gastric acid and ulceration****4.1 Dyspepsia****Dyspepsia****Overview**

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by 'alarm features' (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in *uninvestigated dyspepsia*, treatment involves a **proton pump inhibitor** for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for *Helicobacter pylori* and given eradication therapy if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the 'test and treat' strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.

If *H. pylori* is present in patients with *functional (investigated, non-ulcer) dyspepsia*, eradication therapy should be provided. If symptoms persist, treatment with either a **proton pump inhibitor** or a **histamine H<sub>2</sub>-receptor antagonist** can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

## ANTACIDS

## Antacids

## Overview

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in *non-erosive gastro-oesophageal reflux*; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs; proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

**Aluminium- and magnesium-containing** antacids (e.g. aluminium hydroxide p. 925, magnesium carbonate p. 67, co-magaldrox p. 66 and magnesium trisilicate p. 67), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as **hydrotalcite** confer no special advantage.

Sodium bicarbonate p. 910 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

**Bismuth-containing** antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating.

**Calcium-containing** antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

## Simeticone

Simeticone (activated dimeticone) p. 68 is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

## Alginates

**Alginates** taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel ('raft') that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

## ANTACIDS &gt; ALGINATE

## Alginic acid

## ● INDICATIONS AND DOSE

## GAVISCON INFANT® POWDER SACHETS

## Management of gastro-oesophageal reflux disease

- ▶ BY MOUTH
- ▶ Child 1-23 months (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day
- ▶ Child 1-23 months (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day

- **CONTRA-INDICATIONS** Intestinal obstruction · preterm neonates · where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)

- **INTERACTIONS** → Appendix 1 (antacids).

Not to be used with other preparations containing thickening agents.

Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

- **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

- **RENAL IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium.

- **PRESCRIBING AND DISPENSING INFORMATION** Each half of the dual-sachet is identified as 'one dose'.

To avoid errors prescribe with directions in terms of 'dose'.

## ANTACIDS > ALUMINIUM AND MAGNESIUM

### Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 925, magnesium hydroxide p. 54.

#### ● INDICATIONS AND DOSE

##### **MAALOX®**

##### **Dyspepsia**

▶ BY MOUTH

- ▶ Child 14–17 years: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required
- ▶ Adult: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required

##### **MUCOGEL®**

##### **Dyspepsia**

▶ BY MOUTH

- ▶ Child 12–17 years: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required
- ▶ Adult: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required

- **PRESCRIBING AND DISPENSING INFORMATION** Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

**MUCOGEL®** Mucogel® suspension is low in sodium.

**MAALOX®** Maalox® suspension is low in sodium.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Oral suspension**

▶ **Maalox** (Sanofi)

Magnesium hydroxide 39 mg per 1 ml, Aluminium hydroxide gel dried 44 mg per 1 ml Maalox oral suspension sugar-free | 500 ml [GSL] £3.35 DT price = £2.99

▶ **Mucogel** (Chemidex Pharma Ltd)

Magnesium hydroxide 39 mg per 1 ml, Aluminium hydroxide gel dried 44 mg per 1 ml Mucogel oral suspension sugar-free | 500 ml [GSL] £2.99 DT price = £2.99

## Co-simalcite

#### ● INDICATIONS AND DOSE

##### **Dyspepsia**

▶ BY MOUTH

- ▶ Child 8–11 years: 5 mL 4 times a day as required, to be taken between meals and at bedtime
- ▶ Child 12–17 years: 10 mL 4 times a day as required, to be taken between meals and at bedtime
- ▶ Adult: 10 mL 4 times a day as required, to be taken between meals and at bedtime

- **CONTRA-INDICATIONS** Hypophosphataemia · infants · neonates

##### **CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ Aluminium-containing antacids Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.
- **INTERACTIONS** → Appendix 1 (antacids). Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

##### ● SIDE-EFFECTS

##### **SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Constipation and diarrhoea Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects.
- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.
- **RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
  - ▶ In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
  - ▶ In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
- **PRESCRIBING AND DISPENSING INFORMATION** *Altacite Plus®* is low in Na<sup>+</sup>.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Simeticone 40 mg per 1 ml** Infacol 40mg/ml oral suspension sugar-free | 50 ml (GSL) £2.71 DT price = £2.71

**Oral drops**▶ **Dentinolx Infant** (Dendron Ltd)

**Simeticone 8.4 mg per 1 ml** Dentinolx Infant colic drops | 100 ml (GSL) £1.73

Combinations available: **Simeticone with aluminium hydroxide and magnesium hydroxide**, p. 67

## 4.2 Gastric and duodenal ulceration

### Peptic ulceration

#### Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

#### *Helicobacter pylori* infection

Eradication of *Helicobacter pylori* reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The

presence of *H. pylori* should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; reinfection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 496, and either amoxicillin p. 506 or metronidazole p. 499 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate *H. pylori* in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H<sub>2</sub>-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of *H. pylori* eradication and are **not** recommended.

Tinidazole p. 501 is also used occasionally for *H. pylori* eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated *H. pylori* associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate p. 70, plus tetracycline p. 523, plus metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under *NSAID-associated ulcers* for the role of *H. pylori* eradication therapy in patients starting or taking a NSAID. Also see *Dyspepsia* p. 64 for *H. pylori* eradication in patients with dyspepsia.

#### Test for *Helicobacter pylori*

<sup>13</sup>C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of <sup>13</sup>C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific <sup>13</sup>C-urea breath test kit for children is available (*Helicobacter Test INFAI for children of the age 3–11*<sup>®</sup>). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

#### NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be **withdrawn** if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity (e.g.

Recommended regimens for *Helicobacter pylori* eradication

Acid suppressant	Antibacterial			Price for 7-day course
	Amoxicillin	Clarithromycin	Metronidazole	
Esomeprazole 20 mg twice daily	1 g twice daily	500 mg twice daily	–	£6.63
	–	250 mg twice daily	400 mg twice daily	£4.30
Lansoprazole 30 mg twice daily	1 g twice daily	500 mg twice daily	–	£5.52
	1 g twice daily	–	400 mg twice daily	£3.70
	–	250 mg twice daily	400 mg twice daily	£3.19
Omeprazole 20 mg twice daily	1 g twice daily	500 mg twice daily	–	£5.36
	500 mg 3 times a day	–	400 mg 3 times a day	£3.40
	–	250 mg twice daily	400 mg twice daily	£3.03
Pantoprazole 40 mg twice daily	1 g twice daily	500 mg twice daily	–	£5.48
	–	250 mg twice daily	400 mg twice daily	£3.15
Rabeprazole sodium 20 mg twice daily	1 g twice daily	500 mg twice daily	–	£6.04
	–	250 mg twice daily	400 mg twice daily	£3.71

cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a  $H_2$ -receptor antagonist such as ranitidine p. 72 given at twice the usual dose or misoprostol p. 73 are alternatives. Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a  $H_2$ -receptor antagonist or misoprostol. On healing, patients should be tested for *H. pylori* and given eradication therapy if *H. pylori* is present (see also Test for *Helicobacter pylori*).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

## GASTROPROTECTIVE COMPLEXES AND CHELATORS

## Chelates and complexes

## Overview

Tripotassium dicitratobismuthate p. 70 is a bismuth chelate effective in healing gastric and duodenal ulcers. See under Peptic ulceration p. 68 for the role of tripotassium dicitratobismuthate in a *Helicobacter pylori* eradication regimen for those who have not responded to first-line regimens.

The bismuth content of tripotassium dicitratobismuthate is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate below may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

## Sucralfate

## ● INDICATIONS AND DOSE

## Benign gastric ulceration | Benign duodenal ulceration

## ▶ BY MOUTH

- Child 15–17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

## Chronic gastritis

## ▶ BY MOUTH

- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

## Prophylaxis of stress ulceration in child under intensive care

## ▶ BY MOUTH

- Child 15–17 years: 1 g 6 times a day; maximum 8 g per day

continued →

**Prophylaxis of stress ulceration**

## ▶ BY MOUTH

▶ Adult: 1 g 6 times a day; maximum 8 g per day

- **UNLICENSED USE** Not licensed for use in children under 15 years. Tablets not licensed for prophylaxis of stress ulceration.
- **CAUTIONS** Patients under intensive care (**Important:** reports of bezoar formation)
  - ▶ **CAUTIONS, FURTHER INFORMATION**
  - ▶ Bezoar formation Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.
- **INTERACTIONS** → Appendix 1 (sucralfate).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation
  - ▶ **Uncommon** Back pain · bezoar formation · diarrhoea · dizziness · drowsiness · dry mouth · eadache · flatulence · gastric discomfort · indigestion · nausea · rash
- **PREGNANCY** No evidence of harm; absorption from gastro-intestinal tract negligible.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; aluminium is absorbed and may accumulate.
- **DIRECTIONS FOR ADMINISTRATION** Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by *mouth*, sucralfate should be given 1 hour before meals. *Oral suspension* blocks fine-bore feeding tubes. Crushed *tablets* may be dispersed in water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed and caramel.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 5

▶ **Sucralfate (Non-proprietary)**

Sucralfate 1 gram Sucralfate 1g tablets | 100 tablet no price available

- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** To be swallowed with half a glass of water. Twice-daily dosage to be taken 30 minutes before breakfast and main evening meal. Four-times-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal.
- **PATIENT AND CARER ADVICE** Milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal. Antacids, fruit, or fruit juice should not be taken half an hour before or after a dose. Patients and carers should be aware that the patient may develop darkened tongue and blackened faeces.
- **MEDICINAL FORMS**
  - ▶ There can be variation in the licensing of different medicines containing the same drug.
  - ▶ No licensed medicines identified.

**H<sub>2</sub>-RECEPTOR ANTAGONISTS****H<sub>2</sub>-receptor antagonists****Overview**

**Histamine H<sub>2</sub>-receptor antagonists** heal *gastric and duodenal ulcers* by reducing gastric acid output as a result of histamine H<sub>2</sub>-receptor blockade; they are also used to relieve symptoms of *gastro-oesophageal reflux disease*. H<sub>2</sub>-receptor antagonists should not normally be used for *Zollinger-Ellison syndrome* because proton pump inhibitors are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens.

In adults, H<sub>2</sub>-receptor antagonists are used for the treatment of *functional dyspepsia* and may be used for the treatment of *uninvestigated dyspepsia* without alarm features.

H<sub>2</sub>-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H<sub>2</sub>-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from *gastroduodenal erosions in hepatic coma*, and possibly in other conditions requiring intensive care. H<sub>2</sub>-receptor antagonists also reduce the risk of *acid aspiration* in obstetric patients at delivery (Mendelson's syndrome).

**Tripotassium dicitratobismuthate**● **INDICATIONS AND DOSE**

**Eradication failure of *Helicobacter pylori* infection (in combination with omeprazole, tetracycline and metronidazole)**

## ▶ BY MOUTH

▶ Adult: 120 mg 4 times a day for 2 weeks

**Benign gastric and duodenal ulceration**

## ▶ BY MOUTH

▶ Adult: 240 mg twice daily, alternatively 120 mg 4 times a day both dosage regimens taken for 28 days followed by a further 28 days if necessary, maintenance dose not indicated but course may be repeated after interval of 1 month

- **INTERACTIONS** → Appendix 1 (tripotassium dicitratobismuthate).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** May blacken faeces · may darken tongue
  - ▶ **Uncommon** Constipation · diarrhoea · nausea · pruritus · rash · vomiting
- **PREGNANCY** Manufacturer advises avoid on theoretical grounds.

**H<sub>2</sub>-receptor antagonists**

- **CAUTIONS** Signs and symptoms of gastric cancer (in adults)
  - ▶ **CAUTIONS, FURTHER INFORMATION**
  - ▶ Gastric cancer
  - ▶ In adults H<sub>2</sub>-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with 'alarm features' in such cases gastric malignancy should be ruled out before treatment.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · dizziness · headache
  - ▶ **Uncommon** Erythema multiforme · rash · toxic epidermal necrolysis
  - ▶ **Rare** Arthralgia · blood disorders · bradycardia · cholestatic jaundice · confusion · depression · hallucinations · hepatitis · leucopenia · myalgia · pancytopenia · psychiatric reactions · thrombocytopenia
  - ▶ **Frequency not known** Gynaecomastia · impotence
- ▶ **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the elderly or the very ill.

## Cimetidine

F 70

### ● INDICATIONS AND DOSE

#### Benign duodenal ulceration

##### ► BY MOUTH

- Adult: 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

#### Benign gastric ulceration

##### ► BY MOUTH

- Adult: 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

#### NSAID-associated ulceration

##### ► BY MOUTH

- Adult: 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

#### Reflux oesophagitis

##### ► BY MOUTH

- Adult: 400 mg 4 times a day for 4–8 weeks

#### Prophylaxis of stress ulceration

##### ► BY MOUTH

- Adult: 200–400 mg every 4–6 hours

#### Gastric acid reduction in obstetrics

##### ► BY MOUTH

- Adult: Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

#### Gastric acid reduction during surgical procedures

##### ► BY MOUTH

- Adult: 400 mg, to be given 90–120 minutes before induction of general anaesthesia

#### Short-bowel syndrome

##### ► BY MOUTH

- Adult: 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

#### To reduce degradation of pancreatic enzyme supplements

##### ► BY MOUTH

- Adult: 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1½ hours before meals

- **INTERACTIONS** → Appendix 1 (histamine H<sub>2</sub>-antagonists).

### ● SIDE-EFFECTS

- **Common or very common** Malaise
- **Uncommon** Tachycardia
- **Rare** Interstitial nephritis
- **Very rare** Alopecia · galactorrhoea · pancreatitis · vasculitis

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Significant amount present in milk—not known to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Reduce dose. Increased risk of confusion.

- **RENAL IMPAIRMENT** Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>. Reduce

dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>. Occasional risk of confusion.

- **EXCEPTIONS TO LEGAL CATEGORY** Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

## Ranitidine

### ● INDICATIONS AND DOSE

#### Benign gastric ulceration | Duodenal ulceration

##### ▶ BY MOUTH

- ▶ Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- ▶ Child 6 months–2 years: 2–4 mg/kg twice daily
- ▶ Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
- ▶ Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
- ▶ Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

### Chronic episodic dyspepsia

##### ▶ BY MOUTH

- ▶ Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night

### NSAID-associated gastric ulceration

##### ▶ BY MOUTH

- ▶ Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

### NSAID-associated duodenal ulcer

##### ▶ BY MOUTH

- ▶ Adult: 300 mg twice daily for 4 weeks, to achieve a higher healing rate

### Prophylaxis of NSAID-associated gastric ulcer |

### Prophylaxis of NSAID-associated duodenal ulcer

##### ▶ BY MOUTH

- ▶ Adult: 300 mg twice daily

### Gastro-oesophageal reflux disease

##### ▶ BY MOUTH

- ▶ Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

### Moderate to severe gastro-oesophageal reflux disease

##### ▶ BY MOUTH

- ▶ Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

### Long-term treatment of healed gastro-oesophageal reflux disease

##### ▶ BY MOUTH

- ▶ Adult: 150 mg twice daily

### Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics

##### ▶ BY MOUTH

- ▶ Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

### Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures

##### ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

### Prophylaxis of stress ulceration

##### ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

### Reflux oesophagitis and other conditions where gastric acid reduction is beneficial

##### ▶ BY MOUTH

- ▶ Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- ▶ Child 6 months–2 years: 2–4 mg/kg twice daily
- ▶ Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
- ▶ Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

**Conditions where reduction of gastric acidity is beneficial and oral route not available**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50 mg every 6–8 hours
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours

**● UNLICENSED USE**

- ▶ In children *Oral* preparations not licensed for use in children under 3 years.
- ▶ In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.

- **INTERACTIONS** → Appendix 1 (histamine H<sub>2</sub>-antagonists).

**● SIDE-EFFECTS**

- ▶ **Uncommon** Blurred vision
- ▶ **Frequency not known** Alopecia · interstitial nephritis · involuntary movement disorders · pancreatitis
- **PREGNANCY** Manufacturer advises avoid unless essential, but not known to be harmful.
- **BREAST FEEDING** Significant amount present in milk, but not known to be harmful.

**● RENAL IMPAIRMENT**

- ▶ In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m<sup>2</sup>.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Zantac*®), give intermittently in Glucose 5% or Sodium Chloride 0.9%.

**● PATIENT AND CARER ADVICE**

- In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.

Medicines for Children leaflet: Ranitidine for acid reflux  
[www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux](http://www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux)

- **EXCEPTIONS TO LEGAL CATEGORY** Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

**PROSTAGLANDIN ANALOGUES AND PROSTAMIDES > PROSTAGLANDINS, GASTROPROTECTIVE****Misoprostol**

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It also acts as a potent uterine stimulant.

**● INDICATIONS AND DOSE****Benign gastric ulceration | Benign duodenal ulceration | NSAID-associated ulceration****▶ BY MOUTH**

- ▶ Adult: 800 micrograms daily in 2–4 divided doses continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

**Prophylaxis of NSAID-induced gastric ulcer | Prophylaxis of duodenal ulcer****▶ BY MOUTH**

- ▶ Adult: 200 micrograms 4 times a day, reduced if not tolerated to 200 micrograms 2–3 times a day, use lower dose is less effective

- **CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) · inflammatory bowel disease

- **INTERACTIONS** → Appendix 1 (misoprostol)

**● SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea
- ▶ **Frequency not known** Abdominal pain · abnormal vaginal bleeding · dizziness · dyspepsia · flatulence · intermenstrual bleeding · menorrhagia · nausea · postmenopausal bleeding · rashes · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Diarrhoea May occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that misoprostol should not be used in women of

childbearing age unless pregnancy has been excluded. In such patients it is advised that misoprostol should only be used if the patient takes *effective contraceptive measures* and has been advised of the *risks of taking misoprostol if pregnant*.

- **PREGNANCY** Avoid—potent uterine stimulant (has been used to induce abortion). Teratogenic risk in first trimester.
- **BREAST FEEDING** Present in milk, but amount probably too small to be harmful.

## PROTON PUMP INHIBITORS

### Proton pump inhibitors

#### Overview

Proton pump inhibitors are effective short-term treatments for *gastric* and *duodenal ulcers*; they are also used in combination with antibacterials for the eradication of *Helicobacter pylori* (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of *dyspepsia* and *gastro-oesophageal reflux disease*.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in *Zollinger–Ellison syndrome*; high doses are often required.

### Proton pump inhibitors

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell.

#### IMPORTANT SAFETY INFORMATION

MHRA ADVICE: PROTON PUMP INHIBITORS (PPIS): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLÉ) have been reported in patients taking PPIs. Drug-induced SCLÉ can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- advise them to avoid exposing the skin to sunlight;
- consider SCLÉ as a possible diagnosis;
- consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops SCLÉ with a particular PPI may be at risk of the same reaction with another;

- in most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLÉ only if there are no signs of remission after a few weeks or months.

- **CAUTIONS** Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) (in adults) · may increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection) · may mask the symptoms of gastric cancer (in adults) · patients at risk of osteoporosis

#### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.
- ▶ Gastric cancer
- ▶ In adults Particular care is required in those presenting with 'alarm features', in such cases gastric malignancy should be ruled out before treatment.

#### SIDE-EFFECTS

- **Common or very common** Abdominal pain · constipation · diarrhoea · flatulence · gastro-intestinal disturbances · headache · nausea · vomiting
- ▶ **Uncommon** Arthralgia · dizziness · dry mouth · fatigue · myalgia · paraesthesia · peripheral oedema · pruritus · rash · sleep disturbances
- ▶ **Rare** Alopecia · anaphylaxis · blood disorders · bronchospasm · confusion · depression · fever · gynaecomastia · hallucinations · hepatitis · hypersensitivity reactions · hypomagnesaemia (usually after 1 year of treatment, but sometimes after 3 months of treatment) · hyponatraemia · interstitial nephritis · jaundice · leucocytosis · leucopenia · pancytopenia · photosensitivity · Stevens-Johnson syndrome · stomatitis · sweating · taste disturbance · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

Rebound acid hypersecretion and protracted dyspepsia may occur after stopping prolonged treatment with a proton pump inhibitor.

- **MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.
- **PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

above

## Esomeprazole

#### INDICATIONS AND DOSE

##### NSAID-associated gastric ulcer

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily for 4–8 weeks
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

##### Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment

- ▶ BY MOUTH
- ▶ Adult: 20 mg daily

##### Prophylaxis of NSAID-associated gastric or duodenal ulcer

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

**Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)**

## ▶ BY MOUTH

- ▶ Child 1-11 years (body-weight 10-19 kg): 10 mg once daily for 8 weeks
- ▶ Child 1-11 years (body-weight 20 kg and above): 10-20 mg once daily for 8 weeks
- ▶ Child 12-17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
- ▶ Adult: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily

## ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 40 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

**Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis)**

## ▶ BY MOUTH

- ▶ Child 1-11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
- ▶ Child 12-17 years: 20 mg once daily for up to 4 weeks
- ▶ Adult: 20 mg once daily for up to 4 weeks, then 20 mg daily if required
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg once daily continue until oral administration is possible, injection to be given over at least 3 minutes

**Zollinger-Ellison syndrome**

## ▶ BY MOUTH

- ▶ Adult: Initially 40 mg twice daily, adjusted according to response; usual dose 80-160 mg daily, daily doses above 80 mg should be given in 2 divided doses

**Severe peptic ulcer bleeding (following endoscopic treatment)**

## ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 80 mg, to be given over 30 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, then (by mouth) 40 mg once daily for 4 weeks

**Helicobacter pylori eradication in combination with clarithromycin and amoxicillin or metronidazole**

## ▶ BY MOUTH

- ▶ Adult: 20 mg twice daily

- **UNLICENSED USE** Tablets and capsules not licensed for use in children 1-11 years.

- **INTERACTIONS** → Appendix 1 (proton pump inhibitors).

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT**

- ▶ In adults In severe hepatic impairment max. 20 mg daily. Severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours.
- ▶ In children 1-11 years max. 10 mg daily in severe impairment. 12-17 years max. 20 mg daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in adults For *intravenous infusion* (Nexium®), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40-80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10-30 minutes; stable for 12 hours in Sodium Chloride 0.9%.

- ▶ With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

● **PATIENT AND CARER ADVICE**

- ▶ With oral use Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## Pantoprazole

#### ● INDICATIONS AND DOSE

***Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with clarithromycin and metronidazole**

##### ► BY MOUTH

- Adult: 40 mg twice daily

#### Benign gastric ulcer

##### ► BY MOUTH

- Adult: 40 mg daily for 8 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

continued →

**Gastric ulcer**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Duodenal ulcer**

- ▶ BY MOUTH
- ▶ Adult: 40 mg daily for 4 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment | Prophylaxis of NSAID-associated duodenal ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment**

- ▶ BY MOUTH
- ▶ Adult: 20 mg daily

**Gastro-oesophageal reflux disease**

- ▶ BY MOUTH
- ▶ Adult: 20–80 mg daily for 4 weeks, continued for further 4 weeks if not fully healed, dose to be taken in the morning; maintenance 20 mg daily and increased to 40 mg daily, increased only if symptoms return
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Zollinger-Ellison syndrome (and other hypersecretory conditions)**

- ▶ BY MOUTH
- ▶ Adult: Initially 80 mg daily (max. per dose 80 mg), adjusted according to response
- ▶ Elderly: 40 mg daily
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 80 mg, alternatively 160 mg in 2 divided doses, if rapid acid control required, then 80 mg once daily (max. per dose 80 mg), adjusted according to response

- **INTERACTIONS** → Appendix 1 (proton pump inhibitors).
- **SIDE-EFFECTS** Hyperlipidaemia · weight changes
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—fetotoxic in *animals*.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—small amount present in milk.
- **HEPATIC IMPAIRMENT** Max. 20 mg daily in severe impairment and cirrhosis. Monitor liver function in hepatic impairment (discontinue if deterioration).
- **RENAL IMPAIRMENT** Max. oral dose 40 mg daily.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Protium®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid; give 40 mg over 15 minutes.
- **EXCEPTIONS TO LEGAL CATEGORY** Pantoprazole 20 mg tablets can be sold to the public for the short-term treatment of reflux symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## 4.3 Gastro-oesophageal reflux disease

### Gastro-oesophageal reflux disease

#### Management

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For *mild symptoms* of gastro-oesophageal reflux disease, initial management may include the use of **antacids** and **alginates**. Alginate-containing antacids can form a 'raft' that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. **Histamine H<sub>2</sub>-receptor antagonists** may relieve symptoms and permit reduction in antacid consumption. However, **proton pump inhibitors** provide more effective relief of symptoms than H<sub>2</sub>-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For *severe symptoms* of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. *oesophagitis*, *oesophageal ulceration*, *oesophagopharyngeal reflux*, *Barrett's oesophagus*), initial management involves the use of a **proton pump inhibitor**; patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H<sub>2</sub>-receptor antagonist). However, for endoscopically confirmed *erosive*, *ulcerative*, or *stricturing* disease, or *Barrett's oesophagus*, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

#### Pregnancy

If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 72 can be tried. Omeprazole p. 76 is reserved for women with severe or complicated reflux disease.

#### Gastro-oesophageal reflux disease in children

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietician). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be

helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H<sub>2</sub>-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H<sub>2</sub>-receptor blockade, the proton pump inhibitor omeprazole can be tried.

#### Other drugs used for Gastro-oesophageal reflux disease

Cimetidine, p. 71 • Esomeprazole, p. 74 • Famotidine, p. 71 • Lansoprazole, p. 75 • Nizatidine, p. 72 • Pantoprazole, p. 77 • Rabeprazole sodium, p. 78

### ANTACIDS > ALGINATE

#### Sodium alginate with calcium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginate acid p. 65, sodium bicarbonate p. 910, calcium carbonate p. 919.

#### ● INDICATIONS AND DOSE

##### Mild symptoms of gastro-oesophageal reflux disease

- ▶ BY MOUTH
- ▶ Child 6–11 years: 5–10 mL, to be taken after meals and at bedtime
- ▶ Child 12–17 years: 10–20 mL, to be taken after meals and at bedtime
- ▶ Adult: 10–20 mL, to be taken after meals and at bedtime

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed or peppermint.

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Gaviscon for gastro-oesophageal reflux disease [www.medicinesforchildren.org.uk/gaviscon-gastro-oesophageal-reflux-disease](http://www.medicinesforchildren.org.uk/gaviscon-gastro-oesophageal-reflux-disease)

- ▶ **Pylobactell** (Torbet Laboratories Ltd)  
Urea [13-C] 100 mg Pylobactell breath test kit | 1 kit [PoM] £20.75

##### Powder

- ▶ **Helicobacter Test INFAI** (INFAI UK Ltd)  
Urea [13-C] 45 mg Helicobacter Test INFAI for children breath test kit sugar-free | 1 kit [PoM] £19.10  
Urea [13-C] 75 mg Helicobacter Test INFAI breath test kit sugar-free | 1 kit [PoM] £21.70

## 5 Food allergy

### Food allergy

#### Management

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as cow's milk or shellfish should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. Sodium cromoglicate p. 253 may be helpful as an adjunct to dietary avoidance.

**Other drugs used for Food allergy** Chlorphenamine maleate, p. 266

## 6 Gastro-intestinal smooth muscle spasm

### Antispasmodics

#### Antimuscarinics

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome*.

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They can be used for the management of *irritable bowel syndrome*.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1022 and dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 81 and hyoscine butylbromide p. 81. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood-brain barrier;

they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other indications for antimuscarinic drugs include arrhythmias, asthma and airways disease, motion sickness, parkinsonism, urinary incontinence, mydriasis and cycloplegia, premedication, and as an antidote to organophosphorus poisoning.

#### Other antispasmodics

Alverine citrate p. 82, mebeverine hydrochloride p. 82, and peppermint oil p. 43 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

### ANTIMUSCARINICS

F 711

#### Dicycloverine hydrochloride (Dicyclomine hydrochloride)

##### ● INDICATIONS AND DOSE

##### Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Child 6-23 months: 5-10 mg 3-4 times a day, dose to be taken 15 minutes before feeds
- ▶ Child 2-11 years: 10 mg 3 times a day
- ▶ Child 12-17 years: 10-20 mg 3 times a day
- ▶ Adult: 10-20 mg 3 times a day

- **CONTRA-INDICATIONS** Child under 6 months
- **PREGNANCY** Not known to be harmful; manufacturer advises use only if essential.
- **BREAST FEEDING** Avoid—present in milk; apnoea reported in infant.
- **EXCEPTIONS TO LEGAL CATEGORY** Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Dicycloverine hydrochloride (Non-proprietary)**  
Dicycloverine hydrochloride 10 mg Dicycloverine 10mg tablets | 100 tablet [PoM] £201.22 DT price = £184.25  
Dicycloverine hydrochloride 20 mg Dicycloverine 20mg tablets | 84 tablet [PoM] £203.42 DT price = £196.69

##### Oral solution

- ▶ **Dicycloverine hydrochloride (Non-proprietary)**  
Dicycloverine hydrochloride 2 mg per 1 ml Dicycloverine 10mg/5ml oral solution | 100 ml [PoM] no price available | 120 ml [PoM] £196.36 DT price = £183.27 | 300 ml [PoM] no price available

## Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride p. 80, aluminium hydroxide p. 925, simeticone p. 68.

### ● INDICATIONS AND DOSE

#### Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Child 12-17 years: 10–20 mL every 4 hours as required
- ▶ Adult: 10–20 mL every 4 hours as required

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Oral suspension

- ▶ **Kolanticon** (Peckforton Pharmaceuticals Ltd)  
Aluminium hydroxide dried 40 mg per 1 ml, Dicycloverine hydrochloride 500 microgram per 1 ml, Simeticone 4 mg per 1 ml, Magnesium oxide light 20 mg per 1 ml. Kolanticon gel sugar-free | 200 ml [P] £4.00 sugar-free | 500 ml [P] £6.00

F 711

## Hyoscine butylbromide

17-Oct-2016

### ● INDICATIONS AND DOSE

#### Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Child 6-11 years: 10 mg 3 times a day
- ▶ Child 12-17 years: 20 mg 4 times a day
- ▶ Adult: 20 mg 4 times a day

#### Irritable bowel syndrome

- ▶ BY MOUTH
- ▶ Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day

#### Acute spasm | Spasm in diagnostic procedures

- ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day

#### Excessive respiratory secretions in palliative care

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 2-4 years: 5 mg 3–4 times a day
- ▶ Child 5-11 years: 10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 5-11 years: 5–10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 20–120 mg/24 hours

#### Bowel colic (in palliative care)

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 2-4 years: 5 mg 3–4 times a day

- ▶ Child 5-11 years: 10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 5-11 years: 5–10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 60–300 mg/24 hours

### PHARMACOKINETICS

Administration by mouth is associated with poor absorption.

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. *Injection* not licensed for use in children (age range not specified by manufacturer).
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Amount too small to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use in children For administration by *mouth*, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
  - ▶ With intravenous use in children For *intravenous injection*, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care

For further information on the use of hyoscine butylbromide in palliative care, see [www.palliativedrugs.com/formulary/en/bnf-1-2.html](http://www.palliativedrugs.com/formulary/en/bnf-1-2.html).
- **EXCEPTIONS TO LEGAL CATEGORY** Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Alverine citrate 120 mg** Spasmonal Forte 120mg capsules | 60 capsule [P] £19.42 DT price = £23.28

## Mebeverine hydrochloride

#### INDICATIONS AND DOSE

**Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm**

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 10-17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals
- ▶ Adult: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

#### Irritable bowel syndrome

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 200 mg twice daily
- ▶ Adult: 200 mg twice daily

- **UNLICENSED USE** *Tablets and liquid* not licensed for use in children under 10 years. *Granules* not licensed for use in children under 12 years. *Modified-release capsules* not licensed for use in children under 18 years.
- **CONTRA-INDICATIONS** Paralytic ileus
- **SIDE-EFFECTS** Allergic reactions · angioedema · rash · urticaria
- **PREGNANCY** Not known to be harmful—manufacturers advise avoid.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Mebeverine for intestinal spasm [www.medicinesforchildren.org.uk/mebeverine-for-intestinal-spasms](http://www.medicinesforchildren.org.uk/mebeverine-for-intestinal-spasms)  
Patients or carers should be given advice on the timing of administration of mebeverine hydrochloride tablets and oral suspension.
- **EXCEPTIONS TO LEGAL CATEGORY**  
▶ In adults Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ Mebeverine hydrochloride (Non-proprietary)

**Mebeverine hydrochloride 135 mg** Mebeverine 135mg tablets | 100 tablet [PoM] £20.00 DT price = £7.02

##### ▶ Colofac (BGP Products Ltd)

**Mebeverine hydrochloride 135 mg** Colofac 135mg tablets | 100 tablet [PoM] £9.02 DT price = £7.02

#### Modified-release capsule

##### ▶ Colofac MR (BGP Products Ltd)

**Mebeverine hydrochloride 200 mg** Colofac MR 200mg capsules | 60 capsule [PoM] £6.92 DT price = £6.92

#### Oral suspension

##### ▶ Mebeverine hydrochloride (Non-proprietary)

**Mebeverine hydrochloride (as Mebeverine pamoate) 10 mg per 1 ml** Mebeverine 50mg/5ml oral suspension sugar free sugar-free | 300 ml [PoM] £163.43-£187.00 DT price = £163.43

## 7 Liver disorders and related conditions

### 7.1 Biliary disorders

#### Biliary disorders

##### Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid ursodeoxycholic acid p. 84 in gallstone disease. Ursodeoxycholic acid is suitable for patients with unpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment.

Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain.

Cholic acid p. 84 may be used to improve the flow of bile in those with inborn errors of primary bile acid synthesis.

A **terpene** mixture (*Rowachol*<sup>®</sup>) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.

##### Bile acid sequestrants

Colestyramine p. 186 is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine.

#### Exocrine pancreatic insufficiency

14-Dec-2016

##### Description of condition

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum.

The main clinical manifestations are maldigestion and malnutrition, associated with low circulating levels of micronutrients, fat-soluble vitamins and lipoproteins. Patients also present with gastro-intestinal symptoms such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from chronic pancreatitis, cystic fibrosis, obstructive pancreatic tumours, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.

##### Aims of treatment

The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

##### Drug treatment

Pancreatic enzyme replacement therapy with pancreatin p. 90 is the mainstay of treatment for exocrine pancreatic insufficiency.

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and utilised by the body. [EvGr](#) Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of maldigestion and malabsorption. [A](#)

Fibrosing colonopathy has been reported in patients with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10 000 units/kg/day of

lipase). Possible risk factors are gender (in children, boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of *Pancrease HL*<sup>®</sup> and *Nutrizym 22*<sup>®</sup> recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10 000 units/kg/day of lipase. Manufacturers of pancreatin recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. [EvGr](#) Acid-suppressing drugs (proton pump inhibitors or H<sub>2</sub>-receptor antagonists) may be trialled in patients who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation advised whenever necessary. [A](#)

Pancreatin preparations			
Preparation	Protease units	Amylase units	Lipase units
Creon <sup>®</sup> 10 000 capsule, e/c granules	600	8000	10 000
Creon <sup>®</sup> Micro e/c granules (per 100 mg)	200	3600	5000
Pancrex <sup>®</sup> granules (per gram)	300	4000	5000
Pancrex V <sup>®</sup> capsule, powder	430	9000	8000
Pancrex V '125' <sup>®</sup> capsule, powder	160	3300	2950

Higher-strength pancreatin preparations			
Preparation	Protease units	Amylase units	Lipase units
Creon <sup>®</sup> 25 000 capsule, e/c pellets	1000	18000	25 000
Creon <sup>®</sup> 40000 capsule, e/c granules	1600	25 000	40 000
Nutrizym 22 <sup>®</sup> capsule, e/c minitables	1100	19 800	22 000
Pancrease HL <sup>®</sup> capsule, e/c minitables	1250	22 500	25 000

##### Non-drug treatment

[EvGr](#) Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended. [A](#)

Medium-chain triglycerides (see MCT oil, in *Borderline substances*), which are directly absorbed by the intestinal mucosa, were thought to be useful in some patients. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

## BILE ACIDS

## Cholic acid

21-Mar-2016

- **DRUG ACTION** Cholic acid is the predominant primary bile acid in humans, which can be used to provide a source of bile acid in patients with inborn deficiencies in bile acid synthesis.

● **INDICATIONS AND DOSE****Inborn errors of primary bile acid synthesis (initiated by a specialist)**▶ **BY MOUTH**

- ▶ **Adult:** Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

- **INTERACTIONS** → Appendix 1 (bile acids).
- **SIDE-EFFECTS** Diarrhoea · gallstones (long term use) · pruritus
- SIDE-EFFECTS, FURTHER INFORMATION**  
Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.
- **PREGNANCY** Limited data available—not known to be harmful, manufacturer advises continue treatment.  
Manufacturer advises monitor patient parameters more frequently in pregnancy.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor closely.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Counselling advised on administration.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

## Ursodeoxycholic acid

● **INDICATIONS AND DOSE****Dissolution of gallstones**▶ **BY MOUTH**

- ▶ **Adult:** 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

**Primary biliary cirrhosis**▶ **BY MOUTH**

- ▶ **Adult:** 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Acute inflammation of the gall bladder · frequent episodes of biliary colic · inflammatory diseases and other conditions of the colon, liver or small intestine which interfere with enterohepatic circulation of bile salts · non-functioning gall bladder · radio-opaque stones
- **CAUTIONS** Liver disease
- **INTERACTIONS** → Appendix 1 (bile acids).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea
  - ▶ **Very rare** Abdominal pain · gallstone calcification · urticaria
  - ▶ **Frequency not known** Nausea · pruritus · vomiting
- **PREGNANCY** No evidence of harm but manufacturer advises avoid.
- **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in chronic liver disease (but used in primary biliary cirrhosis).
- **MONITORING REQUIREMENTS** In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.
- **PATIENT AND CARER ADVICE** Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

Terlipressin acetate 1 mg Variquel 1mg powder and solvent for solution for injection vials | 5 vial [PoM] £89.48

## 8 Obesity

## Obesity

01-Jun-2016

## Description of condition

Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, fatty liver disease, gallstones, and gastro-oesophageal reflux disease. It is also linked to psychological and psychiatric morbidities.

In adults, obesity is generally classified as a body mass index (BMI) of  $\geq 30 \text{ kg/m}^2$ , though BMI should be interpreted with caution as it is not a direct measure of adiposity, particularly in patients who are very muscular or have muscle weakness or atrophy.

Waist circumference should also be considered as it may provide an indication of total body fat and a risk of obesity-related health problems. Men with a waist circumference  $\geq 94 \text{ cm}$  ( $\geq 90 \text{ cm}$  for Asian men), and women with a waist circumference of  $\geq 80 \text{ cm}$  are at increased risk of obesity-related health problems. A waist circumference of  $\geq 102 \text{ cm}$  in men and  $\geq 88 \text{ cm}$  in women indicates a very high risk of obesity-related health problems.

## Aims of treatment

Management should be aimed at modest, sustainable weight loss and maintenance of a healthy weight, to reduce the risk factors associated with obesity.

## Overview

[EvGr] Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity. Patients should be monitored for changes in weight,

as well as changes in blood pressure and blood lipids, and for other associated conditions.  $\blacktriangle$

**EvGr** An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), lithium carbonate, lithium citrate, sodium valproate, sulphonylureas, thiazolidinediones, and tricyclic antidepressants.  $\blacktriangle$

### Lifestyle changes

**EvGr** Patients should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity, and improve diet and eating behaviour.  $\blacktriangle$

### Drug treatment

**EvGr** Drug treatment should **never** be used as the sole element of treatment and should be used as part of an overall weight management plan. An anti-obesity drug should be considered only for those with a BMI of  $\geq 30 \text{ kg/m}^2$ , in whom diet, exercise and behaviour changes fail to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of  $\geq 28 \text{ kg/m}^2$ . A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for vulnerable groups such as in the elderly and younger patients.

The effect of management should be monitored on a regular basis with reinforcement of supporting lifestyle advice. Rates of weight loss may be slower in patients with type 2 diabetes, so less strict goals than in those without diabetes may be appropriate.

Orlistat below, is the only drug currently available in the UK that is recommended specifically for the management of obesity; it acts by reducing the absorption of dietary fat.

Orlistat is licensed for use as an adjunct in the management of obesity in patients with a BMI of  $\geq 30 \text{ kg/m}^2$ , or, in individuals with a BMI of  $\geq 28 \text{ kg/m}^2$  in the presence of other risk factors. Treatment with orlistat may also be used to maintain weight loss rather than to continue to lose weight. Discontinuation of treatment with orlistat should be considered after 12 weeks if weight loss has not exceeded 5% since the start of treatment.  $\blacktriangle$

Drugs which produce a feeling of satiety (such as methylcellulose p. 50 and sterculia p. 51 [unlicensed indications]) have been used in an attempt to control appetite, but there is little evidence for their efficacy. Various centrally acting appetite suppressants, including stimulants and serotonergic drugs (such as dexfenfluramine, fenfluramine, sibutramine, and rimonabant), have been used in the management of obesity but have been withdrawn or are no longer recommended due to serious safety concerns or their addictive potential.

### Surgery

**EvGr** Bariatric surgery may be considered for patients who have a BMI of  $\geq 40 \text{ kg/m}^2$  (Obesity III, morbid obesity), or between 35–39.9  $\text{kg/m}^2$  (Obesity II) and a significant disease (such as type 2 diabetes or high blood pressure) which could be improved with weight loss, and if all appropriate non-surgical measures have been tried but clinically beneficial weight loss has not been achieved or maintained.  $\blacktriangle$

### Useful Resources

Obesity: identification, assessment and management. Clinical Guideline 189. National Institute for Health and Care Excellence. November 2014.  
[www.nice.org.uk/guidance/cg189](http://www.nice.org.uk/guidance/cg189)

## PERIPHERALLY ACTING ANTI-OBESITY DRUGS > LIPASE INHIBITORS

### Orlistat

● **DRUG ACTION** Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

#### ● INDICATIONS AND DOSE

**Adjunct in obesity (in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30  $\text{kg/m}^2$  or more or in individuals with a BMI of 28  $\text{kg/m}^2$  or more in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia)**

► BY MOUTH

► Adult: 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes), if a meal is missed or contains no fat, the dose of orlistat should be omitted

● **CONTRA-INDICATIONS** Cholestasis · chronic malabsorption syndrome

● **CAUTIONS** Chronic kidney disease · may impair absorption of fat-soluble vitamins · volume depletion

#### CAUTIONS, FURTHER INFORMATION

Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

● **INTERACTIONS** → Appendix 1 (orlistat).

► **Multivitamins** If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime.

#### ● SIDE-EFFECTS

► **Common or very common** Abdominal distension (gastro-intestinal effects minimised by reduced fat intake) · abdominal pain (gastro-intestinal effects minimised by reduced fat intake) · anxiety · faecal incontinence · faecal urgency · flatulence · gingival disorders · headache · hypoglycaemia · liquid stools · malaise · menstrual disturbances · oily leakage from rectum · oily stools · respiratory infections · tooth disorders · urinary tract infection

► **Frequency not known** Bullous eruptions · cholelithiasis · diverticulitis · hepatitis · hypothyroidism · oxalate nephropathy · rectal bleeding

● **PREGNANCY** Use with caution.

● **BREAST FEEDING** Avoid—no information available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

► **Orlistat (Non-proprietary)**

DT price = £18.44

## 9 Rectal and anal disorders

### Rectal and anal disorders

#### Overview

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories. These conditions occur commonly in patients suffering from haemorrhoids, fistulas, and proctitis. Cleansing with attention to any minor faecal soiling, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulfasalazine p. 39.

When necessary, topical preparations containing **local anaesthetics** or **corticosteroids** are used, provided perianal thrush has been excluded. Perianal thrush is treated with a topical antifungal preparation.

For the management of other anal disorders, see also Anal fissure below.

#### Soothing haemorrhoidal preparations

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

**Local anaesthetics**, such as lidocaine hydrochloride, are used to relieve pain associated with *haemorrhoids* and *pruritus ani* but good evidence is lacking. Alternative local anaesthetics include tetracaine, cinchocaine (dibucaine), and pramoxine (pramoxine), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be **avoided**, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

#### Compound haemorrhoidal preparations with corticosteroids

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin.

#### Rectal sclerosants

**Oily phenol injection** is used to inject haemorrhoids particularly when unprolapsed.

#### Rectal and anal disorders in children

Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child's fear of defaecation.

## 9.1 Anal fissures

### Anal fissure

31-Aug-2016

#### Description of condition

An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defaecation, and a linear split in the anal mucosa.

### Drug treatment

#### Acute anal fissure

**EvGr** Initial management of acute anal fissures (present for less than 6 weeks) should focus on ensuring that stools are soft and easily passed. Bulk-forming laxatives (such as ispaghula husk p. 50) are recommended and an osmotic laxative (such as lactulose p. 52) can be considered as an alternative—see also Constipation p. 48, for further information about these laxatives. Short-term use of a topical preparation containing a local anaesthetic (such as lidocaine hydrochloride) or a simple analgesic (such as paracetamol p. 414 or ibuprofen p. 999) may be offered for prolonged burning pain following defecation. If these measures are inadequate, the patient should be referred for specialist treatment in hospital. **A**

#### Chronic anal fissure

**EvGr** Chronic anal fissures (present for 6 weeks or longer), and associated pain, may be treated with glyceryl trinitrate rectal ointment 0.4% or 0.2% [unlicensed] p. 207 (available from Special-order manufacturers p. 1422 or specialist importing companies). Limited evidence suggests that the strength used does not influence the effectiveness, but that the higher strength potentially increases the incidence of side-effects. Healing rates with topical glyceryl trinitrate are marginally superior to placebo, but the incidence of headache as an adverse effect is quite high (about 20-30% of patients). Recurrence of the fissure after treatment is common.

As an alternative to glyceryl trinitrate rectal ointment, chronic anal fissure may also be treated with topical diltiazem hydrochloride 2% [unlicensed] or nifedipine 0.2-0.5% [unlicensed] (available from Special-order manufacturers p. 1422 or specialist importing companies), which have a lower incidence of adverse effects than topical glyceryl trinitrate. Oral nifedipine [unlicensed indication] and oral diltiazem hydrochloride [unlicensed indication] may be as effective as topical treatment, but the incidence of adverse effects are likely to be higher and topical preparations are preferred.

Patients who do not respond to first-line treatment may be referred to a specialist for local injection of botulinum toxin type A [unlicensed indication]. **A**

#### Non-drug treatment

**EvGr** Surgery is an effective option for the management of chronic anal fissure in adults but is generally reserved for those who do not respond to drug treatment. **A**

## 9.2 Haemorrhoids

### CORTICOSTEROIDS

#### Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

##### ● INDICATIONS AND DOSE

##### Haemorrhoids | Pruritus ani

##### ► BY RECTUM USING OINTMENT

- Adult: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose should be applied after a bowel movement

##### ► BY RECTUM USING SUPPOSITORIES

- Adult: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) .

local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

- **PRESCRIBING AND DISPENSING INFORMATION** A proprietary brand *Anusol Plus HC*<sup>®</sup> (ointment and suppositories) is on sale to the public.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suppository

- ▶ **Anusol-Hc** (McNeil Products Ltd)

Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg Anusol HC suppositories | 12 suppository [PoM](#) £1.74

Anusol Plus HC suppositories | 12 suppository [P](#) £3.03

##### Ointment

- ▶ **Anusol-Hc** (McNeil Products Ltd)

Hydrocortisone acetate 2.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Benzyl benzoate 12.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram Anusol Plus HC ointment | 15 gram [P](#) £3.03

Anusol HC ointment | 30 gram [PoM](#) £2.49

## Benzyl benzoate with bismuth oxide, hydrocortisone acetate, peru balsam, pramocaine hydrochloride and zinc oxide

#### ● INDICATIONS AND DOSE

##### Haemorrhoids | Pruritus ani

- ▶ BY RECTUM

▶ Adult: Apply twice daily for no longer than 7 days, to be applied morning and night and after a bowel movement

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Cream

- ▶ **Anugesic-Hc** (Pfizer Ltd)

Hydrocortisone acetate 5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram, Benzyl benzoate 12 mg per 1 gram, Peru Balsam 18.5 mg per 1 gram, Zinc oxide 123.5 mg per 1 gram Anugesic HC cream | 30 gram [PoM](#) £3.71

## Cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate

#### ● INDICATIONS AND DOSE

##### Haemorrhoids | Pruritus ani

- ▶ BY RECTUM USING OINTMENT

▶ Adult: Apply twice daily for 5–7 days, apply 3–4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared

- ▶ BY RECTUM USING SUPPOSITORIES

▶ Adult: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

#### Haemorrhoids (severe cases) | Pruritus ani (severe cases)

- ▶ BY RECTUM USING SUPPOSITORIES

▶ Adult: Initially 1 suppository 2–3 times a day for 5–7 days, then 1 suppository once daily on alternate days for 1 week

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suppository

- ▶ **Ultraproct** (Meadow Laboratories Ltd)

Cinchocaine hydrochloride 1 mg, Fluocortolone pivalate 610 microgram, Fluocortolone caproate 630 microgram Ultraproct suppositories | 12 suppository [PoM](#) £4.06

##### Ointment

- ▶ **Ultraproct** (Meadow Laboratories Ltd)

Cinchocaine hydrochloride 5 mg per 1 gram, Fluocortolone pivalate 920 microgram per 1 gram, Fluocortolone caproate 950 microgram per 1 gram Ultraproct ointment | 30 gram [PoM](#) £8.27

## Cinchocaine with hydrocortisone

#### ● INDICATIONS AND DOSE

##### PROCTOSEDYL<sup>®</sup> OINTMENT

##### Haemorrhoids | Pruritus ani

- ▶ TO THE SKIN, OR BY RECTUM

▶ Child: Apply twice daily, to be administered morning and night and after a bowel movement. Apply externally or by rectum. Do not use for longer than 7 days

▶ Adult: Apply twice daily, to be administered morning and night and after a bowel movement. Apply externally or by rectum. Do not use for longer than 7 days

##### PROCTOSEDYL<sup>®</sup> SUPPOSITORIES

##### Haemorrhoids | Pruritus ani

- ▶ BY RECTUM

▶ Child 12–17 years: 1 suppository, insert suppository night and morning and after a bowel movement. Do not use for longer than 7 days

▶ Adult: 1 suppository, insert suppository night and morning and after a bowel movement. Do not use for longer than 7 days

##### UNIROID-HC<sup>®</sup> OINTMENT

##### Haemorrhoids | Pruritus ani

- ▶ TO THE SKIN, OR BY RECTUM

▶ Child 12–17 years: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

▶ Adult: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

##### UNIROID-HC<sup>®</sup> SUPPOSITORIES

##### Haemorrhoids | Pruritus ani

- ▶ BY RECTUM

▶ Child 12–17 years: 1 suppository, insert twice daily and after a bowel movement. Do not use for longer than 7 days

▶ Adult: 1 suppository, insert twice daily and after a bowel movement. Do not use for longer than 7 days

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) · local anaesthetic

component may cause sensitisation (use for short periods only—no longer than a few days)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suppository

###### ▶ Proctosedyl (Sanofi)

Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg Proctosedyl suppositories | 12 suppository [PoM] £5.08

###### ▶ Uniroid HC (Chemidex Pharma Ltd)

Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg Uniroid HC suppositories | 12 suppository [PoM] £1.91

##### Ointment

###### ▶ Proctosedyl (Sanofi)

Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Proctosedyl ointment | 30 gram [PoM] £10.34

###### ▶ Uniroid HC (Chemidex Pharma Ltd)

Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Uniroid HC ointment | 30 gram [PoM] £4.23

## Cinchocaine with prednisolone

#### ● INDICATIONS AND DOSE

##### Haemorrhoids | Pruritus ani

###### ▶ BY RECTUM USING OINTMENT

▶ Adult: Apply twice daily for 5–7 days, apply 3–4 times a day on the first day if necessary, then apply once daily for a few days after symptoms have cleared

###### ▶ BY RECTUM USING SUPPOSITORIES

▶ Adult: 1 suppository daily for 5–7 days, to be inserted after a bowel movement

##### Haemorrhoids (severe cases) | Pruritus ani (severe cases)

###### ▶ BY RECTUM USING SUPPOSITORIES

▶ Adult: Initially 1 suppository 2–3 times a day, then 1 suppository daily for a total of 5–7 days, to be inserted after a bowel movement

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Suppository

###### ▶ Scheriproct (Bayer Plc)

Cinchocaine hydrochloride 1 mg, Prednisolone hexanoate 1.3 mg Scheriproct suppositories | 12 suppository [PoM] £1.38 DT price = £1.38

##### Ointment

###### ▶ Scheriproct (Bayer Plc)

Prednisolone hexanoate 1.9 mg per 1 gram, Cinchocaine hydrochloride 5 mg per 1 gram Scheriproct ointment | 30 gram [PoM] £2.94 DT price = £2.94

## Hydrocortisone with lidocaine

#### ● INDICATIONS AND DOSE

##### Haemorrhoids | Pruritus ani

###### ▶ BY RECTUM USING AEROSOL SPRAY

▶ Adult: 1 spray up to 3 times a day for no longer than 7 days without medical advice, spray once over the affected area

###### ▶ BY RECTUM USING OINTMENT

▶ Adult: Apply several times daily, for short term use only

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Ointment

###### ▶ Hydrocortisone with lidocaine (Non-proprietary)

Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram Lidocaine 5% / Hydrocortisone acetate 0.275% ointment | 20 gram [PoM] no price available DT price = £4.19

###### ▶ Xyloproct (AstraZeneca UK Ltd)

Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram Xyloproct 5%/0.275% ointment | 20 gram [PoM] £4.19 DT price = £4.19

##### Spray

###### ▶ Germoloids HC (Bayer Plc)

Hydrocortisone 2 mg per 1 gram, Lidocaine hydrochloride 10 mg per 1 gram Germoloids HC spray | 30 ml [GSL] £5.20

###### ▶ Perinal (Dermal Laboratories Ltd)

Hydrocortisone 2 mg per 1 gram, Lidocaine hydrochloride 10 mg per 1 gram Perinal spray | 30 ml [P] £6.11

## Hydrocortisone with pramocaine

#### ● INDICATIONS AND DOSE

##### Haemorrhoids | Proctitis

###### ▶ BY RECTUM

▶ Adult: 1 applicatorful 2–3 times a day and

1 applicatorful, after a bowel movement, do not use for longer than 7 days; maximum 4 applicatorfuls per day

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Foam

###### ▶ Proctofoam HC (Meda Pharmaceuticals Ltd)

Hydrocortisone acetate 10 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram Proctofoam HC foam enema | 40 dose [PoM] £6.07 DT price = £6.07

## SCLEROSANTS

### Phenol

#### ● INDICATIONS AND DOSE

##### Haemorrhoids (particularly when unprolapsed)

###### ▶ BY SUBMUCOSAL INJECTION

▶ Adult: 2–3 mL, dose (using phenol 5%) to be injected into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time

- **SIDE-EFFECTS** Irritation · tissue necrosis
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Oily Phenol Injection, BP consists of phenol 5% in a suitable fixed oil.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

##### Solution for injection

###### ▶ Phenol (Non-proprietary)

Phenol 50 mg per 1 ml Oily phenol 5% solution for injection 5ml ampoules | 10 ampoule [PoM] £55.34

Oily phenol 5% solution for injection 2ml ampoules | 10 ampoule [PoM] £38.03

## 10 Reduced exocrine secretions

### PANCREATIC ENZYMES

#### Pancreatin

- **DRUG ACTION** Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

#### ● INDICATIONS AND DOSE

##### CREON® 10000

###### Pancreatic insufficiency

###### ► BY MOUTH

- Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

##### CREON® 25000

###### Pancreatic insufficiency

###### ► BY MOUTH

- Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

##### CREON® 40000

###### Pancreatic insufficiency

###### ► BY MOUTH

- Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

##### CREON® MICRO

###### Pancreatic insufficiency

###### ► BY MOUTH

- Child: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing
- Adult: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing

#### DOSE EQUIVALENCE AND CONVERSION

- For *Creon® Micro*: 100 mg granules = one measured scoopful (scoop supplied with product).

#### NUTRIZYM 22® GASTRO-RESISTANT CAPSULES

##### Pancreatic insufficiency

###### ► BY MOUTH

- Adult: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing)

##### PANCREASE HL®

##### Pancreatic insufficiency

###### ► BY MOUTH

- Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

##### PANCREX®

##### Pancreatic insufficiency

###### ► BY MOUTH

- Child 2-17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water
- Adult: 5–10 g, to be taken just before meals, washed down or mixed with milk or water

##### PANCREX® V

##### Pancreatic insufficiency

###### ► BY MOUTH

- Child 1-11 months: 1–2 capsules, contents of capsule to be mixed with feeds
- Child 1-17 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food
- Adult: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

##### PANCREX® V POWDER

##### Pancreatic insufficiency

###### ► BY MOUTH

- Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water
- Adult: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

##### PANCREX® V TABLETS

##### Pancreatic insufficiency

###### ► BY MOUTH

- Child 2-17 years: 5–15 tablets, to be taken before meals
- Adult: 5–15 tablets, to be taken before meals

##### PANCREX® V TABLETS FORTE

##### Pancreatic insufficiency

###### ► BY MOUTH

- Child 2-17 years: 6–10 tablets, to be taken before meals
- Adult: 6–10 tablets, to be taken before meals

#### ● CONTRA-INDICATIONS

**PANCREASE HL®** Should not be used in children aged 15 years or less with cystic fibrosis

**NUTRIZYM 22® GASTRO-RESISTANT CAPSULES** Should not be used in children aged 15 years or less with cystic fibrosis

- **CAUTIONS** Can irritate the perioral skin and buccal mucosa if retained in the mouth · excessive doses can cause perianal irritation
- **INTERACTIONS** → Appendix 1 (pancreatin).
- **SIDE-EFFECTS** Abdominal discomfort · hyperuricaemia (associated with very high doses) · hyperuricosuria (associated with very high doses) · mucosal irritation · nausea · skin irritation · vomiting

- **PREGNANCY** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour. Gastro-resistant granules should be mixed with milk, slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Any left-over food or liquid containing pancreatin should be discarded. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food).
- In adults Gastric acid secretion may be reduced by giving cimetidine or ranitidine an hour beforehand. Concurrent use of antacids also reduces gastric acidity.
- In children In children with cystic fibrosis with persistent fat malabsorption despite optimal use of enzyme replacement, an H<sub>2</sub>-receptor antagonist or a proton pump inhibitor may improve fat digestion and absorption.
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations may contain pork pancreatin—consult product literature.
- **HANDLING AND STORAGE** Hypersensitivity reactions occur occasionally and may affect those handling the powder.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Pancreatin for pancreatic insufficiency [www.medicinesforchildren.org.uk/pancreatin-for-pancreatic-inefficiency](http://www.medicinesforchildren.org.uk/pancreatin-for-pancreatic-inefficiency)  
Patients or carers should be given advice on administration.  
It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25

- ▶ **Pancrex** (Essential Pharmaceuticals Ltd)

## 11 Stoma care

### Stoma care

24-Feb-2016

#### Description of condition

A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient's pharmaceutical needs correctly.

#### Overview

Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are **unsuitable**, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants.

Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

#### Analgesics

Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

#### Antacids

The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

#### Antisecretory drugs

The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 846 and lanreotide p. 845) are often used to reduce this risk.

#### Antidiarrhoeal drugs

Loperamide hydrochloride p. 63 and codeine phosphate p. 421 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required.

Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

### Digoxin

Patients with a stoma are particularly susceptible to hypokalaemia if taking digoxin p. 103, due to fluid and sodium depletion. Potassium supplements or a potassium-sparing diuretic may be advisable with monitoring for early signs of toxicity.

### Diuretics

Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

### Iron preparations

Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

### Laxatives

Laxatives should not be used in patients with an ileostomy where possible as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs can be tried. If they are insufficient, as small a dose as possible of a stimulant laxative such as senna p. 59 can be used with caution.

### Potassium supplements

Liquid formulations are preferred to modified-release formulations. The daily dose should be split to avoid osmotic diarrhoea.

### Care of stoma

Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

## 1 Arrhythmias

### Arrhythmias

#### Overview

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

#### Ectopic beats

If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

#### Atrial fibrillation

Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate ('rate control') or by attempting to restore and maintain sinus rhythm ('rhythm control'). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

#### Acute presentation

All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion

has been agreed, intravenous amiodarone hydrochloride p. 99, or alternatively flecainide acetate p. 97, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 155 can be given intravenously.

#### Cardioversion

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

#### Drug treatment

*Rate control* is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, heart failure secondary to atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 102) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 148 [unlicensed indication], or verapamil hydrochloride as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 103 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

If drug treatment is required to maintain sinus rhythm ('rhythm control') post-cardioversion, a standard beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride, flecainide acetate, propafenone hydrochloride p. 98, or amiodarone hydrochloride; dronedarone p. 100 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochloride should not be given when there is known ischaemic or structural heart disease. Consider amiodarone hydrochloride in patients with left ventricular impairment or heart failure.

#### Paroxysmal atrial fibrillation

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is not appropriate, an oral anti-arrhythmic drug such as dronedarone (see NICE guidance), sotalol hydrochloride, flecainide acetate, propafenone hydrochloride, or amiodarone hydrochloride can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the 'pill-in-the-pocket' approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs.

#### Stroke prevention

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient's risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014)). Atrial fibrillation: The management of atrial fibrillation recommends using the CHA<sub>2</sub>DS<sub>2</sub>-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA<sub>2</sub>DS<sub>2</sub>-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA<sub>2</sub>DS<sub>2</sub>-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulation treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g. warfarin sodium p. 131, or in non-valvular atrial fibrillation with apixaban p. 117, dabigatran etexilate p. 128, or rivaroxaban p. 120). Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 114 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contra-indicated or

not tolerated, left atrial appendage occlusion can be considered.

#### Atrial flutter

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 148 [unlicensed indication], or verapamil hydrochloride p. 155; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 103 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 97 or propafenone hydrochloride p. 98 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride [unlicensed indication], or verapamil hydrochloride. Amiodarone hydrochloride p. 99 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

#### Paroxysmal supraventricular tachycardia

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 101 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride, verapamil hydrochloride, beta-blockers including sotalol hydrochloride p. 102, flecainide acetate or propafenone hydrochloride.

## Arrhythmias after myocardial infarction

In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atropine sulfate p. 1022 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine sulfate, adrenaline/epinephrine p. 211 should be given by intravenous infusion, and the dose adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at [www.resus.org.uk](http://www.resus.org.uk).

## Ventricular tachycardia

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate, propafenone hydrochloride, and, although less effective, lidocaine hydrochloride p. 97 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

## Torsade de pointes

*Torsade de pointes* is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 924 is usually effective. A beta-blocker (but not sotalol hydrochloride) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

## Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells

during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- Class II: beta-blockers
- Class III: amiodarone; sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

## Supraventricular arrhythmias

Adenosine p. 101 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 116), most side-effects are short lived. Unlike verapamil hydrochloride p. 155, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a **cardiac glycoside** (such as digoxin p. 103) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (**important**: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a **beta-blocker** such as esmolol hydrochloride p. 145 or propranolol hydrochloride p. 142, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 99, **beta-blockers**, disopyramide p. 96, flecainide acetate p. 97, **procaïnamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride p. 98.

## Supraventricular and ventricular arrhythmias

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular

fibrillation or pulseless tachycardia unresponsive to other interventions.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

**Beta-blockers** act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride p. 102 has a role in the management of ventricular arrhythmias.

Disopyramide can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride p. 97), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate belongs to the same general class as lidocaine hydrochloride and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contraindicated if severe).

Drugs for supraventricular arrhythmias include adenosine, **cardiac glycosides**, and verapamil hydrochloride. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

### Ventricular arrhythmias

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, **beta-blockers**, disopyramide, flecainide acetate, **procainamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride.

**Mexiletine** is available from 'special-order' manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.

**Other drugs used for Arrhythmias** Acebutolol, p. 143 · Atenolol, p. 143 · Metoprolol tartrate, p. 145 · Nadolol, p. 141 · Oxprenolol hydrochloride, p. 141

## ANTIARRHYTHMICS > CLASS IA

### Disopyramide

#### • INDICATIONS AND DOSE

**Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction | Maintenance of sinus rhythm after cardioversion**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 300–800 mg daily in divided doses
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 250–375 mg every 12 hours

- **CONTRA-INDICATIONS** Bundle-branch block associated with first-degree AV block · second- and third-degree AV block or bifascicular block (unless pacemaker fitted) · severe heart failure (unless secondary to arrhythmia) · severe sinus node dysfunction
  - **CAUTIONS** Atrial flutter or atrial tachycardia with partial block · avoid in acute porphyrias p. 950 · elderly · heart failure (avoid if severe) · myasthenia gravis · prostatic enlargement · structural heart disease · susceptibility to angle-closure glaucoma
  - **INTERACTIONS** → Appendix 1 (disopyramide).
  - **SIDE-EFFECTS** Angle-closure glaucoma · antimuscarinic effects · AV block · blurred vision · cholestatic jaundice · dry mouth · gastro-intestinal irritation · hypoglycaemia · hypotension · myocardial depression · psychosis · urinary retention · ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval)
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.
  - **BREAST FEEDING** Present in milk—use only if essential. Monitor infant for antimuscarinic effects.
  - **HEPATIC IMPAIRMENT** Half-life prolonged—may need dose reduction. Avoid modified-release preparation.
  - **RENAL IMPAIRMENT** Reduce dose by increasing dose interval; adjust according to response. Avoid modified-release preparation.
  - **MONITORING REQUIREMENTS**
    - ▶ Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur).
    - ▶ Monitor serum potassium.
- 
- **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25

    - ▶ **Rythmodan Retard** (Sanofi)
    - Disopyramide (as Disopyramide phosphate) 250 mg Rythmodan Retard 250mg tablets | 60 tablet [PoM] £32.08 DT price = £32.08

**Capsule**

    - ▶ **Disopyramide (Non-proprietary)**

## ANTIARRHYTHMICS &gt; CLASS IB

## Lidocaine hydrochloride

(Lignocaine hydrochloride)

## ● INDICATIONS AND DOSE

**Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)**

## ▶ BY INTRAVENOUS INJECTION

- Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour

**Ventricular arrhythmias, especially after myocardial infarction in patients without gross circulatory impairment**

## ▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: 100 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

**Ventricular arrhythmias, especially after myocardial infarction in lighter patients or those whose circulation is severely impaired**

## ▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 50 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

- **CONTRA-INDICATIONS** All grades of atrioventricular block · severe myocardial depression · sino-atrial disorders
- **CAUTIONS** Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · post cardiac surgery (consider lower dose)
- **INTERACTIONS** → Appendix 1 (lidocaine).
- **SIDE-EFFECTS**
  - ▶ Common or very common
    - Bradycardia (may lead to cardiac arrest) · confusion · convulsions · dizziness (particularly if injection too rapid) · drowsiness (particularly if injection too rapid) · hypotension (may lead to cardiac arrest) · paraesthesia (particularly if injection too rapid) · respiratory depression
  - ▶ Rare Anaphylaxis
- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

## ● MONITORING REQUIREMENTS

Monitor ECG and have resuscitation facilities available.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## ANTIARRHYTHMICS &gt; CLASS IC

## Flecainide acetate

## ● INDICATIONS AND DOSE

**AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily) (specialist supervision in hospital) | Ventricular tachyarrhythmias resistant to other treatment (specialist supervision in hospital)**

## ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 2 mg/kg (max. per dose 150 mg), to be given over 10–30 minutes with ECG monitoring, followed by (by intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by intravenous infusion) reduced to 100–250 micrograms/kg/hour for up to 24 hours, maximum cumulative dose of 600 mg in first 24 hours, then transfer to oral treatment

**Supraventricular arrhythmias**

## ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 50 mg twice daily, increased if necessary up to 300 mg daily

## ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 200 mg daily

**Ventricular arrhythmias (initiated under direction of hospital consultant)**

## ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients; for maintenance, reduce to the lowest dose that controls the arrhythmia continued →

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.
- **UNLICENSED USE** Capsules, tablets and injection: licensed for AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily). Immediate-release tablets only: licensed for symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions and/or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy. Injection only: licensed for ventricular tachyarrhythmias resistant to other treatment.
- **CONTRA-INDICATIONS** Abnormal left ventricular function · atrial conduction defects (unless pacing rescue available) · bundle branch block (unless pacing rescue available) · control of arrhythmias in acute situations (for modified-release forms only) · distal block (unless pacing rescue available) · haemodynamically significant valvular heart disease · heart failure · history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia · long-standing atrial fibrillation where conversion to sinus rhythm not attempted · second-degree or greater AV block (unless pacing rescue available) · sinus node dysfunction (unless pacing rescue available)
- **CAUTIONS** Atrial fibrillation following heart surgery · elderly (accumulation may occur) · patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)
- **INTERACTIONS** → Appendix 1 (flecainide).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Asthenia · dizziness · dyspnoea · fatigue · fever · oedema · pro-arrhythmic effects · visual disturbances
  - ▶ **Rare** Amnesia · confusion · convulsions · depression · dyskinesia · hallucinations · peripheral neuropathy · pneumonitis
  - ▶ **Frequency not known** Anaemia · anorexia · anxiety · ataxia · corneal deposits · drowsiness · flushing · gastrointestinal disturbances · headache · hepatic dysfunction · hypersensitivity reactions · increased antinuclear antibodies · increased sweating · insomnia · leucopenia · paraesthesia · photosensitivity · rash · syncope · thrombocytopenia · tinnitus · tremor · urticaria · vertigo
- **PREGNANCY** Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in *animal* studies; infant hyperbilirubinaemia also reported.
- **BREAST FEEDING** Significant amount present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Avoid or reduce dose in severe impairment.
- **RENAL IMPAIRMENT** Reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ With intravenous use ECG monitoring and resuscitation facilities may be available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Tambacor*<sup>®</sup>), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Minimum volume in infusion fluids containing chlorides 500 mL.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**Ventricular arrhythmias (specialist supervision in hospital) Paroxysmal supra-ventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital)**

**▶ BY MOUTH**

- ▶ **Adult:** Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 3 days, reduce total daily dose for patients under 70 kg
- ▶ **Elderly:** Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 5 days, reduce total daily dose for patients under 70 kg

- **CONTRA-INDICATIONS** Atrial conduction defects (unless adequately paced) · Brugada syndrome · bundle branch block (unless adequately paced) · cardiogenic shock (except arrhythmia induced) · distal block (unless adequately paced) · electrolyte disturbances · marked hypotension · myasthenia gravis · myocardial infarction within last 3 months · second degree or greater AV block (unless adequately paced) · severe bradycardia · severe obstructive pulmonary disease (due to weak beta-blocking activity) · sinus node dysfunction (unless adequately paced) · uncontrolled congestive heart failure with left ventricular ejection fraction less than 35%
- **CAUTIONS** Elderly · great caution in mild to moderate obstructive airways disease owing to beta-blocking activity · heart failure · pacemaker patients · potential for conversion of paroxysmal atrial fibrillation to atrial flutter with 2:1 or 1:1 conduction block
- **INTERACTIONS** → Appendix 1 (propafenone).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Bradycardia · abdominal pain · anxiety · atrioventricular block · blurred vision · chest pain · constipation · diarrhoea · dizziness · dry mouth · dyspnoea · headache · intraventricular blocks · malaise · nausea · palpitation · sino-atrial block · sleep disorders · tachycardia · taste disturbance · vomiting
- ▶ **Uncommon** Abdominal distension · anorexia · ataxia · erectile dysfunction · flatulence · hypotension · paraesthesia · pro-arrhythmic effects · rash · syncope · thrombocytopenia · vertigo
- ▶ **Frequency not known** Agranulocytosis · cholestasis · confusion · convulsions · extrapyramidal symptoms · erythrocytopenia · hepatitis · jaundice · leucopenia · lupus erythematosus-like syndrome · reduced sperm count (reversible on withdrawal) · restlessness
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use with caution—present in milk.
- **PATIENT AND CARER ADVICE**  
Driving and skilled tasks  
May affect performance of skilled tasks e.g. driving.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

#### ▶ Propafenone hydrochloride (Non-proprietary)

**Propafenone hydrochloride 150 mg** Propafenone 150mg tablets | 90 tablet [PoM] £7.37 DT price = £7.37

**Propafenone hydrochloride 300 mg** Propafenone 300mg tablets | 60 tablet [PoM] no price available DT price = £9.34

#### ▶ Arythmol (BGP Products Ltd)

**Propafenone hydrochloride 150 mg** Arythmol 150mg tablets | 90 tablet [PoM] £7.37 DT price = £7.37

**Propafenone hydrochloride 300 mg** Arythmol 300mg tablets | 60 tablet [PoM] £9.34 DT price = £9.34

## ANTIARRHYTHMICS > CLASS III

### Amiodarone hydrochloride

#### ● INDICATIONS AND DOSE

**Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)**

#### ▶ BY MOUTH

- ▶ **Adult:** 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

#### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

**Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)**

#### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL Glucose 5%, then (by intravenous injection) 150 mg if

required, followed by (by intravenous infusion)  
900 mg/24 hours

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SOFOSBUVIR WITH DACLATASVIR; SOFOSBUVIR AND LEDIPASVIR (MAY 2015); SIMEPREVIR WITH SOFOSBUVIR (AUGUST 2015): RISK OF SEVERE BRADYCARDIA AND HEART BLOCK WHEN TAKEN WITH AMIODARONE  
Avoid concomitant use unless other antiarrhythmics cannot be given.

### ● CONTRA-INDICATIONS

#### GENERAL CONTRA-INDICATIONS

Avoid in severe conduction disturbances (unless pacemaker fitted) · avoid in sinus node disease (unless pacemaker fitted) · iodine sensitivity · sino-atrial heart block (except in cardiac arrest) · sinus bradycardia (except in cardiac arrest) · thyroid dysfunction

#### SPECIFIC CONTRA-INDICATIONS

- ▶ With intravenous use Avoid bolus injection in cardiomyopathy · avoid bolus injection in congestive heart failure · avoid in circulatory collapse · avoid in severe arterial hypotension · avoid in severe respiratory failure

### ● CAUTIONS

#### GENERAL CAUTIONS

Acute porphyrias p. 930 · conduction disturbances (in excessive dosage) · elderly · heart failure · hypokalaemia · severe bradycardia (in excessive dosage)

#### SPECIFIC CAUTIONS

- ▶ With intravenous use moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) · severe hepatocellular toxicity
- **INTERACTIONS** → Appendix 1 (amiodarone). Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Use extreme caution or avoid concomitant use of drugs that prolong QT interval.

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Bradycardia · hyperthyroidism · hypothyroidism · jaundice · nausea · persistent slate grey skin discoloration · phototoxicity · pulmonary toxicity (including pneumonitis and fibrosis) · raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) · reversible corneal microdeposits (sometimes with night glare) · sleep disorders · taste disturbances · tremor · vomiting
- ▶ **Uncommon** Conduction disturbances · onset or worsening of arrhythmia · peripheral myopathy (usually reversible on withdrawal) · peripheral neuropathy (usually reversible on withdrawal)
- ▶ **Very rare** Alopecia · aplastic anaemia · ataxia · benign intracranial hypertension · bronchospasm (in patients with severe respiratory failure) · chronic liver disease · cirrhosis · epididymo-orchitis · exfoliative dermatitis · haemolytic anaemia · headache · hypersensitivity · impaired vision due to optic neuritis or optic neuropathy (including blindness) · impotence · rash · sinus arrest · thrombocytopenia · vasculitis · vertigo
- ▶ **Frequency not known** Hot flushes · hypotension · respiratory distress syndrome · sweating

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Injection-site reactions
- ▶ **Very rare**
- ▶ With intravenous use Anaphylaxis on rapid injection

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.
- ▶ Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.
- ▶ Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.
- ▶ Pulmonary toxicity Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.
- ▶ Peripheral neuropathy Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

● **PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.

● **BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

**● MONITORING REQUIREMENTS**

- ▶ Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
- ▶ Liver function tests required before treatment and then every 6 months.
- ▶ Serum potassium concentration should be measured before treatment.
- ▶ Chest x-ray required before treatment.
- ▶ With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

If concomitant use of amiodarone with sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir cannot be avoided because other anti-arrhythmics are not tolerated or contra-indicated, patients should be closely monitored, particularly during the first weeks of treatment. Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment. Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir should be monitored.

**● DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion (Cordarone X<sup>®</sup>)*, give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).

- ▶ With oral use For administration *by mouth*, tablets may be crushed and dispersed in water; injection solution should **not** be given orally (irritant).

● **PATIENT AND CARER ADVICE** Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

If taking amiodarone with concomitant sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet****CAUTIONARY AND ADVISORY LABELS 11****▶ Amiodarone hydrochloride 100 mg (Non-proprietary)**

Amiodarone 100mg tablets | 28 tablet [PoM] £4.25 DT price = £1.64

**Dronedarone**

- **DRUG ACTION** Dronedarone is a multi-channel blocking anti-arrhythmic drug.

**● INDICATIONS AND DOSE**

**Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)**

▶ BY MOUTH

- ▶ Adult: 400 mg twice daily

- **CONTRA-INDICATIONS** Atrial conduction defects · bradycardia · complete bundle branch block · distal block · existing or previous heart failure or left ventricular systolic dysfunction · haemodynamically unstable patients · liver toxicity associated with previous amiodarone use · lung toxicity associated with previous amiodarone use · permanent atrial fibrillation · prolonged QT interval · second- or third-degree AV block · sick sinus syndrome (unless pacemaker fitted) · sinus node dysfunction
- **CAUTIONS** Coronary artery disease · correct hypokalaemia and hypomagnesaemia before starting and during treatment
- **INTERACTIONS** → Appendix 1 (dronedarone).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Bradycardia · gastro-intestinal disturbances · heart failure · malaise · pruritus · QT-interval prolongation · raised serum creatinine · rash
- ▶ **Uncommon** Dermatitis · eczema · erythema · interstitial lung disease (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) · photosensitivity · pneumonitis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) · pulmonary fibrosis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) · taste disturbance
- ▶ **Rare** Liver injury (including life-threatening acute liver failure)

### SIDE-EFFECTS, FURTHER INFORMATION

Liver injury, including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ Ongoing monitoring should occur under specialist supervision.
  - ▶ Monitor for heart failure.
  - ▶ Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
  - ▶ Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
  - ▶ Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.
- **PATIENT AND CARER ADVICE**
  - Heart failure Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen.
  - Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - ▶ **Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012) NICE TA197**  
Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:
      - who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older and
      - who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure

Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

## ANTIARRHYTHMICS > OTHER

### Adenosine

#### ● INDICATIONS AND DOSE

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias**

#### ▶ BY RAPID INTRAVENOUS INJECTION

- ▶ Adult: Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) in patients with a heart transplant | Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant**

#### ▶ BY RAPID INTRAVENOUS INJECTION

- ▶ Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine

**Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate**

#### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

- **UNLICENSED USE** Adenosine doses in the BNF may differ from those in the product literature.
- **CONTRA-INDICATIONS** Asthma · chronic obstructive lung disease · decompensated heart failure · long QT syndrome · second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) · severe hypotension
- **CAUTIONS** Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) · atrial flutter with accessory pathway (conduction down anomalous pathway may increase) · autonomic dysfunction · bundle branch block · first-degree AV block · heart transplant · left main coronary artery stenosis · left to

right shunt · pericardial effusion · pericarditis · QT-interval prolongation · recent myocardial infarction · severe heart failure · stenotic carotid artery disease with cerebrovascular insufficiency · stenotic valvular heart disease · uncorrected hypovolaemia

● **INTERACTIONS** → Appendix 1 (adenosine); also possibility of interaction with drugs tending to impair myocardial conduction.

● **SIDE-EFFECTS**

▶ **Common or very common** Angina (discontinue) · apprehension · arrhythmia (discontinue if asystole or severe bradycardia occur) · AV block · dizziness · dyspnoea · flushing · headache · nausea · sinus pause

▶ **Uncommon** Blurred vision · hyperventilation · metallic taste · palpitation · sweating · weakness

▶ **Very rare** Bronchospasm · injection-site reactions · transient worsening of intracranial hypertension

▶ **Frequency not known** Cardiac arrest · convulsions · hypotension (discontinue if severe) · respiratory failure (discontinue) · syncope · vomiting

● **PREGNANCY** Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** No information available—unlikely to be present in milk owing to short half-life.

● **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.

● **DIRECTIONS FOR ADMINISTRATION** For *rapid intravenous injection* give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

**Solution for injection**

ELECTROLYTES: May contain Sodium

▶ **Adenosine (Non-proprietary)**

**Adenosine 3 mg per 1 ml** Adenosine 6mg/2ml solution for injection vials | 6 vial **[PoM]** £26.70–£29.24 (Hospital only)

▶ **Adenocor** (Sanofi)

**Adenosine 3 mg per 1 ml** Adenocor 6mg/2ml solution for injection vials | 6 vial **[PoM]** £29.94 (Hospital only)

**Solution for infusion**

ELECTROLYTES: May contain Sodium

▶ **Adenosine (Non-proprietary)**

**Adenosine 3 mg per 1 ml** Adenosine 30mg/10ml solution for infusion vials | 6 vial **[PoM]** £70.00–£85.57 (Hospital only)

▶ **Adenoscan** (Sanofi)

**Adenosine 3 mg per 1 ml** Adenoscan 30mg/10ml solution for infusion vials | 6 vial **[PoM]** £85.57

## BETA-ADRENOCEPTOR BLOCKERS >

### NON-SELECTIVE

139

## Sotalol hydrochloride

● **INDICATIONS AND DOSE**

**Symptomatic non-sustained ventricular tachyarrhythmias | Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery | Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter**

▶ **BY MOUTH**

▶ **Adult:** Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days

### Life-threatening arrhythmias including ventricular tachyarrhythmias

▶ **BY MOUTH**

▶ **Adult:** Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days, higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

### IMPORTANT SAFETY INFORMATION

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (**important:** particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).

● **CONTRA-INDICATIONS** Long QT syndrome (congenital or acquired) · torsade de pointes

● **CAUTIONS** Diarrhoea (severe or prolonged)

● **INTERACTIONS** Extreme caution or avoid concomitant use of drugs that prolong QT interval.

● **SIDE-EFFECTS** Arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in females)

● **BREAST FEEDING** Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

● **RENAL IMPAIRMENT** Use half normal dose if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

● **MONITORING REQUIREMENTS** Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 8

## CARDIAC GLYCOSIDES

### Cardiac glycosides

#### Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Emergency treatment of poisoning p. 1204). Digoxin-specific antibody p. 1213 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine

sulfate p. 1022 and when measures beyond the withdrawal of digoxin below and correction of any electrolyte abnormalities are considered necessary.

## Digoxin

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

## Digoxin

- **DRUG ACTION** Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

### ● INDICATIONS AND DOSE

#### Rapid digitalisation, for atrial fibrillation or flutter

##### ▶ BY MOUTH

- ▶ Adult: 0.75–1.5 mg in divided doses, dose to be given over 24 hours, reduce dose in the elderly

#### Maintenance, for atrial fibrillation or flutter

##### ▶ BY MOUTH

- ▶ Adult: Maintenance 125–250 micrograms daily, dose according to renal function and initial loading dose, reduce dose in the elderly

#### Heart failure (for patients in sinus rhythm)

##### ▶ BY MOUTH

- ▶ Adult: 62.5–125 micrograms once daily, reduce dose in the elderly

### Emergency loading dose, for atrial fibrillation or flutter

#### ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Loading dose 0.75–1 mg, to be given over at least 2 hours, then (by mouth) maintenance, loading dose is rarely necessary, maintenance dose to be started on the day following the loading dose, reduce dose in the elderly

### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.
- ▶ When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

- **UNLICENSED USE** Digoxin doses in the BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution) · hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution) · intermittent complete heart block · myocarditis · second degree AV block · supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) · ventricular tachycardia or fibrillation
- **CAUTIONS** Hypercalcaemia (risk of digitalis toxicity) · hypokalaemia (risk of digitalis toxicity) · hypomagnesaemia (risk of digitalis toxicity) · hypoxia (risk of digitalis toxicity) · recent myocardial infarction · severe respiratory disease · sick sinus syndrome · thyroid disease
- **INTERACTIONS** → Appendix 1 (cardiac glycosides).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arrhythmias · blurred vision · conduction disturbances · diarrhoea · dizziness · eosinophilia · nausea · rash · vomiting · yellow vision
  - ▶ **Uncommon** Depression
  - ▶ **Very rare** Anorexia · apathy · confusion · fatigue · gynaecomastia on long-term use · headache · intestinal ischaemia and necrosis · psychosis · thrombocytopenia · weakness
- **Overdose**

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.
- **PREGNANCY** May need dosage adjustment.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Reduce dose. Monitor plasma-digoxin concentration in renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.
  - ▶ Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion (*Lanoxin*<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours.
  - ▶ With oral use For oral administration, oral solution must **not** be diluted.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for digoxin elixir (use pipette).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

**Tablet**▶ **Digoxin (Non-proprietary)**

**Digoxin 62.5 microgram** Digoxin 62.5microgram tablets | 28 tablet [PoM] £9.99 DT price = £2.03 | 500 tablet [PoM] no price available

**Digoxin 125 microgram** Digoxin 125microgram tablets | 28 tablet [PoM] £4.99 DT price = £2.10

**Digoxin 250 microgram** Digoxin 250microgram tablets | 28 tablet [PoM] £4.99 DT price = £2.04 | 500 tablet [PoM] no price available

▶ **Lanoxin (Aspen Pharma Trading Ltd)**

**Digoxin 62.5 microgram** Lanoxin PG 62.5microgram tablets | 500 tablet [PoM] £8.09

**Digoxin 125 microgram** Lanoxin 125 tablets | 500 tablet [PoM] £8.09

**Digoxin 250 microgram** Lanoxin 250microgram tablets | 500 tablet [PoM] £8.09

**Oral solution**▶ **Lanoxin (Aspen Pharma Trading Ltd)**

**Digoxin 50 microgram per 1 ml** Lanoxin PG 50micrograms/ml elixir | 60 ml [PoM] £5.35 DT price = £5.35

**Solution for injection**

EXCIPIENTS: May contain Alcohol, propylene glycol

▶ **Digoxin (Non-proprietary)**

**Digoxin 100 microgram per 1 ml** Lanoxin Injection Pediatric 100micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] no price available

**Solution for infusion**▶ **Digoxin (Non-proprietary)**

**Digoxin 250 microgram per 1 ml** Digoxin 500micrograms/2ml solution for infusion ampoules | 10 ampoule [PoM] £7.00

▶ **Lanoxin (Aspen Pharma Trading Ltd)**

**Digoxin 250 microgram per 1 ml** Lanoxin 500micrograms/2ml solution for infusion ampoules | 5 ampoule [PoM] £3.30

## 2 Bleeding disorders

### Antifibrinolytic drugs and haemostatics

**Overview**

Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin p. 611 is used in the management of mild to moderate haemophilia and von Willebrand's disease. It is also used for fibrinolytic response testing.

Etamsylate p. 105 reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

**ANTIHAEMORRHAGICS > ANTIFIBRINOLYTICS**

### Tranexamic acid

**INDICATIONS AND DOSE****Local fibrinolysis**▶ **BY MOUTH**

▶ **Adult:** 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day

▶ **INITIALLY BY SLOW INTRAVENOUS INJECTION**

▶ **Adult:** 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, dose may be followed by continuous infusion; (by continuous intravenous infusion) 25–50 mg/kg, dose to be given over 24 hours

**Menorrhagia**▶ **BY MOUTH**

▶ **Adult:** 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

**Hereditary angioedema**▶ **BY MOUTH**

▶ **Adult:** 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

**Epistaxis**▶ **BY MOUTH**

▶ **Adult:** 1 g 3 times a day for 7 days

**General fibrinolysis**▶ **BY SLOW INTRAVENOUS INJECTION**

▶ **Adult:** 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

- **UNLICENSED USE** Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.
- **CONTRA-INDICATIONS** Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) · history of convulsions · thromboembolic disease
- **CAUTIONS** Irregular menstrual bleeding (establish cause before initiating therapy) · massive haematuria (avoid if risk of ureteric obstruction) · patients receiving oral contraceptives (increased risk of thrombosis)
- **CAUTIONS, FURTHER INFORMATION**
- ▶ **Menorrhagia** Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Diarrhoea (reduce dose) · nausea · vomiting
- ▶ **Uncommon** Dermatitis
- ▶ **Rare** Impairment of colour vision (discontinue) · thromboembolic events · visual disturbances (discontinue)
- ▶ **Frequency not known** Convulsions (usually with high doses) · hypotension (on rapid intravenous injection) · malaise (on rapid intravenous injection)
- **PREGNANCY** No evidence of teratogenicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Small amount present in milk—antifibrinolytic effect in infant unlikely.
- **RENAL IMPAIRMENT** Reduce dose—consult product literature for details.
- **MONITORING REQUIREMENTS** Regular liver function tests in long-term treatment of hereditary angioedema.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cyklokrapron<sup>®</sup>), give continuously in Glucose 5% or Sodium chloride 0.9%.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

- ▶ **Tranexamic acid (Non-proprietary)**  
Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet [PoM] £32.10 DT price = £4.18
- ▶ **Cyklokrapron** (Meda Pharmaceuticals Ltd)  
Tranexamic acid 500 mg Cyklokrapron 500mg tablets | 60 tablet [PoM] £14.30 DT price = £4.18

##### Solution for injection

- ▶ **Tranexamic acid (Non-proprietary)**  
Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 5 ampoule [PoM] £7.50 (Hospital only) | 10 ampoule [PoM] £15.47 (Hospital only)
- ▶ **Cyklokrapron** (Pfizer Ltd)  
Tranexamic acid 100 mg per 1 ml Cyklokrapron 500mg/5ml solution for injection ampoules | 10 ampoule [PoM] £15.47

## ANTIHAEMORRHAGICS > HAEMOSTATICS

### Etamsylate

(Ethamsylate)

#### INDICATIONS AND DOSE

##### Short-term blood loss in menorrhagia

- ▶ BY MOUTH
- ▶ Adult: 500 mg 4 times a day during menstruation

- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment
- **SIDE-EFFECTS** Diarrhoea · fever (discontinue treatment) · headache · nausea · rashes · vomiting
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

## 2.1 Coagulation factor deficiencies

### BLOOD AND RELATED PRODUCTS > COAGULATION PROTEINS

#### Dried prothrombin complex

(Human prothrombin complex)

#### INDICATIONS AND DOSE

**Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

#### Major bleeding in patients on warfarin following phytonadione (initiated under specialist supervision)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 25–50 units/kg

- **CONTRA-INDICATIONS** Angina · history of heparin induced thrombocytopenia · recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)
- **CAUTIONS** Disseminated intravascular coagulation · history of myocardial infarction or coronary heart disease · postoperative use · risk of thrombosis
- **SIDE-EFFECTS**
  - ▶ Rare Headache
  - ▶ Very rare Anaphylaxis · antibody formation · hypersensitivity reactions · pyrexia
  - ▶ Frequency not known Disseminated intravascular coagulation · nephrotic syndrome · thrombotic events
- **HEPATIC IMPAIRMENT** Monitor closely in hepatic impairment (risk of thromboembolic complications).
- **PRESCRIBING AND DISPENSING INFORMATION** Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X. Available from CSL Behring ( Beriplex<sup>®</sup> P/N), Octapharma ( Octaplex<sup>®</sup>).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

### Factor IX fraction, dried

#### INDICATIONS AND DOSE

##### Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

- ▶ BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation
- **CAUTIONS** Risk of thrombosis—principally with former low purity products
- **SIDE-EFFECTS** Allergic reactions · chills · dizziness · fever · gastro-intestinal disturbances · headache
- **PRESCRIBING AND DISPENSING INFORMATION** Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder and solvent for solution for injection

- ▶ **AlphaNine** (Grifols UK Ltd)  
Factor IX high purity 1000 unit AlphaNine 1,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £390.00  
Factor IX high purity 1500 unit AlphaNine 1,500unit powder and solvent for solution for injection vials | 1 vial [PoM] no price available
- ▶ **Haemonine** (Biotest (UK) Ltd)  
Factor IX high purity 500 unit Haemonine 500unit powder and solvent for solution for injection vials | 1 vial [PoM] £255.00 (Hospital only)  
Factor IX high purity 1000 unit Haemonine 1,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £510.00 (Hospital only)
- ▶ **Mononine** (CSL Behring UK Ltd)  
Factor IX high purity 1000 unit Mononine 1,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £478.43

► **Replenie-VF** (Bio Products Laboratory Ltd)

**Factor IX high purity 500 unit** Replenie-VF 500unit powder and solvent for solution for injection vials | 1 vial [PoM] £180.00 | 10 vial [PoM] no price available

**Factor IX high purity 1000 unit** Replenie-VF 1,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £360.00 | 10 vial [PoM] no price available

**Powder and solvent for solution for infusion**

► **BeneFIX** (Pfizer Ltd)

**Nonacog alfa 250 unit** BeneFIX 250unit powder and solvent for solution for infusion vials | 1 vial [PoM] £151.80 (Hospital only)

**Nonacog alfa 500 unit** BeneFIX 500unit powder and solvent for solution for infusion vials | 1 vial [PoM] £303.60 (Hospital only)

**Nonacog alfa 1000 unit** BeneFIX 1,000unit powder and solvent for solution for infusion vials | 1 vial [PoM] £607.20 (Hospital only)

**Nonacog alfa 2000 unit** BeneFIX 2,000unit powder and solvent for solution for infusion vials | 1 vial [PoM] £1,214.40 (Hospital only)

**Nonacog alfa 3000 unit** BeneFIX 3,000unit powder and solvent for solution for infusion vials | 1 vial [PoM] £1,821.60 (Hospital only)

## Factor VIIa (recombinant)

### (Eptacog alfa (activated))

● **INDICATIONS AND DOSE**

**Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia**

► BY INTRAVENOUS INJECTION

► Adult: (consult haematologist)

● **CAUTIONS** Disseminated intravascular coagulation · risk of thrombosis

● **SIDE-EFFECTS**

- **Uncommon** Deep vein thrombosis · fever · pulmonary embolism · rash · venous thromboembolic events
- **Rare** Angina · arterial thrombotic events · cerebrovascular accident · coagulation disorders · headache · myocardial infarction · nausea
- **Frequency not known** Anaphylaxis · angioedema · flushing

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

► **NovoSeven** (Novo Nordisk Ltd)

**Eptacog alfa activated 50000 unit** NovoSeven 1mg (50,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £525.20 (Hospital only)

NovoSeven 1mg (50,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £525.20 (Hospital only)

**Eptacog alfa activated 100000 unit** NovoSeven 2mg (100,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £1,050.40 (Hospital only)

NovoSeven 2mg (100,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £1,050.40 (Hospital only)

**Eptacog alfa activated 250000 unit** NovoSeven 5mg (250,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £2,626.00 (Hospital only)

NovoSeven 5mg (250,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £2,626.00 (Hospital only)

**Eptacog alfa activated 400000 unit** NovoSeven 8mg (400,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £4,201.60 (Hospital only)

NovoSeven 8mg (400,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £4,201.60 (Hospital only)

## Factor VIII fraction, dried

### (Human coagulation factor VIII, dried)

● **INDICATIONS AND DOSE**

**Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand's disease**

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION

► Adult: (consult haematologist)

● **CAUTIONS** Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A<sub>1</sub>, B<sub>1</sub> or AB—less likely with high potency concentrates

● **SIDE-EFFECTS** Anaphylaxis · angioedema · antibody formation · blurred vision · chills · coughing · dizziness · drowsiness · dyspnoea · fever · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypotension · palpitation · paraesthesia · taste disturbances · urticaria

● **MONITORING REQUIREMENTS** Monitor for development of factor VIII inhibitors.

● **PRESCRIBING AND DISPENSING INFORMATION** Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of Von Willebrand factor. *Optivate*<sup>®</sup>, *Fanhdi*<sup>®</sup>, and *Octanate*<sup>®</sup> are not indicated for use in Von Willebrand's disease.

Recombinant human coagulation factor VIII including octocog alfa, morocotog alfa, and simocotog alfa are not indicated for use in Von Willebrand's disease.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**Octocog alfa 3000 unit** Kogenate Bayer 3,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £1,890.00

## Factor XIII fraction, dried

### (Human fibrin-stabilising factor, dried)

- **INDICATIONS AND DOSE**

**Congenital factor XIII deficiency**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **SIDE-EFFECTS**

- ▶ Rare Allergic reactions · fever

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- ▶ **Fibrogammin P** (CSL Behring UK Ltd)

**Factor XIII 250 unit** Fibrogammin 250unit powder and solvent for solution for injection vials | 1 vial [PoM] £90.59

**Factor XIII 1250 unit** Fibrogammin 1,250unit powder and solvent for solution for injection vials | 1 vial [PoM] £452.95

## Fibrinogen, dried

### (Human fibrinogen)

- **INDICATIONS AND DOSE**

**Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Risk of thrombosis

- **SIDE-EFFECTS**

- ▶ Rare Allergic reactions · fever
- ▶ Very rare Myocardial infarction · pulmonary embolism · thromboembolic events

- **PREGNANCY** Manufacturer advises not known to be harmful—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Fibrinogen is prepared from human plasma.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- ▶ **Riastap** (CSL Behring UK Ltd)

**Fibrinogen 1 gram** Riastap 1g powder for solution for infusion vials | 1 vial [PoM] £340.00

## Protein C concentrate

- **INDICATIONS AND DOSE**

**Congenital protein C deficiency**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Hypersensitivity to heparins

- **SIDE-EFFECTS**

- ▶ Very rare Bleeding · dizziness · fever · hypersensitivity reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Protein C is prepared from human plasma.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- ▶ **Ceprotin** (Baxalta UK Ltd)

**Protein C 500 unit** Ceprotin 500unit powder and solvent for solution for injection vials | 1 vial [PoM] no price available

**Protein C 1000 unit** Ceprotin 1000unit powder and solvent for solution for injection vials | 1 vial [PoM] no price available

## BLOOD AND RELATED PRODUCTS >

### HAEMOSTATIC PRODUCTS

## Factor VIII inhibitor bypassing fraction

- **INDICATIONS AND DOSE**

**Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors | Treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation

- **SIDE-EFFECTS** Anaphylaxis · disseminated intravascular coagulation · flushing · hypersensitivity · hypotension · myocardial infarction · paraesthesia · pyrexia · rash · thrombosis · urticaria
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

- ▶ **FEIBA Imuno** (Baxalta UK Ltd)  
Factor VIII inhibitor bypassing fraction 500 unit FEIBA 500unit powder and solvent for solution for injection vials | 1 vial **[PoM]** no price available

#### Powder and solvent for solution for infusion

- ▶ **FEIBA Imuno** (Baxalta UK Ltd)  
Factor VIII inhibitor bypassing fraction 1000 unit FEIBA 1,000unit powder and solvent for solution for infusion vials | 1 vial **[PoM]** no price available

## BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

### Fresh frozen plasma

#### INDICATIONS AND DOSE

**Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

**Major bleeding in patients on warfarin following phytonadione (if dried prothrombin complex is unavailable)**

- ▶ Adult: 15 mL/kilogram

- **CONTRA-INDICATIONS** Avoid use as a volume expander · IgA deficiency with confirmed antibodies to IgA
- **CAUTIONS** Cardiac decompensation · need for compatibility · pulmonary oedema · severe protein S deficiency (avoid products with low protein S activity e.g. *OctaplasLG*<sup>®</sup>)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Nausea · pruritus · rash
  - ▶ **Uncommon** Oedema · vomiting
  - ▶ **Rare** Agitation · allergic reactions · bronchospasm · cardiorespiratory collapse · chills · fever · tachycardia
  - ▶ **Very rare** Arrhythmia · hypertension · thromboembolism
- **PRESCRIBING AND DISPENSING INFORMATION** Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (*OctaplasLG*<sup>®</sup>).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## 2.2 Subarachnoid haemorrhage

### CALCIUM-CHANNEL BLOCKERS

F 147

#### Nimodipine

- **DRUG ACTION** Nimodipine is a dihydropyridine calcium-channel blocker.

#### INDICATIONS AND DOSE

**Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage**

- ▶ BY MOUTH
- ▶ Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days

**Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 70 kg): Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter
- ▶ Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

**Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Cerebral oedema · hypotension · severely raised intracranial pressure
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers, alcohol (infusion only)). Avoid concomitant administration with other calcium-channel blockers, beta-blocker and nephrotoxic drugs.
- **SIDE-EFFECTS** Flushing · gastro-intestinal disorders · headache · hypotension · ileus · nausea · sweating and feeling of warmth · thrombocytopenia · variation in heart-rate
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Elimination reduced in cirrhosis—monitor blood pressure.
- **RENAL IMPAIRMENT**
  - ▶ With intravenous use Manufacturer advises monitor renal function closely in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid concomitant administration of nimodipine infusion and tablets.

- ▶ With oral use For administration *by mouth*, tablets may be crushed or halved but are light sensitive—administer immediately.
- ▶ With intravenous use For *intravenous infusion*, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light.
- ▶ With intravenous use Polyethylene, polypropylene, or glass apparatus should be used. PVC should be avoided.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

- ▶ **Nimotop** (Bayer Plc)  
Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet [PoM] £40.00

#### Solution for infusion

- ▶ **Nimotop** (Bayer Plc)  
Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 5 vial [PoM] £68.00 (Hospital only)

## 3 Blood clots

### 3.1 Blocked catheters and lines

**Other drugs used for Blocked catheters and lines** Heparin (unfractionated), p. 125 · Urokinase, p. 129

#### ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

### Epoprostenol

#### (Prostacyclin)

- **DRUG ACTION** Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

#### ● INDICATIONS AND DOSE

**Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated | Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)**

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

#### PHARMACOKINETICS

Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- **CONTRA-INDICATIONS** Severe left ventricular dysfunction
- **CAUTIONS** Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) · extreme caution in coronary artery disease · haemorrhagic diathesis · pulmonary veno-occlusive disease · reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) · risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)
- **INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anxiety · arthralgia · bleeding · bradycardia · chest pain · diarrhoea ·

- flushing · headache · hypotension · jaw pain · nausea · rash · sepsis · tachycardia · thrombocytopenia · vomiting
- ▶ **Uncommon** Dry mouth · sweating
- ▶ **Very rare** Agitation · hyperthyroidism · malaise · pallor
- ▶ **Frequency not known** Hyperglycaemia · pulmonary oedema (avoid chronic use if occurs during dose titration)
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Anticoagulant monitoring required when given with anticoagulants.
- **TREATMENT CESSATION** Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Flolan<sup>®</sup>)*, give continuously in Sodium chloride 0.9%; reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for *pulmonary hypertension* dilute further with glycine buffer diluent only and administer via a central venous catheter (can give via peripheral vein until central venous access established); for *renal dialysis* may be diluted further with sodium chloride 0.9%; protect infusion from light. For *intravenous infusion (Veletri<sup>®</sup>)*, give continuously in Sodium chloride 0.9%; reconstitute each vial with 5 mL sodium chloride 0.9% then dilute to required concentration with sodium chloride 0.9% (consult product literature); administer through an in-line 0.22 micron filter; for *pulmonary hypertension*, administer via a central venous catheter (can give via peripheral vein until central venous access established); protect infusion from direct sunlight.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

- ▶ **Veletri** (Actelion Pharmaceuticals UK Ltd)  
Epoprostenol (as Epoprostenol sodium) 1.5 mg Veletri 1.5mg powder for solution for infusion vials | 1 vial [PoM] £49.24
- Epoprostenol (as Epoprostenol sodium) 500 microgram Veletri 500microgram powder for solution for infusion vials | 1 vial [PoM] £24.44

#### Powder and solvent for solution for infusion

- ▶ **Epoprostenol (Non-proprietary)**  
Epoprostenol (as Epoprostenol sodium) 1.5 mg Epoprostenol 1.5mg powder and solvent (pH10.5) for solution for infusion vials | 1 vial [PoM] £49.24
- Epoprostenol (as Epoprostenol sodium) 500 microgram Flolan 500microgram powder and solvent (pH12) for solution for infusion vials | 1 vial [PoM] £22.22
- Epoprostenol 500microgram powder and solvent (pH10.5) for solution for infusion vials | 1 vial [PoM] £22.22
- ▶ **Flolan** (GlaxoSmithKline UK Ltd)  
Epoprostenol (as Epoprostenol sodium) 1.5 mg Flolan 1.5mg powder and solvent (pH10.5) for solution for infusion vials | 1 vial [PoM] £44.76
- Flolan 1.5mg powder and solvent (pH12) for solution for infusion vials | 1 vial [PoM] £44.76
- Epoprostenol (as Epoprostenol sodium) 500 microgram Flolan 500microgram powder and solvent (pH10.5) for solution for infusion vials | 1 vial [PoM] £22.22

## 3.2 Thromboembolism

### Venous thromboembolism

#### Overview

Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.

## Prophylaxis of venous thromboembolism

All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. NICE clinical guideline 92 (January 2010) provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health ([www.gov.uk/dh](http://www.gov.uk/dh)).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition.

Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism, should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 125 is preferred for patients in renal failure. Fondaparinux sodium p. 119 is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastro-intestinal, bariatric, or day surgery procedures. The oral anticoagulants apixaban p. 117, dabigatran etexilate p. 128, and rivaroxaban p. 120 are indicated for thromboprophylaxis following hip or knee replacement surgery.

Pharmacological prophylaxis in general surgery should usually continue for 5–7 days, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen or pelvis. Hip or knee replacement surgery, and hip fracture surgery, require an extended duration of pharmacological prophylaxis, depending on the preparation used (consult product literature).

General medical patients who are considered to be at high risk of venous thromboembolism should be offered pharmacological prophylaxis on admission. Choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, heparin (unfractionated) (if patient in renal failure), or fondaparinux sodium. Prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Edoxaban p. 118, an inhibitor of factor Xa, is given orally for the treatment and prophylaxis of venous thromboembolism, although, it should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy. Duration of therapy should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation, and longer durations should be based on permanent risk factors or idiopathic deep-vein thrombosis or pulmonary embolism. Edoxaban is also licensed for the prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and at least one other risk factor.

## Treatment of venous thromboembolism

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 131 is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is  $\geq 2$  for at least 24 hours). Laboratory monitoring for heparin (unfractionated), preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated)). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

## Management of venous thromboembolism in pregnancy

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparinux sodium p. 123, enoxaparin sodium p. 124, and tinzaparin sodium p. 126. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

## Extracorporeal circuits

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

## Haemorrhage

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1213 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

## Management of stroke

### Overview

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

### Transient ischaemic attack

Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 114 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 115 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

## Ischaemic stroke

### Initial management

Alteplase p. 205 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolytics and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 131 should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis.

### Long-term management

Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a *transient ischaemic attack*, long-term treatment with modified-release dipyridamole in combination with aspirin is recommended. If patients are intolerant of aspirin, or it is contra-indicated, then modified-release dipyridamole p. 116 alone is recommended; if patients are intolerant of dipyridamole, or it is contra-indicated, then aspirin alone is recommended. Patients who are intolerant of both aspirin and dipyridamole should receive clopidogrel alone [unlicensed use].

Following an *ischaemic stroke* (not associated with atrial fibrillation), clopidogrel is recommended as long-term treatment. If clopidogrel is contra-indicated or not tolerated, patients should receive modified-release dipyridamole in combination with aspirin; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin sodium or an alternative anticoagulant (see Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation.

A statin should be initiated 48 hours after stroke symptom onset, irrespective of the patient's serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of <130/80 mmHg. Beta-blockers should not be used in the management of

hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

## Intracerebral haemorrhage

### Initial Management

Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed; anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

### Long-term management

Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

## Oral anticoagulants

### Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

### Coumarins and phenindione

The oral anticoagulants warfarin sodium p. 131, acenocoumarol p. 131 and phenindione p. 131, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 114 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 113) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

### Dose

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

### Target INR

The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on

oral anticoagulation with warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction

INR 3.5 for:

- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;
- Mechanical prosthetic heart valves:
- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
  - consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

### Duration

The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

The following durations of warfarin sodium for the treatment of deep-vein thrombosis and pulmonary embolism reflect the recommendations of the British Society for Haematology (Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324):

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

### Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324) are based on the result of the INR and whether there is major

or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytonadione p. 958 (vitamin K<sub>1</sub>) by slow intravenous injection; give dried prothrombin complex p. 105 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytonadione (vitamin K<sub>1</sub>) by slow intravenous injection; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytonadione (vitamin K<sub>1</sub>) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytonadione (vitamin K<sub>1</sub>) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding—withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

### Peri-operative anticoagulation

Warfarin sodium should usually be stopped 5 days before elective surgery; phytonadione (vitamin K<sub>1</sub>) by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is  $\geq 1.5$ . If haemostasis is adequate, warfarin sodium can be resumed at the normal maintenance dose on the evening of surgery or the next day.

Patients stopping warfarin sodium prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy ('bridging') with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin sodium p. 131 who require emergency surgery that can be delayed for 6–12 hours can be given intravenous phytonadione p. 958 (vitamin K<sub>1</sub>) to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex p. 105 can be given in addition to intravenous phytonadione (vitamin K<sub>1</sub>) and the INR checked before surgery.

### Combined anticoagulant and antiplatelet therapy

Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated. The addition of warfarin sodium, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient's risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin p. 114 and warfarin sodium) or triple therapy (e.g. aspirin with clopidogrel p. 115 and warfarin sodium) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin sodium dual therapy is lower than with clopidogrel and warfarin sodium. Depending on the indications being treated and the patient's risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin sodium therapy is

complete, or *vice versa* (on specialist advice) in order to reduce the length of time on dual or triple therapy.

## Parenteral anticoagulants

### Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

### Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as 'standard' or heparin (unfractionated) p. 125 to distinguish it from the **low molecular weight heparins**, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

### Low molecular weight heparins

Low molecular weight heparins (dalteparin sodium p. 123, enoxaparin sodium p. 124, and tinzaparin sodium p. 126) are usually preferred over heparin (unfractionated) in the *prevention* of Venous thromboembolism p. 109 because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and *once-daily subcutaneous* administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the *treatment* of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under Acute coronary syndromes p. 201) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

### Heparinoids

Danaparoid sodium p. 122 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

### Argatroban

An oral anticoagulant can be given with argatroban monohydrate p. 126, but it should only be started once thrombocytopenia has substantially resolved.

### Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial

infarction undergoing primary percutaneous coronary intervention—see also Management of ST-segment elevation myocardial infarction (STEMI) in Acute coronary syndromes p. 201).

### Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

### Epoprostenol

**Epoprostenol** (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

### Fondaparinux

**Fondaparinux sodium** is a synthetic pentasaccharide that inhibits activated factor X.

**Other drugs used for Thromboembolism** Streptokinase, p. 206

## ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

## Antiplatelet drugs

### Overview

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin p. 114 in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

Clopidogrel p. 115 is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation; in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation; the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin. Patients who are not already taking clopidogrel should receive a loading dose prior to procedure.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with

atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium p. 131 is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance).

Clopidogrel also has uses in stroke.

Dipyridamole p. 116 is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 203, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 204, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

Cangrelor p. 197, in combination with aspirin, is licensed for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received treatment with oral clopidogrel, prasugrel or ticagrelor prior to the procedure and in whom oral therapy with these drugs is not suitable. Cangrelor is to be used under expert supervision only.

#### Antiplatelet drugs and coronary stents

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either cangrelor, clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

#### Glycoprotein IIb/IIIa inhibitors

**Glycoprotein IIb/IIIa inhibitors** prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab p. 198 is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin (unfractionated) p. 125 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatid p. 198 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 199 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tirofiban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment

elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatid and tirofiban should be used by specialists only.

Epoprostenol p. 109 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

## Aspirin

### (Acetylsalicylic Acid)

#### ● INDICATIONS AND DOSE

##### Cardiovascular disease (secondary prevention)

► BY MOUTH

► Adult: 75 mg daily

##### Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) | Management of ST-segment elevation myocardial infarction (STEMI)

► BY MOUTH

► Adult: 300 mg, chewed or dispersed in water

##### Suspected transient ischaemic attack

► BY MOUTH

► Adult: 300 mg once daily until diagnosis established

##### Transient ischaemic attack (long-term treatment in combination with dipyridamole) | Ischaemic stroke not associated with atrial fibrillation (in combination with dipyridamole if clopidogrel contra-indicated or not tolerated) | Ischaemic stroke not associated with atrial fibrillation (used alone if clopidogrel and dipyridamole contra-indicated or not tolerated)

► BY MOUTH

► Adult: 75 mg once daily

##### Acute ischaemic stroke

► BY MOUTH

► Adult: 300 mg once daily for 14 days, to be initiated 24 hours after thrombolysis or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis

##### Atrial fibrillation following a disabling ischaemic stroke (before being considered for anticoagulant treatment)

► BY MOUTH

► Adult: 300 mg once daily for 14 days

##### Following disabling ischaemic stroke in patients receiving anticoagulation for a prosthetic heart valve and who are at significant risk of haemorrhagic transformation

► BY MOUTH

► Adult: 300 mg once daily, anticoagulant treatment stopped for 7 days and to be substituted with aspirin

##### Following coronary by-pass surgery

► BY MOUTH

► Adult: 75–300 mg daily

##### Mild to moderate pain | Pyrexia

► BY MOUTH

► Adult: 300–900 mg every 4–6 hours as required; maximum 4 g per day

► BY RECTUM

► Adult: 450–900 mg every 4 hours; maximum 3.6 g per day

- **CONTRA-INDICATIONS** Active peptic ulceration · bleeding disorders (antiplatelet dose) · children under 16 years (risk of Reye's syndrome) · haemophilia · previous peptic ulceration (analgesic dose) · severe cardiac failure (analgesic dose)

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- Reye's syndrome. Owing to an association with Reye's syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

- **CAUTIONS** Allergic disease · anaemia · asthma · dehydration · elderly · G6PD deficiency · preferably avoid during fever or viral infection in children (risk of Reye's syndrome) · previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) · thyrotoxicosis · uncontrolled hypertension
  - **INTERACTIONS** → Appendix 1 (aspirin). Caution with concomitant use of drugs that increase risk of bleeding.
  - **SIDE-EFFECTS** Blood disorders (with analgesic doses) · bronchospasm · confusion (with analgesic doses) · gastro-intestinal haemorrhage (occasionally major) · gastro-intestinal irritation (with slight asymptomatic blood loss at higher doses) · haemorrhage including subconjunctival haemorrhage (reported with antiplatelet doses) · increased bleeding time · skin reactions in hypersensitive patients · tinnitus (with analgesic doses)
- Overdose**  
The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.
- For specific details on the management of poisoning, see *Aspirin*, under Emergency treatment of poisoning p. 1204.
- **ALLERGY AND CROSS-SENSITIVITY** Aspirin is **contra-indicated** in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.
  - **PREGNANCY** Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.
  - **BREAST FEEDING** Avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.
  - **HEPATIC IMPAIRMENT** Avoid in severe impairment—increased risk of gastro-intestinal bleeding.
  - **RENAL IMPAIRMENT** Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.
  - **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.
  - **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
Aspirin Dispersibles Tablets 300 mg may be prescribed.
  - **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 32

##### ▶ Aspirin (Non-proprietary)

**Aspirin 75 mg** Aspirin 75mg tablets | 28 tablet [PoM] £1.13 DT price = £1.13

**Aspirin 300 mg** Aspirin 300mg tablets | 100 tablet [PoM] £10.47

##### ▶ Nu-Seals (Alliance Pharmaceuticals Ltd)

**Aspirin 75 mg** Nu-Seals 75 gastro-resistant tablets | 56 tablet [P] £3.12

#### Suppository

CAUTIONARY AND ADVISORY LABELS 32

##### ▶ Aspirin (Non-proprietary)

**Aspirin 150 mg** Aspirin 150mg suppositories | 10 suppository [P] £18.67

**Aspirin 300 mg** Aspirin 300mg suppositories | 10 suppository [P] £35.89

## Clodigrogl

#### ● INDICATIONS AND DOSE

**Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clodigrogl**

##### ▶ BY MOUTH

▶ Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

**Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor | Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor**

##### ▶ BY MOUTH

▶ Adult: 75 mg once daily

**Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke**

##### ▶ BY MOUTH

▶ Adult: 75 mg once daily

**Prevention of atherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)**

##### ▶ BY MOUTH

▶ Adult: Initially 300 mg, then 75 mg daily for up to 12 months

continued →

**Prevention of artherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)**

## ▶ BY MOUTH

- Adult 18–75 years: Initially 300 mg, then 75 mg for at least 4 weeks
- Adult 76 years and over: 75 mg daily for at least 4 weeks

**Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation and at least one risk factor for a vascular event (with aspirin) and for whom warfarin is unsuitable**

## ▶ BY MOUTH

- Adult: 75 mg once daily

- **UNLICENSED USE** 600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose. Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.

- **CONTRA-INDICATIONS** Active bleeding

- **CAUTIONS** Discontinue 7 days before elective surgery if antiplatelet effect not desirable · patients at risk of increased bleeding from trauma, surgery, or other pathological conditions

- **INTERACTIONS** → Appendix 1 (clopidogrel). Caution with concomitant use of drugs that increase risk of bleeding.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · bleeding disorders (including gastro-intestinal and intracranial) · diarrhoea · dyspepsia
- ▶ **Uncommon** Constipation · decreased platelets · dizziness · duodenal ulcers · eosinophilia · flatulence · gastric ulcer · gastritis · headache · leucopenia · nausea · paraesthesia · pruritus · rash · vomiting
- ▶ **Rare** Vertigo
- ▶ **Very rare** Acquired haemophilia · acute liver failure · agranulocytosis · arthralgia · blood disorders · bronchospasm · colitis · confusion · eosinophilic pneumonia · fever · glomerulonephritis · hallucinations · hepatitis · hypersensitivity-like reactions · interstitial pneumonitis · lichen planus · pancreatitis · pancytopenia · severe thrombocytopenia · Stevens-Johnson syndrome · stomatitis · taste disturbance · thrombocytopenic purpura · toxic epidermal necrolysis · vasculitis

- **ALLERGY AND CROSS-SENSITIVITY** Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of bleeding). Avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

● **NATIONAL FUNDING/ACCESS DECISIONS**● **NICE technology appraisals (TAs)**

- ▶ Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

[www.nice.org.uk/TA210](http://www.nice.org.uk/TA210)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients **only**.

The *Scottish Medicines Consortium* has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Clopidogrel (Non-proprietary)**

**Clopidogrel 75 mg** Clopidogrel 75mg tablets | 28 tablet [PoM] £30.53 DT price = £1.44 | 30 tablet [PoM] £32.71

▶ **Grepid** (Beacon Pharmaceuticals Ltd)

**Clopidogrel 75 mg** Grepid 75mg tablets | 30 tablet [PoM] £32.28

▶ **Plavix** (Sanofi)

**Clopidogrel 75 mg** Plavix 75mg tablets | 30 tablet [PoM] £35.64

**Clopidogrel (as Clopidogrel hydrogen sulfate) 300 mg** Plavix 300mg tablets | 30 tablet [PoM] £142.54 DT price = £142.54

**Dipyridamole**● **INDICATIONS AND DOSE**

● **Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin) | Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves**

## ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 200 mg twice daily, to be taken preferably with food

● **Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves**

## ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 300–600 mg daily in 3–4 divided doses

**Myocardial imaging—diagnostic use only**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: (consult product literature)

- **CAUTIONS** Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of exacerbation) · rapidly worsening angina · recent myocardial infarction

- **INTERACTIONS** → Appendix 1 (dipyridamole).

Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE-EFFECTS** Angioedema · dizziness · gastro-intestinal effects · hot flushes · hypersensitivity reactions · hypotension · increased bleeding after surgery · increased bleeding during surgery · myalgia · rash · severe bronchospasm · tachycardia · throbbing headache · thrombocytopenia · urticaria · worsening symptoms of coronary heart disease

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Manufacturers advise use only if essential—small amount present in milk.

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

- ▶ **Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210**

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:

- a transient ischaemic attack, **or**
- an ischaemic stroke, only if clopidogrel is contra-indicated or not tolerated.

Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, **or**
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

## ANTITHROMBOTIC DRUGS > FACTOR XA INHIBITORS

### Apixaban

- **DRUG ACTION** Apixaban is a direct inhibitor of activated factor X (factor Xa).

- **INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism following knee replacement surgery**

- ▶ BY MOUTH

▶ Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery

**Prophylaxis of venous thromboembolism following hip replacement surgery**

- ▶ BY MOUTH

▶ Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

- ▶ BY MOUTH

▶ Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily

**Prophylaxis of recurrent deep-vein thrombosis |**

**Prophylaxis of recurrent pulmonary embolism**

- ▶ BY MOUTH

▶ Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age ≥ 75 years**

- ▶ BY MOUTH

▶ Adult 18–79 years: 5 mg twice daily

- ▶ Adult 80 years and over (body-weight up to 61 kg): 2.5 mg twice daily

- ▶ Adult 80 years and over (body-weight 61 kg and above): 5 mg twice daily

continued →

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal) · prosthetic heart valve (efficacy not established) · risk of bleeding
- **INTERACTIONS** → Appendix 1 (apixaban). Caution in concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - **Common or very common** Anaemia · bruising · haemorrhage · nausea
  - **Uncommon** Hypotension · rash · thrombocytopenia
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment and in hepatic disease associated with coagulopathy.
- **RENAL IMPAIRMENT** When used for *prophylaxis of stroke and systemic embolism in atrial fibrillation*, reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute, or if serum-creatinine  $\geq 133$  micromol/litre and age  $\geq 80$  years or body-weight  $\leq 60$  kg. When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism*, use with caution if creatinine clearance 15–29 mL/minute. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available.
- **MONITORING REQUIREMENTS**
  - Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
  - No routine anticoagulant monitoring required (INR tests are unreliable).
- **PRESCRIBING AND DISPENSING INFORMATION** Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation. Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012)** NICE TA245  
Apixaban is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery.  
[www.nice.org.uk/TA245](http://www.nice.org.uk/TA245)
    - **Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013)** NICE TA275  
Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in

accordance with its licensed indication; with one or more of the following risk factors:

- previous stroke or transient ischaemic attack
- symptomatic heart failure
- age  $\geq 75$  years
- diabetes mellitus
- hypertension

The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

[www.nice.org.uk/TA275](http://www.nice.org.uk/TA275)

- **Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015)**

NICE TA341

Apixaban is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults.

[www.nice.org.uk/TA341](http://www.nice.org.uk/TA341)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Eliquis** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Apixaban 2.5 mg** Eliquis 2.5mg tablets | 10 tablet [PoM] £9.50 | 20 tablet [PoM] £19.00 | 60 tablet [PoM] £57.00 DT price = £57.00

**Apixaban 5 mg** Eliquis 5mg tablets | 28 tablet [PoM] £26.60 | 56 tablet [PoM] £53.20 DT price = £53.20

**Edoxaban**

25-Apr-2016

- **DRUG ACTION** Edoxaban is a direct and reversible inhibitor of activated factor X (factor Xa), which prevents conversion of prothrombin to thrombin and prolongs clotting time, thereby reducing the risk of thrombus formation.

**INDICATIONS AND DOSE**

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, in patients with at least one risk factor (such as congestive heart failure, hypertension, aged 75 years and over, diabetes mellitus, previous stroke or transient ischaemic attack)**

**► BY MOUTH**

- Adult (body-weight up to 61 kg): 30 mg once daily
- Adult (body-weight 61 kg and above): 60 mg once daily

**Treatment of deep-vein thrombosis | Prophylaxis of recurrent deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent pulmonary embolism**

**► BY MOUTH**

- Adult (body-weight up to 61 kg): 30 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days
- Adult (body-weight 61 kg and above): 60 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Maximum dose of 30 mg once daily with concomitant ciclosporin, dronedarone, erythromycin, or ketoconazole.

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · arteriovenous malformations · current or recent gastro-intestinal ulceration · hepatic disease (associated with coagulopathy

and clinically relevant bleeding risk) · known or suspected oesophageal varices · major intraspinal or intracerebral vascular abnormalities · presence of malignant neoplasms at high risk of bleeding · recent brain or spinal injury · recent brain, spinal or ophthalmic surgery · recent intracranial haemorrhage · uncontrolled severe hypertension · vascular aneurysms

#### CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Risk for major bleeding. Edoxaban treatment is contra-indicated in patients with significant risk factors for major bleeding, these include those listed above.
- **CAUTIONS** Moderate to severe mitral stenosis (safety and efficacy not established) · prosthetic heart valve (safety and efficacy not established) · risk of bleeding · surgery
- CAUTIONS, FURTHER INFORMATION**
- ▶ **Surgery** Manufacturer recommends to discontinue treatment at least 24 hours before a surgical procedure; the risk of bleeding should be weighed against the urgency of the intervention—consult product literature.
- **INTERACTIONS** → Appendix 1 (edoxaban). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · epistaxis · haemorrhage · nausea · pruritus · rash
  - ▶ **Uncommon** Urticaria
  - ▶ **Rare** Allergic oedema
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Management of bleeding. Should a bleeding complication arise in a patient receiving edoxaban, the manufacturer recommends to delay the next dose or treatment should be discontinued as appropriate.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment; use with caution in mild to moderate impairment.
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose to 30 mg once daily in moderate to severe impairment; avoid in end-stage renal disease or in patients undergoing dialysis.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor renal function before treatment and when clinically indicated during treatment; monitor hepatic function before treatment and repeat periodically if treatment duration longer than 1 year.
  - ▶ Manufacturer advises monitor for signs of mucosal bleeding and anaemia in patients at increased risk; treatment should be stopped if severe bleeding occurs.
  - ▶ No routine anticoagulant monitoring required (INR tests are unreliable).
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ Edoxaban for treating and preventing deep vein thrombosis and pulmonary embolism (August 2015) NICE TA354 Edoxaban (*Lixiana*®) is recommended as an option for treating and preventing recurrent deep vein thrombosis and pulmonary embolism. [www.nice.org.uk/guidance/ta354](http://www.nice.org.uk/guidance/ta354)
  - ▶ Edoxaban for preventing stroke and systemic embolism in non-valvular atrial fibrillation (September 2015) NICE TA355 Edoxaban (*Lixiana*®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation, with one or more of the following risk factors:
    - previous stroke or transient ischaemic attack

- congestive heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of edoxaban treatment compared to warfarin, apixaban, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

[www.nice.org.uk/TA355](http://www.nice.org.uk/TA355)

#### ● MEDICINAL FORMS

## Fondaparinux sodium

- **DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

#### ● INDICATIONS AND DOSE

**Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery**

- ▶ BY SUBCUTANEOUS INJECTION

▶ Adult: Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily

**Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness**

- ▶ BY SUBCUTANEOUS INJECTION

▶ Adult: 2.5 mg once daily

**Treatment of superficial-vein thrombosis**

- ▶ BY SUBCUTANEOUS INJECTION

▶ Adult (body-weight 50 kg and above): 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively

**Treatment of unstable angina and non-ST-segment elevation myocardial infarction**

- ▶ BY SUBCUTANEOUS INJECTION

▶ Adult: 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

**Treatment of ST-segment elevation myocardial infarction**

- ▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

**Treatment of deep-vein thrombosis and pulmonary embolism**

- ▶ BY SUBCUTANEOUS INJECTION

▶ Adult (body-weight up to 50 kg): 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)

▶ Adult (body-weight 50–100 kg): 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is continued →

started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR  $\geq 2$  for at least 24 hours)

- ▶ **Adult** (body-weight 101 kg and above): 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR  $\geq 2$  for at least 24 hours)

- **CONTRA-INDICATIONS** Active bleeding · bacterial endocarditis
- **CAUTIONS** Active gastro-intestinal ulcer disease · bleeding disorders · brain surgery · elderly patients · low body-weight · ophthalmic surgery · recent intracranial haemorrhage · risk of catheter thrombus during percutaneous coronary intervention · spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) · spinal surgery
- **INTERACTIONS** → Appendix 1 (fondaparinux). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · bleeding · purpura
  - ▶ **Uncommon** Chest pain · dyspnoea · gastro-intestinal disturbances · hepatic impairment · oedema · pruritus · rash · thrombocythaemia · thrombocytopenia
  - ▶ **Rare** Anxiety · confusion · cough · dizziness · drowsiness · flushing · headache · hyperbilirubinaemia · hypokalaemia · hypotension · injection-site reactions · vertigo
  - ▶ **Frequency not known** Atrial fibrillation · pyrexia · tachycardia
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution in severe impairment (increased risk of bleeding).
- **RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.
  - ▶ When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m<sup>2</sup>.
  - ▶ When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Avoid if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>.
  - ▶ When used for treatment of venous thromboembolism Use with caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Arixtra<sup>®</sup>), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

#### ● MEDICINAL FORMS

Arixtra 1.5mg/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £62.79 (Hospital only)

**Fondaparinux sodium 12.5 mg per 1 ml** Arixtra 7.5mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53

Arixtra 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53

Arixtra 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53

## Rivaroxaban

- **DRUG ACTION** Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

#### ● INDICATIONS AND DOSE

##### Prophylaxis of venous thromboembolism following knee replacement surgery

###### ▶ BY MOUTH

- ▶ **Adult:** 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery

##### Prophylaxis of venous thromboembolism following hip replacement surgery

###### ▶ BY MOUTH

- ▶ **Adult:** 10 mg once daily for 5 weeks, to be started 6–10 hours after surgery

##### Initial treatment of deep-vein thrombosis | Initial treatment of pulmonary embolism

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 15 mg twice daily for 21 days, to be taken with food

##### Continued treatment of deep-vein thrombosis (following initial treatment) | Continued treatment of pulmonary embolism (following initial treatment) | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism

###### ▶ BY MOUTH

- ▶ **Adult:** 20 mg once daily, to be taken with food

##### Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age $\geq 75$ years, or diabetes mellitus

###### ▶ BY MOUTH

- ▶ **Adult:** 20 mg once daily, to be taken with food

##### Prophylaxis of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers (in combination with aspirin alone or aspirin and clopidogrel)

###### ▶ BY MOUTH

- ▶ **Adult:** 2.5 mg twice daily usual duration 12 months

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ For information on changing from, or to, other anticoagulants—consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · in *acute coronary syndrome*—previous stroke · in *acute coronary syndrome*—transient ischaemic attack · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) · bronchiectasis · prosthetic heart valve (efficacy not established) · risk of

bleeding · rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy · severe hypertension · vascular retinopathy

● **INTERACTIONS** → Appendix 1 (rivaroxaban).

Caution in concomitant use of drugs that increase risk of bleeding.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dizziness · dyspepsia · haemorrhage · headache · hypotension · nausea · pain in extremities · pruritus · rash · renal impairment · vomiting
- ▶ **Uncommon** Angioedema · dry mouth · malaise · syncope · tachycardia · thrombocythaemia
- ▶ **Rare** Jaundice · oedema

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Avoid in liver disease with coagulopathy.

● **RENAL IMPAIRMENT** When used for *treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism*, initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15–49 mL/minute. For *prophylaxis of stroke and systemic embolism in atrial fibrillation*, reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute. When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery and prophylaxis of atherothrombotic events in acute coronary syndrome*, use with caution if creatinine clearance 15–29 mL/minute.

Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).

Avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance.

● **MONITORING REQUIREMENTS**

- ▶ Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- ▶ No routine anticoagulant monitoring required (INR tests are unreliable).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water or apple puree just before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ **Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009)** NICE TA170

Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

[www.nice.org.uk/TA170](http://www.nice.org.uk/TA170)

- ▶ **Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation (May 2012)** NICE TA256
- Rivaroxaban is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors:

- previous stroke or transient ischaemic attack
- congestive heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient.

[www.nice.org.uk/TA256](http://www.nice.org.uk/TA256)

- ▶ **Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism (July 2012)** NICE TA261

Rivaroxaban is an option for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis.

[www.nice.org.uk/TA261](http://www.nice.org.uk/TA261)

- ▶ **Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013)** NICE TA287

Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults.

[www.nice.org.uk/TA287](http://www.nice.org.uk/TA287)

- ▶ **Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015)** NICE TA335

Rivaroxaban is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient's risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient.

A decision on continuation of treatment should be taken no later than 12 months after starting treatment.

[www.nice.org.uk/TA335](http://www.nice.org.uk/TA335)

● **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2012) that rivaroxaban (*Xarelto*®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## ANTITHROMBOTIC DRUGS > HEPARINOIDS

### Danaparoid sodium

#### ● INDICATIONS AND DOSE

##### Prevention of deep-vein thrombosis in general or orthopaedic surgery

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery

##### Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

###### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- ▶ Adult (body-weight 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- ▶ Adult (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

- **CONTRA-INDICATIONS** Active peptic ulcer (unless this is the reason for operation) · acute bacterial endocarditis · diabetic retinopathy · epidural anaesthesia (with treatment doses) · haemophilia and other haemorrhagic disorders · recent cerebral haemorrhage · severe hypertension · spinal anaesthesia (with treatment doses) · thrombocytopenia (unless patient has heparin-induced thrombocytopenia)
- **CAUTIONS** Antibodies to heparins (risk of antibody-induced thrombocytopenia) · body-weight over 90 kg · recent bleeding · risk of bleeding
- **INTERACTIONS** → Appendix 1 (danaparoid). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS** Bleeding · hypersensitivity reactions · rash
- **PREGNANCY** Manufacturer advises avoid—limited information available but not known to be harmful.
- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.
- **RENAL IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available. Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.
- **MONITORING REQUIREMENTS** Monitor anti factor Xa activity in patients with body-weight over 90 kg.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Orgaran*®), give continuously in Glucose 5% or Sodium chloride 0.9%.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

###### ▶ Danaparoid sodium (Non-proprietary)

Danaparoid sodium 1250 unit per 1 ml Danaparoid sodium 750units/0.6ml solution for injection ampoules | 10 ampoule [PoM] £599.99

## ANTITHROMBOTIC DRUGS > HEPARINS

### Heparins

- **CONTRA-INDICATIONS** Acute bacterial endocarditis · after major trauma · epidural anaesthesia with treatment doses · haemophilia and other haemorrhagic disorders · peptic ulcer · recent cerebral haemorrhage · recent surgery to eye · recent surgery to nervous system · severe hypertension · spinal anaesthesia with treatment doses · thrombocytopenia (including history of heparin-induced thrombocytopenia)
- **CAUTIONS** Elderly
- **INTERACTIONS** → Appendix 1 (heparins). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Rare** Alopecia (on prolonged use) · anaphylaxis · angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · osteoporosis (risk lower with low molecular weight heparins) · priapism · rebound hyperlipidaemia (following unfractionated heparin withdrawal) · skin necrosis · urticaria
  - ▶ **Frequency not known** Haemorrhage · thrombocytopenia
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Haemorrhage** If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).
  - ▶ **Heparin-induced thrombocytopenia** Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be **stopped** and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.
  - ▶ **Hyperkalaemia** Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to unfractionated or low molecular weight heparin.
- **MONITORING REQUIREMENTS**
  - ▶ **Heparin-induced thrombocytopenia** Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology's Guidelines on the diagnosis and management of heparin-

induced thrombocytopenia: second edition. *Br J Haematol* 2012; **159**: 528–540.

- ▶ **Hyperkalaemia** Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

F 122

## Dalteparin sodium

### ● INDICATIONS AND DOSE

#### FRAGMIN®

**Treatment of deep-vein thrombosis, with oral anticoagulant treatment | Treatment of pulmonary embolism, with oral anticoagulant treatment**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation established

**Treatment of deep-vein thrombosis, with oral anticoagulant treatment (in patients at increased risk of haemorrhage) | Treatment of pulmonary embolism, with oral anticoagulant treatment (in patients at increased risk of haemorrhage)**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 100 units/kg twice daily until adequate oral anticoagulation established

**Unstable coronary artery disease**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days

**Prevention of clotting in extracorporeal circuits**

##### ▶ TO THE DEVICE AS A FLUSH

- ▶ Adult: (consult product literature)

#### FRAGMIN® GRADUATED SYRINGES

**Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

**Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 70 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight up to 80 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days).

#### FRAGMIN® SINGLE-DOSE SYRINGES

**Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

**Prophylaxis of deep-vein thrombosis in surgical patients—high risk**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by

2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

**Prophylaxis of deep-vein thrombosis in medical patients**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 5000 units every 24 hours

**Treatment of deep-vein thrombosis, with oral anticoagulant treatment | Treatment of pulmonary embolism, with oral anticoagulant treatment**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 46 kg): 7500 units once daily until adequate oral anticoagulation established
- ▶ Adult (body-weight 46–56 kg): 10 000 units once daily until adequate oral anticoagulation established
- ▶ Adult (body-weight 57–68 kg): 12 500 units once daily until adequate oral anticoagulation established
- ▶ Adult (body-weight 69–82 kg): 15 000 units once daily until adequate oral anticoagulation established
- ▶ Adult (body-weight 83 kg and above): 18 000 units once daily until adequate oral anticoagulation established

**Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight 40–45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 46–56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 57–68 kg): 12 500 units once daily for 30 days, then 10 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 69–82 kg): 15 000 units once daily for 30 days, then 12 500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 83–98 kg): 18 000 units once daily for 30 days, then 15 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 99 kg and above): 18 000 units once daily for 30 days, then 18 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

**Treatment of venous thromboembolism in pregnancy**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.

- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Dose reduction may be required in severe impairment—risk of bleeding may be increased.
- **RENAL IMPAIRMENT** Risk of bleeding may be increased—dose reduction may be required. Use of unfractionated heparin may be preferable.
- **MONITORING REQUIREMENTS**
  - ▶ For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.
  - ▶ Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are overweight or overweight).
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (February 2011) that dalteparin (*Fragmin*<sup>®</sup>) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism and prevention of its recurrence in patients with solid tumours.

#### • MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

##### ▶ **Fragmin** (Pfizer Ltd)

**Dalteparin sodium 2500 unit per 1 ml** Fragmin 10,000units/4ml solution for injection ampoules | 10 ampoule [PoM] £51.22

**Dalteparin sodium 10000 unit per 1 ml** Fragmin 10,000units/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.23

Fragmin 10,000units/1ml solution for injection ampoules | 10 ampoule [PoM] £51.22

**Dalteparin sodium 12500 unit per 1 ml** Fragmin 2,500units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £18.58

**Dalteparin sodium 25000 unit per 1 ml** Fragmin 18,000units/0.72ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £50.82

Fragmin 15,000units/0.6ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £42.34

Fragmin 5,000units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £28.23

Fragmin 12,500units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £35.29

Fragmin 7,500units/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £42.34

Fragmin 100,000units/4ml solution for injection vials | 1 vial [PoM] £48.66

Fragmin 10,000units/0.4ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.23

## Enoxaparin sodium

#### • INDICATIONS AND DOSE

##### Treatment of venous thromboembolism in pregnancy

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight

- ▶ Adult (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

##### Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

##### Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

##### Prophylaxis of deep-vein thrombosis in medical patients

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 40 mg every 24 hours

##### Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

##### Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)

###### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only

##### Treatment of acute ST-segment elevation myocardial infarction (patients undergoing percutaneous coronary intervention)

###### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

###### ▶ INITIALLY BY SUBCUTANEOUS INJECTION

- ▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

##### Unstable angina | Non-ST-segment-elevation myocardial infarction

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 1 mg/kg every 12 hours usually for 2–8 days (minimum 2 days)

##### Prevention of clotting in extracorporeal circuits

###### ▶ TO THE DEVICE AS A FLUSH

- ▶ Adult: (consult product literature)

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mg equivalent to 100 units.

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.

- **CAUTIONS** Low body-weight (increased risk of bleeding)
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight of enoxaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Risk of bleeding increased; reduce dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—consult product literature for details. Use of unfractionated heparin may be preferable.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).
- **DIRECTIONS FOR ADMINISTRATION** When administered in conjunction with a thrombolytic, enoxaparin should be given between 15 minutes before and 30 minutes after the start of thrombolytic therapy.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

##### ▶ Clexane (Sanofi)

- Enoxaparin sodium 100 mg per 1 ml Clexane 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £39.26 DT price = £39.26
- Clexane 300mg/3ml solution for injection multidose vials | 1 vial [PoM] £21.33
- Clexane 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £55.13 DT price = £55.13
- Clexane 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £30.27 DT price = £30.27
- Clexane 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £72.30 DT price = £72.30
- Clexane 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £20.86 DT price = £20.86
- Enoxaparin sodium 150 mg per 1 ml Clexane Forte 120mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £87.93 DT price = £87.93
- Clexane Forte 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £99.91 DT price = £99.91

F 122

## Heparin (unfractionated)

#### ● INDICATIONS AND DOSE

**Treatment of mild to moderate pulmonary embolism | Treatment of unstable angina | Treatment of acute peripheral arterial occlusion**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

##### **Treatment of severe pulmonary embolism**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

#### **Treatment of deep-vein thrombosis**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

#### **Thromboprophylaxis in medical patients**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 5000 units every 8–12 hours

#### **Thromboprophylaxis in surgical patients**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8–12 hours

#### **Thromboprophylaxis during pregnancy**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 5000–10 000 units every 12 hours, to be administered with monitoring, **Important:** prevention of prosthetic heart-valve thrombosis in pregnancy calls for **specialist management**

#### **Haemodialysis**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour

#### **Prevention of clotting in extracorporeal circuits**

##### ▶ TO THE DEVICE AS A FLUSH

- ▶ Adult: (consult product literature)

#### **To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices**

##### ▶ TO THE DEVICE AS A FLUSH

- ▶ Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use

- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- **BREAST FEEDING** Not excreted into milk due to high molecular weight.
- **HEPATIC IMPAIRMENT** Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).
- **RENAL IMPAIRMENT** Risk of bleeding increased in severe impairment—dose may need to be reduced.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses listed take into account the guidelines of the British Society for Haematology.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

#### **Solution for injection**

EXCIPIENTS: May contain Benzyl alcohol

##### ▶ Heparin (unfractionated) (Non-proprietary)

- Heparin sodium 1000 unit per 1 ml Heparin sodium 1,000units/1ml solution for injection ampoules | 10 ampoule [PoM] £14.85
- Heparin sodium 5,000units/5ml solution for injection vials | 10 vial [PoM] £16.50-£37.41

## Tinzaparin sodium

### ● INDICATIONS AND DOSE

#### INNOHEP® 10,000 UNITS/ML

#### Prophylaxis of deep-vein thrombosis (general surgery)

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 3500 units for 1 dose, dose to be given 2 hours before surgery, then 3500 units every 24 hours

#### Prophylaxis of deep-vein thrombosis (orthopaedic surgery)

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg for 1 dose, dose to be given 2 hours before surgery, then 50 units/kg every 24 hours, alternatively initially 4500 units for 1 dose, dose to be given 12 hours before surgery, then 4500 units every 24 hours

#### Prevention of clotting in extracorporeal circuits

##### ▶ TO THE DEVICE AS A FLUSH

- Adult: (consult product literature)

#### INNOHEP® 20,000 UNITS/ML

#### Extended treatment of venous thromboembolism in patients with solid tumours | Prophylaxis of venous thromboembolism in patients with solid tumours

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily for up to 6 months

#### Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily until adequate oral anticoagulation established, treatment regimens do not require anticoagulation monitoring

#### Treatment of venous thromboembolism in pregnancy

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

- **UNLICENSED USE** Not licensed for the treatment of venous thromboembolism in pregnancy.

### ● SIDE-EFFECTS

#### ▶ Uncommon Headache

- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

- **BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.

- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Risk of bleeding may be increased. Unfractionated heparin may be preferable. In renal impairment monitoring of anti-Factor Xa may be required if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with tinzaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

## ANTITHROMBOTIC DRUGS > THROMBIN INHIBITORS, DIRECT

### Argatroban monohydrate

### ● INDICATIONS AND DOSE

#### Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment

##### ▶ INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased to up to 10 micrograms/kg/minute maximum duration of treatment 14 days

#### Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)

##### ▶ BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: (consult product literature)

### Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

#### ► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Reduced to 2 micrograms/kg/minute, dose should be temporarily reduced and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

- **CAUTIONS** Bleeding disorders · diabetic retinopathy · gastro-intestinal ulceration · immediately after lumbar puncture · major surgery (especially of brain, spinal cord, or eye) · risk of bleeding · severe hypertension · spinal anaesthesia
- **INTERACTIONS** → Appendix 1 (argatroban). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - **Common or very common** Haemorrhage · nausea · purpura
  - **Uncommon** Alopecia · constipation · deafness · diarrhoea · dizziness · fever · gastritis · headache · hepatic failure · hepatomegaly · hiccups · hyperbilirubinaemia · hypertension · hypoglycaemia · hyponatraemia · hypotension · malaise · muscle weakness · myalgia · rash · renal impairment · sweating · syncope · tachycardia · visual disturbance · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce initial dose to 500 nanograms/kg/minute in moderate impairment. Avoid in severe impairment or in patients with hepatic impairment undergoing percutaneous coronary intervention.
- **MONITORING REQUIREMENTS** Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Exembo<sup>®</sup>) give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute each 2.5-mL vial with 250 mL infusion fluid.

#### ● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for infusion**

EXCIPIENTS: May contain Ethanol

- **Exembo** (Mitsubishi Tanabe Pharma Europe Ltd)

Argatroban monohydrate 100 mg per 1 mL Exembo 250mg/2.5mL concentrate for solution for infusion vials | 1 vial [POM] no price available

## Bivalirudin

- **DRUG ACTION** Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

#### ● **INDICATIONS AND DOSE**

### Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel)

#### ► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour (for up to 72 hours in medically managed patients)

### Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass

#### ► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg for 1 dose, then (by intravenous injection) 500 micrograms/kg for 1 dose, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4–12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin

### Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)

#### ► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion) 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour for a further 4–12 hours if necessary

- **CONTRA-INDICATIONS** Active bleeding · bleeding disorders · severe hypertension · subacute bacterial endocarditis
- **CAUTIONS** Brachytherapy procedures · previous exposure to lepirudin (theoretical risk from lepirudin antibodies)
- **INTERACTIONS** → Appendix 1 (bivalirudin). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - **Common or very common** Bleeding (discontinue) · ecchymosis
  - **Uncommon** Allergic reactions · anaemia · headache · hypotension · isolated reports of anaphylaxis · nausea · thrombocytopenia
  - **Rare** Back pain · bradycardia · dyspnoea · tachycardia · thrombosis · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT**
  - Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
  - When used for percutaneous coronary intervention Reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> and monitor blood clotting parameters.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Angio<sup>®</sup>), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230 Bivalirudin in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. [www.nice.org.uk/TA230](http://www.nice.org.uk/TA230)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2008) that bivalirudin (*Angiox*<sup>®</sup>) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

The *Scottish Medicines Consortium* has advised (August 2010) that bivalirudin (*Angiox*<sup>®</sup>) is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

**MEDICINAL FORMS**

Bivalirudin 250 mg Angiox 250mg powder for solution for injection vials | 10 vial [PoM] | no price available

**Dabigatran etexilate**

- ▶ **DRUG ACTION** Dabigatran etexilate is a direct thrombin inhibitor with a rapid onset of action.

**INDICATIONS AND DOSE****Prophylaxis of venous thromboembolism following total knee replacement surgery**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 110 mg, to be taken 1-4 hours after surgery, followed by 220 mg once daily for 9 days, to be taken 12-24 hours after initial dose
- ▶ Adult 75 years and over: 75 mg, to be taken 1-4 hours after surgery, followed by 150 mg once daily for 9 days, to be taken 12-24 hours after initial dose

**Prophylaxis of venous thromboembolism following total knee replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 110 mg, to be taken 1-4 hours after surgery, followed by 150 mg once daily for 9 days, to be taken 12-24 hours after initial dose
- ▶ Adult 75 years and over: 75 mg, to be taken 1-4 hours after surgery, followed by 150 mg once daily for 9 days, to be taken 12-24 hours after initial dose

**Prophylaxis of venous thromboembolism following total hip replacement surgery**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 110 mg, to be taken 1-4 hours after surgery, followed by 220 mg once daily for 27-34 days, to be taken 12-24 hours after initial dose
- ▶ Adult 75 years and over: 75 mg, to be taken 1-4 hours after surgery, followed by 150 mg once daily for 27-34 days, to be taken 12-24 hours after initial dose

**Prophylaxis of venous thromboembolism following total hip replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 110 mg, to be taken 1-4 hours after surgery, followed by 150 mg daily for 27-34 days, to be taken 12-24 hours after initial dose
- ▶ Adult 75 years and over: 75 mg, to be taken 1-4 hours after surgery, followed by 150 mg once daily for 27-34 days, to be taken 12-24 hours after initial dose

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- ▶ Adult 75-79 years: 110-150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- ▶ Adult 80 years and over: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

**Treatment of deep-vein thrombosis in patients with moderate renal impairment | Treatment of deep-vein thrombosis in patients at increased risk of bleeding | Treatment of pulmonary embolism in patients with moderate renal impairment | Treatment of pulmonary embolism in patients at increased risk of bleeding | Prophylaxis of recurrent deep-vein thrombosis in patients with moderate renal impairment | Prophylaxis of recurrent deep-vein thrombosis in patients at increased risk of bleeding | Prophylaxis of recurrent pulmonary embolism in patients with moderate renal impairment | Prophylaxis of recurrent pulmonary embolism in patients at increased risk of bleeding**

- ▶ BY MOUTH
- ▶ Adult: 110-150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

**Treatment of deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Treatment of pulmonary embolism in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent pulmonary embolism in patients receiving concomitant treatment with verapamil**

- ▶ BY MOUTH
- ▶ Adult: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension**

- ▶ BY MOUTH
- ▶ Adult 18-74 years: 150 mg twice daily
- ▶ Adult 75-79 years: 110-150 mg twice daily
- ▶ Adult 80 years and over: 110 mg twice daily

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients receiving concomitant treatment with verapamil**

- ▶ BY MOUTH
- ▶ Adult: 110 mg twice daily

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension, in patients at increased risk of bleeding | Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension, in patients with moderate renal impairment**

- ▶ BY MOUTH
- ▶ Adult: 110-150 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For information on changing from, or to, other anticoagulants, consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · do not use as anticoagulant for prosthetic heart valve · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs) · bacterial endocarditis · bleeding disorders · body-weight less than 50 kg · elderly · gastritis · gastro-oesophageal reflux · oesophagitis · recent biopsy · recent major trauma · thrombocytopenia
- **INTERACTIONS** → Appendix 1 (dabigatran). Caution in concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anaemia · diarrhoea · dyspepsia · haemorrhage · nausea
  - ▶ **Uncommon** Dysphagia · gastro-intestinal ulcer · gastro-oesophageal reflux · hepatobiliary disorders · oesophagitis · thrombocytopenia · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal studies*.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease, especially if prothrombin time already prolonged.
- **RENAL IMPAIRMENT** When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery*, reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil. When used for *treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation*, consider reduced dose of 110 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding.  
Avoid if creatinine clearance less than 30 mL/minute. In renal impairment monitor renal function at least annually (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance).
- **MONITORING REQUIREMENTS**
  - ▶ Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
  - ▶ No routine anticoagulant monitoring required (INR tests are unreliable).
  - ▶ Assess renal function (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.
- **DIRECTIONS FOR ADMINISTRATION** When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.
- **PRESCRIBING AND DISPENSING INFORMATION** Dabigatran etexilate, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma,

immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deep-vein thrombosis or pulmonary embolism.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008)** NICE TA157  
Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.  
[www.nice.org.uk/TA157](http://www.nice.org.uk/TA157)
- ▶ **Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012)** NICE TA249  
Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:
  - previous stroke, transient ischaemic attack, or systemic embolism
  - left ventricular ejection fraction <40%
  - symptomatic heart failure
  - age ≥ 75 years
  - age ≥ 65 years in patients with diabetes mellitus, coronary artery disease, or hypertension
 The risks and benefits of dabigatran compared to warfarin should be discussed with the patient.  
[www.nice.org.uk/TA249](http://www.nice.org.uk/TA249)
- ▶ **Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and /or pulmonary embolism (December 2014)** NICE TA327  
Dabigatran etexilate is recommended, within its marketing authorisation, as an option for treating and for preventing recurrent deep vein thrombosis and pulmonary embolism in adults.  
[www.nice.org.uk/TA327](http://www.nice.org.uk/TA327)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 25

## ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

£ 204

### Urokinase

#### ● INDICATIONS AND DOSE

##### Deep-vein thrombosis (thromboembolic occlusive vascular disease)

##### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

##### Pulmonary embolism (thromboembolic occlusive vascular disease)

##### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

continued →

**Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)**

- ▶ BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

**Occluded central venous catheters (blocked by fibrin clots)**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/mL; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

**Occluded arteriovenous haemodialysis shunts (blocked by fibrin clots)**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

**SYNER-KINASE®****Deep-vein thrombosis (thromboembolic occlusive vascular disease)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

**Pulmonary embolism (thromboembolic occlusive vascular disease)**

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by (by intravenous infusion) 4400 micrograms/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses adjusted according to response; maximum 3 doses per day

**Occlusive peripheral arterial disease**

- ▶ BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

**Occluded intravenous catheters and cannulas (blocked by fibrin clots)**

- ▶ BY INTRA-ARTERIAL INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Dose reduction may be required.
- **RENAL IMPAIRMENT** Dose reduction may be required.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Syner-KINASE®*), give continuously or intermittently in Sodium chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection****▶ Urokinase (Non-proprietary)**

**Urokinase 10000 unit** Urokinase 10,000unit powder for solution for injection vials | 1 vial [PoM] £33.79

**Urokinase 50000 unit** Urokinase 50,000unit powder for solution for injection vials | 1 vial [PoM] £69.70

**Urokinase 100000 unit** Urokinase 100,000unit powder for solution for injection vials | 1 vial [PoM] £106.17

**Urokinase 250000 unit** Urokinase 250,000unit powder for solution for injection vials | 1 vial [PoM] £185.65

**Urokinase 500000 unit** Urokinase 500,000unit powder for solution for injection vials | 1 vial [PoM] £365.00

**▶ Syner-KINASE** (Syner-Med (Pharmaceutical Products) Ltd)

**Urokinase 10000 unit** Syner-KINASE 10,000unit powder for solution for injection vials | 1 vial [PoM] £35.95 (Hospital only)

**Urokinase 25000 unit** Syner-KINASE 25,000unit powder for solution for injection vials | 1 vial [PoM] £45.95 (Hospital only)

**Urokinase 100000 unit** Syner-KINASE 100,000unit powder for solution for injection vials | 1 vial [PoM] £112.95 (Hospital only)

**Urokinase 250000 unit** Syner-KINASE 250,000unit powder for solution for injection vials | 1 vial [PoM] no price available (Hospital only)

**Urokinase 500000 unit** Syner-KINASE 500,000unit powder for solution for injection vials | 1 vial [PoM] no price available (Hospital only)

**ANTITHROMBOTIC DRUGS > VITAMIN K ANTAGONISTS****Vitamin K antagonists**

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum · haemorrhagic stroke · significant bleeding
- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) · conditions in which risk of bleeding is increased · history of gastrointestinal bleeding · peptic ulcer · postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) · recent ischaemic stroke · recent surgery · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (coumarins, phenindione). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may affect warfarin control. Caution if concomitant use of drugs that increase risk of bleeding. Avoid cranberry juice.
- **SIDE-EFFECTS** Alopecia · diarrhoea · haemorrhage · hepatic dysfunction · jaundice · nausea · pancreatitis · purpura · pyrexia · rash · skin necrosis (increased risk in patients with protein C or protein S deficiency) · vomiting · ‘purple toes’
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.
- **PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.
- **MONITORING REQUIREMENTS**
  - ▶ The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
  - ▶ It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
  - ▶ Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.
- **PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In **England, Wales, and Northern Ireland**, they are available for purchase from:

3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham  
OL9 9QH  
Tel: 0845 610 1112  
GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com).  
In **Scotland**, treatment booklets and starter information packs can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on (0131) 6299 967  
Electronic copies of the booklets and further advice are also available at [www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant](http://www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant).

## Acenocoumarol

(Nicoumalone)

### ● INDICATIONS AND DOSE

**Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks**

#### ▶ BY MOUTH

- Adult: Initially 2–4 mg once daily for 2 days, alternatively initially 6 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, liver disease, severe heart failure with hepatic congestion, and malnutrition

- **CAUTIONS** Patients over 65 years
- **SIDE-EFFECTS**
  - ▶ **Rare** Anorexia
  - ▶ **Very rare** Vasculitis
- **BREAST FEEDING** Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment, especially if prothrombin time is already prolonged.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
**Tablet**  
CAUTIONARY AND ADVISORY LABELS 10
  - ▶ **Acenocoumarol (Non-proprietary)**  
**Acenocoumarol 1 mg** Acenocoumarol 1mg tablets | 100 tablet [PoM] no price available DT price = £4.62
  - ▶ **Sinthrome** (Merus Labs Luxco S.a.R.L.)  
**Acenocoumarol 1 mg** Sinthrome 1mg tablets | 100 tablet [PoM] £4.62 DT price = £4.62

## Phenindione

### ● INDICATIONS AND DOSE

**Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism**

#### ▶ BY MOUTH

- Adult: Initially 200 mg on day 1, then 100 mg on day 2, then, adjusted according to response; maintenance 50–150 mg daily
- **SIDE-EFFECTS** Agranulocytosis · eosinophilia · exanthema · exfoliative dermatitis · fever · hypersensitivity reactions · leucopenia · micro-adenopathy · renal damage · urine coloured pink or orange
- **BREAST FEEDING** Avoid. Risk of haemorrhage; increased by vitamin K deficiency.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.  
Patient counselling is advised for phenindione tablets (may turn urine pink or orange).
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
**Tablet**  
CAUTIONARY AND ADVISORY LABELS 10, 14
  - ▶ **Phenindione (Non-proprietary)**  
**Phenindione 10 mg** Phenindione 10mg tablets | 28 tablet [PoM] £519.98 DT price = £519.98
  - Phenindione 25 mg** Phenindione 25mg tablets | 28 tablet [PoM] £519.98 DT price = £519.98
  - Phenindione 50 mg** Phenindione 50mg tablets | 28 tablet [PoM] £51.84

## Warfarin sodium

10-Oct-2016

### ● INDICATIONS AND DOSE

**Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks**

#### ▶ BY MOUTH

- Adult: Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time, reported as INR (international normalised ratio), a lower induction dose can be given over 3–4 weeks in patients who do not require rapid anticoagulation, elderly patients to be given a lower induction dose; maintenance 3–9 mg daily, to be taken at the same time each day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: WARFARIN: REPORTS OF CALCIPHYLAXIS (JULY 2016)

An EU-wide review has concluded that on rare occasions, warfarin use may lead to calciphylaxis—patients should be advised to consult their doctor if they develop a painful skin rash; if calciphylaxis is diagnosed, appropriate treatment should be started and consideration should be given to stopping treatment with warfarin. The MHRA has advised that calciphylaxis is most commonly observed in patients with known risk factors such as end-stage renal disease, however cases have also been reported in patients with normal renal function.

- **SIDE-EFFECTS** Calciphylaxis
- **PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytonadione (vitamin K<sub>1</sub>).
- **BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. In severe renal impairment, monitor INR more frequently.
- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

**Warfarin sodium 1 mg per 1 ml** Warfarin 1mg/ml oral suspension sugar free sugar-free | 150 ml [PoM] £108.00 DT price = £108.00

## Thresholds and targets for treatment

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:

- Clinic blood pressure 140/90 mmHg or higher, *and* ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk  $\geq 20\%$ ; in the absence of these conditions, advise lifestyle changes and review annually. For patients under 40 years with stage 1 hypertension but **no** overt target-organ damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension

Stage 2 hypertension:

- Clinic blood pressure 160/100 mmHg or higher, *and* ambulatory daytime average or home blood pressure average 150/95 mmHg or higher

- Treat all patients who have stage 2 hypertension, regardless of age

Severe hypertension:

- Clinic systolic blood pressure  $\geq 180$  mmHg or clinic diastolic blood pressure  $\geq 110$  mmHg; treat promptly—see Hypertensive Crises, below.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient's waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly, below. A target clinic blood pressure below 130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

## Drug treatment of hypertension

A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment. Response to drug treatment may be affected by age and ethnicity.

### Patients under 55 years:

Step 1

- **ACE inhibitor**; if not tolerated, offer an **angiotensin-II receptor antagonist**. If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a **beta-blocker**; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes

Step 2

- ACE inhibitor or angiotensin-II receptor antagonist in combination with a **calcium-channel blocker**. If a calcium-channel blocker is not tolerated or if there is

## 4 Blood pressure conditions

### 4.1 Hypertension

#### Hypertension

##### Overview

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127 (August 2011), Hypertension—Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

evidence of, or a high risk of, heart failure, give a **thiazide-related diuretic** (e.g. chlortalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiazide-related diuretic (see Step 1)

Step 3

- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker *and* a thiazide-related diuretic
- Step 4 (resistant hypertension)
- Consider seeking specialist advice
- Add low-dose **spironolactone** [unlicensed indication], or use high-dose thiazide related diuretic if plasma-potassium concentration above 4.5 mmol/litre
- Monitor renal function and electrolytes
- If additional diuretic therapy is contra-indicated, ineffective, or not tolerated, consider an **alpha-blocker** or a beta-blocker

**Patients over 55 years, and patients of any age who are of African or Caribbean family origin:**

Step 1

- Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide)
- Step 2
- Calcium-channel blocker *or* thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin)
- Steps 3 and 4
- Treat as for patients under 55 years

### Other measures to reduce cardiovascular risk

Aspirin p. 114 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. For the role of aspirin in the prevention of stroke in patients with atrial fibrillation, see Arrhythmias p. 93.

Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

### Hypertension in the elderly

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient's waking hours) is below 145/85 mmHg.

### Isolated systolic hypertension

Isolated systolic hypertension (systolic pressure  $\geq 160$  mmHg, diastolic pressure  $< 90$  mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

### Hypertension in diabetes

For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

### Hypertension in renal disease

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

### Hypertension in pregnancy

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol hydrochloride p. 140 is widely used for treating hypertension in pregnancy. Methyldopa p. 136 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 153 [unlicensed] are also used.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of  $< 150/100$  mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of  $< 140/90$  mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 114 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged  $\geq 40$  years, pregnancy interval  $> 10$  years, BMI  $\geq 35$  kg/m<sup>2</sup> at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with

oral labetalol hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol hydrochloride is unsuitable, methyl dopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyl dopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of  $\geq 160/110$  mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 171, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg.

Also see use of magnesium sulfate p. 924 in pre-eclampsia and eclampsia.

### Hypertensive crises

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A *hypertensive emergency* is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside p. 173 [unlicensed], nicardipine hydrochloride p. 152, labetalol hydrochloride, glyceryl trinitrate p. 207, phentolamine mesilate p. 173, hydralazine hydrochloride, or esmolol hydrochloride p. 145; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure  $\geq 180/110$  mmHg) without acute target-organ damage is defined as a *hypertensive urgency*; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calcium-channel blockers amlodipine p. 147 or felodipine p. 150. Use of sublingual nifedipine is not recommended.

Also see advice on short-term management of hypertensive episodes in pheochromocytoma.

### Pheochromocytoma

Long-term management of pheochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in pheochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred.

Phenoxybenzamine hydrochloride p. 172, a powerful alpha-blocker, is effective in the management of pheochromocytoma but it has many side-effects. Phentolamine mesilate is a short-acting alpha-blocker used mainly during surgery of pheochromocytoma; its use for the diagnosis of pheochromocytoma has been superseded by measurement of catecholamines in blood and urine.

**Metirosine** (available from 'special-order' manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of pheochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor

blocking drug may also be required. Metirosine should **not** be used to treat essential hypertension.

## Antihypertensive drugs

### Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 171 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 173 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 172 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 216, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 717, doxazosin p. 716, and terazosin p. 719 have alpha-blocking and vasodilator properties.

Ambrisentan p. 174, bosentan p. 175, iloprost p. 174, macitentan p. 175, sildenafil p. 744, and tadalafil p. 746 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 109 can be used in patients with primary pulmonary hypertension resistant to other treatments. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Riociguat p. 176 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

**Sitaxentan** has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

### Centrally acting antihypertensive drugs

Methyl dopa p. 136 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 136 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 137, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

### Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine monosulfate p. 173, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred.

### Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however,

reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 717, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

#### Prostatic hyperplasia

Alfuzosin hydrochloride p. 715, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 718, and terazosin are indicated for benign prostatic hyperplasia.

## Drugs affecting the renin-angiotensin system

### Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

#### Heart failure

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 180 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

#### Hypertension

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

#### Diabetic nephropathy

ACE inhibitors have a role in the management of diabetic nephropathy.

#### Prophylaxis of cardiovascular events

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

#### Initiation under specialist supervision

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);

- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

#### Renal effects

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

#### ACE inhibitors in combination with other drugs

See also, *Concomitant use of drugs affecting the renin-angiotensin system*, below.

#### Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

#### Combination products

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

### Angiotensin-II receptor antagonists

Azilsartan medoxomil p. 166, candesartan cilexetil p. 166, eprosartan p. 166, irbesartan p. 167, losartan potassium p. 167, olmesartan medoxomil p. 168, telmisartan p. 169, and valsartan p. 170 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

#### Renal effects

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under Angiotensin-converting enzyme inhibitors, above).

#### Renin inhibitor

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

### Concomitant use of drugs affecting the renin-angiotensin system

Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 171 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

## ANTIHYPERTENSIVES, CENTRALLY ACTING

### Clonidine hydrochloride

#### ● INDICATIONS AND DOSE

##### Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 50–100 micrograms 3 times a day, increase dose every second or third day, usual maximum dose 1.2 mg daily

### Prevention of recurrent migraine | Prevention of vascular headache

#### ▶ BY MOUTH

- ▶ Adult: Initially 50 micrograms twice daily for 2 weeks, then increased if necessary to 75 micrograms twice daily

- **UNLICENSED USE** Clonidine may also be used for Tourette syndrome and sedation—unlicensed indications.
- **CONTRA-INDICATIONS** Severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome
- **CAUTIONS** Cerebrovascular disease • constipation • heart failure • history of depression • mild to moderate bradyarrhythmia • polyneuropathy • Raynaud's syndrome or other occlusive peripheral vascular disease
- **INTERACTIONS** → Appendix 1 (clonidine).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Constipation • depression • dizziness • drowsiness • dry mouth • headache • malaise • nausea • postural hypotension • salivary gland pain • sexual dysfunction • sleep disturbances • vomiting
- ▶ **Uncommon** Bradycardia • delusion • hallucination • paraesthesia • pruritus • rash • Raynaud's syndrome • urticaria
- ▶ **Rare** Alopecia • AV block • colonic pseudo-obstruction • decreased lacrimation • gynaecomastia • nasal dryness
- ▶ **Frequency not known** Bradyarrhythmia • confusion • fluid retention • hepatitis • impaired visual accommodation
- **PREGNANCY** May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.
- **BREAST FEEDING** Avoid—present in milk.
- **RENAL IMPAIRMENT** Use with caution in severe impairment—reduce initial dose and increase gradually.
- **TREATMENT CESSATION** In hypertension, must be withdrawn gradually to avoid severe rebound hypertension.
- **PATIENT AND CARER ADVICE**
- ▶ **Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Clonidine is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

#### ▶ Clonidine hydrochloride (Non-proprietary)

**Clonidine hydrochloride 25 microgram** Clonidine 25microgram tablets | 112 tablet **[PoM]** £9.15 DT price = £5.30

#### ▶ Catapres (Boehringer Ingelheim Ltd)

**Clonidine hydrochloride 100 microgram** Catapres 100microgram tablets | 100 tablet **[PoM]** £8.04 DT price = £8.04

#### ▶ Dixarit (Boehringer Ingelheim Ltd)

**Clonidine hydrochloride 25 microgram** Dixarit 25microgram tablets | 112 tablet **[PoM]** £6.99 DT price = £5.30

### Methyldopa

#### ● INDICATIONS AND DOSE

##### Hypertension

#### ▶ BY MOUTH

- ▶ Adult: Initially 250 mg 2–3 times a day, dose should be increased gradually at intervals of at least 2 days; maximum 3 g per day

- **Elderly:** Initially 125 mg twice daily, dose should be increased gradually; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyria p. 930 · depression · phaeochromocytoma
- **CAUTIONS** History of depression
- **INTERACTIONS** → Appendix 1 (methyl dopa).
- **SIDE-EFFECTS** Amenorrhoea · arthralgia · asthenia · Bell's palsy · bone-marrow depression · bradycardia · decreased libido · depression · dizziness · drug fever · dry mouth · eosinophilia · exacerbation of angina · failure of ejaculation · gastro-intestinal disturbances · gynaecomastia · haemolytic anaemia · headache · hepatitis · hyperprolactinaemia · hypersensitivity reactions · impaired mental acuity · impotence · jaundice · leucopenia · lupus erythematosus-like syndrome · mild psychosis · myalgia · myocarditis · nasal congestion · nightmares · oedema · pancreatitis · paraesthesia · parkinsonism · pericarditis · postural hypotension · rashes · sedation · sialadenitis · stomatitis · thrombocytopenia · toxic epidermal necrolysis

#### SIDE-EFFECTS, FURTHER INFORMATION

Side-effects are minimised if the daily dose is kept below 1 g.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in history of liver disease. Avoid in active liver disease.
- **RENAL IMPAIRMENT** Start with small dose. Increased sensitivity to hypotensive and sedative effect.
- **MONITORING REQUIREMENTS** Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.
- **EFFECT ON LABORATORY TESTS** Interference with laboratory tests. Positive direct Coombs' test in up to 20% of patients (may affect blood cross-matching).
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

## BETA-ADRENOCEPTOR BLOCKERS

### Beta-adrenoceptor blocking drugs

#### Overview

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Oxprenolol hydrochloride p. 141, pindolol p. 141, acebutolol p. 143, and celiprolol hydrochloride p. 145 have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol p. 143, celiprolol hydrochloride, nadolol p. 141, and sotalol hydrochloride p. 102 are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol fumarate p. 144, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labetalol hydrochloride p. 140, celiprolol hydrochloride, carvedilol p. 139, and nebivolol p. 146 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate, metoprolol tartrate p. 145, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta<sub>2</sub> (bronchial) receptors and are, therefore, relatively *cardioselective*, but they are not *cardiospecific*. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

### Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with *phaeochromocytoma*. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 172 should always be used together with the beta-blocker.

### Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with *angina* (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

### Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of *myocardial infarction*. However, uncontrolled heart failure, hypotension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol tartrate may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol tartrate, propranolol hydrochloride p. 142, and timolol maleate p. 142 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention.

### Arrhythmias

Beta-blockers act as *anti-arrhythmic drugs* principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 145 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 102, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

### Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 144 and carvedilol p. 139 reduce mortality in any grade of stable heart failure; nebivolol p. 146 is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure.

**Thyrotoxicosis**

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 142 can reverse clinical symptoms of *thyrotoxicosis* within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

**Other uses**

Beta-blockers have been used to alleviate some symptoms of *anxiety*; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the *prophylaxis of migraine*. Betaxolol p. 1037, carteolol hydrochloride p. 1036, levobunolol hydrochloride p. 1036, and timolol maleate p. 142 are used topically in *glaucoma*.

## Beta-adrenoceptor blockers (systemic)

- **CONTRA-INDICATIONS** Asthma · cardiogenic shock · hypotension · marked bradycardia · metabolic acidosis · phaeochromocytoma (apart from specific use with alpha-blockers) · Prinzmetal's angina · second-degree AV block · severe peripheral arterial disease · sick sinus syndrome · third-degree AV block · uncontrolled heart failure

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ **Bronchospasm** Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

- **CAUTIONS** Diabetes · first-degree AV block · history of obstructive airways disease (introduce cautiously) · myasthenia gravis · portal hypertension (risk of deterioration in liver function) · psoriasis · symptoms of hypoglycaemia may be masked · symptoms of thyrotoxicosis may be masked

- **INTERACTIONS** → Appendix 1 (beta-blockers).

- ▶ **Verapamil and beta-blockers** Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved). There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

**SIDE-EFFECTS**

- ▶ **Rare** Dry eyes (reversible on withdrawal) · rashes (reversible on withdrawal)
- ▶ **Frequency not known** Alopecia · bradycardia · bronchospasm · coldness of the extremities · conduction disorders · dizziness · dyspnoea · exacerbation of intermittent claudication · exacerbation of psoriasis · exacerbation of Raynaud's phenomenon · fatigue · gastrointestinal disturbances · headache · heart failure · hyperglycaemia (in patients with or without diabetes) · hypoglycaemia (in patients with or without diabetes) · hypotension · paraesthesia · peripheral vasoconstriction · psychoses · purpura · sexual dysfunction · sleep disturbances (with nightmares) · symptoms of hypoglycaemia masked · thrombocytopenia · vertigo · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Bradycardia** With administration by intravenous injection, excessive bradycardia can occur and may be countered with **intravenous injection** of atropine sulfate.

**Overdose**

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 1204.

- **ALLERGY AND CROSS-SENSITIVITY** Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).
- **PREGNANCY** Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.
- **BREAST FEEDING** With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.
- **MONITORING REQUIREMENTS** Monitor lung function (in patients with a history of obstructive airway disease).
- **TREATMENT CESSATION** Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.

## BETA-ADRENOCEPTOR BLOCKERS > ALPHA- AND BETA-ADRENOCEPTOR BLOCKERS

### Carvedilol

**INDICATIONS AND DOSE****Hypertension**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 12.5 mg once daily for 2 days, then increased to 25 mg once daily; increased if necessary up to 50 mg daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses
- ▶ **Elderly:** Initially 12.5 mg daily, initial dose may provide satisfactory control

**Angina**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 12.5 mg twice daily for 2 days, then increased to 25 mg twice daily

**Adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 3.125 mg twice daily, dose to be taken with food, then increased to 6.25 mg twice daily, then increased to 12.5 mg twice daily, then increased to 25 mg twice daily, dose should be increased at intervals of at least 2 weeks up to the highest tolerated dose, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg; max. 50 mg twice daily in patients over 85 kg

- **CONTRA-INDICATIONS** Acute or decompensated heart failure requiring intravenous inotropes
- **SIDE-EFFECTS** Allergic skin reactions · angina · AV block · changes in liver enzymes · depressed mood · disturbances of micturition · influenza-like symptoms · leucopenia · nasal stuffiness · postural hypotension · thrombocytopenia · wheezing

- **PREGNANCY** Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).
- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.
- **MONITORING REQUIREMENTS** Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

CAUTIONARY AND ADVISORY LABELS 8

##### ▶ Carvedilol (Non-proprietary)

**Carvedilol 3.125 mg** Carvedilol 3.125mg tablets | 28 tablet PoM  
 £8.00 DT price = £0.87

**Carvedilol 6.25 mg** Carvedilol 6.25mg tablets | 28 tablet PoM  
 £8.99 DT price = £0.98

**Carvedilol 12.5 mg** Carvedilol 12.5mg tablets | 28 tablet PoM  
 £9.99 DT price = £0.96

**Carvedilol 25 mg** Carvedilol 25mg tablets | 28 tablet PoM £12.50  
 DT price = £1.19

##### ▶ BY INTRAVENOUS INJECTION

▶ **Adult:** 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

##### ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

- **CAUTIONS** Liver damage
- **SIDE-EFFECTS**
- ▶ **Rare** Lichenoid rash
- ▶ **Frequency not known** Difficulty in micturition · epigastric pain · liver damage · nausea · postural hypotension · vomiting · weakness
- **PREGNANCY** The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).
- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- **HEPATIC IMPAIRMENT** Avoid—severe hepatocellular injury reported.
- **RENAL IMPAIRMENT** Dose reduction may be required.
- **MONITORING REQUIREMENTS**
- ▶ **Liver damage** Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.
- **EFFECT ON LABORATORY TESTS** Interferes with laboratory tests for catecholamines.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette. Avoid upright position during and for 3 hours after intravenous administration.

#### ● INDICATIONS AND DOSE

##### Controlled hypotension in anaesthesia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ **Adult:** (consult product literature or local protocols)

##### Hypertension of pregnancy

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** Initially 20 mg/hour, then increased if necessary to 40 mg/hour after 30 minutes, then increased if necessary to 80 mg/hour after 30 minutes, then increased if necessary to 160 mg/hour after 30 minutes, adjusted according to response; Usual maximum 160 mg/hour
- ▶ BY MOUTH
- ▶ **Adult:** Use dose for hypertension

##### Hypertension following myocardial infarction

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** 15 mg/hour, then increased to up to 120 mg/hour, dose to be increased gradually

##### Hypertensive emergencies

- ▶ BY INTRAVENOUS INJECTION
- ▶ **Adult:** 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course
- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

##### Hypertension

- ▶ BY MOUTH
- ▶ **Adult:** Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- ▶ **Elderly:** Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day

## BETA-ADRENOCEPTOR BLOCKERS > NON-SELECTIVE

F 139

### Nadolol

#### ● INDICATIONS AND DOSE

##### Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 80 mg once daily, then increased in steps of up to 80 mg every week if required, doses higher than the maximum are rarely necessary; maximum 240 mg per day

##### Angina

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg once daily, then increased if necessary up to 160 mg daily, doses should be increased at weekly intervals, maximum dose rarely is used; maximum 240 mg per day

##### Arrhythmias

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg once daily, then increased if necessary up to 160 mg once daily, doses should be increased at weekly intervals; reduced to 40 mg daily if bradycardia occurs

##### Migraine prophylaxis

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg once daily, then increased in steps of 40 mg every week, adjusted according to response; maintenance 80–160 mg once daily

##### Thyrotoxicosis (adjunct)

- ▶ BY MOUTH
- ▶ Adult: 80–160 mg once daily

- **BREAST FEEDING** Water soluble beta-blockers such as nadolol are present in breast milk in greater amounts than other beta blockers.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Increase dosage interval if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

## Propranolol hydrochloride

### ● INDICATIONS AND DOSE

#### Thyrototoxicosis (adjunct)

- BY MOUTH
- Adult: 10–40 mg 3–4 times a day

#### Thyrototoxic crisis

- BY INTRAVENOUS INJECTION
- Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

#### Hypertension

- BY MOUTH
- Adult: Initially 80 mg twice daily, dose should be increased at weekly intervals as required; maintenance 160–320 mg daily

#### Prophylaxis of variceal bleeding in portal hypertension

- BY MOUTH
- Adult: Initially 40 mg twice daily, then increased to 80 mg twice daily (max. per dose 160 mg twice daily), dose to be adjusted according to heart rate

#### Phaeochromocytoma (only with an alpha-blocker) in preparation for surgery

- BY MOUTH
- Adult: 60 mg daily for 3 days before surgery

#### Phaeochromocytoma (only with an alpha-blocker) in patients unsuitable for surgery

- BY MOUTH
- Adult: 30 mg daily

#### Angina

- BY MOUTH
- Adult: Initially 40 mg 2–3 times a day; maintenance 120–240 mg daily

#### Hypertrophic cardiomyopathy | Anxiety tachycardia

- BY MOUTH
- Adult: 10–40 mg 3–4 times a day

#### Anxiety with symptoms such as palpitation, sweating and tremor

- BY MOUTH
- Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

#### Prophylaxis after myocardial infarction

- BY MOUTH
- Adult: Initially 40 mg 4 times a day for 2–3 days, then 80 mg twice daily, start treatment 5 to 21 days after infarction

#### Essential tremor

- BY MOUTH
- Adult: Initially 40 mg 2–3 times a day; maintenance 80–160 mg daily

#### Migraine prophylaxis

- BY MOUTH
- Adult: 80–240 mg daily in divided doses

#### Arrhythmias

- BY MOUTH
- Adult: 10–40 mg 3–4 times a day
- BY INTRAVENOUS INJECTION
- Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum 10 mg per course (5 mg in anaesthesia)

### ● SIDE-EFFECTS

- Rare Dry eyes (reversible on withdrawal)
- HEPATIC IMPAIRMENT Reduce oral dose.
- RENAL IMPAIRMENT Manufacturer advises caution; dose reduction may be required.

- PRESCRIBING AND DISPENSING INFORMATION Modified-release preparations can be used for once daily administration.

**Atenolol****INDICATIONS AND DOSE****Hypertension**

- ▶ BY MOUTH
- ▶ Adult: 25–50 mg daily, higher doses are rarely necessary

**Angina**

- ▶ BY MOUTH
- ▶ Adult: 100 mg daily in 1–2 divided doses continued →

**Arrhythmias**

- ▶ BY MOUTH
- ▶ Adult: 50–100 mg daily
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 2.5 mg every 5 minutes (max. per dose 10 mg), repeated if necessary, given at a rate of 1 mg/minute
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

**Migraine prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 50–200 mg daily in divided doses

**Early intervention within 12 hours of myocardial infarction**

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 5 mg, to be given over 5 minutes, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg daily

- **UNLICENSED USE** Use of atenolol for migraine prophylaxis is an unlicensed indication.
- **BREAST FEEDING** Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.
- **RENAL IMPAIRMENT**
  - ▶ With oral use Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m<sup>2</sup>; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.
  - ▶ With intravenous use Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m<sup>2</sup>; max. 10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tenormin<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.

## Celiprolol hydrochloride

### ● INDICATIONS AND DOSE

#### Mild to moderate hypertension

##### ▶ BY MOUTH

- ▶ Adult: 200 mg once daily, dose to be taken in the morning, then increased if necessary to 400 mg once daily

### ● SIDE-EFFECTS

- ▶ Rare Depression · pneumonitis
- ▶ Frequency not known Hot flushes
- **BREAST FEEDING** Manufacturers advise avoidance.
- **HEPATIC IMPAIRMENT** Consider dose reduction.

- **RENAL IMPAIRMENT** Reduce dose by half if eGFR 15–40 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 8, 22

## Co-tenidone

### ● INDICATIONS AND DOSE

#### Hypertension

##### ▶ BY MOUTH

- ▶ Adult: 50/12.5 mg daily, alternatively increased if necessary to 100/25 mg daily, doses higher than 50 mg atenolol rarely necessary

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ A mixture of atenolol and chlortalidone in mass proportions corresponding to 4 parts of atenolol and 1 part chlortalidone.

- **SIDE-EFFECTS** Allergic interstitial nephritis · jaundice

- **PREGNANCY** Avoid. Diuretics not used to treat hypertension in pregnancy.
- **BREAST FEEDING** Atenolol present in milk in greater amounts than some other beta-blockers. Possible toxicity due to beta-blockade—monitor infant. Large doses of chlortalidone may suppress lactation.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—consider alternative treatment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Metoprolol tartrate

### ● INDICATIONS AND DOSE

#### Hypertension

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 200 mg once daily

#### Angina

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 50–100 mg 2–3 times a day

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 200–400 mg daily

continued →

**Arrhythmias**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg

**Migraine prophylaxis**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 100–200 mg daily in divided doses
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 200 mg daily

**Hyperthyroidism (adjunct)**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 50 mg 4 times a day

**In surgery**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 2–4 mg, given at induction or to control arrhythmias developing during anaesthesia, then 2 mg, repeated if necessary; maximum 10 mg per course

**Early intervention within 12 hours of infarction**

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 5 mg every 2 minutes, to a max. of 15 mg, followed by (by mouth) 50 mg every 6 hours for 48 hours, to be taken 15 minutes after intravenous injection; (by mouth) maintenance 200 mg daily in divided doses

- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**CALCIUM-CHANNEL BLOCKERS****Calcium-channel blockers****Overview**

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 155, diltiazem hydrochloride p. 148, and the dihydropyridine calcium-channel blockers (amlodipine p. 147, felodipine p. 150, lacidipine p. 151, lercanidipine hydrochloride p. 152, nicardipine hydrochloride p. 152, nifedipine p. 153, and nimodipine p. 108). Verapamil hydrochloride and diltiazem hydrochloride should usually be **avoided** in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride, and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a

longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Isradipine p. 151, lacidipine and lercanidipine hydrochloride have similar effects to those of nifedipine and nicardipine hydrochloride; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

### Unstable angina

Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with beta-blockers.

## Calcium-channel blockers

● **DRUG ACTION** Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

### ● SIDE-EFFECTS

#### Overdose

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur.

For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 1204.

● **TREATMENT CESSATION** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

## Amlodipine

● **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.

### ● INDICATIONS AND DOSE

#### Prophylaxis of angina

##### ► BY MOUTH

► **Adult:** Initially 5 mg once daily; maximum 10 mg per day

#### Hypertension

##### ► BY MOUTH

► **Adult:** Initially 5 mg once daily; maximum 10 mg per day

### DOSE EQUIVALENCE AND CONVERSION

► Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

● **CONTRA-INDICATIONS** Cardiogenic shock · significant aortic stenosis · unstable angina

● **INTERACTIONS** → Appendix 1 (calcium-channel blockers).

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · dizziness · fatigue · flushing · headache · nausea · oedema · palpitation · sleep disturbances

► **Uncommon** Alopecia · arthralgia · asthenia · back pain · chest pain · dry mouth · dyspnoea · gastro-intestinal disturbances · gynaecomastia · hypotension · impotence · mood changes · muscle cramps · myalgia · paraesthesia · pruritus · purpura · rashes · rhinitis · skin discolouration · sweating · syncope · taste disturbances · tinnitus · tremor · urinary disturbances · visual disturbances · weight changes

► **Very rare** Angioedema · arrhythmias · cholestasis · coughing · gastritis · gingival hyperplasia · hepatitis · hyperglycaemia · jaundice · myocardial infarction · pancreatitis · peripheral neuropathy · tachycardia · thrombocytopenia · urticaria · vasculitis

► **Frequency not known** Erythema multiforme

#### Overdose

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

● **PREGNANCY** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** May need dose reduction—half-life prolonged.

● **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ► Amlodipine (Non-proprietary)

**Amlodipine 5 mg** Amlodipine 5mg tablets | 28 tablet [POM] £9.42  
DT price = £0.73

**Amlodipine 10 mg** Amlodipine 10mg tablets | 28 tablet [POM]  
£14.07 DT price = £0.78

##### ► Istin (Pfizer Ltd)

**Amlodipine 5 mg** Istin 5mg tablets | 28 tablet [POM] £11.08 DT  
price = £0.73

**Amlodipine 10 mg** Istin 10mg tablets | 28 tablet [POM] £16.55 DT  
price = £0.78

**Oral solution**▶ **Amlodipine (Non-proprietary)**

**Amlodipine 1 mg per 1 ml** Amlodipine 5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £75.90 DT price = £75.77

**Amlodipine 2 mg per 1 ml** Amlodipine 10mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £115.96 DT price = £115.75

Combinations available: **Olmesartan with amlodipine**, p. 168 - **Olmesartan with amlodipine and hydrochlorothiazide**, p. 169

**Amlodipine with valsartan**

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 147, valsartan p. 170.

**● INDICATIONS AND DOSE****Hypertension in patients stabilised on the individual components in the same proportions**

**SLOZEM®****Angina | Mild to moderate hypertension**

- ▶ BY MOUTH
- ▶ Adult: Initially 240 mg once daily; increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 360 mg once daily

**TILDIEM RETARD®****Mild to moderate hypertension**

- ▶ BY MOUTH
- ▶ Adult: Initially 90–120 mg twice daily; increased if necessary to 360 mg daily in divided doses
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 120 mg twice daily

**Angina**

- ▶ BY MOUTH
- ▶ Adult: Initially 90–120 mg twice daily; increased if necessary to 480 mg daily in divided doses
- ▶ Elderly: Up to 120 mg twice daily, dose form not appropriate for initial dose titration

**TILDIEM® LA****Angina | Mild to moderate hypertension**

- ▶ BY MOUTH
- ▶ Adult: Initially 200 mg once daily, to be taken with or before food, increased if necessary to 300–400 mg once daily; maximum 500 mg per day
- ▶ Elderly: Initially 200 mg once daily, increased if necessary to 300 mg once daily

**VIAZEM® XL****Angina | Mild to moderate hypertension**

- ▶ BY MOUTH
- ▶ Adult: Initially 180 mg once daily, adjusted according to response to 240 mg once daily; maximum 360 mg per day
- ▶ Elderly: Initially 120 mg once daily, adjusted according to response

**ZEMTARD®****Angina**

## ▶ BY MOUTH

- Adult: 180–300 mg once daily, increased if necessary to 480 mg once daily
- Elderly: Initially 120 mg once daily, increased if necessary to 480 mg once daily

**Mild to moderate hypertension**

## ▶ BY MOUTH

- Adult: 180–300 mg once daily, increased if necessary to 360 mg once daily
- Elderly: Initially 120 mg once daily, increased if necessary to 360 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · left ventricular failure with pulmonary congestion · second- or third-degree AV block (unless pacemaker fitted) · severe bradycardia · sick sinus syndrome
- **CAUTIONS** Bradycardia (avoid if severe) · first degree AV block · heart failure · prolonged PR interval · significantly impaired left ventricular function

- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).

• **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · AV block · bradycardia · dizziness · gastro-intestinal disturbances · headache · hot flushes · hypotension · malaise · oedema (notably of ankles) · palpitation · sino-atrial block

- ▶ **Rare** Erythema multiforme · exfoliative dermatitis · photosensitivity · rashes

- ▶ **Frequency not known** Depression · extrapyramidal symptoms · gum hyperplasia · gynaecomastia · hepatitis

**Overdose**

In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

- **HEPATIC IMPAIRMENT** Reduce dose.

**TILDIEM RETARD®** Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

**SLOZEM®** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**DILZEM® XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ANGITIL® XL** Dose form not appropriate for initial dose titration.

**DILCARDIA® SR** Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

**TILDIEM® LA** Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

**VIAZEM® XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

**ADIZEM-XL®** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ZEMTARD®** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

- **RENAL IMPAIRMENT** Start with smaller dose.

**TILDIEM RETARD®** Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

**SLOZEM®** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**DILZEM® XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ANGITIL® XL** Dose form not appropriate for initial dose titration.

**DILCARDIA® SR** Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

**TILDIEM® LA** Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

**VIAZEM® XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

**ADIZEM-XL®** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ZEMTARD®** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

- **PRESCRIBING AND DISPENSING INFORMATION** The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release', their duration of action corresponds to that of tablets requiring administration more frequently.

Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed.

- **PATIENT AND CARER ADVICE**

**TILDIEM RETARD®** Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

## Felodipine

- **DRUG ACTION** Felodipine is a dihydropyridine calcium-channel blocker.

### ● INDICATIONS AND DOSE

#### Prophylaxis of angina

- ▶ BY MOUTH
- ▶ **Adult:** Initially 5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning
- ▶ **Elderly:** Initially 2.5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning

#### Hypertension

- ▶ BY MOUTH
- ▶ **Adult:** Initially 5 mg once daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed
- ▶ **Elderly:** Initially 2.5 mg daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed

- **CONTRA-INDICATIONS** Cardiac outflow obstruction · significant cardiac valvular obstruction (e.g. aortic stenosis) · uncontrolled heart failure · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Predisposition to tachycardia · severe left ventricular dysfunction · withdraw if cardiogenic shock develops · withdraw if existing pain worsens shortly after initiating treatment · withdraw if ischaemic pain occurs shortly after initiating treatment
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Flushing · headache · peripheral oedema
- ▶ **Uncommon** Abdominal pain · dizziness · malaise · nausea · palpitation · paraesthesia · pruritus · rash · tachycardia
- ▶ **Rare** Arthralgia · impotence · myalgia · syncope · vomiting
- ▶ **Very rare** Gum hyperplasia · leucocytoclastic vasculitis · photosensitivity · urinary frequency
- **PREGNANCY** Avoid; toxicity in *animal* studies; may inhibit labour.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Dose reduction may be required.

### ● MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Combinations available: **Ramipril with felodipine**, p. 165

F 147

## Isradipine

### ● INDICATIONS AND DOSE

#### Hypertension

- ▶ **BY MOUTH**
- ▶ **Adult:** 2.5 mg twice daily for 3–4 weeks, then increased if necessary to 5 mg twice daily, dose increased exceptionally up to 10 mg twice daily
- ▶ **Elderly:** 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance 2.5–5 mg once daily may be sufficient

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · cardiogenic shock · during or within 1 month of myocardial infarction · unstable angina
- **CAUTIONS** Chronic heart failure · poor cardiac reserve · severe aortic stenosis · sick sinus syndrome (if pacemaker not fitted)
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal discomfort · dizziness · dyspnoea · fatigue · flushing · headache · palpitation · peripheral oedema · polyuria · rash · tachycardia
- ▶ **Uncommon** Hypotension · weight gain

- ▶ **Very rare** Anaemia · anorexia · anxiety · arrhythmia · arthralgia · blood disorders · bradycardia · cough · depression · drowsiness · erectile dysfunction · gum hyperplasia · heart failure · hypersensitivity reactions · leucopenia · nausea · paraesthesia · thrombocytopenia · visual disturbance · vomiting
- ▶ **Frequency not known** Gynaecomastia · hepatitis

#### Overdose

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- **PREGNANCY** May inhibit labour. Risk to fetus should be balanced against risk of uncontrolled maternal hypertension.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance dose of 2.5 mg or 5 mg once daily may be sufficient.
- **RENAL IMPAIRMENT** Use with caution.

#### Hypertension

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 2 mg daily; increased if necessary to 4 mg daily, then increased if necessary to 6 mg daily, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · aortic stenosis · avoid within 1 month of myocardial infarction · cardiogenic shock · unstable angina
- **CAUTIONS** Cardiac conduction abnormalities · poor cardiac reserve
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dizziness · flushing · headache · oedema · palpitation
- ▶ **Rare** Aggravation of angina · asthenia · erythema · gastrointestinal disturbances · gum hyperplasia · mood disturbances · muscle cramps · polyuria · pruritus · skin rash
- Overdose**
- In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.
- **PREGNANCY** Manufacturer advises avoid; may inhibit labour.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Antihypertensive effect possibly increased.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Lacidipine (Non-proprietary)**

**Lacidipine 2 mg** Lacidipine 2mg tablets | 28 tablet [PoM] £6.85 DT price = £2.40

**Lacidipine 4 mg** Lacidipine 4mg tablets | 28 tablet [PoM] £6.85 DT price = £2.53

▶ **Molap** (Rivopharm (UK) Ltd)

**Lacidipine 4 mg** Molap 4mg tablets | 28 tablet [PoM] £3.66 DT price = £2.53

▶ **Motens** (GlaxoSmithKline UK Ltd)

**Lacidipine 2 mg** Motens 2mg tablets | 28 tablet [PoM] £2.95 DT price = £2.40

**Lacidipine 4 mg** Motens 4mg tablets | 28 tablet [PoM] £3.10 DT price = £2.53

**Lercanidipine hydrochloride**

F 147

- **DRUG ACTION** Lercanidipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE****Mild to moderate hypertension**▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg once daily; increased if necessary to 20 mg daily, dose can be adjusted after 2 weeks

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · aortic stenosis · uncontrolled heart failure · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Left ventricular dysfunction · sick sinus syndrome (if pacemaker not fitted)
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Dizziness · flushing · headache · palpitation · peripheral oedema · tachycardia
  - ▶ **Rare** Angina · asthenia · drowsiness · gastro-intestinal disturbances · myalgia · polyuria · rash
  - ▶ **Very rare** Gingival hyperplasia · hypotension · myocardial infarction

**Overdose**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe disease.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet****CAUTIONARY AND ADVISORY LABELS 22**▶ **Lercanidipine hydrochloride (Non-proprietary)**

**Lercanidipine hydrochloride 10 mg** Lercanidipine 10mg tablets | 28 tablet [PoM] £12.99 DT price = £4.68

**Lercanidipine hydrochloride 20 mg** Lercanidipine 20mg tablets | 28 tablet [PoM] £15.99 DT price = £5.67

▶ **Zanidip** (Recordati Pharmaceuticals Ltd)

**Lercanidipine hydrochloride 10 mg** Zanidip 10mg tablets | 28 tablet [PoM] £5.70 DT price = £4.68

**Lercanidipine hydrochloride 20 mg** Zanidip 20mg tablets | 28 tablet [PoM] £10.82 DT price = £5.67

**Nicardipine hydrochloride**

F 147

- **DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE****Prophylaxis of angina**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Adult:** Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

**Mild to moderate hypertension**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Adult:** Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- ▶ **Adult:** Initially 30 mg twice daily; increased if necessary up to 45 mg twice daily. usual dose 30–60 mg twice daily

**Life-threatening hypertension (specialist use only) | Post-operative hypertension (specialist use only)**▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 3–5 mg/hour for 15 minutes, increased in steps of 0.5–1 mg every 15 minutes, adjusted according to response, maximum rate 15 mg/hour, reduce dose gradually when target blood pressure achieved; maintenance 2–4 mg/hour
- ▶ **Elderly:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

**Life-threatening hypertension in patients with hepatic or renal impairment (specialist use only) | Postoperative hypertension in patients with hepatic or renal impairment (specialist use only)**▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

**Acute life-threatening hypertension in pregnancy (specialist use only)**▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, usual maximum rate 4 mg/hour in treatment of pre-eclampsia (maximum rate 15 mg/hour)

**CONTRA-INDICATIONS****GENERAL CONTRA-INDICATIONS**

Acute porphyrias p. 930 · cardiogenic shock · significant or advanced aortic stenosis · unstable or acute attacks of angina

**SPECIFIC CONTRA-INDICATIONS**

- ▶ With intravenous use avoid within 8 days of myocardial infarction · compensatory hypertension
- ▶ With oral use avoid within 1 month of myocardial infarction

**CAUTIONS****GENERAL CAUTIONS**

Congestive heart failure · elderly · pulmonary oedema · significantly impaired left ventricular function · stroke · withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose

**SPECIFIC CAUTIONS**

- ▶ With intravenous use Elevated intracranial pressure · portal hypertension
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).

- **SIDE-EFFECTS** Atrioventricular block · depression · dizziness · drowsiness · dyspnoea · flushing · frequency of micturition · gastro-intestinal disturbances · gingival hyperplasia · headache · hypotension · impotence · insomnia · nausea · palpitations · paraesthesia · paralytic ileus · peripheral oedema · pruritus · pulmonary oedema · rashes · tachycardia · thrombocytopenia · tinnitus · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Hypotension and reflex tachycardia Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur—during intravenous use consider stopping infusion or decreasing dose by half.

**Overdose**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- **PREGNANCY** May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in *animal* studies. Risk of severe maternal hypotension and fatal foetal hypoxia—avoid excessive decrease in blood pressure. For treatment of acute life-threatening hypertension only.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT**
- ▶ With oral use Use with caution—consider using lowest initial dose and extending dosing interval according to individual response.
- ▶ With intravenous use Use with caution—use lower initial dose.
- **RENAL IMPAIRMENT**
- ▶ With oral use Consider using lowest initial dose and extending dosing interval according to individual response.
- ▶ With intravenous use Use with caution—use lower initial dose.
- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored.
 

For *intravenous infusion* give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution *via* central venous line only) and give *via* volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

- ▶ **Nicardipine hydrochloride (Non-proprietary)**
- ▶ **Nicardipine hydrochloride 20 mg** Nicardipine 20mg capsules | 56 capsule [PoM] £8.38 DT price = £6.00
- ▶ **Nicardipine hydrochloride 30 mg** Nicardipine 30mg capsules | 56 capsule [PoM] £9.73 DT price = £6.37
- ▶ **Cardene** (Astellas Pharma Ltd)
- ▶ **Nicardipine hydrochloride 20 mg** Cardene 20mg capsules | 56 capsule [PoM] £6.00 DT price = £6.00
- ▶ **Nicardipine hydrochloride 30 mg** Cardene 30mg capsules | 56 capsule [PoM] £6.96 DT price = £6.37

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Cardene SR** (Astellas Pharma Ltd)
- ▶ **Nicardipine hydrochloride 30 mg** Cardene SR 30mg capsules | 56 capsule [PoM] £7.15 DT price = £7.15
- ▶ **Nicardipine hydrochloride 45 mg** Cardene SR 45mg capsules | 56 capsule [PoM] £10.40 DT price = £10.40

**Solution for infusion**

- ▶ **Nicardipine hydrochloride (Non-proprietary)**
- ▶ **Nicardipine hydrochloride 1 mg per 1 ml** Nicardipine 10mg/10ml solution for injection ampoules | 5 ampoule [PoM] £50.00
- ▶ **Nicardipine hydrochloride 2.5 mg per 1 ml** Cardene i.v. 25mg/10ml solution for infusion ampoules | 10 ampoule [PoM] no price available

147

**Nifedipine**

21-Nov-2016

- **DRUG ACTION** Nifedipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE****Raynaud's syndrome**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Angina prophylaxis (not recommended)**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Postponement of premature labour**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: Initially 20 mg, followed by 10–20 mg 3–4 times a day, adjusted according to uterine activity

**Hiccup in palliative care**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: 10 mg 3 times a day

**ADALAT RETARD®****Hypertension | Angina prophylaxis**

- ▶ **BY MOUTH**
- ▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**ADALAT®****Angina prophylaxis (not recommended) | Raynaud's phenomenon**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For *Adalat®*: Adalat liquid gel capsules contain 5 mg nifedipine in 0.17 mL and 10 mg nifedipine in 0.34 mL.

**ADALAT® LA****Hypertension**

- ▶ **BY MOUTH**
- ▶ Adult: 20–30 mg once daily, increased if necessary up to 90 mg once daily

**Angina prophylaxis**

- ▶ **BY MOUTH**
- ▶ Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

**ADIPINE® MR****Hypertension | Angina prophylaxis**

- ▶ **BY MOUTH**
- ▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**ADIPINE® XL****Hypertension | Angina prophylaxis**

- ▶ **BY MOUTH**
- ▶ Adult: 30 mg daily, increased if necessary up to 90 mg daily

continued →

**CORACTEN® SR****Hypertension | Angina prophylaxis**

## ▶ BY MOUTH

- ▶ Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

**CORACTEN® XL****Hypertension | Angina prophylaxis**

## ▶ BY MOUTH

- ▶ Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily

**FORTIPINE® LA 40****Hypertension | Angina prophylaxis**

## ▶ BY MOUTH

- ▶ Adult: Initially 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

**NIFEDIPRESS® MR****Hypertension | Angina prophylaxis**

## ▶ BY MOUTH

- ▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**TENSIPINE® MR****Hypertension | Angina prophylaxis**

## ▶ BY MOUTH

- ▶ Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

**VALNI® XL****Severe hypertension | Prophylaxis of angina**

## ▶ BY MOUTH

- ▶ Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

- **UNLICENSED USE** Not licensed for use in postponing premature labour.
- **CONTRA-INDICATIONS** Acute attacks of angina · cardiogenic shock · significant aortic stenosis · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Diabetes mellitus · elderly · heart failure · poor cardiac reserve · severe hypotension · short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia · significantly impaired left ventricular function (heart failure deterioration observed) · withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment
- **ADALAT® LA** Crohn's disease · decreased lumen diameter of the gastro-intestinal tract · history of gastro-intestinal obstruction · history of oesophageal obstruction · inflammatory bowel disease
- **CAUTIONS, FURTHER INFORMATION**  
Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn's disease).
- **VALNI® XL** Decreased lumen diameter of gastro-intestinal tract · history of gastro-intestinal obstruction · history of oesophageal obstruction · ileostomy after proctocolectomy · inflammatory bowel disease
- **CAUTIONS, FURTHER INFORMATION**  
Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy.
- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).

**● SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · dizziness · gastro-intestinal disturbance · headache · hypotension · lethargy · oedema · palpitation · vasodilatation
- ▶ **Uncommon** Angioedema · anxiety · chills · dyspnoea · dysuria · epistaxis · erectile dysfunction · hypersensitivity reactions · jaundice · joint swelling · migraine · myalgia · nasal congestion · nocturia · paraesthesia · polyuria · pruritus · rash · sleep disturbance · sweating · syncope · tachycardia · tremor · urticaria · vertigo · visual disturbance
- ▶ **Rare** Anorexia · gum hyperplasia · hyperglycaemia · male infertility · mood disturbances · photosensitivity reactions · purpura
- ▶ **Frequency not known** Agranulocytosis · anaphylaxis · bezoar formation (with some modified-release preparations) · dysphagia · gynaecomastia · intestinal obstruction · intestinal ulcer

**Overdose**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- **PREGNANCY** May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.
- **BREAST FEEDING** Amount too small to be harmful but manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Dose reduction may be required in severe liver disease.  
Some modified-release formulations may not be suitable for dose titration in hepatic disease—consult product literature.

**ADALAT® LA** Dose form not appropriate.

**VALNI® XL** Dose form not appropriate.

**● DIRECTIONS FOR ADMINISTRATION**

**FORTIPINE® LA 40** Take with or just after food, or a meal.

- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

**Palliative care**

For further information on the use of nifedipine in palliative care, see [www.palliativedrugs.com/formulary/en/nifedipine.html](http://www.palliativedrugs.com/formulary/en/nifedipine.html).

**● PATIENT AND CARER ADVICE**

**ADALAT® LA** Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops

## Verapamil hydrochloride

### ● INDICATIONS AND DOSE

#### Treatment of supraventricular arrhythmias

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 40–120 mg 3 times a day
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5–10 mg, to be given over 2 minutes, preferably with ECG monitoring
- ▶ Elderly: 5–10 mg, to be given over 3 minutes, preferably with ECG monitoring

#### Paroxysmal tachyarrhythmias

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 2 minutes, preferably with ECG monitoring
- ▶ Elderly: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 3 minutes, preferably with ECG monitoring

#### Angina

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 80–120 mg 3 times a day

### Hypertension

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 240–480 mg daily in 2–3 divided doses

#### Prophylaxis of cluster headache (initiated under specialist supervision)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 240–960 mg daily in 3–4 divided doses

#### HALF SECURON<sup>®</sup> SR

#### Hypertension (in patients new to verapamil)

- ▶ BY MOUTH
- ▶ Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

#### Hypertension

- ▶ BY MOUTH
- ▶ Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

#### Angina

- ▶ BY MOUTH
- ▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

#### Prophylaxis after myocardial infarction where beta-blockers not appropriate

- ▶ BY MOUTH
- ▶ Adult: 360 mg daily in divided doses, started at least 1 week after infarction, given as either 240 mg in the morning and 120 mg in the evening *or* 120 mg 3 times daily

#### SECURON<sup>®</sup> SR

#### Hypertension (in patients new to verapamil)

- ▶ BY MOUTH
- ▶ Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

#### Hypertension

- ▶ BY MOUTH
- ▶ Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

#### Angina

- ▶ BY MOUTH
- ▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

#### Prophylaxis after myocardial infarction where beta-blockers not appropriate

- ▶ BY MOUTH
- ▶ Adult: 360 mg daily in divided doses, started at least 1 week after infarction, given as either 240 mg in the morning and 120 mg in the evening *or* 120 mg 3 times daily

#### UNIVER<sup>®</sup>

#### Hypertension (in patients new to verapamil)

- ▶ BY MOUTH
- ▶ Adult: Initially 120 mg daily; maximum 480 mg per day

#### Hypertension

- ▶ BY MOUTH
- ▶ Adult: 240 mg daily; maximum 480 mg per day

#### Angina

- ▶ BY MOUTH
- ▶ Adult: 360 mg daily; maximum 480 mg per day

#### VERAPRESS<sup>®</sup> MR

#### Hypertension

- ▶ BY MOUTH
- ▶ Adult: 240 mg daily, increased if necessary to 240 mg twice daily

continued →

**Angina**

- ▶ BY MOUTH
- ▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

**VERTAB® SR 240****Mild to moderate hypertension**

- ▶ BY MOUTH
- ▶ Adult: 240 mg daily, increased if necessary to 240 mg twice daily

**Angina**

- ▶ BY MOUTH
- ▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

**● UNLICENSED USE**

- ▶ With oral use Prophylaxis of cluster headaches is an unlicensed indication.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · history of heart failure (even if controlled by therapy) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

- **CAUTIONS** Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · first-degree AV block

- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).

- ▶ **Verapamil and beta-blockers** Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed.

It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

**● SIDE-EFFECTS**

- ▶ **Common or very common** Constipation
- ▶ **Uncommon** Ankle oedema · dizziness · fatigue · flushing · headache · nausea · vomiting
- ▶ **Rare** Allergic reactions · angioedema · arthralgia · asystole · bradycardia · erythema · erythromelalgia · gingival hyperplasia after long-term treatment · gynaeomastia after long-term treatment · heart block · heart failure · hypotension · increased prolactin concentration · myalgia · paraesthesia · pruritus · Stevens-Johnson syndrome · urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Intravenous administration or high doses Hypotension, heart failure, bradycardia, heart block, and asystole are side-effects associated with intravenous administration or high doses.

**Overdose**

In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Oral dose may need to be reduced.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**DIURETICS > POTASSIUM-SPARING DIURETICS > OTHER****Amiloride with cyclopenthiazine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, amiloride hydrochloride p. 218, cyclopenthiazine p. 220.

**● INDICATIONS AND DOSE****Hypertension**

- ▶ BY MOUTH
- ▶ Adult: 1–2 tablets daily, dose to be taken in the morning

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

EXCIPIENTS: May contain Gluten

- ▶ **Navispare** (AMCo)
- Amiloride hydrochloride 2.5 mg, Cyclopenthiazine 250 microgram** Navispare 2.5mg/250microgram tablets | 28 tablet **[PoM]** £3.24 DT price = £3.24

## DIURETICS &gt; THIAZIDES AND RELATED DIURETICS

Thiazides and related diuretics 

● **CONTRA-INDICATIONS** Addison's disease · hypercalcaemia · hyponatraemia · refractory hypokalaemia · symptomatic hyperuricaemia

● **CAUTIONS** Diabetes · gout · hyperaldosteronism · malnourishment · nephrotic syndrome · systemic lupus erythematosus

**CAUTIONS, FURTHER INFORMATION**

▶ **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

▶ **Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

▶ **Existing conditions** Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

● **INTERACTIONS** → Appendix 1 (diuretics).

**SIDE-EFFECTS**

▶ **Common or very common** Altered plasma-lipid concentrations · gout · hypercalcaemia · hyperglycaemia · hyperuricaemia · hypochloreaemic alkalosis · hypokalaemia · hypomagnesaemia · hyponatraemia · metabolic and electrolyte disturbances · mild gastrointestinal disturbances · postural hypotension

▶ **Uncommon** Agranulocytosis · blood disorders · impotence · leucopenia · thrombocytopenia

▶ **Frequency not known** Cardiac arrhythmias · dizziness · headache · hypersensitivity reactions · intrahepatic cholestasis · pancreatitis · paraesthesia · photosensitivity · pneumonitis · pulmonary oedema · severe skin reactions · visual disturbances

● **PREGNANCY** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

● **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.

● **RENAL IMPAIRMENT** Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m<sup>2</sup> and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m<sup>2</sup> but is associated with a risk of excessive diuresis. Electrolytes should be monitored in renal impairment.

● **MONITORING REQUIREMENTS** Electrolytes should be monitored, particularly with high doses and long-term use.

 above

## Bendroflumethiazide

(Bendrofluazide)

**INDICATIONS AND DOSE****Oedema**

▶ **BY MOUTH**  
▶ **Adult:** Initially 5–10 mg once daily or on alternate days, dose to be taken in the morning, then maintenance 5–10 mg 1–3 times a week

**Hypertension**

▶ **BY MOUTH**  
▶ **Adult:** 2.5 mg daily, dose to be taken in the morning, higher doses are rarely necessary

● **BREAST FEEDING** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Bendroflumethiazide (Non-proprietary)**

**Bendroflumethiazide 2.5 mg** Bendroflumethiazide 2.5mg tablets | 28 tablet [PoM](#) £3.68 DT price = £0.67 | 500 tablet [PoM](#) no price available

**Bendroflumethiazide 5 mg** Bendroflumethiazide 5mg tablets | 28 tablet [PoM](#) £9.80 DT price = £0.87 | 500 tablet [PoM](#) no price available

▶ **Aprinox (AMCo)**

**Bendroflumethiazide 2.5 mg** Aprinox 2.5mg tablets | 500 tablet [PoM](#) £27.31

▶ **Neo-Naclex (AMCo)**

**Bendroflumethiazide 2.5 mg** Neo-Naclex 2.5mg tablets | 28 tablet [PoM](#) £0.33 DT price = £0.67

**Combinations available:** *Timolol with bendroflumethiazide*, p. 143

 above

## Co-amilozide

**INDICATIONS AND DOSE****Hypertension**

▶ **BY MOUTH**  
▶ **Adult:** Initially 2.5/25 mg daily, increased if necessary up to 5/50 mg daily

**Congestive heart failure**

▶ **BY MOUTH**  
▶ **Adult:** Initially 2.5/25 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

**Oedema and ascites in cirrhosis of the liver**

▶ **BY MOUTH**  
▶ **Adult:** Initially 5/50 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

**DOSE EQUIVALENCE AND CONVERSION**

▶ A mixture of amiloride hydrochloride and hydrochlorothiazide in the mass proportions of 1 part amiloride hydrochloride to 10 parts hydrochlorothiazide.

● **CONTRA-INDICATIONS** Anuria · hyperkalaemia

● **CAUTIONS** Diabetes mellitus · elderly

● **SIDE-EFFECTS** Abdominal pain · agitation · alopecia · angina · anorexia · arrhythmias · arthralgia · confusion · constipation · cough · diarrhoea · dizziness · dry mouth ·

dyspepsia · dyspnoea · encephalopathy · fever · flatulence · flushing · gastro-intestinal bleeding · headache · hyperkalaemia · insomnia · jaundice · malaise · muscle cramp · nasal congestion · nausea · palpitation · paraesthesia · postural hypotension · pruritus · raised intra-ocular pressure · rash · respiratory distress · restlessness · sexual dysfunction · sweating · thirst · tinnitus · tremor · urinary disturbances · visual disturbance · vomiting · weakness

- **BREAST FEEDING** Avoid—no information regarding amiloride component available. Amount of hydrochlorothiazide in milk probably too small to be harmful. Large doses of hydrochlorothiazide may suppress lactation.
- **RENAL IMPAIRMENT** Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **MONITORING REQUIREMENTS** Monitor electrolytes.

#### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Tablet

##### ▶ Co-amilozide (Non-proprietary)

## Hydrochlorothiazide

#### INDICATIONS AND DOSE

Indications listed in combination monographs (available in the UK only in combination with other drugs)

- ▶ BY MOUTH
- ▶ Adult: Doses listed in combination monographs

#### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Combinations available: *Co-zidocapt*, p. 160 · *Enalapril with hydrochlorothiazide*, p. 160 · *Irbesartan with hydrochlorothiazide*, p. 167 · *Lisinopril with hydrochlorothiazide*, p. 162 · *Losartan with hydrochlorothiazide*, p. 168 · *Olmesartan with amlodipine and hydrochlorothiazide*, p. 169 · *Olmesartan with hydrochlorothiazide*, p. 169 · *Quinapril with hydrochlorothiazide*, p. 164 · *Telmisartan with hydrochlorothiazide*, p. 170 · *Timolol with amiloride and hydrochlorothiazide*, p. 143 · *Valsartan with hydrochlorothiazide*, p. 170

## Indapamide

- **DRUG ACTION** Indapamide is a thiazide-like diuretic with antihypertensive effects. At lower doses, vasodilatation is more prominent than diuresis; the diuretic effect becomes more apparent with higher doses.

#### INDICATIONS AND DOSE

##### Essential hypertension

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 2.5 mg daily, dose to be taken in the morning
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 1.5 mg daily, dose to be taken preferably in the morning

- **CAUTIONS** Acute porphyrias p. 930
- **SIDE-EFFECTS** Diuresis (with doses above 2.5 mg daily) · palpitation
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to sulfonamides.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

#### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Indapamide 1.5 mg Tensaid XL 1.5mg tablets | 30 tablet [PoM](#) £3.40 DT price = £3.40

Combinations available: *Perindopril arginine with indapamide*, p. 163

## DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ACE INHIBITORS

## Angiotensin-converting enzyme inhibitors

- **CONTRA-INDICATIONS** The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m<sup>2</sup> · the combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus
- **CAUTIONS** Afro-Caribbean patients (may respond less well to ACE inhibitors) · concomitant diuretics · first dose hypotension (especially in patients taking high doses of

diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) · peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) · primary aldosteronism (patients may respond less well to ACE inhibitors) · the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use with care (or avoid) in those with a history of idiopathic or hereditary angioedema · use with care in patients with hypertrophic cardiomyopathy · use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

#### CAUTIONS, FURTHER INFORMATION

- Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.

#### • INTERACTIONS → Appendix 1 (ACE inhibitors).

- **SIDE-EFFECTS** Pruritus · abdominal pain · altered liver function tests · angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients) · arthralgia · blood disorders · bronchospasm · cholestatic jaundice · constipation · diarrhoea · dizziness · dyspepsia · eosinophilia · fatigue · fever · fulminant hepatic necrosis · haemolytic anaemia · headache · hepatic failure · hepatitis · hyperkalaemia · hypoglycaemia · leucocytosis · leucopenia · malaise · myalgia · nausea · neutropenia · pancreatitis · paraesthesia · persistent dry cough · photosensitivity · positive antinuclear antibody · profound hypotension · raised erythrocyte sedimentation rate · rash · renal impairment · rhinitis · serositis · sinusitis · sore throat · taste disturbance · thrombocytopenia · urticaria · vasculitis · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- Hepatic effects In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.
- **ALLERGY AND CROSS-SENSITIVITY** ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
- **PREGNANCY** ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.
- **BREAST FEEDING** Information on the use of ACE inhibitors in breast-feeding is limited.
- **RENAL IMPAIRMENT** Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.
- **MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).
- **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

F 158

## Captopril

### • INDICATIONS AND DOSE

#### Hypertension

##### ► BY MOUTH

- Adult: Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses,

doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

- Elderly: Initially 6.25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

#### Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension

##### ► BY MOUTH

- Adult: Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

#### Heart failure

##### ► BY MOUTH

- Adult (under close medical supervision): Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

#### Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients

##### ► BY MOUTH

- Adult: Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours; increased if tolerated to 50 mg twice daily for 4 weeks

#### Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision)

##### ► BY MOUTH

- Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses exceeding 75 mg per day to be increased gradually

#### Diabetic nephropathy in type 1 diabetes mellitus

##### ► BY MOUTH

- Adult: 75–100 mg daily in divided doses

### • SIDE-EFFECTS

- **Common or very common** Alopecia · dry mouth · dyspnoea · sleep disorder
- **Uncommon** Angina · arrhythmia · flushing · pallor · palpitation · Raynaud's syndrome · tachycardia
- **Rare** Anorexia · stomatitis
- **Very rare** Allergic alveolitis · blurred vision · cardiac arrest · cardiogenic shock · cerebrovascular events · confusion · depression · eosinophilic pneumonia · glossitis · gynaecomastia · hyponatraemia · impotence · peptic ulcer · photosensitivity · Stevens-Johnson syndrome · syncope
- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.
- **RENAL IMPAIRMENT** Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m<sup>2</sup>; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m<sup>2</sup>; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m<sup>2</sup>; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

**MEDICINAL FORMS**

F 158

**Lisinopril****INDICATIONS AND DOSE****Hypertension**▶ **BY MOUTH**

- ▶ Adult: Initially 10 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

**Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion**▶ **BY MOUTH**

- ▶ Adult: Initially 2.5–5 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg**▶ **BY MOUTH**

- ▶ Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100–120 mmHg**▶ **BY MOUTH**

- ▶ Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, increase to maintenance dose only after at least 3 days of the initial dose, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Renal complications of diabetes mellitus**▶ **BY MOUTH**

- ▶ Adult: Initially 2.5–5 mg once daily, adjusted according to response; usual dose 10–20 mg once daily

**Heart failure (adjunct) (under close medical supervision)**▶ **BY MOUTH**

- ▶ Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

### ● SIDE-EFFECTS

- ▶ **Uncommon** Raynaud's syndrome · vertigo · asthenia · cerebrovascular accident · confusion · impotence · mood changes · myocardial infarction · palpitation · sleep disturbances · tachycardia
- ▶ **Rare** Alopecia · dry mouth · gynaecomastia · psoriasis
- ▶ **Very rare** Allergic alveolitis · pemphigus · profuse sweating · pulmonary infiltrates · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.
- **RENAL IMPAIRMENT** Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m<sup>2</sup> (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m<sup>2</sup> (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

## Moexipril hydrochloride

### ● INDICATIONS AND DOSE

**Essential hypertension (monotherapy)**

#### ▶ BY MOUTH

- ▶ Adult: Initially 7.5 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day
- ▶ Elderly: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

**Essential hypertension when used in addition with nifedipine or other antihypertensive drug**

#### ▶ BY MOUTH

- ▶ Adult: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

### ● CAUTIONS

Significant mitral valve stenosis

### ● SIDE-EFFECTS

#### ▶ Very rare

Numbness

- ▶ **Frequency not known** Alopecia · angina · appetite · arrhythmias · blurred vision · cerebrovascular accident · confusion · depression · drowsiness · dry mouth · dyspnoea · flushing · hyperuricaemia · impotence · myocardial infarction · palpitation · pemphigus · sleep disturbance · Stevens-Johnson syndrome · sweating · syncope · tachycardia · tinnitus · toxic epidermal necrolysis · weight changes

#### ● BREAST FEEDING

Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

#### ● HEPATIC IMPAIRMENT

Initial dose 3.75 mg once daily. Moexipril is a prodrug and requires close monitoring in patients with hepatic impairment.

#### ● RENAL IMPAIRMENT

If eGFR less than 40 mL/minute/1.73 m<sup>2</sup>, initial dose 3.75 mg once daily titrated to max. 15 mg once daily.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## Perindopril arginine

### ● INDICATIONS AND DOSE

#### Hypertension

#### ▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day
- ▶ Elderly: Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

**Hypertension, if used in addition to diuretic, or in cardiac decompensation or volume depletion**

#### ▶ BY MOUTH

- ▶ Adult: Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

**Symptomatic heart failure (adjunct) (under close medical supervision)**

## ▶ BY MOUTH

- Adult: Initially 2.5 mg once daily for 2 weeks, then increased if tolerated to 5 mg once daily, dose to be taken in the morning

**Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease**

## ▶ BY MOUTH

- Adult: Initially 5 mg once daily for 2 weeks, then increased if tolerated to 10 mg once daily, dose to be taken in the morning
- Elderly: Initially 2.5 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 1 week, then increased if tolerated to 10 mg once daily, dose to be taken in the morning

- **SIDE-EFFECTS** Asthenia · mood disturbances · sleep disturbances
- **HEPATIC IMPAIRMENT** Perindopril is a prodrug and requires close monitoring in patients with hepatic impairment.
- **RENAL IMPAIRMENT** Max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>.

**Trandolapril****INDICATIONS AND DOSE****Mild to moderate hypertension**

## ▶ BY MOUTH

▶ Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day

**Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)**

## ▶ BY MOUTH

▶ Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually

- **SIDE-EFFECTS** Alopecia · angina · arrhythmias · asthenia · bronchitis · cerebral haemorrhage · dry mouth · dyspnoea · hot flushes · ileus · myocardial infarction · nervousness · palpitation · psoriasis-like efflorescence · skin reactions · sleep disturbances · Stevens-Johnson syndrome · sweating · syncope · tachycardia · toxic epidermal necrolysis · transient ischaemic attacks

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Symptomatic hypotension If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.
- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.
- **HEPATIC IMPAIRMENT** Trandolapril is a prodrug and requires close monitoring in patients with hepatic impairment.
- **RENAL IMPAIRMENT** Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**▶ **Trandolapril (Non-proprietary)**

**Trandolapril 500 microgram** Trandolapril 500microgram capsules | 14 capsule [PoM](#) £1.66 DT price = £1.66

**Trandolapril 4 mg** Trandolapril 4mg capsules | 28 capsule [PoM](#) £13.24 DT price = £13.24

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM** > **ANGIOTENSIN II RECEPTOR ANTAGONISTS****Angiotensin II receptor antagonists**

- **CONTRA-INDICATIONS** The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; the combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with diabetes mellitus
- **CAUTIONS** Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) · aortic or mitral valve stenosis · elderly (lower initial doses may be appropriate) · hypertrophic cardiomyopathy · patients with a history of angioedema · patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) · renal artery stenosis
- **INTERACTIONS** → Appendix 1 (angiotensin-II receptor antagonists).
- **SIDE-EFFECTS** Hyperkalaemia · angioedema (may be delayed onset) · symptomatic hypotension including dizziness (particularly in patients with intravascular volume depletion, e.g. those taking high-dose diuretics)

## 166 Blood pressure conditions

- **PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.
- **BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.
- **RENAL IMPAIRMENT** Use with caution, starting with low dose, and adjust according to response.
- **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

##### Hypertension

- ▶ BY MOUTH
- ▶ Adult 18-74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
- ▶ Adult 75 years and over: Initially 20-40 mg once daily, increased if necessary to 80 mg once daily

##### Hypertension with intravascular volume depletion

- ▶ BY MOUTH
- ▶ Adult: Initially 20-40 mg daily, increased if necessary to 80 mg daily

- **CAUTIONS** Heart failure
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · raised creatine kinase
  - ▶ **Uncommon** Hyperuricaemia · peripheral oedema · raised creatinine · malaise
- **HEPATIC IMPAIRMENT** Manufacturer advises to consider initial dose of 20 mg in mild to moderate impairment (limited information available). Manufacturer advises avoid in severe impairment (no information available). Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Edarbi** (Takeda UK Ltd) ▼
- Azilsartan medoxomil 20 mg** Edarbi 20mg tablets | 28 tablet [PoM](#) £16.80 DT price = £16.80
- Azilsartan medoxomil 40 mg** Edarbi 40mg tablets | 28 tablet [PoM](#) £16.80 DT price = £16.80
- Azilsartan medoxomil 80 mg** Edarbi 80mg tablets | 28 tablet [PoM](#) £19.95 DT price = £19.95

### Candesartan cilexetil

#### ● INDICATIONS AND DOSE

##### Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 8 mg once daily, increased if necessary up to 32 mg once daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

##### Hypertension with intravascular volume depletion

- ▶ BY MOUTH
- ▶ Adult: Initially 4 mg once daily, increased if necessary up to 32 mg daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

#### Heart failure with impaired left ventricular systolic function when ACE inhibitors are not tolerated | Heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: Initially 4 mg once daily, increased at intervals of at least 2 weeks to 'target' dose of 32 mg once daily or to maximum tolerated dose

- **CONTRA-INDICATIONS** Cholestasis
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Headache · vertigo
  - ▶ **Very rare** Arthralgia · back pain · blood disorders · cough · hepatitis · hyponatraemia · myalgia · nausea · pruritus · rash · urticaria
- **HEPATIC IMPAIRMENT** Initially 4 mg once daily in mild or moderate impairment. Avoid in severe hepatic impairment.
- **RENAL IMPAIRMENT** Initially 4 mg daily. Use with caution if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>—limited experience.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Valsartan

### ● INDICATIONS AND DOSE

#### Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 80 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

#### Hypertension with intravascular volume depletion

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

**Heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used | Heart failure, in conjunction with an ACE inhibitor when a beta-blocker cannot be used (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg twice daily, increased to up to 160 mg twice daily, doses to be increased at intervals of at least 2 weeks

### Myocardial infarction with left ventricular failure or left ventricular systolic dysfunction (adjunct)

- ▶ BY MOUTH
- ▶ Adult: Initially 20 mg twice daily, increased if necessary up to 160 mg twice daily, doses to be increased over several weeks if tolerated

### ● CONTRA-INDICATIONS

#### Biliary cirrhosis · cholestasis

#### ● SIDE-EFFECTS

- ▶ Common or very common Renal impairment
- ▶ Uncommon Acute renal failure · cough · fatigue · gastrointestinal disturbance · headache · syncope
- ▶ Frequency not known Hypersensitivity reactions · myalgia · neutropenia · pruritus · rash · serum sickness · thrombocytopenia · vasculitis

### ● HEPATIC IMPAIRMENT

Max. dose 80 mg daily in mild to moderate impairment. Avoid in severe hepatic impairment.

### ● RENAL IMPAIRMENT

Use with caution if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>—no information available.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ▶ Valsartan (Non-proprietary)

**Valsartan 40 mg** Valsartan 40mg tablets | 7 tablet [PoM] £5.00 DT price = £2.38 | 28 tablet [PoM] no price available

**Valsartan 80 mg** Valsartan 80mg tablets | 28 tablet [PoM] £13.69 DT price = £13.69

**Valsartan 160 mg** Valsartan 160mg tablets | 28 tablet [PoM] £14.69 DT price = £14.69

**Valsartan 320 mg** Valsartan 320mg tablets | 28 tablet [PoM] £20.23 DT price = £13.43

#### Capsule

##### ▶ Valsartan (Non-proprietary)

**Valsartan 40 mg** Valsartan 40mg capsules | 28 capsule [PoM] £13.97 DT price = £1.41

**Valsartan 80 mg** Valsartan 80mg capsules | 28 capsule [PoM] £13.97 DT price = £1.75

**Valsartan 160 mg** Valsartan 160mg capsules | 28 capsule [PoM] £18.41 DT price = £1.41

#### Oral solution

##### ▶ Diovan (Novartis Pharmaceuticals UK Ltd)

**Valsartan 3 mg per 1 ml** Diovan 3mg/1ml oral solution | 160 ml [PoM] £7.20

Combinations available: *Amlodipine with valsartan*, p. 148

## Valsartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, valsartan above, hydrochlorothiazide p. 158.

### ● INDICATIONS AND DOSE

#### Hypertension not adequately controlled by valsartan alone

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ Valsartan with hydrochlorothiazide (Non-proprietary)

**Hydrochlorothiazide 12.5 mg, Valsartan 80 mg** Valsartan 80mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £13.97 DT price = £7.97

**Hydrochlorothiazide 25 mg, Valsartan 160 mg** Valsartan 160mg / Hydrochlorothiazide 25mg tablets | 28 tablet [PoM] £18.41 DT price = £10.60

**Hydrochlorothiazide 12.5 mg, Valsartan 160 mg** Valsartan 160mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £18.41 DT price = £2.42

▶ **Co-Diovan** (Novartis Pharmaceuticals UK Ltd)

**Hydrochlorothiazide 12.5 mg, Valsartan 80 mg** Co-Diovan 80mg/12.5mg tablets | 28 tablet [PoM] £16.76 DT price = £7.97

**Hydrochlorothiazide 25 mg, Valsartan 160 mg** Co-Diovan 160mg/25mg tablets | 28 tablet [PoM] £22.09 DT price = £10.60

**Hydrochlorothiazide 12.5 mg, Valsartan 160 mg** Co-Diovan 160mg/12.5mg tablets | 28 tablet [PoM] £22.09 DT price = £2.42

## DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > RENIN INHIBITORS

### Aliskiren

- **DRUG ACTION** Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.

#### ● INDICATIONS AND DOSE

##### Essential hypertension either alone or in combination with other antihypertensives

###### ▶ BY MOUTH

- ▶ Adult: 150 mg once daily, increased if necessary to 300 mg once daily

- **CONTRA-INDICATIONS** Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/1.73 m<sup>2</sup> · concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with diabetes mellitus · hereditary angioedema · idiopathic angioedema

- **CAUTIONS** Combination treatment with an ACE inhibitor · combination treatment with an angiotensin-II receptor antagonist · concomitant use of diuretics (first doses may cause hypotension—initiate with care) · history of angioedema · moderate to severe congestive heart failure · patients at risk of renal impairment · salt depletion (first doses may cause hypotension—initiate with care) · volume depletion (first doses may cause hypotension—initiate with care)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Concomitant use of drugs affecting the renin-angiotensin system · Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

- **INTERACTIONS** → Appendix 1 (aliskiren).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · dizziness · hyperkalaemia · diarrhoea
- ▶ **Uncommon** Acute renal failure (reversible on discontinuation of treatment) · hypotension · palpitation ·

peripheral oedema · cough · pruritus · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

- ▶ **Rare** Anaemia · angioedema · erythema
- ▶ **Frequency not known** Liver disorders · nausea · vertigo · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

If diarrhoea severe or persistent discontinue treatment.

- **PREGNANCY** Manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR is less than 30 mL/minute/1.73 m<sup>2</sup>—no information available. Use with caution in renal artery stenosis—no information available. Monitor plasma-potassium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor patients with a history of angioedema closely during treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (January 2010) that aliskiren (*Rasilez*<sup>®</sup>) is **not** recommended for use within NHS Scotland.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

##### ▶ **Rasilez** (Novartis Pharmaceuticals UK Ltd)

**Aliskiren (as Aliskiren hemifumarate) 150 mg** Rasilez 150mg tablets | 28 tablet [PoM] £28.51 DT price = £28.51

**Aliskiren (as Aliskiren hemifumarate) 300 mg** Rasilez 300mg tablets | 28 tablet [PoM] £34.27 DT price = £34.27

## VASODILATORS > VASODILATOR ANTIHYPERTENSIVES

### Hydralazine hydrochloride

#### ● INDICATIONS AND DOSE

##### Moderate to severe hypertension (adjunct)

###### ▶ BY MOUTH

- ▶ Adult: Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

##### Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision)

###### ▶ BY MOUTH

- ▶ Adult: Initially 25 mg 3–4 times a day, subsequent doses to be increased every 2 days if necessary; usual maintenance 50–75 mg 4 times a day

##### Hypertensive emergencies (including during pregnancy) | Hypertension with renal complications

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 200–300 micrograms/minute; usual maintenance 50–150 micrograms/minute

###### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5–10 mg, to be diluted with 10 mL sodium chloride 0.9%; dose may be repeated after 20–30 minutes

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · cor pulmonale · dissecting aortic aneurysm · high output heart failure · idiopathic systemic lupus erythematosus · myocardial insufficiency due to mechanical obstruction · severe tachycardia

- **CAUTIONS** Cerebrovascular disease · coronary artery disease (may provoke angina, avoid after myocardial

infarction until stabilised) · occasionally blood pressure reduction too rapid even with low parenteral doses

- **INTERACTIONS** → Appendix 1 (hydralazine).
- **SIDE-EFFECTS**
- ▶ **Rare Rashes**
- ▶ **Frequency not known** Abnormal liver function · agitation · anorexia · anxiety · arthralgia · blood disorders · dizziness · dyspnoea · fever · fluid retention · flushing · gastro-intestinal disturbances · haematuria · haemolytic anaemia · headache · hypotension · increased lacrimation · jaundice · leucopenia · myalgia · nasal congestion · palpitation · paraesthesia · peripheral neuritis · polyneuritis · proteinuria · raised plasma creatinine · systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylators individually) · tachycardia · thrombocytopenia
- SIDE-EFFECTS, FURTHER INFORMATION**
- The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.
- **PREGNANCY** Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.
- **BREAST FEEDING** Present in milk but not known to be harmful. Monitor infant in breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Apresoline*<sup>®</sup>) give continuously in Sodium chloride 0.9%. Suggested infusion volume 500 mL.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

EXCIPIENTS: May contain Gluten, propylene glycol

- ▶ **Hydralazine hydrochloride (Non-proprietary)**
- Hydralazine hydrochloride 10 mg** Apo-Hydralazine 10mg tablets | 100 tablet [PoM] no price available
- Hydralazine hydrochloride 25 mg** Hydralazine 25mg tablets | 56 tablet [PoM] £8.25 DT price = £7.15 | 84 tablet [PoM] £14.00
- Hydralazine hydrochloride 50 mg** Hydralazine 50mg tablets | 56 tablet [PoM] £15.46 DT price = £13.93
- ▶ **Apresoline (AMCO)**
- Hydralazine hydrochloride 25 mg** Apresoline 25mg tablets | 84 tablet [PoM] £3.38

#### Powder for solution for injection

- ▶ **Hydralazine hydrochloride (Non-proprietary)**
- Hydralazine hydrochloride 20 mg** Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule [PoM] £64.50
- ▶ **Apresoline (AMCO)**
- Hydralazine hydrochloride 20 mg** Apresoline 20mg powder for solution for injection ampoules | 5 ampoule [PoM] £11.09

## Minoxidil

#### ● INDICATIONS AND DOSE

**Severe hypertension, in addition to a diuretic and a beta-blocker**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of

at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

- ▶ **Elderly:** Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Acute porphyrias p. 930 · after myocardial infarction (until stabilised) · angina
- **INTERACTIONS** → Appendix 1 (vasodilator antihypertensives).
- **SIDE-EFFECTS** Breast tenderness · gastro-intestinal disturbances · hypertrichosis · peripheral oedema · rashes · reversible rise in creatinine and blood urea nitrogen · sodium retention · tachycardia · water retention · weight gain
- **PREGNANCY** Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT** Use with caution in significant impairment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

▶ **Loniten** (Pfizer Ltd)

**Minoxidil 2.5 mg** Loniten 2.5mg tablets | 60 tablet [PoM] £8.88 DT price = £8.88

**Minoxidil 5 mg** Loniten 5mg tablets | 60 tablet [PoM] £15.83 DT price = £15.83

## 4.1a Hypertension associated with phaeochromocytoma

**Other drugs used for Hypertension associated with phaeochromocytoma** Propranolol hydrochloride, p. 142

## VASODILATORS > PERIPHERAL VASODILATORS

### Phenoxybenzamine hydrochloride

#### ● INDICATIONS AND DOSE

**Hypertension in phaeochromocytoma**

▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1–2 mg/kg daily in 2 divided doses

- **CONTRA-INDICATIONS** During recovery period after myocardial infarction (usually 3–4 weeks) · history of cerebrovascular accident
- **CAUTIONS** Avoid contact with skin (risk of contact sensitisation) · avoid in acute porphyrias p. 930 · carcinogenic in *animals* · cerebrovascular disease · congestive heart failure · elderly · severe ischaemic heart disease
- **SIDE-EFFECTS**
- ▶ **Rare** Gastro-intestinal disturbances
- ▶ **Frequency not known** Inhibition of ejaculation · lassitude · miosis · nasal congestion · postural hypotension (with dizziness and marked compensatory tachycardia)
- **PREGNANCY** Hypotension may occur in newborn.

- **BREAST FEEDING** May be present in milk.
- **RENAL IMPAIRMENT** Use with caution.
- **HANDLING AND STORAGE** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Capsule

- ▶ Phenoxybenzamine hydrochloride (Non-proprietary)  
Phenoxybenzamine hydrochloride 10 mg Phenoxybenzamine 10mg capsules | 30 capsule [PoM](#) £97.38 DT price = £97.38

## Phentolamine mesilate

#### INDICATIONS AND DOSE

**Hypertensive episodes due to phaeochromocytoma e.g. during surgery**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 2–5 mg, repeated if necessary

#### Diagnosis of phaeochromocytoma

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Angina · coronary insufficiency · evidence of coronary artery disease · history of myocardial infarction · hypotension
- **CAUTIONS** Elderly · gastritis · peptic ulcer
- **INTERACTIONS** → Appendix 1 (alpha-blockers).
- **SIDE-EFFECTS** Acute or prolonged hypotension · angina · arrhythmias · chest pain · diarrhoea · dizziness · flushing · nasal congestion · nausea · postural hypotension · tachycardia · vomiting
- **PREGNANCY** Use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

## 4.1b Hypertensive crises

**Other drugs used for Hypertensive crises** Hydralazine hydrochloride, p. 171 · Labetalol hydrochloride, p. 140

### ANTIADRENERGIC AGENTS, PERIPHERALLY ACTING

## Guanethidine monosulfate

#### INDICATIONS AND DOSE

**Hypertensive crisis (but no longer recommended)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 10–20 mg, dose may be repeated after 3 hours if necessary

- **CONTRA-INDICATIONS** Heart failure · phaeochromocytoma

- **CAUTIONS** Asthma · cerebral arteriosclerosis · coronary arteriosclerosis · history of peptic ulceration
- **INTERACTIONS** → Appendix 1 (adrenergic neurone blockers).
- **SIDE-EFFECTS** Diarrhoea · drowsiness · failure of ejaculation · fluid retention · headache · nasal congestion · postural hypotension
- **PREGNANCY** Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.
- **RENAL IMPAIRMENT** Reduce dose if eGFR 40–65 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 40 mL/minute/1.73 m<sup>2</sup>.
- **LESS SUITABLE FOR PRESCRIBING** Guanethidine monosulfate is less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ Guanethidine monosulfate (Non-proprietary)  
Guanethidine monosulfate 10 mg per 1 ml Guanethidine 10mg/1ml solution for injection ampoules | 5 ampoule [PoM](#) £224.15

### VASODILATORS > VASODILATOR ANTIHYPERTENSIVES

## Sodium nitroprusside

#### INDICATIONS AND DOSE

**Hypertensive emergencies**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

**Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 20–400 micrograms/minute, use lower doses for patients being treated with other antihypertensives

**Controlled hypotension in anaesthesia during surgery**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Up to 1.5 micrograms/kg/minute

**Acute or chronic heart failure**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days

- **UNLICENSED USE** Not licensed for use in the UK.
- **CONTRA-INDICATIONS** Compensatory hypertension · Leber's optic atrophy · severe vitamin B<sub>12</sub> deficiency
- **CAUTIONS** Elderly · hyponatraemia · hypothermia · hypothyroidism · impaired cerebral circulation · ischaemic heart disease
- **INTERACTIONS** → Appendix 1 (sodium nitroprusside).
- **SIDE-EFFECTS** Abdominal pain · acute transient phlebitis · anxiety · dizziness · headache · nausea · palpitation · perspiration · reduced platelet count · retching · retrosternal discomfort
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.

**Overdose**

Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see cyanide in Emergency treatment of poisoning p. 1204).

- **PREGNANCY** Avoid prolonged use—potential for accumulation of cyanide in fetus.
- **BREAST FEEDING** No information available. Caution advised due to thiocyanate metabolite.
- **HEPATIC IMPAIRMENT** Use with caution. In hepatic failure—cyanide or thiocyanate metabolites may accumulate.
- **RENAL IMPAIRMENT** Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.
- **MONITORING REQUIREMENTS** Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.
- **TREATMENT CESSATION** Avoid sudden withdrawal—terminate infusion over 15–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for infusion**▶ **Sodium nitroprusside (Non-proprietary)**

Sodium nitroprusside dihydrate 50 mg Sodium nitroprusside 50mg powder and solvent for solution for infusion vials | 1 vial [PoM](#) no price available

## 4.1c Pulmonary hypertension

**Other drugs used for Pulmonary hypertension**

Epoprostenol, p. 109 · Sildenafil, p. 744 · Tadalafil, p. 746

### ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

#### Iloprost

**INDICATIONS AND DOSE****Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)**

## ▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ **Adult:** Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

- **CONTRA-INDICATIONS** Conditions which increase risk of haemorrhage · congenital or acquired valvular defects of the myocardium · decompensated cardiac failure (unless under close medical supervision) · pulmonary veno-occlusive disease · severe arrhythmias · unstable angina · within 3 months of cerebrovascular events · within 6 months of myocardial infarction

- **CAUTIONS** Acute pulmonary infection · chronic obstructive pulmonary disease · Hypotension (do not initiate if systolic blood pressure below 85 mmHg) · severe asthma · unstable pulmonary hypertension with advanced right heart failure

- **INTERACTIONS** → Appendix 1 (iloprost).

**SIDE-EFFECTS**

- ▶ **Common or very common** Chest pain · cough · diarrhoea · dyspnoea · haemorrhage · headache · hypotension · jaw pain · nausea · oral irritation · rash · throat pain · vomiting
- ▶ **Frequency not known** Bronchospasm · taste disturbance · thrombocytopenia · wheezing

- **PREGNANCY** Use if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature). Elimination reduced.

- **DIRECTIONS FOR ADMINISTRATION** For *inhaled treatment*, to minimise accidental exposure use only with nebulisers listed in *Ventavis*® product literature in a well ventilated room.

- **PRESCRIBING AND DISPENSING INFORMATION** Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2005) that iloprost (*Ventavis*®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser liquid**▶ **Ventavis** (Bayer Plc)

Iloprost (as Iloprost trometamol) 10 microgram per 1 ml Ventavis 10micrograms/ml nebuliser solution 1ml ampoules | 30 ampoule [PoM](#) £400.19 | 168 ampoule [PoM](#) £2,241.08

### ENDOTHELIN RECEPTOR ANTAGONISTS

#### Ambrisentan

**INDICATIONS AND DOSE****Pulmonary arterial hypertension (initiated under specialist supervision)**

## ▶ BY MOUTH

- ▶ **Adult:** 5 mg once daily, increased if necessary to 10 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Max. 5 mg daily with concomitant ciclosporin.

- **CONTRA-INDICATIONS** Idiopathic pulmonary fibrosis

- **CAUTIONS** Not to be initiated in significant anaemia

- **INTERACTIONS** → Appendix 1 (ambrisentan).

**SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anaemia · chest pain · constipation · diarrhoea · dizziness · dyspnoea · epistaxis · flushing · headache · heart failure · hypotension · malaise · nausea · palpitation · peripheral oedema · upper respiratory-tract disorders · vomiting

- ▶ **Uncommon** Autoimmune hepatitis · hepatic injury · syncope

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

- **PREGNANCY** Avoid (teratogenic in *animal studies*).

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

### ● MONITORING REQUIREMENTS

- ▶ Monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed).
- ▶ Monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2008) that ambrisentan (*Volibris*®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Volibris** (GlaxoSmithKline UK Ltd)  
Ambrisentan 5 mg Volibris 5mg tablets | 30 tablet PoM £1,618.08
- Ambrisentan 10 mg Volibris 10mg tablets | 30 tablet PoM £1,618.08

## Bosentan

### ● INDICATIONS AND DOSE

#### Pulmonary arterial hypertension (initiated under specialist supervision)

##### ▶ BY MOUTH

- ▶ Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

#### Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

##### ▶ BY MOUTH

- ▶ Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 930

- **CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg

- **INTERACTIONS** → Appendix 1 (bosentan).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · diarrhoea · flushing · gastro-oesophageal reflux · headache · hypotension · oedema · palpitation · syncope
- ▶ **Uncommon** Leucopenia · neutropenia · thrombocytopenia
- ▶ **Rare** Liver cirrhosis · liver failure

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

- **PREGNANCY** Avoid (teratogenic in *animal* studies).

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment.

### ● MONITORING REQUIREMENTS

- ▶ Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).
- ▶ Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.

- **TREATMENT CESSATION** Avoid abrupt withdrawal—withdraw treatment gradually.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Tracleer** (Actelion Pharmaceuticals UK Ltd)  
Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5mg tablets | 56 tablet PoM £1,510.21
- Bosentan (as Bosentan monohydrate) 125 mg Tracleer 125mg tablets | 56 tablet PoM £1,510.21

## Macitentan

### ● INDICATIONS AND DOSE

#### Pulmonary arterial hypertension (initiated under specialist supervision)

##### ▶ BY MOUTH

- ▶ Adult: 10 mg daily

- **CONTRA-INDICATIONS** Severe anaemia

- **CAUTIONS** Patients over 75 years · pulmonary veno-occlusive disease

- **INTERACTIONS** → Appendix 1 (macitentan).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · bronchitis · headache · hypotension · upper respiratory-tract disorders · urinary-tract infection

- ▶ **Frequency not known** Leucopenia · thrombocytopenia

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.

- **PREGNANCY** Toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Do not initiate if serum transaminases exceed 3 times upper limit of normal. Avoid in moderate and severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available). In renal impairment consider monitoring blood pressure (risk of hypotension).

### ● MONITORING REQUIREMENTS

- ▶ Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
- ▶ Monitor haemoglobin concentration before treatment and then as indicated.

- **PATIENT AND CARER ADVICE** Patient card should be provided.

Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2014) that macitentan (*Opsumit*®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Opsumit** (Actelion Pharmaceuticals UK Ltd) ▼  
Macitentan 10 mg Opsumit 10mg tablets | 30 tablet PoM £2,306.00

## GUANYLATE CYCLASE STIMULATORS

## Riociguat

19-Oct-2016

## ● INDICATIONS AND DOSE

**Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision) | Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)**

## ▶ BY MOUTH

Adult: Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased to up to 2.5 mg 3 times a day (max. per dose 2.5 mg 3 times a day), increase up to maximum dose only if systolic blood pressure  $\geq$  95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

## IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PULMONARY HYPERTENSION ASSOCIATED WITH IDIOPATHIC INTERSTITIAL PNEUMONIAS (PH-IIP) (AUGUST 2016)

Interim results from a terminated study to investigate the efficacy and safety of riociguat in patients with symptomatic PH-IIP, showed increased mortality and increased risk of serious adverse events in the riociguat group compared with the placebo group. The MHRA has advised that use of riociguat is contra-indicated in these patients and that existing treatment for this unauthorised indication should be discontinued.

- **CONTRA-INDICATIONS** History of serious haemoptysis · previous bronchial artery embolisation · pulmonary hypertension associated with idiopathic interstitial pneumonias · pulmonary veno-occlusive disease
- **CAUTIONS** Autonomic dysfunction · elderly (risk of hypotension) · hypotension (do not initiate if systolic blood pressure below 95 mmHg) · hypovolaemia · severe left ventricular outflow obstruction
- CAUTIONS, FURTHER INFORMATION**  
Smoking cessation advised (response possibly reduced); dose adjustment may be necessary if smoking started or stopped during treatment.
- **INTERACTIONS** → Appendix 1 (riociguat).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anemia · constipation · diarrhoea · dizziness · dyspepsia · dysphagia · epistaxis · gastritis · gastro-oesophageal reflux · haemoptysis · headache · hypotension · nasal congestion · nausea · palpitation · peripheral oedema · vomiting
  - ▶ **Uncommon** Pulmonary haemorrhage
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment. Monthly pregnancy tests advised.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Titrate dose cautiously in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Titrate dose cautiously—risk of hypotension. Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—limited information available.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water or soft foods and swallowed immediately.
- **PATIENT AND CARER ADVICE** Smoking cessation advised (response possibly reduced). Patients should inform prescriber if smoking started or stopped during treatment; dose adjustment may be necessary.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (November 2014) that riociguat (*Adempas*®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in patients for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

## 4.2 Hypotension and shock

## Sympathomimetics

## Inotropic sympathomimetics

## Shock

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 211, dobutamine p. 210 or dopamine hydrochloride p. 177. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine p. 178 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 259.

## Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to

constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 254. As well as constricting peripheral vessels ephedrine hydrochloride also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride to manage associated bradycardia (although intravenous injection of atropine sulfate p. 1179 may also be required if bradycardia persists).

## SYMPATHOMIMETICS > INOTROPIC

### Dopamine hydrochloride

- **DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta<sub>1</sub> receptors in cardiac muscle, and increases contractility with little effect on rate.

#### ● INDICATIONS AND DOSE

##### Cardiogenic shock in infarction or cardiac surgery

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 2–5 micrograms/kg/minute

- **CONTRA-INDICATIONS** Pheochromocytoma · tachyarrhythmia
- **CAUTIONS** Correct hypovolaemia · hyperthyroidism · low dose in shock due to acute myocardial infarction
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Chest pain · dyspnoea · headache · hypotension · nausea · palpitation · tachycardia · vasoconstriction · vomiting
  - ▶ **Uncommon** Bradycardia · gangrene · hypertension · mydriasis
  - ▶ **Rare** Fatal ventricular arrhythmias
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation—not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use.
 

For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

##### Solution for infusion

###### ▶ Dopamine hydrochloride (Non-proprietary)

Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule [PoM] £19.42-£20.00 | 10 ampoule [PoM] £9.04

Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] no price available

Dopamine hydrochloride 160 mg per 1 ml Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule [PoM] £34.00

## SYMPATHOMIMETICS > VASOCONSTRICTOR

### Metaraminol

#### ● INDICATIONS AND DOSE

##### Acute hypotension

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15–100 mg, adjusted according to response

##### Emergency treatment of acute hypotension

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

- **CONTRA-INDICATIONS** Hypertension
- **CAUTIONS** Cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS** Angle-closure glaucoma · anorexia · anxiety · arrhythmias · bradycardia · confusion · dyspnoea · fatal ventricular arrhythmia reported in Laennec's cirrhosis · headache · hypertension · hypoxia · insomnia · nausea · palpitation · peripheral ischaemia · psychosis · tachycardia · tremor · urinary retention · vomiting · weakness
- **PREGNANCY** May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Aramine*®), give continuously or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Suggested volume 500 mL.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

##### Solution for injection

###### ▶ Metaraminol (Non-proprietary)

Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £31.97

### Midodrine hydrochloride

01-Apr-2016

- **DRUG ACTION** Midodrine hydrochloride is a pro-drug of desglymidodrine. Desglymidodrine is a sympathomimetic agent, which acts on peripheral alpha-adrenergic receptors to increase arterial resistance, resulting in an increase in blood pressure.

#### ● INDICATIONS AND DOSE

**Severe orthostatic hypotension due to autonomic dysfunction when corrective factors have been ruled out and other forms of treatment are inadequate**

▶ BY MOUTH

- ▶ Adult: Initially 2.5 mg 3 times a day, increased if necessary up to 10 mg 3 times a day, dose to be increased at weekly intervals, according to blood pressure measurements; usual

continued →

maintenance 10 mg 3 times a day, avoid administration at night; the last daily dose should be taken at least 4 hours before bedtime

- **CONTRA-INDICATIONS** Aortic aneurysm · blood vessel spasm · bradycardia · cardiac conduction disturbances · cerebrovascular occlusion · congestive heart failure · hypertension · hyperthyroidism · myocardial infarction · narrow-angle glaucoma · pheochromocytoma · proliferative diabetic retinopathy · serious obliterative blood vessel disease · serious prostate disorder · urinary retention
- **CAUTIONS** Atherosclerotic cardiovascular disease (especially with symptoms of intestinal angina or claudication of the legs) · autonomic dysfunction · elderly (manufacturer recommends cautious dose titration) · prostate disorders
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Chills · dyspepsia · flushing · headache · nausea · paraesthesia · piloerection · pruritus · rash · stomatitis · supine hypertension (dose dependent) · urinary disorders
  - ▶ **Uncommon** Excitability · irritability · reflex bradycardia · restlessness · sleep disorders
  - ▶ **Rare** Hepatic dysfunction · palpitations · tachycardia
  - ▶ **Frequency not known** Abdominal pain · anxiety · confusion · diarrhoea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Supine hypertension** Manufacturer advises that treatment must be stopped if supine hypertension is not controlled by reducing the dose.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe or acute impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises measure hepatic and renal function before treatment and at regular intervals during treatment.
  - ▶ Manufacturer advises regular monitoring of supine and standing blood pressure due to the risk of hypertension in the supine position.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients report symptoms of supine hypertension (such as chest pain, palpitations, shortness of breath, headache and blurred vision) immediately. The risk of supine hypertension at night can be reduced by raising the head of the bed.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Bramox** (Brancaster Pharma Ltd)  
**Midodrine hydrochloride 2.5 mg** Bramox 2.5mg tablets | 100 tablet **[PoM]** £55.05 DT price = £55.05  
**Midodrine hydrochloride 5 mg** Bramox 5mg tablets | 100 tablet **[PoM]** £75.05 DT price = £75.05

## Noradrenaline/norepinephrine

### ● INDICATIONS AND DOSE

#### Acute hypotension

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 0.16–0.33 mL/minute, adjusted according to response, to be given via central venous catheter, of a solution containing noradrenaline 40 micrograms(base)/mL

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

- **CONTRA-INDICATIONS** Hypertension
- **CAUTIONS** Coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS** Angle-closure glaucoma · anorexia · anxiety · arrhythmias · bradycardia · confusion · dyspnoea · headache · hypertension · hypoxia · insomnia · nausea · palpitation · peripheral ischaemia · psychosis · tachycardia · tremor · urinary retention · vomiting · weakness
- **PREGNANCY** Avoid—may reduce placental perfusion.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For treatment of acute hypotension in adults, use a solution containing noradrenaline 40 micrograms (base)/mL. For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride and glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalis.
- **PRESCRIBING AND DISPENSING INFORMATION** For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.

### ● MEDICINAL FORMS

**Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 ml** Noradrenaline (Norepinephrine) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule **[PoM]** £44.00  
 Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule **[PoM]** £116.00  
 Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule **[PoM]** £12.00 (Hospital only)  
 Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule **[PoM]** £22.00 (Hospital only)  
 Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule **[PoM]** £58.00  
 Noradrenaline (Norepinephrine) 2mg/2ml concentrate for solution for Infusion ampoules | 5 ampoule **[PoM]** £11.00

## Phenylephrine hydrochloride

### ● INDICATIONS AND DOSE

#### Acute hypotension

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: Initially 2–5 mg, followed by 1–10 mg, after at least 15 minutes if required
- ▶ BY SLOW INTRAVENOUS INJECTION
  - Adult: 100–500 micrograms, repeated as necessary after at least 15 minutes
- ▶ BY INTRAVENOUS INFUSION
  - Adult: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

- **CONTRA-INDICATIONS** Hypertension · severe hyperthyroidism
- **CAUTIONS** Coronary disease · coronary vascular thrombosis · diabetes · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia
- CAUTIONS, FURTHER INFORMATION**
  - Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.
- **INTERACTIONS** → Appendix 1 (sympathomimetics). Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.
- **SIDE-EFFECTS** Angle-closure glaucoma · anorexia · anxiety · arrhythmias · bradycardia (also reflex bradycardia) · confusion · dyspnoea · headache · hypertension · hypoxia · insomnia · nausea · palpitation · peripheral ischaemia · psychosis · tachycardia · tremor · urinary retention · vomiting · weakness
- **PREGNANCY** Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.
- **MONITORING REQUIREMENTS** Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 10 mg in 500 mL infusion fluid.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Phenylephrine hydrochloride 10 mg per 1 ml** Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule **[PoM]** £99.12

## 5 Heart failure

### Heart failure

#### Drug treatment

Drug treatment of **heart failure** associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An **ACE inhibitor**, titrated to a 'target dose' (or the maximum tolerated dose if lower), together with a **beta-blocker**, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An **angiotensin-II receptor antagonist** may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan cilexetil p. 166 or valsartan p. 170 may be given under specialist supervision as adjuncts to an ACE inhibitor in the treatment of heart failure when other treatments are unsuitable; the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. The combination of valsartan with sacubitril p. 181, an angiotensin-II receptor antagonist with a neprilysin inhibitor, may be a suitable alternative for those patients already stabilised on an ACE inhibitor or angiotensin-II receptor antagonist.

The beta-blockers bisoprolol fumarate p. 144 and carvedilol p. 139 are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol p. 146 is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone p. 180 can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone p. 180 may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient's clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate p. 208 with hydralazine hydrochloride p. 171 but this combination may be poorly tolerated. The combination of isosorbide dinitrate and hydralazine hydrochloride may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

Digoxin p. 103 improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure

due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan cilexetil, or isosorbide dinitrate with hydroalazine hydrochloride.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A **thiazide diuretic** may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m<sup>2</sup>) and a **loop diuretic** is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone p. 220 may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

**Other drugs used for Heart failure** Bendroflumethiazide, p. 157 · Captopril, p. 159 · Chlortalidone, p. 219 · Coamilofide, p. 157 · Cyclopentiazide, p. 220 · Enalapril maleate, p. 160 · Fosinopril sodium, p. 161 · Glyceryl trinitrate, p. 207 · Isosorbide mononitrate, p. 209 · Ivabradine, p. 200 · Lisinopril, p. 161 · Losartan potassium, p. 167 · Metoprolol tartrate, p. 145 · Perindopril arginine, p. 162 · Perindopril erbumine, p. 163 · Prazosin, p. 717 · Quinapril, p. 163 · Ramipril, p. 164 · Sodium nitroprusside, p. 173

## DIURETICS > POTASSIUM-SPARING DIURETICS > ALDOSTERONE ANTAGONISTS

### Co-flumactone

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone below.

#### INDICATIONS AND DOSE

##### Congestive heart failure

###### BY MOUTH

- Adult: Initially 100/100 mg daily; maintenance 25/25–200/200 mg daily, maintenance dose not recommended because spironolactone generally given in lower dose

- LESS SUITABLE FOR PRESCRIBING Co-flumactone tablets are less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

###### Aldactide (Pfizer Ltd)

Hydroflumethiazide 25 mg, Spironolactone 25 mg Aldactide 25 tablets | 100 tablet (PoM) £20.23 DT price = £20.23

Hydroflumethiazide 50 mg, Spironolactone 50 mg Aldactide 50 tablets | 28 tablet (PoM) £10.70 | 100 tablet (PoM) £38.23 DT price = £38.23

### Eplerenone

#### INDICATIONS AND DOSE

**Adjunct in stable patients with left ventricular ejection fraction <40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) (Adjunct in chronic mild heart failure with left ventricular ejection fraction <30%)**

###### BY MOUTH

- Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment

- CONTRA-INDICATIONS Hyperkalaemia
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1 (diuretics). Concomitant use of potassium-sparing diuretics or potassium supplements is contra-indicated.
- SIDE-EFFECTS
  - Common or very common Azotaemia · constipation · cough · diarrhoea · dizziness · hyperkalaemia · hypotension · muscle spasm · musculoskeletal pain · nausea · pruritus · rash · renal impairment · syncope
  - Uncommon Arterial thrombosis · atrial fibrillation · back pain · cholecystitis · dehydration · dyslipidaemia · eosinophilia · epidermal growth factor receptor decreased · flatulence · gynaecomastia · headache · hyperglycaemia · hypoesthesia · hyponatraemia · hypothyroidism · insomnia · malaise · pharyngitis · postural hypotension · pyelonephritis · sweating · tachycardia · vomiting
  - Frequency not known Angioedema
- PREGNANCY Manufacturer advises caution—no information available.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Initially 25 mg on alternate days if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>, adjust dose according to serum-potassium concentration—consult product literature. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Increased risk of hyperkalaemia in renal impairment—close monitoring required.
- MONITORING REQUIREMENTS Monitor plasma-potassium concentration before treatment, during initiation, and when dose changed.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

###### Eplerenone (Non-proprietary)

Eplerenone 25 mg Eplerenone 25mg tablets | 28 tablet (PoM) £42.72 DT price = £6.06

Eplerenone 25 mg Inspira 25mg tablets | 28 tablet (PoM) £42.72 DT price = £6.06

Eplerenone 50 mg Inspira 50mg tablets | 28 tablet (PoM) £42.72 DT price = £7.21

### Spironolactone

#### INDICATIONS AND DOSE

##### Oedema | Ascites in cirrhosis of the liver

###### BY MOUTH

- Adult: 100–400 mg daily, adjusted according to response

##### Malignant ascites

###### BY MOUTH

- Adult: Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

##### Nephrotic syndrome

###### BY MOUTH

- Adult: 100–200 mg daily

##### Oedema in congestive heart failure

###### BY MOUTH

- Adult: Initially 100 mg daily, alternatively initially 25–200 mg daily, dose may be taken as a single dose or divided doses, maintenance dose adjusted according to response

**Moderate to severe heart failure (adjunct)**

## ▶ BY MOUTH

- Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

**Resistant hypertension (adjunct)**

## ▶ BY MOUTH

- Adult: 25 mg once daily

**Primary hyperaldosteronism in patients awaiting surgery**

## ▶ BY MOUTH

- Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

- **UNLICENSED USE** Resistant hypertension (adjunct) unlicensed indication.
- **CONTRA-INDICATIONS** Addison's disease · anuria · hyperkalaemia
- **CAUTIONS** Acute porphyrias p. 930 · elderly · potential metabolic products carcinogenic in *rodents*
- **INTERACTIONS** → Appendix 1 (diuretics). Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.
- **SIDE-EFFECTS** Acute renal failure · agranulocytosis · alopecia · benign breast tumour · breast pain · changes in libido · confusion · dizziness · drowsiness · electrolyte disturbances · gastro-intestinal disturbances · gynaecomastia · hepatotoxicity · hyperkalaemia (discontinue) · hypertrichosis · hyperuricaemia · hyponatraemia · leg cramps · leucopenia · malaise · menstrual disturbances · rash · Stevens-Johnson syndrome · thrombocytopenia
- **PREGNANCY** Use only if potential benefit outweighs risk—feminisation of male fetus in *animal* studies.
- **BREAST FEEDING** Metabolites present in milk, but amount probably too small to be harmful.
- **RENAL IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **MONITORING REQUIREMENTS** Monitor electrolytes—discontinue if hyperkalaemia occurs (in *severe heart failure* monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

## CAUTIONARY AND ADVISORY LABELS 21

▶ **Spirolactone (Non-proprietary)**

**Spirolactone 25 mg** Spirolactone 25mg tablets | 28 tablet **[PoM]** £1.95 DT price = £1.26

**Spirolactone 50 mg** Spirolactone 50mg tablets | 28 tablet **[PoM]** £4.99 DT price = £1.79

▶ **Aldactone (Pfizer Ltd)**

**Spirolactone 25 mg** Aldactone 25mg tablets | 100 tablet **[PoM]** £8.89

**Spirolactone 50 mg** Aldactone 50mg tablets | 100 tablet **[PoM]** £17.78

**Spirolactone 100 mg** Aldactone 100mg tablets | 28 tablet **[PoM]** £9.96 DT price = £2.16 | 100 tablet **[PoM]** £35.56

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ANGIOTENSIN II RECEPTOR ANTAGONISTS****Valsartan with sacubitril**

17-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consult, valsartan p. 170.

- **DRUG ACTION** Sacubitril (a prodrug) inhibits the breakdown of natriuretic peptides resulting in varied effects including increased diuresis, natriuresis, and vasodilation.

**INDICATIONS AND DOSE**

**Symptomatic chronic heart failure with reduced ejection fraction (in patients not currently taking an ACE inhibitor or angiotensin II receptor antagonist, or stabilised on low doses of either of these agents)**

## ▶ BY MOUTH

- Adult: Initially 26/24 mg twice daily for 3–4 weeks, increased if tolerated to 51/49 mg twice daily for 3–4 weeks, then increased if tolerated to 103/97 mg twice daily

**Symptomatic chronic heart failure with reduced ejection fraction (in patients currently stabilised on an ACE inhibitor or angiotensin II receptor antagonist)**

## ▶ BY MOUTH

- Adult: Initially 51/49 mg twice daily for 2–4 weeks, increased if tolerated to 103/97 mg twice daily, consider a starting dose of 26/24 mg if systolic blood pressure less than 110 mmHg

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ *Entresto*<sup>®</sup> tablets contain valsartan and sacubitril; the proportions are expressed in the form x/y where x and y are the strength in milligrams of valsartan and sacubitril respectively. Valsartan, in this formulation, is more bioavailable than other tablet formulations—26 mg, 51 mg, and 103 mg valsartan is equivalent to 40 mg, 80 mg and 160 mg, respectively. Furthermore, note that the 26/24 mg, 51/49 mg and 103/97 mg strengths are sometimes referred to as a total of both drug strengths, that is, 50 mg, 100 mg and 200 mg, respectively.

- **CONTRA-INDICATIONS** Concomitant use of ACE inhibitor (separate administration by 36 hours) · systolic blood pressure less than 100 mmHg
- **INTERACTIONS** → Appendix 1 (angiotensin-II receptor antagonists, sacubitril)
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · diarrhoea · gastritis · hypoglycaemia · hypokalaemia · nausea · vertigo
- **PREGNANCY** Manufacturer advises avoid—toxicity with sacubitril in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises starting dose of 26/24 mg twice daily in moderate impairment. Contra-indicated in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer recommends a starting dose of 26/24 mg twice daily if eGFR less than 30 mL/minute/1.73m<sup>2</sup>. Also consider this starting dose if eGFR 30 to 60 mL/minute/1.73m<sup>2</sup>.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Sacubitril valsartan for treating symptomatic chronic heart failure with reduced ejection fraction (April 2016)** NICE TA388 Sacubitril valsartan is recommended as an option for treating symptomatic chronic heart failure with reduced ejection fraction, only in adults:

- with New York Heart Association class II to IV symptoms **and**
- a left ventricular ejection fraction of 35% or less **and**
- who are already taking a stable dose of an ACE inhibitor or angiotensin II receptor antagonist.

## PHOSPHODIESTERASE TYPE-3 INHIBITORS

### Enoximone

- **DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

#### ● INDICATIONS AND DOSE

**Congestive heart failure where cardiac output reduced and filling pressures increased**

##### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 0.5–1 mg/kg, rate not exceeding 12.5 mg/minute, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required

##### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day

- **CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction
- **INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).
- **SIDE-EFFECTS** Chills · diarrhoea · ectopic beats · fever · headache · hypotension · insomnia · nausea · oliguria · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · upper and lower limb pain · urinary retention · ventricular tachycardia (more likely in patients with pre-existing arrhythmias) · vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **HEPATIC IMPAIRMENT** Dose reduction may be required.
- **RENAL IMPAIRMENT** Consider dose reduction.
- **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

- **DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

For *intravenous infusion* (Perfan<sup>®</sup>), give continuously or intermittently in Sodium chloride 0.9% or Water for injections; dilute to a concentration of 2.5 mg/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

- ▶ **Perfan** (Myogen GmbH)

**Enoximone 5 mg per 1 ml** Perfán 100mg/20ml solution for injection ampoules | 10 ampoule [PoM] no price available (Hospital only)

## Milrinone

- **DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

#### ● INDICATIONS AND DOSE

**Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) | Acute heart failure, including low output states following heart surgery**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

- **CONTRA-INDICATIONS** Severe hypovolaemia
- **CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction
- **INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Ectopic beats · headache · hypotension · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · ventricular tachycardia
  - ▶ **Uncommon** Chest pain · hypokalaemia · thrombocytopenia · tremor · ventricular fibrillation
  - ▶ **Very rare** Anaphylaxis · bronchospasm · rash
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>—consult product literature for details.
- **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
- **DIRECTIONS FOR ADMINISTRATION** Avoid extravasation. For *intravenous injection*, may be given either undiluted or diluted before use. For *intravenous infusion* (Primacor<sup>®</sup>) give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

##### Solution for infusion

- ▶ **Primacor** (Sanofi)  
Milirinone 1 mg per 1 ml Primacor 10mg/10ml solution for injection ampoules | 10 ampoule (POM) £199.06

## SYMPATHOMIMETICS > INOTROPIC

### Dopexamine hydrochloride

- **DRUG ACTION** Dopexamine acts on beta<sub>2</sub> receptors in cardiac muscle to produce a positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

#### INDICATIONS AND DOSE

**Inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery**

##### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 0.5 microgram/kg/minute, to be administered into central or large peripheral vein, then increased if necessary to 1 microgram/kg/minute, increased if necessary up to 6 micrograms/kg/minute, in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

- **CONTRA-INDICATIONS** Aortic stenosis · hypertrophic cardiomyopathy · left ventricular outlet obstruction · phaeochromocytoma · thrombocytopenia
- **CAUTIONS** Correct hypovolaemia before starting and during treatment · hyperglycaemia · hyperthyroidism · hypokalaemia · myocardial infarction · recent angina
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS**  
▶ **Common or very common** Angina · arrhythmias · bradycardia · dyspnoea · headache · myocardial infarction · nausea · reversible thrombocytopenia · sweating · tachycardia · tremor · vomiting
- **PREGNANCY** No information available—manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Monitor blood pressure, pulse, plasma potassium, and blood glucose.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous infusion to be diluted before use. For *continuous intravenous infusion*, dilute to a concentration of 400 or 800 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; max. concentration *via* large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused *via* central vein; give *via* infusion pump or other device which provides accurate control of rate; contact with metal in infusion apparatus should be minimised; incompatible with bicarbonate.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

- ▶ **Dopacard** (Teva UK Ltd)  
Dopexamine hydrochloride 10 mg per 1 ml Dopacard 50mg/5ml concentrate for solution for infusion ampoules | 10 ampoule (POM) £252.00 (Hospital only)

## 6 Hyperlipidaemia

### Lipid-regulating drugs

#### Primary and secondary prevention of cardiovascular disease

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

#### Primary prevention

Individuals at high risk of developing cardiovascular disease include those who have diabetes mellitus, chronic kidney disease (eGFR < 60 mL/minute/1.73 m<sup>2</sup>) and/or albuminuria, and those with familial hypercholesterolaemia. The risk also increases with age; those aged 85 years and over are at particularly high risk, especially if they smoke or have hypertension. Preventative measures are also required for other individuals who are considered to be at high risk of developing atherosclerotic cardiovascular disease based on risk estimated using risk calculators (see Risk calculators); those with a 10-year risk of cardiovascular disease of 10% or more stand to benefit most from drug treatment. Patients with a 10-year cardiovascular risk of less than 10% may benefit from an assessment of their lifetime risk (using the JBS3 tool—see Risk calculators for more detail), discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

#### Risk calculators

Risk assessment calculators are recommended by both NICE (clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) and JBS3 (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease 2014). They should not be used in patients at high cardiovascular risk. Both calculators are unsuitable for assessing risk in those aged 85 years and over, and NICE advises against using a risk assessment tool in those with type 1 diabetes mellitus.

The QRISK<sup>®</sup> 2 risk calculator [www.qrisk.org/](http://www.qrisk.org/) is recommended by NICE clinical guideline 181, and the JBS3 risk calculator [www.jbs3risk.com/pages/risk\\_calculator.htm](http://www.jbs3risk.com/pages/risk_calculator.htm) is endorsed by JBS3. Both tools assess cardiovascular risk—coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack, on the basis of lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease, diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, or a family history of premature cardiovascular disease. Risk assessment tools underestimate risk in patients with additional risk due to existing conditions or medication, such as:

- serious mental disorder
- autoimmune disorders such as systemic lupus erythematosus and other systemic inflammatory disorders
- antiretroviral treatment
- medication causing dyslipidaemia as a side-effect e.g. antipsychotics, corticosteroids, or immunosuppressants
- triglyceride concentration > 4.5 mmol/litre

Cardiovascular disease risk is also underestimated in those who are already taking antihypertensive or lipid-regulating drugs, and in those who have recently stopped smoking.

Severe obesity (BMI > 40 kg/m<sup>2</sup>) also increases cardiovascular risk; the need for further treatment of risk

factors in patients below the cardiovascular risk threshold for treatment should be based on clinical judgement.

### Preventative measures for primary prevention

All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation.

Offer a statin as first-line drug treatment if lifestyle modifications are inappropriate or ineffective (see also Statins for the prevention of cardiovascular disease). Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

### Secondary prevention

Statin should be offered to all patients, including the elderly, with cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

### Preventative measures for secondary prevention

Patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation, however, initiation of lipid-regulating drug treatment should not be delayed to manage modifiable risk factors, and must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of co-morbidities and secondary causes of dyslipidaemia.

### Statins for the prevention of cardiovascular disease

A statin reduces the risk of cardiovascular disease events, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. Before starting treatment with statins, secondary causes of dyslipidaemia should be addressed; these include uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, and excessive alcohol consumption. Patients with hypothyroidism should receive adequate thyroid replacement therapy (before assessing the requirement for lipid-regulating treatment if for primary prevention) because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

For the purpose of reducing cardiovascular risk, NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) defines statins by the percentage reduction in LDL-cholesterol they achieve:

For *primary prevention*, NICE Clinical Guideline 181 recommends that atorvastatin p. 191 a high-intensity statin (when prescribed at a dose of at least 20 mg/day), should be offered to those with a 10-year risk of cardiovascular disease of 10% or more; patients aged 85 years and over may benefit from atorvastatin to reduce the risk of non-fatal myocardial infarction. For *secondary prevention*, atorvastatin is also recommended. Patients taking a low- or medium-intensity statin should discuss the benefits and risks of switching to a high intensity statin at their next medication review.

A statin should be considered for *all* adults with type 1 diabetes mellitus, particularly those aged 40 years and over, or who have had diabetes for more than 10 years, or who have established nephropathy, or other risk factors for cardiovascular disease. JBS3 recommendations (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease (JBS3) 2014) in diabetes mellitus

differ in certain respects from NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease)—see JBS3 recommendations for further details. In type 2 diabetes, assess level of risk using the risk calculator and treat for primary prevention if necessary.

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high intensity statin. NICE Clinical Guideline 181 recommends aiming for a reduction in non-HDL cholesterol concentration greater than 40%; JBS3 recommends a target non-HDL cholesterol concentration below 2.5 mol/litre. If these are not achieved, ensure lifestyle modifications are optimised and consider increasing the dose of the statin if started on less than atorvastatin 80 mg and the patient is judged to be at higher risk because of comorbidities, risk score or, using clinical judgement.

Specialist advice should be sought about treatment options for patients at high risk of cardiovascular disease or those with existing cardiovascular disease, who are intolerant of three different statins.

**Fibrates** should not be routinely used for primary or secondary prevention. Nicotinic acid p. 190, **bile acid sequestrants**, and **omega-3 fatty acid compounds** are not recommended for primary or secondary prevention.

### Hypercholesterolaemia, hypertriglyceridaemia, and familial hypercholesterolaemia

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 187; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate p. 188 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should **not** be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A 'high-intensity' statin (as defined in NICE Clinical Guideline 71, August 2008. Identification and management of familial hypercholesterolaemia) e.g. rosuvastatin p. 193 (initiated by a specialist) or atorvastatin p. 191 should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a 'high-intensity' statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Reduction in low-density lipoprotein cholesterol			
Therapy intensity	Drug	Daily dose (reduction in LDL cholesterol)	
High-intensity	Atorvastatin	20mg (43%)	
		40mg (49%)	
		80mg (55%)	
	Rosuvastatin	10mg (43%)	
		20mg (48%)	
		40mg (53%)	
	Simvastatin	80mg (42%)	
Medium-intensity	Atorvastatin	10mg (37%)	
		Fluvastatin	80mg (33%)
		Rosuvastatin	5mg (38%)
	Simvastatin	20mg (32%) 40mg (37%)	
Low-intensity	Fluvastatin	20mg (21%)	
		40mg (27%)	
		Pravastatin	10mg (20%) 20mg (24%) 40mg (29%)
	Simvastatin	10mg (27%)	

Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.

## Statins

Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

## Alirocumab

Alirocumab p. 195 is licensed for the treatment of primary hypercholesterolaemia (heterozygous familial and non-familial) or mixed dyslipidaemia as an adjunct to dietary measures. It can be used in combination with a statin, or with a statin and other lipid-regulating drugs, in patients unable to achieve their LDL-cholesterol treatment goals with the maximum tolerated dose of a statin. It can also be used alone or in combination with other lipid-regulating drugs if a statin is contra-indicated or not tolerated.

## Bile acid sequestrants

Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Treatment with bile acid sequestrants may be appropriate under specialist supervision if statins and ezetimibe are inappropriate, and when LDL-cholesterol is severely raised, for example in familial hypercholesterolaemia.

## Fibrates

Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mol/litre or in those who cannot tolerate a statin (specialist use).

## Lomitapide

Lomitapide p. 195 is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozygous familial hypercholesterolaemia.

## Nicotinic acid group

The value of nicotinic acid is limited by its side-effects, especially vasodilatation.

Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol).

Acipimox p. 190 seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

## Omega-3 fatty acid compounds

There is no evidence that omega-3 fatty acid compounds reduce the risk of cardiovascular disease.

**Other drugs used for Hyperlipidaemia** Inositol nicotinate, p. 221

## LIPID MODIFYING DRUGS > BILE ACID SEQUESTRANTS

### Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- **SIDE-EFFECTS** Constipation · diarrhoea · gastro-intestinal discomfort · hypertriglyceridaemia (aggravation) · hypoprothrombinaemia associated with vitamin K deficiency · increased risk of bleeding · nausea · vomiting
- **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

▀ above

### Colesevelam hydrochloride

#### • INDICATIONS AND DOSE

#### Primary hypercholesterolaemia as an adjunct to dietary measures (monotherapy)

- BY MOUTH
- Adult: 3.75 g daily in 1–2 divided doses; maximum 4.375 g per day

#### Primary hypercholesterolaemia as an adjunct to dietary measures, in combination with a statin | Primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin

- BY MOUTH
- Adult: 2.5–3.75 g daily in 1–2 divided doses, may be taken at the same time as the statin and ezetimibe

- **CONTRA-INDICATIONS** Biliary obstruction · bowel obstruction
- **CAUTIONS** Gastro-intestinal motility disorders · inflammatory bowel disease · major gastro-intestinal surgery
- **INTERACTIONS** → Appendix 1 (colesevelam).
- **SIDE-EFFECTS** Headache · myalgia
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **MONITORING REQUIREMENTS** Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colestevlam.
- **DIRECTIONS FOR ADMINISTRATION** Other drugs should be taken at least 4 hours before or after colestevlam to reduce possible interference with absorption.
- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestevlam hydrochloride tablets (avoid other drugs at same time).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 21

F 185

#### ● INDICATIONS AND DOSE

**Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures**

##### ▶ BY MOUTH

- ▶ Adult: Initially 5 g 1–2 times a day, increased in steps of 5 g every month if required, total daily dose may be given in 1–2 divided doses; maximum 30 g per day

- **INTERACTIONS** → Appendix 1 (colestipol).

- **DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided.

Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Colestipol hydrochloride (Non-proprietary)**

**Colestipol hydrochloride 1 gram** Colestid 1g tablets | 120 tablet [PoM] no price available

##### Granules

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Colestid** (Pfizer Ltd)

**Colestipol hydrochloride 5 gram** Colestid 5g granules sachets plain sugar-free | 30 sachet [PoM] £15.05

Colestid Orange 5g granules sachets sugar-free | 30 sachet [PoM] £15.05

## Colestyramine

### (Cholestyramine)

F 185

#### ● INDICATIONS AND DOSE

**Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures | Primary prevention of coronary heart disease in men aged 35–59 years with primary hypercholesterolaemia who have not responded to diet and other appropriate measures**

##### ▶ BY MOUTH

- ▶ Adult: Initially 4 g daily, increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response; maximum 36 g per day

**Pruritus associated with partial biliary obstruction and primary biliary cirrhosis**

##### ▶ BY MOUTH

- ▶ Adult: 4–8 g once daily

**Diarrhoea associated with Crohn's disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation**

##### ▶ BY MOUTH

- ▶ Adult: Initially 4 g daily, increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response, if no response within 3 days an alternative therapy should be initiated; maximum 36 g per day

**Accelerated elimination of teriflunomide**

##### ▶ BY MOUTH

- ▶ Adult: 8 g 3 times a day for 11 days; reduced to 4 g 3 times a day, dose should only be reduced if not tolerated

**Accelerated elimination of leflunomide (washout procedure)**

##### ▶ BY MOUTH

- ▶ Adult: 8 g 3 times a day for 11 days

- **CONTRA-INDICATIONS** Complete biliary obstruction (not likely to be effective)

- **INTERACTIONS** → Appendix 1 (colestyramine).

- **SIDE-EFFECTS**

- ▶ **Rare** Intestinal obstruction

- ▶ **Frequency not known** Hyperchloraemic acidosis (on prolonged use)

- **DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content.

Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Powder

CAUTIONARY AND ADVISORY LABELS 13

EXCIPIENTS: May contain Aspartame, sucrose

- ▶ **Colestyramine (Non-proprietary)**

**Colestyramine anhydrous 4 gram** Colestyramine 4g oral powder sachets | 50 sachet [PoM] no price available

Colestyramine 4g oral powder sachets sugar free sugar-free | 50 sachet [PoM] £24.46-£30.00 DT price = £27.61

- ▶ **Questran** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Colestyramine anhydrous 4 gram** Questran 4g oral powder sachets | 50 sachet [PoM] £10.76

- ▶ **Questran Light** (Bristol-Myers Squibb Pharmaceuticals Ltd)  
Colestyramine anhydrous 4 gram Questran Light 4g oral powder sachets sugar-free | 50 sachet [PoM] £16.15 DT price = £27.61

## LIPID MODIFYING DRUGS > CHOLESTEROL ABSORPTION INHIBITORS

### Ezetimibe

19-May-2016

- **DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol. If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

#### ● INDICATIONS AND DOSE

**Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia**

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily

- **INTERACTIONS** → Appendix 1 (ezetimibe). There is an increased risk of rhabdomyolysis if ezetimibe used in combination with a statin.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Fatigue · gastro-intestinal disturbances · headache · myalgia
- ▶ **Rare** Anaphylaxis · angioedema · arthralgia · hepatitis · hypersensitivity reactions · rash
- ▶ **Very rare** Cholecystitis · cholelithiasis · myopathy · pancreatitis · raised creatine kinase · rhabdomyolysis · thrombocytopenia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment—may accumulate.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Ezetimibe for treating primary heterozygous-familial and non-familial hypercholesterolaemia (February 2016) NICE TA385 This guidance should be used with NICE's guidelines on cardiovascular disease: risk assessment and reduction, including lipid modification and familial hypercholesterolaemia: identification and management (see Lipid-regulating drugs p. 183).

Ezetimibe, alone, is recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adult patients in whom initial statin therapy is contra-indicated, or who are intolerant of initial statin therapy.

Ezetimibe, in combination with initial statin therapy, is also recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adult patients when:

- serum total or low-density lipoprotein (LDL) cholesterol concentration is not appropriately controlled either after appropriate dose titration of initial statin therapy or because dose titration is limited by intolerance to the initial statin therapy **and**
- a change from initial statin therapy to an alternative statin is being considered.

When prescribing ezetimibe in combination with statin, ezetimibe should be prescribed on the basis of lowest acquisition cost.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Ezetrol** (Merck Sharp & Dohme Ltd)  
**Ezetimibe 10 mg** Ezetrol 10mg tablets | 28 tablet [PoM] £26.31 DT price = £26.31

Combinations available: *Simvastatin with ezetimibe*, p. 194

## LIPID MODIFYING DRUGS > FIBRATES

### Bezafibrate

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

#### ● INDICATIONS AND DOSE

**Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 200 mg 3 times a day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 400 mg once daily, modified-release dose form is not appropriate in patients with renal impairment

- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment

- **INTERACTIONS** → Appendix 1 (fibrates). Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension · anorexia · diarrhoea · nausea
- ▶ **Uncommon** Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · photosensitivity reactions · pruritus · rash · renal failure · urticaria
- ▶ **Rare** Pancreatitis · peripheral neuropathy
- ▶ **Very rare** Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis

- **PREGNANCY** Manufacturers advise avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m<sup>2</sup>.

**Myotoxicity** Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

Avoid *immediate-release* preparations if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.

Avoid *modified-release* preparations if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.

- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

## Ciprofibrate

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

- **INDICATIONS AND DOSE**

**Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia**

▶ BY MOUTH

▶ Adult: 100 mg daily

- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates
- **CAUTIONS** Correct hypothyroidism before initiating treatment
- **INTERACTIONS** → Appendix 1 (fibrates)  
Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distension · anorexia · diarrhoea · nausea
  - ▶ **Uncommon** Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · photosensitivity reactions · pruritus · rash · renal failure · urticaria
  - ▶ **Rare** Pancreatitis · peripheral neuropathy
  - ▶ **Very rare** Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis
  - ▶ **Frequency not known** Pneumonitis · pulmonary fibrosis
- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose to 100 mg on alternate days in moderate impairment. Avoid in severe impairment. Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

- **MONITORING REQUIREMENTS**

- ▶ Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
- ▶ Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Ciprofibrate (Non-proprietary)**

**Ciprofibrate 100 mg** Ciprofibrate 100mg tablets | 28 tablet PoM  
£134.21 DT price = £112.06

## Fenofibrate

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

- **INDICATIONS AND DOSE**

**Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk**

▶ BY MOUTH USING CAPSULES

▶ Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin, 200 mg capsules not appropriate for use in renal impairment, 267 mg capsules not appropriate for initial dose titration, or in renal impairment

▶ BY MOUTH USING TABLETS

▶ Adult: 160 mg daily, tablets not appropriate in renal impairment

- **CONTRA-INDICATIONS** Gall bladder disease · pancreatitis (unless due to severe hypertriglyceridaemia) · photosensitivity to ketoprofen
- **CAUTIONS** Correct hypothyroidism before initiating treatment
- **INTERACTIONS** → Appendix 1 (fibrates).  
Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distension · anorexia · diarrhoea · nausea
  - ▶ **Uncommon** Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · pancreatitis · photosensitivity reactions · pruritus · pulmonary embolism · rash · renal failure · urticaria
  - ▶ **Rare** Hepatitis · peripheral neuropathy
  - ▶ **Very rare** Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia ·

Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis

- ▶ **FREQUENCY NOT KNOWN** Interstitial pneumopathies
- **PREGNANCY** Avoid—embryotoxicity in *animal* studies.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>. Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
- **MONITORING REQUIREMENTS**
  - ▶ Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
  - ▶ Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Combinations available: *Simvastatin with fenofibrate*, p. 195

## Gemfibrozil

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

#### ● INDICATIONS AND DOSE

**Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemia if statin contra-indicated or not tolerated**

##### ▶ BY MOUTH

- ▶ Adult: 1.2 g daily in 2 divided doses, maintenance 0.9–1.2 g daily

- **CONTRA-INDICATIONS** History of gall-bladder or biliary tract disease including gallstones · photosensitivity to fibrates
- **CAUTIONS** Correct hypothyroidism before initiating treatment · elderly
- **INTERACTIONS** → Appendix 1 (fibrates). The combination of gemfibrozil and a statin should preferably be avoided; high risk of muscle effects (especially rhabdomyolysis).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dyspepsia · eczema · fatigue · flatulence · headache · nausea · rash · vertigo · vomiting
  - ▶ **Uncommon** Atrial fibrillation
  - ▶ **Rare** Hepatitis · paraesthesia · alopecia · anaemia · angioedema · appendicitis · blurred vision · bone-marrow suppression · cholestatic jaundice · depression · disturbances in hepatic function · dizziness · drowsiness · eosinophilia · exfoliative dermatitis · leucopenia · myalgia · myasthenia · myopathy · myositis accompanied by increase in creatine kinase (discontinue if raised significantly) · pancreatitis · photosensitivity · pruritus · sexual dysfunction · thrombocytopenia · urticaria
- **PREGNANCY** Manufacturers advise avoid unless essential— toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor blood counts for first year.
  - ▶ Monitor liver-function (discontinue treatment if abnormalities persist).
  - ▶ Consider monitoring creatine kinase if used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

CAUTIONARY AND ADVISORY LABELS 21

▶ **Olbetam (Pfizer Ltd)**

**Acipimox 250 mg** Olbetam 250mg capsules | 90 capsule **[PoM]**  
£46.33 DT price = £46.33

**Nicotinic acid**

● **DRUG ACTION** In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

**INDICATIONS AND DOSE**

**Adjunct to statin in dyslipidaemia or used alone if statin not tolerated**

▶ BY MOUTH

▶ Adult: (consult product literature)

● **CONTRA-INDICATIONS** Active peptic ulcer disease · arterial bleeding

● **CAUTIONS** Acute myocardial infarction · diabetes mellitus · gout · history of peptic ulceration · unstable angina

● **INTERACTIONS** → Appendix 1 (nicotinic acid).

**SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · diarrhoea · dyspepsia · flushing · nausea · pruritus · rash · vomiting

▶ **Uncommon** Dizziness · headache · hypophosphataemia · increase in uric acid · palpitation · peripheral oedema · prolonged prothrombin time · reduced platelet count · shortness of breath · tachycardia

▶ **Rare** Hypotension · insomnia · myalgia · myasthenia · myopathy · reduced glucose tolerance · rhinitis · syncope

▶ **Very rare** Anorexia · rhabdomyolysis · visual disturbance

▶ **Frequency not known** Jaundice

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ Prostaglandin-mediated symptoms Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid.

● **PREGNANCY** No information available—manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk—avoid.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment. Discontinue if severe abnormalities in liver function tests. Manufacturer advises monitor liver function in mild to moderate hepatic impairment.

● **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, modified-release tablet, capsule

**Capsule**▶ **Nicotinic acid (Non-proprietary)**

**Nicotinic acid 500 mg** Solgar Niacin 500mg capsules | 100 capsule  
no price available

**LIPID MODIFYING DRUGS > STATINS****Statins**

● **DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.

● **CAUTIONS** Elderly · high alcohol intake · history of liver disease · hypothyroidism · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

**CAUTIONS, FURTHER INFORMATION**

▶ **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

▶ **Hypothyroidism** Hypothyroidism should be managed adequately before starting treatment with a statin.

● **INTERACTIONS** → Appendix 1 (statins).

There is an increased incidence of myopathy if a statin is given with a fibrate (the combination of a statin and gemfibrozil should preferably be avoided), with lipid-lowering doses of nicotinic acid, with fusidic acid (risk of rhabdomyolysis—the combination of a statin and fusidic acid should be avoided; temporarily discontinue statin and restart 7 days after last fusidic acid dose), or with drugs that increase the plasma-statin concentration, such as macrolide antibiotics, imidazole and triazole antifungals, and ciclosporin; close monitoring of liver function and, if muscular symptoms occur, of creatine kinase is necessary.

● **SIDE-EFFECTS**

- ▶ **Rare** Hepatitis · jaundice
- ▶ **Very rare** Hepatic failure · interstitial lung disease · lupus erythematosus-like reactions · pancreatitis
- ▶ **Frequency not known** Alopecia · altered liver function tests · amnesia · arthralgia · asthenia · depression · dizziness · fatigue · gastro-intestinal disturbances · headache · hyperglycaemia · hypersensitivity reactions · may be associated with the development of diabetes mellitus (particularly in those already at risk of the condition) · myalgia · myopathy · myositis · paraesthesia · peripheral neuropathy · pruritus · rash · rhabdomyolysis · sexual dysfunction · sleep disturbance · thrombocytopenia · urticaria · visual disturbance

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Muscle effects** The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses.

If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.

Statins should not be discontinued if there is an increase in the blood-glucose concentration or HbA<sub>1c</sub> as the benefits continue to outweigh the risks.

- ▶ **Interstitial lung disease** If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

- **CONCEPTION AND CONTRACEPTION** Adequate contraception is required during treatment and for 1 month afterwards.

- **PREGNANCY** Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

- **HEPATIC IMPAIRMENT** Statins should be used with caution in those with a history of liver disease. Avoid in active liver disease or when there are unexplained persistent elevations in serum transaminases.

● **MONITORING REQUIREMENTS**

- ▶ Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.
- ▶ **Liver function** There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014)). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease). Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should **not** be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.
- ▶ **Creatine kinase** Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.
- ▶ **Diabetes** Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbA<sub>1c</sub> checked before starting statin treatment, and then repeated after 3 months.
- **PATIENT AND CARER ADVICE** Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

190

## Atorvastatin

● **INDICATIONS AND DOSE**

**Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures**

▶ **BY MOUTH**

- ▶ **Adult:** Usual dose 10 mg once daily; increased if necessary up to 80 mg once daily, dose to be increased at intervals of at least 4 weeks

**Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures**

▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg once daily, then increased to 40 mg once daily, dose to be increased at intervals of at least 4 weeks; maximum 80 mg per day

**Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event**

▶ **BY MOUTH**

- ▶ **Adult:** 20 mg once daily, dose can be increased if necessary

continued →

**Secondary prevention of cardiovascular events**

## ▶ BY MOUTH

▶ Adult: 80 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Reduced dose required (max. 10 mg daily) with concomitant ciclosporin, or tipranavir combined with ritonavir—seek specialist advice.  
Maximum dose of 40 mg once daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.

- **UNLICENSED USE** Not licensed for use in secondary prevention of cardiovascular events.  
Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events.
- **LICENSING** Haemorrhagic stroke
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Back pain · epistaxis · hyperglycaemia · nasopharyngitis · pharyngeolaryngeal pain
  - ▶ **Uncommon** Anorexia · blurred vision · chest pain · hypoglycaemia · malaise · neck pain · peripheral oedema · pyrexia · tinnitus · weight gain
  - ▶ **Rare** Cholestasis · Stevens-Johnson syndrome · toxic epidermal necrolysis
  - ▶ **Very rare** Gynaecomastia · hearing loss
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in *primary* prevention; unlicensed in *secondary* prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/1.73 m<sup>2</sup>); max. 80 mg once daily.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for atorvastatin tablets (muscle effects).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Atorvastatin (Non-proprietary)**

Atorvastatin (as Atorvastatin calcium trihydrate)

**Pravastatin sodium**● **INDICATIONS AND DOSE**

**Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control**

▶ **BY MOUTH**

- Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

**Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina | Adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia**

▶ **BY MOUTH**

- Adult: 40 mg daily, dose to be taken at night

**Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation**

▶ **BY MOUTH**

- Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

● **SIDE-EFFECTS**

- ▶ **Uncommon** Abnormal urination · dysuria · nocturia · urinary frequency

- ▶ **Very rare** Fulminant hepatic necrosis

- **BREAST FEEDING** Manufacturer advises avoid—small amount of drug present in breast milk.

- **RENAL IMPAIRMENT** Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for pravastatin tablets (muscle effects).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Pravastatin sodium (Non-proprietary)**

**Pravastatin sodium 10 mg** Pravastatin 10mg tablets | 28 tablet [PoM] £16.10 DT price = £0.91

**Pravastatin sodium 20 mg** Pravastatin 20mg tablets | 28 tablet [PoM] £29.60 DT price = £1.10

**Pravastatin sodium 40 mg** Pravastatin 40mg tablets | 28 tablet [PoM] £29.60 DT price = £1.37

**Rosuvastatin**● **INDICATIONS AND DOSE**

**Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures**

▶ **BY MOUTH**

- ▶ Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary to 20 mg once daily, dose to be increased at intervals of at least 4 weeks
- ▶ Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks.
- ▶ Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks

**Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis**

▶ **BY MOUTH**

- ▶ Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks

**Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures, in patients with high cardiovascular risk (under expert supervision)**

▶ **BY MOUTH**

- ▶ Adult: Initially 5–10 mg once daily, increased if necessary to 20 mg once daily, then increased if necessary to 40 mg once daily, dose to be increased at intervals of at least 4 weeks

**Prevention of cardiovascular events in patients at high risk of a first cardiovascular event**

▶ **BY MOUTH**

- ▶ Adult 18–69 years: 20 mg once daily
- ▶ Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.
- ▶ Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily

**Prevention of cardiovascular events in patients at high risk of a first cardiovascular event and with risk factors for myopathy or rhabdomyolysis**

▶ **BY MOUTH**

- ▶ Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Initially 5 mg once daily with concomitant fibrate increased if necessary to max. 20 mg daily. For dose adjustments with concomitant atazanavir, clopidogrel, darunavir, dronedarone, eltrombopag, ezetimibe, itraconazole, lopinavir, or tipranavir, consult product literature. Maximum dose 5 mg with concomitant ombitasvir, paritaprevir, and ritonavir given with dasabuvir, but maximum 10 mg daily with concomitant ombitasvir, paritaprevir, and ritonavir given without dasabuvir.

- **CAUTIONS** Patients of Asian origin

- **SIDE-EFFECTS**
  - ▶ Common or very common Proteinuria
  - ▶ Very rare Gynaecomastia · haematuria
  - ▶ Frequency not known Oedema · Stevens-Johnson syndrome
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for rosuvastatin tablets (muscle effects).

## Simvastatin

#### ● INDICATIONS AND DOSE

**Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures**

- ▶ BY MOUTH

▶ Adult: 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

**Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures**

- ▶ BY MOUTH

▶ Adult: Initially 40 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

**Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus**

- ▶ BY MOUTH

▶ Adult: Initially 20–40 mg once daily, increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Max. 10 mg daily with concomitant bezafibrate or ciprofibrate.

Max. 20 mg daily with concomitant amiodarone, verapamil, diltiazem, amlodipine, or ranolazine.

Max. 40 mg daily with concomitant lomitapide.

- **SIDE-EFFECTS**
  - ▶ Rare Anaemia
  - ▶ Frequency not known Tendinopathy
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).
- **EXCEPTIONS TO LEGAL CATEGORY** Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

EXCIPIENTS: May contain Propylene glycol

- ▶ **Simvastatin (Non-proprietary)**

**Simvastatin 4 mg per 1 ml** Simvastatin 20mg/5ml oral suspension sugar free sugar-free | 150 ml [PoM] £119.40 DT price = £119.40

**Simvastatin 8 mg per 1 ml** Simvastatin 40mg/5ml oral suspension sugar free sugar-free | 150 ml [PoM] £182.40 DT price = £182.40

## Simvastatin with ezetimibe

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin above, ezetimibe p. 187.

#### ● INDICATIONS AND DOSE

**Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone**

- ▶ BY MOUTH

▶ Adult: (consult product literature)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Inegy** (Merck Sharp & Dohme Ltd)

**Ezetimibe 10 mg, Simvastatin 20 mg** Inegy 10mg/20mg tablets | 28 tablet [PoM] £33.42 DT price = £33.42

**Ezetimibe 10 mg, Simvastatin 40 mg** Inegy 10mg/40mg tablets | 28 tablet [PoM] £38.98 DT price = £38.98

**Ezetimibe 10 mg, Simvastatin 80 mg** Inegy 10mg/80mg tablets | 28 tablet [PoM] £41.21 DT price = £41.21

## Simvastatin with fenofibrate

19-Apr-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin p. 194, fenofibrate p. 188.

### ● INDICATIONS AND DOSE

**Adjunct to diet and exercise in mixed dyslipidaemia, when LDL-cholesterol levels are adequately controlled with the corresponding dose of simvastatin monotherapy (in patients at high cardiovascular risk)**

#### ► BY MOUTH

- Adult: 20/145 mg once daily, alternatively 40/145 mg once daily, dose should be based on previous simvastatin monotherapy dose

● **CAUTIONS** History of pulmonary embolism

### ● SIDE-EFFECTS

- **Common or very common** Gastroenteritis
- **Uncommon** Dermatitis · eczema

● **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; use with caution if eGFR 60–89 mL/minute/1.73 m<sup>2</sup>.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Butylated hydroxyanisole, lecithin

#### ► Cholib (BGP Products Ltd)

Simvastatin 20 mg, Fenofibrate 145 mg Cholib 145mg/20mg tablets | 30 tablet [POM] £7.71 DT price = £7.71

Simvastatin 40 mg, Fenofibrate 145 mg Cholib 145mg/40mg tablets | 30 tablet [POM] £8.33 DT price = £8.33

## LIPID MODIFYING DRUGS > OTHER

## Alirocumab

24-Oct-2016

● **DRUG ACTION** Alirocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

### ● INDICATIONS AND DOSE

**Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contraindicated or not tolerated)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 75–150 mg every 2 weeks, adjusted according to response, to be administered into the thigh, abdomen or upper arm, dose adjustments should be made at 4-weekly intervals

● **INTERACTIONS** → Appendix 1 (alirocumab)

### ● SIDE-EFFECTS

- **Common or very common** Oropharyngeal pain · pruritus · rhinorrhea
- **Rare** Eczema (discoid) · urticaria
- **Frequency not known** Vasculitis

● **PREGNANCY** Manufacturer advises avoid unless clinical condition requires treatment—maternal toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage outside refrigerator.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

► **Alirocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016)** NICE TA393

Alirocumab is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if :

- low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation **and**
- the manufacturer provides alirocumab with the discount agreed in the patient access scheme.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA393](http://www.nice.org.uk/TA393)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (Aug 2016) that alirocumab (*Praluent*®) is accepted for restricted use within NHS Scotland for treatment of primary hypercholesterolaemia or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within its license), for specialist use only and only in patients at high cardiovascular risk as follows:

- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C ≥ 5.0mmol/L, for primary prevention of cardiovascular events, or
- patients with HeFH and LDL-C ≥ 3.5mmol/L, for secondary prevention of cardiovascular events, or
- patients at high risk due to previous cardiovascular events and LDL-C ≥ 4.0mmol/L, or
- patients with recurrent/polyvascular disease and LDL-C ≥ 3.5mmol/L

This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Polysorbates

#### ► Praluent (Sanofi) ▼

Alirocumab 75 mg per 1 ml Praluent 75mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [POM] £168.00 | 2 pre-filled disposable injection [POM] £336.00

Alirocumab 150 mg per 1 ml Praluent 150mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [POM] £168.00 | 2 pre-filled disposable injection [POM] £336.00

## Lomitapide

● **DRUG ACTION** Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

### ● INDICATIONS AND DOSE

**Adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)**

#### ► BY MOUTH

- Adult: Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

- **CONTRA-INDICATIONS** Significant or chronic bowel disease
- **CAUTIONS** Concomitant use of hepatotoxic drugs · lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required · patients over 65 years
- **INTERACTIONS** → Appendix 1 (lomitapide).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Bloating · abdominal pain · appetite changes · constipation · diarrhoea · dizziness · dyspepsia · ecchymosis · eructation · erythematous rash · flatulence · gastro-oesophageal reflux disease · gastroenteritis · haemorrhoids · headache · hepatic steatosis · hepatomegaly · hypokalaemia · leucopenia · malaise · migraine · muscle spasms · nausea · neutropenia · raised serum transaminases · tenesmus · vomiting · weight loss
  - ▶ **Uncommon** Abnormal gait · anaemia · arthralgia · chest pain · drowsiness · dry mouth · dry skin · eye swelling · gastro-intestinal haemorrhage · haematemesis · haematuria · hyperbilirubinaemia · joint swelling · myalgia · pain in extremities · paraesthesia · proteinuria · pyrexia · sweating · vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

Reduce dose if serum transaminases raised during treatment (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.
- **PREGNANCY** Avoid—teratogenicity and embryotoxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose if serum transaminases raised during treatment (consult product literature). Max. 40 mg daily in mild impairment. Avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.
- **RENAL IMPAIRMENT** Max. 40 mg daily in end-stage renal disease.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
  - ▶ Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## 7 Myocardial ischaemia

### Stable angina

#### Overview

It is important to distinguish stable angina from unstable angina. *Stable angina* usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long term management to prevent angina attacks and to reduce the risk of cardiovascular events.

#### Management

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 207 which can be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a **beta-blocker** or a **calcium-channel blocker**. In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amlodipine p. 147, felodipine p. 150, modified-release nifedipine p. 153) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, addition of a long-acting **nitrate**, ivabradine p. 200, nicorandil p. 201, or ranolazine p. 199 can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nicorandil, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events.

#### Antianginal drugs

Nitrates, calcium-channel blockers, and potassium channel activators (use in adults only) have a vasodilating and, consequently, blood pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Nicorandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce

additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contra-indicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm.

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

### ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

#### Cangrelor

16-Feb-2016

- **DRUG ACTION** Cangrelor is a direct P2Y<sub>12</sub> platelet receptor antagonist that blocks adenosine diphosphate induced platelet activation and aggregation.

#### • INDICATIONS AND DOSE

**In combination with aspirin for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received an oral P2Y<sub>12</sub> inhibitor (e.g. clopidogrel, prasugrel, ticagrelor) prior to the PCI procedure and in whom oral therapy with a P2Y<sub>12</sub> inhibitor is not suitable (under expert supervision)**

#### ▶ INITIALLY BY INTRAVENOUS INJECTION

• **Adult:** Initially 30 micrograms/kg, to be given as a bolus dose, followed immediately by (by intravenous infusion) 4 micrograms/kg/minute, start treatment before percutaneous coronary intervention and continue infusion for at least 2 hours or for the duration of intervention if longer; maximum duration of infusion 4 hours

- **CONTRA-INDICATIONS** Active bleeding · history of stroke · history of transient ischaemic attack · patients at increased risk of bleeding (e.g. impaired haemostasis, irreversible coagulation disorders, major surgery or trauma, uncontrolled severe hypertension)
- **CAUTIONS** Disease states associated with increased bleeding risk
- **INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dyspnoea · ecchymosis · haematoma · haemorrhage (including gastro-intestinal and intracranial)
  - ▶ **Uncommon** Acute renal failure · cardiac tamponade · epistaxis · haemoptysis · rash · retroperitoneal haemorrhage (fatalities reported) · urticaria
  - ▶ **Rare** Anaemia · bruising · thrombocytopenia
  - ▶ **Very rare** Menorrhagia
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises potential risk to infant—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal impairment—increased risk of bleeding.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous bolus injection and intravenous infusion*, reconstitute each 50 mg vial with 5 mL of water for injection and gently swirl, do not shake vigorously. Withdraw 5 mL of reconstituted solution, add to 250 mL of either Sodium Chloride 0.9% or Glucose 5% and mix thoroughly. The bolus injection and infusion should be administered from the infusion solution.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

##### ▶ Kengrexal (Chiesi Ltd) ▼

**Cangrelor (as Cangrelor tetrasodium) 50 mg** Kengrexal 50mg powder for concentrate for solution for injection / infusion vials | 10 vial [POM] £2,500.00 (Hospital only)

## ANTITHROMBOTIC DRUGS > GLYCOPROTEIN IIB/IIIA INHIBITORS

### Abciximab

#### ● INDICATIONS AND DOSE

**Prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention (specialist use only)**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. per dose 10 micrograms/minute), to be started 10–60 minutes before percutaneous coronary intervention and continue for 12 hours

**Short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (specialist use only)**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. per dose 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

- **CONTRA-INDICATIONS** Active internal bleeding · arteriovenous malformation or aneurysm · haemorrhagic diathesis · hypertensive retinopathy · intracranial neoplasm · intracranial or intraspinal surgery or trauma within last 2 months · major surgery within last 2 months · severe hypertension · stroke within last 2 years · thrombocytopenia · vasculitis
- **CAUTIONS** Discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) · elderly
- **INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Back pain · bleeding manifestations · bradycardia · chest pain · fever · headache · hypotension · nausea · puncture site pain · thrombocytopenia · vomiting
  - ▶ **Rare** Adult respiratory distress · cardiac tamponade · hypersensitivity reactions

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of bleeding.

- **RENAL IMPAIRMENT** Caution in severe impairment—increased risk of bleeding.

#### ● MONITORING REQUIREMENTS

- ▶ Measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit.

- ▶ Monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (ReoPro<sup>®</sup>)*, give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ ReoPro (Eli Lilly and Company Ltd)

Abciximab 2 mg per 1 ml ReoPro 10mg/5ml solution for injection vials | 1 vial [POM] £250.24

### Eptifibatid

#### ● INDICATIONS AND DOSE

**In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

- **CONTRA-INDICATIONS** Abnormal bleeding within 30 days · aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia
- **CAUTIONS** Discontinue if emergency cardiac surgery necessary · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · risk of bleeding—discontinue immediately if uncontrolled serious bleeding
- **INTERACTIONS** Caution with concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Bleeding manifestations
  - ▶ **Very rare** Anaphylaxis · rash
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of bleeding.

- **RENAL IMPAIRMENT** Reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
  - ▶ Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Solution for injection**

- ▶ **Integrilin** (GlaxoSmithKline UK Ltd)  
Eptifibatide 2 mg per 1 ml Integrilin 20mg/10ml solution for injection vials | 1 vial [PoM] £13.61 (Hospital only)

##### **Solution for infusion**

- ▶ **Integrilin** (GlaxoSmithKline UK Ltd)  
Eptifibatide 750 microgram per 1 ml Integrilin 75mg/100ml solution for infusion vials | 1 vial [PoM] £42.79 (Hospital only)

## Tirofiban

#### ● INDICATIONS AND DOSE

**In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis) (initiated under specialist supervision)**

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

**In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

**In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)**

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

- **CONTRA-INDICATIONS** Abnormal bleeding within 30 days · history of aneurysm · history of arteriovenous malformation · history of haemorrhagic stroke · history of intracranial disease · history of neoplasm · increased INR · increased prothrombin time · severe hypertension · stroke within 30 days · thrombocytopenia
- **CAUTIONS** Active peptic ulcer (within 3 months) · acute pericarditis · anaemia · aortic dissection · cardiogenic shock · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary.

discontinue immediately if serious or uncontrollable bleeding occurs · discontinue if emergency cardiac surgery necessary · elderly · faecal occult blood · haematuria · haemorrhagic retinopathy · low body-weight · major surgery within 3 months (avoid if within 6 weeks) · organ biopsy or lithotripsy within last 2 weeks · puncture of non-compressible vessel within 24 hours · risk of bleeding (within 3 months) · severe heart failure · severe trauma within 3 months (avoid if within 6 weeks) · traumatic or protracted cardiopulmonary resuscitation within last 2 weeks · uncontrolled severe hypertension · vasculitis

- **INTERACTIONS** → Appendix 1 (tirofiban). Concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration).
- **SIDE-EFFECTS** Bleeding manifestations · fever · headache · nausea · reversible thrombocytopenia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate liver disease. Avoid in severe liver disease—increased risk of bleeding.
- **RENAL IMPAIRMENT** Use half normal dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Increased risk of bleeding. Monitor carefully if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aggrastat<sup>®</sup>), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## PIPERAZINE DERIVATIVES

### Ranolazine

#### ● INDICATIONS AND DOSE

**As adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies**

##### ▶ BY MOUTH

- ▶ Adult: Initially 375 mg twice daily for 2–4 weeks, then increased to 500 mg twice daily, then adjusted according to response to 750 mg twice daily; reduced if not tolerated to 375–500 mg twice daily

- **CAUTIONS** Body-weight less than 60 kg · elderly · moderate to severe congestive heart failure · QT interval prolongation
- **INTERACTIONS** → Appendix 1 (ranolazine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Asthenia · constipation · dizziness · headache · nausea · vomiting
  - ▶ **Uncommon** Abdominal pain · anorexia · anxiety · chromaturia · confusion · cough · dehydration · drowsiness · dry mouth · dyspepsia · dyspnoea · dysuria · epistaxis · flatulence · haematuria · hallucination · hot flush · hypoaesthesia · hypotension · insomnia · joint swelling · lethargy · muscle cramp · pain in extremities · peripheral oedema · prolonged QT interval · pruritus · sweating · syncope · tinnitus · tremor · visual disturbance · weight loss
  - ▶ **Rare** Allergic dermatitis · amnesia · angioedema · cold extremities · erectile dysfunction · erosive duodenitis · impaired hearing · loss of consciousness · pancreatitis · parosmia · rash · renal failure · throat tightness · urticaria
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in mild impairment; avoid in moderate and severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE** Patient alert card to be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (October 2012) that ranolazine (*Ranexa*®) is **not** recommended for use within NHS Scotland.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

## SELECTIVE SINUS NODE I<sub>f</sub> INHIBITORS

### Ivabradine

#### ● INDICATIONS AND DOSE

#### Treatment of angina in patients in normal sinus rhythm

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg twice daily for 3–4 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
- ▶ **Elderly:** Initially 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

#### Mild to severe chronic heart failure

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

- **CONTRA-INDICATIONS** Acute myocardial infarction · cardiogenic shock · congenital QT syndrome · do not

initiate for angina if heart rate below 70 beats per minute · do not initiate for chronic heart failure if heart rate below 75 beats per minute · immediately after cerebrovascular accident · patients dependent on pacemaker · second- and third-degree heart block · severe hypotension · sick-sinus syndrome · sino-atrial block · unstable angina · unstable or acute heart failure

- **CAUTIONS** Atrial fibrillation or other arrhythmias (treatment ineffective) · elderly · in angina, consider stopping if there is no or limited symptom improvement after 3 months · intraventricular conduction defects · mild to moderate hypotension (avoid if severe) · retinitis pigmentosa
- **INTERACTIONS** → Appendix 1 (ivabradine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Atrial fibrillation · blurred vision · bradycardia · dizziness · first-degree heart block · headache · phosphenes · ventricular extrasystoles · visual disturbances
  - ▶ **Uncommon** Angioedema · constipation · diarrhoea · dyspnoea · eosinophilia · hyperuricaemia · muscle cramps · nausea · palpitations · raised plasma-creatinine concentration · rash · supraventricular extrasystoles · vertigo
  - ▶ **Very rare** Second and third-degree heart block · sick sinus syndrome
- **PREGNANCY** Manufacturer advises avoid—*toxicity* in animal studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor regularly for atrial fibrillation (consider benefits and risks of continued treatment if atrial fibrillation occurs).
  - ▶ Monitor for bradycardia, especially after any dose increase, and discontinue if resting heart rate persistently below 50 beats per minute or continued symptoms of bradycardia despite dose reduction.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ **Ivabradine for the treatment of chronic heart failure (November 2012)** NICE TA267  
Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:
    - have a left ventricular ejection fraction of ≤ 35%, *and*
    - are in sinus rhythm with a heart rate of ≥ 75 beats per minute
 Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse.  
[www.nice.org.uk/TA267](http://www.nice.org.uk/TA267)
- **Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (September 2012) that ivabradine (*Procoralan*®) is accepted for restricted use within NHS Scotland in accordance with its licensed indication for heart failure only if resting heart rate remains ≥ 75 beats per minute despite optimal standard therapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**VASODILATORS > POTASSIUM-CHANNEL OPENERS****Nicorandil**

24-Feb-2016

**INDICATIONS AND DOSE****Prophylaxis and treatment of stable angina (second-line)**

## ▶ BY MOUTH

- ▶ **Adult:** Initially 5–10 mg twice daily, then increased if tolerated to 40 mg twice daily; usual dose 10–20 mg twice daily, use lower initial dose regimen if patient susceptible to headache

- **CONTRA-INDICATIONS** Acute pulmonary oedema · cardiogenic shock · hypovolaemia · left ventricular failure with low filling pressures · severe hypotension

- **CAUTIONS** Acute myocardial infarction with acute left ventricular failure and low filling pressures · diverticular disease (risk of fistula formation or bowel perforation) · G6PD deficiency · heart failure (class III–IV) · hyperkalaemia · low systolic blood pressure

- **INTERACTIONS** → Appendix 1 (nicorandil).

**SIDE-EFFECTS**

- ▶ **Common or very common** Cutaneous vasodilation with flushing · dizziness · headache (especially on initiation, usually transitory) · increase in heart rate (at high doses) · nausea · rectal bleeding · vomiting · weakness
- ▶ **Uncommon** Angioedema · hypotension · myalgia · oral ulceration
- ▶ **Rare** Abdominal pain · anal ulceration · cholestasis · gastrointestinal ulceration · hepatitis · jaundice · pruritus · rash · skin ulceration
- ▶ **Very rare** Eye ulceration
- ▶ **Frequency not known** Gastrointestinal haemorrhage

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Nicorandil-induced ulceration** Nicorandil can cause serious skin, mucosal, and eye ulceration; including gastrointestinal ulcers, which may progress to perforation, haemorrhage, fistula or abscess. Stop treatment if ulceration occurs and consider an alternative.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** No information available—manufacturer advises avoid.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Nicorandil (Non-proprietary)**

- ▶ **Ikorel** (Zentiva)  
**Nicorandil 10 mg** Ikorel 10mg tablets | 60 tablet **[PoM]** £7.71 DT price = £2.33
- Nicorandil 20 mg** Ikorel 20mg tablets | 60 tablet **[PoM]** £14.64 DT price = £4.54

**7.1 Acute coronary syndromes****Acute coronary syndromes****Overview**

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

**Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)**

These are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

**Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)**

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

**Initial management**

**Oxygen** should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

**Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 207 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 208 is given. If pain continues, diamorphine hydrochloride p. 423 or morphine p. 429 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 403 should also be given.

Aspirin p. 114 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 115 should also be given. Prasugrel p. 203 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor p. 204 is also an alternative to clopidogrel (see NICE guidance). Patients should also receive either heparin (unfractionated) p. 125, a **low molecular weight heparin**, or fondaparinux sodium p. 119.

Patients without contra-indications should receive **beta-blockers** which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 148 or verapamil hydrochloride p. 155 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatid p. 198 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 199 (in combination with heparin (unfractionated), aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab p. 198 or eptifibatid (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 127 can be considered as an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; see Antiplatelet drugs p. 113 for the use of antiplatelet drugs in patients undergoing coronary stenting.

#### Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

### ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

#### Management of ST-segment elevation myocardial infarction (STEMI)

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine hydrochloride or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

#### Initial management

**Oxygen** should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride (or, if left ventricular function is not compromised, cyclizine p. 401) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, should also be given. Prasugrel, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor, is also an alternative to clopidogrel (see NICE guidance).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a **thrombolytic drug**, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a **glycoprotein IIb/IIIa inhibitor** can be used to reduce the risk of immediate vascular occlusion in intermediate- and

high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 124); bivalirudin is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting in Antiplatelet drugs p. 113.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

**Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 207 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 208 is given.

Early administration of some **beta-blockers** has been shown to be of benefit and should be given to patients without contra-indications.

**ACE inhibitors**, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment).

All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 652.

#### Long-term management

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin p. 114 should be given to all patients, unless contra-indicated. The addition of clopidogrel p. 115 has been shown to reduce morbidity and mortality. Prasugrel p. 203 or ticagrelor p. 204 are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 131 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 120, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents in Antiplatelet drugs p. 113.

**Beta-blockers** should be given to all patients in whom they are not contra-indicated. Acebutolol p. 143, metoprolol tartrate p. 145, propranolol hydrochloride p. 142 and timolol maleate p. 142 are suitable; for patients with left ventricular dysfunction, carvedilol p. 139, bisoprolol fumarate p. 144, or long-acting metoprolol tartrate may be appropriate.

Diltiazem hydrochloride p. 148 [unlicensed] or verapamil hydrochloride p. 155 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular

dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

**Nitrates** are used for patients with angina.

Eplerenone p. 180 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

See also the role of **statins** in preventing recurrent cardiovascular events in Lipid-regulating drugs p. 183.

### Prevention of cardiovascular events

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.

In patients with stable angina, addition of an **ACE inhibitor** should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

#### Other drugs used for Acute coronary syndromes

Captopril, p. 159 • Dalteparin sodium, p. 123 • Lisinopril, p. 161 • Perindopril arginine, p. 162 • Perindopril erbumine, p. 163 • Ramipril, p. 164 • Trandolapril, p. 165 • Valsartan, p. 170

## ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

### Prasugrel

#### ● INDICATIONS AND DOSE

**In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention**

► BY MOUTH

- Adult 18-74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
- Adult 18-74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
- Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

**Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI**

► BY MOUTH

- Adult: Loading dose 60 mg, not to be administered until the time of percutaneous coronary intervention in order to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate based on age and weight

**Alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention**

► BY MOUTH

- Adult: 60 mg, as a single dose

● **CONTRA-INDICATIONS** Active bleeding • history of stroke or transient ischaemic attack

● **CAUTIONS** Body-weight less than 60 kg • discontinue at least 7 days before elective surgery if antiplatelet effect not desirable • elderly • patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease)

● **INTERACTIONS** → Appendix 1 (prasugrel). Caution with concomitant use of drugs that increase risk of bleeding.

#### ● SIDE-EFFECTS

► **Common or very common** Anaemia • gastro-intestinal haemorrhage • haematoma • haematuria • haemorrhage • intracranial haemorrhage • rash

► **Uncommon** Angioedema • hypersensitivity reactions

► **Rare** Thrombocytopenia

► **Frequency not known** Thrombotic thrombocytopenic purpura

● **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Use with caution in moderate impairment—increased risk of bleeding. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Use with caution—increased risk of bleeding.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- **Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014)** NICE TA317 Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention.  
[www.nice.org.uk/TA317](http://www.nice.org.uk/TA317)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2009) that prasugrel (*Eflent*<sup>®</sup>), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

► **Eflent** (Eli Lilly and Company Ltd)

- Prasugrel (as Prasugrel hydrochloride) 5 mg Eflent 5mg tablets | 28 tablet (POM) £47.56 DT price = £47.56
- Prasugrel (as Prasugrel hydrochloride) 10 mg Eflent 10mg tablets | 28 tablet (POM) £47.56 DT price = £47.56

## Ticagrelor

### ● INDICATIONS AND DOSE

**In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome**

► BY MOUTH

► Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months

**Alternative to clopidogrel in patients undergoing percutaneous coronary intervention**

► BY MOUTH

► Adult: 180 mg, as a single dose

- **CONTRA-INDICATIONS** Active bleeding · history of intracranial haemorrhage
- **CAUTIONS** Asthma · bradycardia (unless pacemaker fitted) · chronic obstructive pulmonary disease · discontinue 7 days before elective surgery if antiplatelet effect not desirable · history of hyperuricaemia · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastrointestinal bleeding, or coagulation disorders) · second- or third-degree AV block (unless pacemaker fitted) · sick sinus syndrome (unless pacemaker fitted)
- **INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - **Common or very common** Bruising · dyspnoea · haemorrhage
  - **Uncommon** Abdominal pain · diarrhoea · dizziness · dyspepsia · gastritis · headache · nausea · pruritus · rash · vomiting
  - **Rare** Confusion · constipation · hyperuricaemia · paraesthesia · raised serum creatinine · vertigo
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor renal function 1 month after initiation.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - **Ticagrelor for the treatment of acute coronary syndromes (October 2011)** NICE TA236

Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:

  - with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, or
  - with non-ST-segment elevation myocardial infarction (NSTEMI), or
  - admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist. Characteristics to be used in defining treatment with ticagrelor for unstable angina are:
    - age 60 years or older;
    - previous myocardial infarction or previous coronary artery bypass grafting;
    - coronary artery disease with stenosis of 50% or more in at least two vessels;
    - previous ischaemic stroke;

- previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation;
  - diabetes mellitus;
  - peripheral arterial disease, or
  - chronic renal dysfunction (creatinine clearance less than 60 mL/minute/1.73 m<sup>2</sup>).
- [www.nice.org.uk/TA236](http://www.nice.org.uk/TA236)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

► **Brilique** (AstraZeneca UK Ltd)

**Ticagrelor 60 mg** Brilique 60mg tablets | 56 tablet **[PoM]** £54.60 DT price = £54.60

**Ticagrelor 90 mg** Brilique 90mg tablets | 56 tablet **[PoM]** £54.60 DT price = £54.60

## ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

### Fibrinolytic drugs

#### Overview

The value of thrombolytic drugs for the treatment of *myocardial infarction* has been established. Streptokinase p. 206 and alteplase p. 205 have been shown to reduce mortality. Reteplase p. 205 and tenecteplase p. 206 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 129 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

### Fibrinolytics

- **DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.
- **CONTRA-INDICATIONS** Active pulmonary disease with cavitation · acute pancreatitis · aneurysm · aortic dissection · bacterial endocarditis · bleeding diatheses · coagulation defects · coma · heavy vaginal bleeding · history of cerebrovascular disease (especially recent events or with any residual disability) · oesophageal varices · pericarditis · recent haemorrhage · recent surgery (including dental extraction) · recent symptoms of possible peptic ulceration · recent trauma · severe hypertension
- **CAUTIONS** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) · elderly · external chest compression · hypertension · risk of bleeding (including that from venepuncture or invasive procedures)

- **INTERACTIONS** Caution with recent or concomitant use of drugs that increase the risk of bleeding.
- **SIDE-EFFECTS** Allergic reactions · anaphylaxis · angina (when used in myocardial infarction) · back pain · bleeding · bleeding (usually limited to the site of injection, but can occur from other sites) · cerebral oedema (caused by reperfusion) · convulsions · fever · flushing · hypotension · intracerebral haemorrhage · nausea · pulmonary oedema (caused by reperfusion) · rash · recurrent ischaemia (when used in myocardial infarction) · reperfusion arrhythmias (when used in myocardial infarction) · uveitis · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Bleeding Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).
- ▶ Hypotension Hypotension can usually be controlled by elevating the patient's legs, or by reducing the rate of infusion or stopping it temporarily.
- **PREGNANCY** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment as there is an increased risk of bleeding.

10% of dose is to be administered by intravenous injection and the remainder by intravenous infusion

#### ACTILYSE CATHFLO®

#### Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS**
- ▶ When used for acute ischaemic stroke Convulsion accompanying stroke · history of stroke in patients with diabetes · hyperglycaemia · hypoglycaemia · severe stroke · stroke in last 3 months
- **INTERACTIONS** Contra-indicated if concomitant treatment with oral anticoagulants.
- **SIDE-EFFECTS** Risk of cerebral bleeding increased in acute stroke
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).
- **MONITORING REQUIREMENTS**
- ▶ When used for acute ischaemic stroke Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
- ▶ **Alteplase for the treatment of acute ischaemic stroke (September 2012) NICE TA264**  
Alteplase is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:
  - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, *and*
  - intracranial haemorrhage has been excluded by appropriate imaging techniques.[www.nice.org.uk/TA264](http://www.nice.org.uk/TA264)

F 204

## Alteplase

### (rt-PA; Tissue-type plasminogen activator)

#### ● INDICATIONS AND DOSE

#### Acute myocardial infarction, accelerated regimen

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
- ▶ Adult (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

#### Acute myocardial infarction

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

#### Pulmonary embolism

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg

#### Acute ischaemic stroke (under specialist neurology physician only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult 18–79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment **must** begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial

#### Acute myocardial infarction

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes

#### Deep-vein thrombosis | Pulmonary embolism | Acute arterial thromboembolism | Central retinal venous or arterial thrombosis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)

### ● SIDE-EFFECTS

- ▶ Rare Guillain-Barré syndrome
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Streptase<sup>®</sup>), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

- ▶ **Streptokinase (Non-proprietary)**  
**Streptokinase 1.5 mega u** Biofactor Streptokinase 1.5million unit powder for solution for infusion vials | 1 vial [PoM] £83.44  
**Streptokinase 250000 unit** Biofactor Streptokinase 250,000unit powder for solution for infusion vials | 1 vial [PoM] £15.91  
**Streptokinase 750000 unit** Biofactor Streptokinase 750,000unit powder for solution for infusion vials | 1 vial [PoM] £41.72

F 204

## Tenecteplase

### ● INDICATIONS AND DOSE

#### Acute myocardial infarction

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 30–50 mg (max. per dose 50 mg), dose to be given over 10 seconds and Initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature

- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

- ▶ **Metalyse** (Boehringer Ingelheim Ltd)  
**Tenecteplase 8000 unit** Metalyse 8,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £502.25  
**Tenecteplase 10000 unit** Metalyse 10,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £502.25

## NITRATES

## Nitrates

### Overview

Nitrates have a useful role in *angina*. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

*Sublingual* glyceryl trinitrate p. 207 is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The *aerosol* spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by *transdermal* preparations (but tolerance may develop).

Isosorbide dinitrate p. 208 is active *sublingually* and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for *modified-release* preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 209. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by *intravenous injection* when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

## Nitrates

- **CONTRA-INDICATIONS** Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema
- **CAUTIONS** Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

#### CAUTIONS, FURTHER INFORMATION

- ▶ Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually

overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

● **INTERACTIONS** → Appendix 1 (nitrates).

● **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Dizziness · postural hypotension · tachycardia · throbbing headache
- ▶ **Uncommon** Flushing · heartburn · nausea · rash · syncope · temporary hypoxaemia · vomiting
- ▶ **Very rare** Angle-closure glaucoma
- ▶ **Frequency not known** Paradoxical bradycardia

**SPECIFIC SIDE-EFFECTS**

- ▶ **Uncommon**
  - ▶ With transdermal use Application site reactions with transdermal patches
  - ▶ **Frequency not known**
- ▶ With intravenous use Abdominal pain · apprehension · diaphoresis · muscle twitching · palpitation · prolonged administration has been associated with methaemoglobinaemia · restlessness · retrosternal discomfort · severe hypotension

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ With intravenous use Specific side-effects following injection (particularly if given too rapidly) include severe hypotension, diaphoresis, apprehension, restlessness, muscle twitching, retrosternal discomfort, palpitation, abdominal pain; prolonged administration has been associated with methaemoglobinaemia.

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in nitrate hypersensitivity.

● **BREAST FEEDING** No information available—manufacturers advise use only if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** Caution in severe impairment.

● **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

● **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate during intravenous infusion.

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

206

## Glyceryl trinitrate

● **INDICATIONS AND DOSE**

**Prophylaxis and treatment of angina**

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
- ▶ Adult: 0.3–1 mg, dose may be repeated as required

**Control of hypertension and myocardial ischaemia during and after cardiac surgery | Induction of controlled hypotension during surgery | Congestive heart failure | Unstable angina**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response, consult product literature for recommended starting doses specific to indication

**Treatment or prophylaxis of angina**

- ▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- ▶ Adult: 1–2 sprays, dose to be administered under tongue and then close mouth

**Anal fissure**

- ▶ BY RECTUM USING OINTMENT
- ▶ Adult: Apply 2.5 centimetres every 12 hours until pain ceases. Max. duration of use 8 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

**DEPONIT®**

**Prophylaxis of angina**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: One '5' or one '10' patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two '10' patches every 24 hours if necessary, to be replaced every 24 hours, siting replacement patch on different area

**MINITRAN®**

**Prophylaxis of angina**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: One '5' patch to be applied to chest or upper arm; replace every 24 hours, siting replacement patch on different area, dose to be adjusted according to response

**Maintenance of venous patency ('5' patch only)**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: (consult product literature)

**NITRO-DUR®**

**Prophylaxis of angina**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: One '0.2mg/h' patch to be applied to chest or outer upper arm and replaced every 24 hours, siting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day

**PERCUTOL®**

**Prophylaxis of angina**

- ▶ TO THE SKIN
- ▶ Adult: Usual dose 1–2 inches every 3–4 hours as required, to be measured on to *Applirule*® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

**Prophylaxis of angina (to determine dose)**

- ▶ TO THE SKIN
- ▶ Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, to be measured on to *Applirule*® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

**TRANSIDERM-NITRO®**

**Prophylaxis of angina**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: One '5' or one '10' patch to be applied to lateral chest wall and replaced every 24 hours, siting replacement patch on different area, max. two '10' patches daily

**Prophylaxis of phlebitis and extravasation ('5' patch only)**

- ▶ BY TRANSFERMAL APPLICATION
- ▶ Adult: (consult product literature)

● **SIDE-EFFECTS**

- ▶ With rectal use Burning · diarrhoea · itching · rectal bleeding

● **PREGNANCY** Not known to be harmful.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion* (*Nitrocline*®, *Nitronal*®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For *Nitrocline*®, suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as *Viaflex*® or

*Striflex*<sup>®</sup>; use glass or polyethylene containers or give via a syringe pump.

- ▶ With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ With sublingual use Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.
- **PATIENT AND CARER ADVICE** Rectal ointment should be discarded 8 weeks after first opening.

**PERCUTOL**<sup>®</sup> Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2008) that glyceryl trinitrate 0.4% ointment (*Rectogesic*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Sublingual tablet**

CAUTIONARY AND ADVISORY LABELS 16

- ▶ **Glyceryl trinitrate (Non-proprietary)**

Glyceryl trinitrate 300 microgram sublingual tablets | 100 tablet [P] no price available DT price = £2.30

**Glyceryl trinitrate 500 microgram** Glyceryl trinitrate 500 microgram sublingual tablets | 100 tablet [P] £7.05 DT price = £7.05

**Glyceryl trinitrate 600 microgram** Glyceryl trinitrate 600 microgram sublingual tablets | 100 tablet [P] no price available

**Sublingual spray**

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Glyceryl trinitrate (Non-proprietary)**

**Glyceryl trinitrate 400 microgram per 1 dose** Glyceryl trinitrate 400 micrograms/dose pump sublingual spray | 180 dose [P] £2.63 DT price = £1.79 | 200 dose [P] £2.71 DT price = £1.82

Glyceryl trinitrate 400 micrograms/dose aerosol sublingual spray | 180 dose [P] £3.20 DT price = £3.00 | 200 dose [P] £3.50 DT price = £3.50

- ▶ **Coro-Nitro** (J M Loveridge Ltd)

**Glyceryl trinitrate 400 microgram per 1 dose** Coro-Nitro 400 micrograms/dose pump sublingual spray | 200 dose [GSU] £3.44 DT price = £1.82

- ▶ **Glytrin** (Aspire Pharma Ltd)

**Glyceryl trinitrate 400 microgram per 1 dose** Glytrin 400 micrograms/dose aerosol sublingual spray | 200 dose [P] £3.44 DT price = £3.50

- ▶ **Nitrolingual** (Merck Serono Ltd)

**Glyceryl trinitrate 400 microgram per 1 dose** Nitrolingual 400 micrograms/dose pump sublingual spray | 75 dose [P] no price available (Hospital only) | 180 dose [P] £3.10 DT price = £1.79 | 200 dose [P] £3.44 DT price = £1.82

- ▶ **Nitromin** (Teva UK Ltd)

**Glyceryl trinitrate 400 microgram per 1 dose** Nitromin 400 micrograms/dose pump sublingual spray | 180 dose [P] £2.63 DT price = £1.79 | 200 dose [P] £2.71 DT price = £1.82

**Solution for infusion**

EXCIPIENTS: May contain Ethanol, propylene glycol

- ▶ **Glyceryl trinitrate (Non-proprietary)**

**Glyceryl trinitrate 1 mg per 1 ml** Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial [PoM] £15.90 | 25 vial [PoM] no price available

**Glyceryl trinitrate 5 mg per 1 ml** Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule [PoM] £64.90  
Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule [PoM] £32.45

- ▶ **Nitrocin** (UCB Pharma Ltd)

**Glyceryl trinitrate 1 mg per 1 ml** Nitrocin 10mg/10ml solution for infusion ampoules | 10 ampoule [PoM] £58.75 (Hospital only)

- ▶ **Nitronal** (Merck Serono Ltd)

**Glyceryl trinitrate 1 mg per 1 ml** Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule [PoM] £18.04  
Nitronal 50mg/50ml solution for infusion vials | 1 vial [PoM] £14.76

**Transdermal patch**

- ▶ **Deponit** (UCB Pharma Ltd)

**Glyceryl trinitrate 5 mg per 24 hour** Deponit 5 transdermal patches | 28 patch [P] £12.77

**Glyceryl trinitrate 10 mg per 24 hour** Deponit 10 transdermal patches | 28 patch [P] £14.06

- ▶ **Minitran** (Meda Pharmaceuticals Ltd)

**Glyceryl trinitrate 5 mg per 24 hour** Minitran 5 transdermal patches | 30 patch [P] £11.62

**Glyceryl trinitrate 10 mg per 24 hour** Minitran 10 transdermal patches | 30 patch [P] £12.87

**Glyceryl trinitrate 15 mg per 24 hour** Minitran 15 transdermal patches | 30 patch [P] £14.19

- ▶ **Nitro-Dur** (Merck Sharp & Dohme Ltd)

**Glyceryl trinitrate 5 mg per 24 hour** Nitro-Dur 0.2mg/hour transdermal patches | 28 patch [P] £10.59

**Glyceryl trinitrate 10 mg per 24 hour** Nitro-Dur 0.4mg/hour transdermal patches | 28 patch [P] £11.72

**Glyceryl trinitrate 15 mg per 24 hour** Nitro-Dur 0.6mg/hour transdermal patches | 28 patch [P] £12.90

- ▶ **Transderm-Nitro** (Novartis Pharmaceuticals UK Ltd)

**Glyceryl trinitrate 5 mg per 24 hour** Transderm-Nitro 5 transdermal patches | 28 patch [P] £20.46

**Glyceryl trinitrate 10 mg per 24 hour** Transderm-Nitro 10 transdermal patches | 28 patch [P] £22.49

**Ointment**

EXCIPIENTS: May contain Wool fat and related substances including lanolin

- ▶ **Percutol** (Aspire Pharma Ltd)

**Glyceryl trinitrate 20 mg per 1 gram** Percutol 2% ointment | 60 gram [P] £79.00 DT price = £79.00

**Rectal ointment**

EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin

- ▶ **Rectogesic** (Kyowa Kirin Ltd)

**Glyceryl trinitrate 4 mg per 1 gram** Rectogesic 0.4% rectal ointment | 30 gram [PoM] £39.30 DT price = £39.30

F 206

## Isosorbide dinitrate

- **INDICATIONS AND DOSE**

**Prophylaxis and treatment of angina**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ Adult: 30–120 mg daily in divided doses

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ Adult: 2–10 mg/hour, increased if necessary up to 20 mg/hour

**Left ventricular failure**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ Adult: 40–160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ Adult: Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

**Prophylaxis of angina**

- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- ▶ Adult: 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

- **PREGNANCY** May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Isoket* 0.05%<sup>®</sup>, *Isoket* 0.1%<sup>®</sup>), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; *Isoket* 0.05%<sup>®</sup> can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Isosorbide dinitrate (Non-proprietary)**

**Isosorbide dinitrate 10 mg** Isosorbide dinitrate 10mg tablets | 56 tablet [P] £13.41 DT price = £13.41

**Isosorbide dinitrate 20 mg** Isosorbide dinitrate 20mg tablets | 56 tablet [PoM] no price available DT price = £14.38 | 56 tablet [P] £14.38 DT price = £14.38

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25

▶ **Isosorbide dinitrate (Non-proprietary)**

**Isosorbide dinitrate 20 mg** Isosorbide dinitrate 20mg modified-release tablets | 56 tablet [P] no price available DT price = £2.58

**Isosorbide dinitrate 40 mg** Isosorbide dinitrate 40mg modified-release tablets | 56 tablet [P] no price available DT price = £6.36

▶ **Isoket Retard** (UCB Pharma Ltd)

**Isosorbide dinitrate 20 mg** Isoket Retard 20 tablets | 56 tablet [P] £2.58 DT price = £2.58

**Isosorbide dinitrate 40 mg** Isoket Retard 40 tablets | 56 tablet [P] £6.36 DT price = £6.36

**Solution for injection**▶ **Isosorbide dinitrate (Non-proprietary)**

**Isosorbide dinitrate 1 mg per 1 ml** Isosorbide dinitrate 10mg/10ml concentrate for solution for injection ampoules | 10 ampoule [PoM] £21.80

▶ **Isoket** (UCB Pharma Ltd)

**Isosorbide dinitrate 1 mg per 1 ml** Isoket 0.1% solution for injection 10ml ampoules | 10 ampoule [PoM] £26.93 (Hospital only)

**Solution for infusion**▶ **Isosorbide dinitrate (Non-proprietary)**

206

**Isosorbide mononitrate****INDICATIONS AND DOSE****Prophylaxis of angina | Adjunct in congestive heart failure**

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 20 mg 2–3 times a day, alternatively initially 40 mg twice daily, increased if necessary up to 120 mg daily in divided doses

**Prophylaxis of angina (for patients who have not previously had a nitrate) | Adjunct in congestive heart failure (for patients who have not previously had a nitrate)**

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 10 mg twice daily, increased if necessary up to 120 mg daily in divided doses

**CHEMYDUR® 60XL****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

**ELANTAN® LA****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning, the lowest effective dose should be used

**IMDUR®****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet once daily, to minimise the occurrence of headache, then 1 tablet once daily, then

increased if necessary to 2 tablets once daily, dose to be taken in the morning

**ISIB® 60XL****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet once daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**ISMO RETARD®****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: 1 tablet once daily, dose to be taken in the morning

**ISODUR®****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning

**ISOTARD®****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: 25–60 mg once daily, if headaches occur with 60 mg tablet, half a 60 mg tablet may be given for 2–4 days, then increased if necessary to 50–120 mg once daily, dose to be taken in the morning

**MODISAL® XL****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet once daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**MONOMAX® SR****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: 40–60 mg daily, increased if necessary to 120 mg daily, dose to be taken in the morning

**MONOMAX® XL****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet once daily for 2–4 days, to minimise occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**MONOMIL® XL****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets once daily, to be taken in the morning

**MONOSORB® XL60****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 0.5 tablet once daily for the first 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**ZEMON®****Prophylaxis of angina**

▶ BY MOUTH

▶ Adult: Initially 30 mg once daily for 2–4 days, to minimise the occurrence of headache, then 40–60 mg once daily, increased if necessary to 80–120 mg once daily, dose to be taken in the morning

- **PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.

## SYMPATHOMIMETICS > INOTROPIC

### Dobutamine

- **DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta<sub>1</sub> receptors in cardiac muscle, and increases contractility with little effect on rate.

#### INDICATIONS AND DOSE

**Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation**

##### BY INTRAVENOUS INFUSION

- ▶ **Adult:** Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

#### Cardiac stress testing

##### BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · elderly · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours

- **INTERACTIONS** → Appendix 1 (sympathomimetics).

#### SIDE-EFFECTS

##### Rare Psychosis

- ▶ **Very rare** Angle-closure glaucoma · AV block · bradycardia · cardiac arrest · coronary artery spasm · hypokalaemia · myocardial infarction · petechial bleeding
- ▶ **Frequency not known** Anxiety · arrhythmias · bronchospasm · cerebral haemorrhage · chest pain · dyspnoea · eosinophilia · fever · headache · hypertension (marked increase in systolic blood pressure indicates overdose) · hypotension · increased urinary urgency · myoclonic spasm · nausea · palpitation · paraesthesia · phlebitis · pruritus of scalp · pulmonary oedema · rash · reduced platelet aggregation (on prolonged use) · tachycardia · tremor · vomiting

- **PREGNANCY** No evidence of harm in *animal* studies—manufacturers advise use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor serum-potassium concentration.

- **DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Sulfités

**Dobutamine (Non-proprietary)**

**Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml** Dobutamine 250mg/50ml solution for infusion vials | 1 vial [PoM] £7.50

**Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml** Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £26.00-£26.25

## 7.1a Cardiac arrest

**Cardiopulmonary resuscitation****Overview**

The algorithm for cardiopulmonary resuscitation (Life support algorithm (image) inside back cover) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at [www.resus.org.uk](http://www.resus.org.uk).

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine below 1 in 10000 (100 micrograms/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone hydrochloride p. 99 should be considered after adrenaline/epinephrine to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride. Lidocaine hydrochloride p. 97, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 1179 is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 259.

**SYMPATHOMIMETICS > VASOCONSTRICTOR****Adrenaline/epinephrine**

**DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta<sub>1</sub> effects); it can cause peripheral vasodilation (a beta<sub>2</sub> effect) or vasoconstriction (an alpha effect).

**INDICATIONS AND DOSE****Cardiopulmonary resuscitation****BY INTRAVENOUS INJECTION**

- Adult: 1 mg every 3–5 minutes as required, a 1 in 10000 (100 micrograms/mL) solution is recommended

**Acute hypotension****BY CONTINUOUS INTRAVENOUS INFUSION**

- Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
- Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension

**Emergency treatment of acute anaphylaxis (under expert supervision) | Angioedema (if laryngeal oedema is present) (under expert supervision)****BY INTRAMUSCULAR INJECTION**

- Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
- Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function

**Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) | Angioedema (if laryngeal oedema is present) (specialist use only)****BY SLOW INTRAVENOUS INJECTION**

- Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

**Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine****BY INTRAVENOUS INFUSION**

- Adult: 2–10 micrograms/minute, adjusted according to response

**EMERADE® 150 MICROGRAMS****Acute anaphylaxis (for self-administration)****BY INTRAMUSCULAR INJECTION**

- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**EMERADE® 300 MICROGRAMS****Acute anaphylaxis (for self-administration)****BY INTRAMUSCULAR INJECTION**

- Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

continued →

- ▶ Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EMERADE® 500 MICROGRAMS****Acute anaphylaxis (for self-administration at risk of severe anaphylaxis)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
- ▶ Adult: 500 micrograms, then 500 micrograms after 5–15 minutes as required

**EPIPEN® AUTO-INJECTOR 0.3MG****Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ▶ Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EPIPEN® JR AUTO-INJECTOR 0.15MG****Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- ▶ Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**JEXT® 150 MICROGRAMS****Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- ▶ Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**JEXT® 300 MICROGRAMS****Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ▶ Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**• UNLICENSED USE**

- ▶ With intramuscular use for acute anaphylaxis in children Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
- ▶ With intravenous use for acute hypotension in children Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

**IMPORTANT SAFETY INFORMATION****SAFE PRACTICE**

Intravenous route should be used with **extreme care** by specialists only.

- **CAUTIONS** Arteriosclerosis (in adults) · arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1 (sympathomimetics) Severe anaphylaxis in patients taking beta-blockers may not respond to adrenaline—consider bronchodilator therapy. Furthermore, adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers.
- **SIDE-EFFECTS** Angina · angle-closure glaucoma · anorexia · anxiety · arrhythmias · cold extremities · confusion · difficulty in micturition · dizziness · dry mouth · dyspnoea · headache · hyperglycaemia · hypersalivation · hypertension (risk of cerebral haemorrhage) · hypokalaemia · insomnia · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitation · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · restlessness · sweating · tachycardia · tissue necrosis at injection site · tissue necrosis of bowel · tissue necrosis of extremities · tissue necrosis of kidneys · tissue necrosis of liver · tremor · urinary retention · vomiting · weakness
- **PREGNANCY** May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.
- **BREAST FEEDING** Present in milk but unlikely to be harmful as poor oral bioavailability.
- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.
- **DIRECTIONS FOR ADMINISTRATION**
  - Acute hypotension
  - ▶ With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. *Neonatal intensive care*, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution. Cardiopulmonary resuscitation
  - ▶ With intravenous use in adults Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation.
- **PRESCRIBING AND DISPENSING INFORMATION** It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.
  - Great vigilance is needed to ensure that the *correct strength* of adrenaline injection is used; anaphylactic shock kits need to make a *very clear distinction* between the 1 in 10 000 strength and the 1 in 1000 strength.
  - Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.
  - Packs for self-administration need to be **clearly labelled with instructions** on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:
    - two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to

feel better, the second injection should be given 5 to 15 minutes after the first;

- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.

Adrenaline for administration by intramuscular injection is available in 'auto-injectors' (e.g. *Emerade*<sup>®</sup>, *EpiPen*<sup>®</sup>, or *Jext*<sup>®</sup>), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

#### ● PATIENT AND CARER ADVICE

Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be *instructed in advance* when and how to inject it.

**JEXT<sup>®</sup> 300 MICROGRAMS** 1.1 mL of the solution remains in the auto-injector device after use.

**JEXT<sup>®</sup> 150 MICROGRAMS** 1.25 mL of the solution remains in the auto-injector device after use.

**EPIPEN<sup>®</sup> JR AUTO-INJECTOR 0.15MG** 1.7 mL of the solution remains in the auto-injector device after use.

**EMERADE<sup>®</sup> 300 MICROGRAMS** 0.2 mL of the solution remains in the auto-injector device after use.

**EPIPEN<sup>®</sup> AUTO-INJECTOR 0.3MG** 1.7 mL of the solution remains in the auto-injector device after use.

**EMERADE<sup>®</sup> 500 MICROGRAMS** No solution remains in the auto-injector device after use.

**EMERADE<sup>®</sup> 150 MICROGRAMS** 0.35 mL of the solution remains in the auto-injector device after use.

Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis [www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis](http://www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis)

- **EXCEPTIONS TO LEGAL CATEGORY** POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

##### Solution for injection

EXCIPIENTS: May contain Sulfites

##### ➤ Adrenaline/epinephrine (Non-proprietary)

**Adrenaline 100 microgram per 1 ml** Adrenaline (base) 100micrograms/1ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule [POM] £60.09

## 8 Oedema

### Diuretics

#### Overview

**Thiazides** are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

**Loop diuretics** are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure.

**Combination diuretic therapy** may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

#### Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlorthalidone p. 219 and indapamide p. 158 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 157 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlorthalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlorthalidone can also be used under

close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 220 and indapamide are chemically related to chlorthalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 220 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, cyclophentiazide p. 220, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

### Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide p. 216 and bumetanide p. 215 are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torsemide p. 217 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

### Potassium-sparing diuretics and aldosterone antagonists

Amiloride hydrochloride p. 218 and triamterene p. 219 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

#### Aldosterone antagonists

Spironolactone p. 180 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication].

Spironolactone is also used in primary hyperaldosteronism (Conn's syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 180 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must **not** be given with aldosterone antagonists

### Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

### Other diuretics

Mannitol p. 217 is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 1037 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide p. 1039 and brinzolamide p. 1038 inhibit the formation of aqueous humour and are used in glaucoma.

### Diuretics with potassium

Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should **not** usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

**Other drugs used for Oedema** Diamorphine hydrochloride, p. 423

## DIURETICS > LOOP DIURETICS

### Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.
- **CONTRA-INDICATIONS** Anuria · comatose and precomatose states associated with liver cirrhosis · renal failure due to nephrotoxic or hepatotoxic drugs · severe hypokalaemia · severe hyponatraemia
- **CAUTIONS** Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) · can exacerbate gout · hypotension should be corrected before initiation of treatment · hypovolaemia should be corrected before initiation of treatment · urinary retention can occur in prostatic hyperplasia
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).
  - ▶ Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus

greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

- ▶ **Urinary retention** If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

● **INTERACTIONS** → Appendix 1 (diuretics).

● **SIDE-EFFECTS**

- ▶ **Very rare** Hyperuricaemia
- ▶ **Frequency not known** Acute urinary retention · blood disorders · bone-marrow depression · deafness (usually with high doses and rapid intravenous administration, and in renal impairment) · electrolyte disturbances · hepatic encephalopathy · hyperglycaemia (less common than with thiazides) · hypersensitivity reactions · hypocalcaemia · hypochloraemia · hypokalaemia · hypomagnesaemia · hyponatraemia · leucopenia · metabolic alkalosis · mild gastro-intestinal disturbances · pancreatitis · photosensitivity · postural hypotension · pruritus · rash · temporary increase in serum-cholesterol and triglyceride concentration · thrombocytopenia · tinnitus (usually with high doses and rapid intravenous administration, and in renal impairment) · visual disturbances

● **HEPATIC IMPAIRMENT** Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.

● **RENAL IMPAIRMENT** High doses of loop diuretics may occasionally be needed in renal impairment. High doses or rapid intravenous administration can cause tinnitus and deafness.

● **MONITORING REQUIREMENTS** Monitor electrolytes during treatment.

F 214

## Bumetanide

● **INDICATIONS AND DOSE**

**Oedema**

▶ **BY MOUTH**

- ▶ **Adult:** 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required
- ▶ **Elderly:** 500 micrograms daily, this lower dose may be sufficient in elderly patients

**Oedema, severe cases**

▶ **BY MOUTH**

- ▶ **Adult:** Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

● **SIDE-EFFECTS** Breast pain · gynaecomastia · musculoskeletal pain (associated with high doses in renal failure)

● **PREGNANCY** Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

● **BREAST FEEDING** No information available. May inhibit lactation.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

▶ **Bumetanide (Non-proprietary)**

**Bumetanide 1 mg** Bumetanide 1mg tablets | 28 tablet **PoM** £7.35  
DT price = £1.43

**Bumetanide 5 mg** Bumetanide 5mg tablets | 28 tablet **PoM** £7.00  
DT price = £6.98

**Oral solution**

▶ **Bumetanide (Non-proprietary)**

**Bumetanide 200 microgram per 1 ml** Bumetanide 1mg/5ml oral solution sugar free sugar-free | 150 ml **PLM** £168.00 DT price = £168.00

Combinations available: *Amiloride with bumetanide*, p. 218

## Co-amilofruse

● **INDICATIONS AND DOSE**

**Oedema**

▶ **BY MOUTH**

- ▶ **Adult:** 2.5/20–10/80 mg daily, dose to be taken in the morning

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ A mixture of amiloride hydrochloride and furosemide (frusemide) in the mass proportions of 1 part amiloride hydrochloride to 8 parts furosemide (frusemide).

● **CONTRA-INDICATIONS** Addison's disease · anuria · comatose or precomatose states associated with liver cirrhosis · dehydration · hyperkalaemia · hypovolaemia · renal failure · severe hypokalaemia · severe hyponatraemia

● **CAUTIONS** Correct hypovolaemia before using in oliguria · diabetes mellitus · elderly · gout · hepatorenal syndrome · hypoproteinaemia · hypotension · impaired micturition · prostatic enlargement

● **INTERACTIONS** → Appendix 1 (diuretics).

● **SIDE-EFFECTS** Agranulocytosis · anaphylaxis · aplastic anaemia · blood disorders · bone marrow depression (withdraw treatment) · confusion · deafness (usually in renal impairment or in hypoproteinaemia) · dry mouth · eosinophilia · exfoliative dermatitis · gastro-intestinal disturbances · gout · haemolytic anaemia · hepatic encephalopathy · hyperglycaemia · hypersensitivity reactions · hyperuricaemia · hypocalcaemia · hypokalaemia (due to furosemide—may be followed by hyperkalaemia due to amiloride) · hypomagnesaemia · hyponatraemia · hypotension · intrahepatic cholestasis · leucopenia · metabolic alkalosis or acidosis · pancreatitis · paraesthesia · photosensitivity · purpura · rashes · Stevens-Johnson syndrome · temporary increase in serum cholesterol and triglyceride concentrations · thrombocytopenia · tinnitus · toxic epidermal necrolysis

● **PREGNANCY** Not used to treat hypertension in pregnancy.

● **BREAST FEEDING** Manufacturers advise avoid—no information regarding amiloride component available. Amount of furosemide in milk too small to be harmful. Furosemide may inhibit lactation.

● **HEPATIC IMPAIRMENT** Increased risk of hypomagnesaemia in alcoholic cirrhosis.

● **RENAL IMPAIRMENT** Risk of hyperkalaemia in renal impairment but may need higher doses. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Monitor plasma-potassium concentration.

● **MONITORING REQUIREMENTS** Monitor electrolytes.

### • MEDICAL FORMS

**Furosemide 20mg/2ml solution for injection ampoules** | 10 ampoule [PoM] £5.50

##### ► **Lasix (Sanofi)**

**Furosemide 10 mg per 1 ml** Lasix 20mg/2ml solution for injection ampoules | 5 ampoule [PoM] £3.74

**Combinations available: Spironolactone with furosemide, p. 218**

## Furosemide

### (Frusemide)

#### • INDICATIONS AND DOSE

##### Oedema

###### ► BY MOUTH

► **Adult:** Initially 40 mg daily, dose to be taken in the morning, then maintenance 20–40 mg daily

###### ► INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► **Adult:** Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

##### Resistant oedema

###### ► BY MOUTH

► **Adult:** 80–120 mg daily

###### ► INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► **Adult:** Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

##### Resistant hypertension

###### ► BY MOUTH

► **Adult:** 40–80 mg daily

###### ► INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► **Adult:** Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

• **CAUTIONS** Hepatorenal syndrome · hypoproteinaemia may reduce diuretic effect and increase risk of side-effects

• **SIDE-EFFECTS** Gout · intrahepatic cholestasis

• **PREGNANCY** Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

• **BREAST FEEDING** Amount too small to be harmful. May inhibit lactation.

• **DIRECTIONS FOR ADMINISTRATION** Intravenous administration rate should not usually exceed 4 mg/minute however single doses of up to 80 mg may be administered more rapidly; a lower rate of infusion may be necessary in renal impairment. For *intravenous infusion*

## Furosemide with potassium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, potassium chloride p. 929.

#### • INDICATIONS AND DOSE

##### Oedema

###### ► BY MOUTH

► **Adult:** (consult product literature)

• **DIRECTIONS FOR ADMINISTRATION** Furosemide with modified-release potassium chloride tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

• **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer furosemide with potassium chloride tablets.

• **LESS SUITABLE FOR PRESCRIBING** Furosemide with potassium chloride tablets are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25, 27

▶ **Diumide-K Continus** (Teofarma)

**Furosemide 40 mg, Potassium chloride 600 mg** Diumide-K Continus tablets | 30 tablet **PoM** £3.00

**Furosemide with triamterene**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide p. 216, triamterene p. 219.

**INDICATIONS AND DOSE****Oedema**

## ▶ BY MOUTH

▶ Adult: 0.5–2 tablets daily, dose to be taken in the morning

● **CONTRA-INDICATIONS** Anuria · comatose or precomatose states associated with liver cirrhosis · dehydration · hyperkalaemia · hypovolaemia · renal failure · severe hypokalaemia · severe hyponatraemia

● **CAUTIONS** Diabetes mellitus · elderly · gout · hepatorenal syndrome · hypotension · impaired micturition · may cause blue fluorescence of urine · prostatic enlargement

● **INTERACTIONS** → Appendix 1 (diuretics).

**SIDE-EFFECTS**

▶ **Rare** Agranulocytosis · anaphylaxis · aplastic anaemia · blood disorders · bone marrow depression (withdraw treatment) · deafness (usually in renal impairment or in hypoproteinaemia) · eosinophilia · exfoliative dermatitis · haemolytic anaemia · hypersensitivity reactions · intrahepatic cholestasis · leucopenia · pancreatitis · paraesthesia · photosensitivity · purpura · rash · thrombocytopenia · tinnitus (usually in renal impairment or in hypoproteinaemia)

▶ **Frequency not known** Dry mouth · electrolyte disturbances · gastro-intestinal disturbances · gout · hyperglycaemia (less common than with thiazides) · hyperkalaemia · hyperuricaemia · hypocalcaemia · hypokalaemia · hypomagnesaemia · hyponatraemia · hypotension · metabolic alkalosis · temporary increase in plasma cholesterol and triglyceride concentration · triamterene found in kidney stones

● **BREAST FEEDING** Triamterene present in milk—manufacturer advises avoid. Furosemide may inhibit lactation.

● **HEPATIC IMPAIRMENT** Increased risk of hypomagnesaemia in alcoholic cirrhosis. Hypokalaemia may precipitate coma.

● **RENAL IMPAIRMENT** May need high doses. Avoid in severe impairment. Monitor plasma-potassium concentration in renal impairment (high risk of hyperkalaemia).

● **MONITORING REQUIREMENTS** Monitor electrolytes.

● **PATIENT AND CARER ADVICE** Urine may look slightly blue in some lights.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## DIURETICS > POTASSIUM-SPARING DIURETICS > ALDOSTERONE ANTAGONISTS

### Spironolactone with furosemide

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone p. 180, furosemide p. 216.

#### INDICATIONS AND DOSE

##### Resistant oedema

- ▶ BY MOUTH
- ▶ Adult: 20/50–80/200 mg daily

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

##### Lasilactone (Sanofi)

**Furosemide 20 mg, Spironolactone 50 mg** Lasilactone 20mg/50mg capsules | 28 capsule [PoM] £7.97

## DIURETICS > POTASSIUM-SPARING DIURETICS > OTHER

### Amiloride hydrochloride

#### INDICATIONS AND DOSE

##### Oedema (monotherapy)

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg daily, alternatively initially 5 mg twice daily, adjusted according to response; maximum 20 mg per day

#### Potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension or congestive heart failure

- ▶ BY MOUTH
- ▶ Adult: Initially 5–10 mg daily

#### Potassium conservation when used as an adjunct to thiazide or loop diuretics for hepatic cirrhosis with ascites

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg daily

- **CONTRA-INDICATIONS** Addison's disease · anuria · hyperkalaemia
- **CAUTIONS** Diabetes mellitus · elderly
- **INTERACTIONS** → Appendix 1 (diuretics).
- **SIDE-EFFECTS** Abdominal pain · agitation · alopecia · angina · anorexia · arrhythmias · arthralgia · confusion · constipation · cough · diarrhoea · dizziness · dry mouth · dyspepsia · dyspnoea · encephalopathy · flatulence · gastro-intestinal bleeding · headache · hyperkalaemia · insomnia · jaundice · malaise · muscle cramp · nasal congestion · nausea · palpitation · paraesthesia · postural hypotension · pruritus · raised intra-ocular pressure · rash · sexual dysfunction · thirst · tinnitus · tremor · urinary disturbances · visual disturbance · vomiting · weakness
- **PREGNANCY** Not to be used to treat gestational hypertension.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **MONITORING REQUIREMENTS** Monitor electrolytes.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### Amiloride hydrochloride (Non-proprietary)

**Amiloride hydrochloride 5 mg** Amiloride 5mg tablets | 28 tablet [PoM] £4.78 DT price = £1.55

### Amiloride with bumetanide

The properties listed below are those particular to the combination only. For the properties of the components please consider, amiloride hydrochloride above, bumetanide p. 215.

#### INDICATIONS AND DOSE

##### Oedema

- ▶ BY MOUTH
- ▶ Adult: 1–2 tablets daily

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### Amiloride with bumetanide (Non-proprietary)

**Bumetanide 1 mg, Amiloride hydrochloride 5 mg** Amiloride 5mg / Bumetanide 1mg tablets | 28 tablet [PoM] £29.60 DT price = £29.60

## Triamterene

### ● INDICATIONS AND DOSE

#### **Oedema | Potassium conservation with thiazide and loop diuretics**

##### ► BY MOUTH

- **Adult:** Initially 150–250 mg daily for 1 week, lower initial dose when given with other diuretics, then reduced to 150–250 mg daily on alternate days, to be taken in divided doses after breakfast and lunch

- **CONTRA-INDICATIONS** Addison's disease · anuria · hyperkalaemia
- **CAUTIONS** Diabetes mellitus · elderly · gout · may cause blue fluorescence of urine
- **INTERACTIONS** → Appendix 1 (triamterene).
- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea · hyperkalaemia · nausea · vomiting
  - **Uncommon** Dry mouth · headache · hyperuricaemia · rash
  - **Rare** Megaloblastic anaemia · pancytopenia · photosensitivity · serum-sickness
  - **Very rare** Renal failure (reversible on discontinuation) · triamterene found in kidney stones
  - **Frequency not known** Jaundice · malaise · slight decrease in blood pressure
- **PREGNANCY** Not used to treat gestational hypertension. Avoid unless essential.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in progressive impairment.
- **RENAL IMPAIRMENT** Avoid in progressive impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **MONITORING REQUIREMENTS** Monitor electrolytes.
- **PATIENT AND CARER ADVICE** Urine may look slightly blue in some lights.

### ● MEDICINAL FORMS

## DIURETICS > THIAZIDES AND RELATED DIURETICS

157

## Chlortalidone

### (Chlortalidone)

### ● INDICATIONS AND DOSE

#### **Ascites due to cirrhosis in stable patients (under close supervision) | Oedema due to nephrotic syndrome**

##### ► BY MOUTH

- **Adult:** Up to 50 mg daily

#### **Hypertension**

##### ► BY MOUTH

- **Adult:** 25 mg daily, dose to be taken in the morning, then increased if necessary to 50 mg daily

#### **Mild to moderate chronic heart failure**

##### ► BY MOUTH

- **Adult:** 25–50 mg daily, dose to be taken in the morning, then increased if necessary to 100–200 mg daily, reduce to lowest effective dose for maintenance

#### **Nephrogenic diabetes insipidus | Partial pituitary diabetes insipidus**

##### ► BY MOUTH

- **Adult:** Initially 100 mg twice daily, then reduced to 50 mg daily

### ● SIDE-EFFECTS

- **Rare** Allergic interstitial nephritis · jaundice
- **BREAST FEEDING** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### **Tablet**

##### ► **Chlortalidone (Non-proprietary)**

**Chlortalidone 25 mg** Chlortalidone 25mg tablets | 100 tablet PoM  
no price available

**Chlortalidone 50 mg** Chlortalidone 50mg tablets | 30 tablet PoM  
£90.55 DT price = £88.00

Combinations available: *Triamterene with chlortalidone*, above

## Co-triamterzide

The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene above, hydrochlorothiazide p. 158.

### ● INDICATIONS AND DOSE

#### **Hypertension**

##### ► BY MOUTH

- **Adult:** 50/25 mg daily, increased if necessary up to 200/100 mg daily, dose to be taken after breakfast

#### **Oedema**

##### ► BY MOUTH

- **Adult:** 50/25 mg twice daily, to be taken after breakfast and after midday meal, increased if necessary to 150/75 mg daily, to be taken as 100/50 mg after breakfast and 50/25 mg after midday meal; continued →

maintenance 50/25 mg daily, alternatively maintenance 100/50 mg once daily on alternate days; maximum 200/100 mg per day

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Dose expressed as x/y mg of triamterene/hydrochlorothiazide.

- **PATIENT AND CARER ADVICE** Urine may look slightly blue in some lights.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Xipamide 20 mg** Diurexin 20mg tablets | 140 tablet **[PoM]** £19.46 DT price = £19.46

**9 Vascular disease****Peripheral vascular disease****Classification and management**

Peripheral vascular disease can be either occlusive (e.g. *intermittent claudication*) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. *Raynaud's syndrome*). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation, effective control of blood pressure, regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 114 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Naftidrofuryl oxalate p. 222 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl oxalate should be assessed for improvement after 3–6 months.

Cilostazol p. 221 is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate below and pentoxifylline p. 222 are not established as being effective for the treatment of intermittent claudication.

Management of *Raynaud's syndrome* includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud's syndrome. Nifedipine p. 153 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl oxalate may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 717, and moxislyte p. 222 are not established as being effective for the treatment of Raynaud's syndrome.

Vasodilator therapy is not established as being effective for *chilblains*.

## ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

### Cilostazol

#### ● INDICATIONS AND DOSE

**Intermittent claudication in patients without rest pain and no peripheral tissue necrosis**

##### ▶ BY MOUTH

- Adult: 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication, patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Reduce dose to 50 mg twice daily with concomitant use of potent inhibitors of cytochrome P450 enzymes CYP3A4 (e.g. clarithromycin, itraconazole, ketoconazole, protease inhibitors) or CYP2C19, or with erythromycin or omeprazole.

- **CONTRA-INDICATIONS** Active peptic ulcer · congestive heart failure · coronary intervention in previous 6 months · haemorrhagic stroke in previous 6 months · history of severe tachyarrhythmia · myocardial infarction in previous 6 months · poorly controlled hypertension · predisposition to bleeding · proliferative diabetic retinopathy · prolongation of QT interval · severe atrial flutter · unstable angina
- **CAUTIONS** Atrial fibrillation · atrial or ventricular ectopy · diabetes mellitus (higher risk of intraocular bleeding) · mild to moderate atrial flutter · stable coronary disease · surgery
- **INTERACTIONS** → Appendix 1 (cilostazol). Caution with concomitant use of drugs that increase risk of bleeding. Contra-indicated with concomitant use of 2 or more antiplatelets or anticoagulants.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · angina · anorexia · arrhythmia · diarrhoea · dizziness · dyspepsia · ecchymosis · flatulence · headache · malaise · nausea · oedema · palpitation · pharyngitis · pruritus · rash · rhinitis · tachycardia · vomiting
  - ▶ **Uncommon** Abnormal dreams · anaemia · anxiety · congestive heart failure · cough · diabetes mellitus · dyspnoea · gastritis · haemorrhage · hyperglycaemia · insomnia · myalgia · myocardial infarction · pneumonia · postural hypotension
  - ▶ **Rare** Bleeding disorders · increased urinary frequency · renal impairment · thrombocythaemia

- ▶ **Frequency not known** Agranulocytosis · aplastic anemia · conjunctivitis · hepatitis · hot flushes · hypertension · leucopenia · pancytopenia · pyrexia · Stevens-Johnson syndrome · thrombocytopenia · tinnitus · toxic epidermal necrolysis

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Blood Disorders** A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe liver disease.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE** Blood disorders Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223 Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA223](http://www.nice.org.uk/TA223)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

## Respiratory system, drug delivery

### Inhalation

This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

#### Inhaler devices

These include *pressurised metered-dose inhalers*, *breath-actuated inhalers*, and *dry powder inhalers*. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. *Spacer devices* can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

*Pressurised metered-dose inhalers* are an effective and convenient method of drug administration in mild to moderate asthma.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

#### Spacer devices

Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (*Volumatic*<sup>®</sup>) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

#### Use and care of spacer devices

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

#### Nebulisers

*Solutions for nebulisation* are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital.

Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta<sub>2</sub> agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta<sub>2</sub> agonist or ipratropium bromide p. 234 to a patient with an *acute exacerbation* of asthma or of chronic obstructive pulmonary disease;
- a beta<sub>2</sub> agonist, corticosteroid, or ipratropium bromide on a *regular basis* to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 512) or a mucolytic to a patient with cystic fibrosis;
- Budesonide p. 246 or adrenaline/epinephrine p. 211 to a child with severe croup;
- Pentamidine isetionate p. 555 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease) and the patient's ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine isetionate to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

#### Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

#### Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

#### Ultrasonic nebulisers

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as dornase alfa p. 274 and nebulised suspensions.

#### Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

#### Oral

The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta<sub>2</sub> agonists, corticosteroids, theophylline p. 256, and leukotriene receptor antagonists.

#### Parenteral

Drugs such as beta<sub>2</sub> agonists, corticosteroids, and aminophylline p. 255 can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in

the community, urgent transfer to hospital should be arranged.

#### Peak flow meters

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are 'poor perceivers' and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

3M Security Print and Systems Limited. Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

GP practices can obtain supplies through their Area Team stores.

NHS Hospitals can order supplies from [www.nhsforms.co.uk/](http://www.nhsforms.co.uk/) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com).

In Scotland, peak flow charts can be obtained by emailing [stockorders.dppas@apsgroup.co.uk](mailto:stockorders.dppas@apsgroup.co.uk).

#### NICE technology appraisals (TAs)

##### Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10

A child's needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

[www.nice.org.uk/TA10](http://www.nice.org.uk/TA10)

##### Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38

A child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

## 1 Airways disease, obstructive

### Asthma

31-Mar-2016

#### Description of condition

Asthma is a common chronic inflammatory condition of the airways characterised by bronchoconstriction. The most frequent symptoms are cough, wheezing, chest tightness, and shortness of breath. The bronchoconstriction is usually reversible (either spontaneously or with the aid of

medication) leading to intermittent symptoms, but in some patients with chronic asthma the inflammation may result in irreversible airway obstruction. Occasionally, asthma symptoms can get gradually or suddenly worse provoking an acute asthma attack that, if severe, may require hospitalisation.

### Aims of treatment

In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, and normal lung function (in practical terms FEV<sub>1</sub> and/or peak flow > 80% predicted or best).

### Lifestyle changes

**EvGr** Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger to themselves and to their children with asthma, of smoking, and be offered appropriate support to stop smoking. Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjuvant to drug treatment in order to improve quality of life and reduce symptoms. **⚡**

### Management of chronic asthma

**EvGr** A stepwise approach aims to stop symptoms quickly and to improve peak flow. Start at the step most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by *stepping up* treatment as necessary and *stepping down* treatment when control is good. Before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute attacks. **⚡**

#### Adult and child over 5 years

##### Step 1—Mild intermittent asthma

- EvGr** Start inhaled short-acting beta<sub>2</sub> agonist (such as salbutamol p. 239 or terbutaline sulfate p. 241) as required

Patients using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. Inhaled ipratropium bromide p. 234, (or, if over 12 years, short-acting beta<sub>2</sub> agonist tablets and syrup, or theophylline p. 256) also act as short-acting bronchodilators but inhaled short-acting beta<sub>2</sub> agonists are preferred.

Move to **step 2** if the patient presents with any one of the following features; is using an inhaled beta<sub>2</sub> agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week, or has had an asthma attack in the last 2 years. **⚡**

##### Step 2—Regular preventer therapy

- EvGr** Consider adding regular inhaled standard-dose corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled sodium cromoglicate p. 253, or inhaled nedocromil sodium p. 253, but are less effective)

Start the inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. Inhaled corticosteroids (except ciclesonide p. 247) should be initially taken twice daily, however, the same total daily dose can be considered once a day if good control is established. **⚡**

**Note**, inhaled standard-dose corticosteroid

*Adult and child over 12 years:* 200–800 micrograms/day beclometasone dipropionate p. 244 or equivalent

*Child 5–12 years:* 200–400 micrograms/day beclometasone dipropionate or equivalent

**EvGr** Beclometasone dipropionate p. 244 and budesonide p. 246 are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 248 and mometasone furoate p. 250 provide equal clinical activity to beclometasone dipropionate and budesonide at half the dosage.

In children, administration of high doses of inhaled corticosteroids may be associated with systemic side-effects, including growth failure, reduced bone mineral density, and adrenal suppression, see individual drug monographs for monitoring information.

If asthma is not adequately controlled, move to **step 3**. **⚡**

##### Step 3—Initial add-on therapy

- EvGr** Consider adding a regular inhaled long-acting beta<sub>2</sub> agonist (LABA) such as formoterol fumarate p. 237 or salmeterol p. 238 (or, in adults only, indacaterol p. 238 or olodaterol p. 238) to be used in conjunction with an inhaled corticosteroid (see also CHM advice for formoterol fumarate and salmeterol)

If the patient is gaining some benefit from addition of a LABA but control is *inadequate* then continue the LABA and increase dose of inhaled corticosteroid to top end of inhaled standard-dose corticosteroid range. If there is *no response* to the LABA, discontinue and increase dose of inhaled corticosteroid. If control is still inadequate, start a trial of either a leukotriene receptor antagonist (montelukast p. 251, or zafirlukast p. 252 if over 12 years) or modified-release theophylline. **⚡**

##### Step 4—Persistent poor control

Consider the following options:

- EvGr** Increase dose of inhaled corticosteroid (a spacer should be used), *or*
- Add a leukotriene receptor antagonist, modified-release theophylline, or modified-release oral beta<sub>2</sub> agonist (caution in patients already taking a LABA) **⚡**

**Note**, increased inhaled corticosteroid dose

*Adult and child over 12 years:* up to 2000 micrograms/day beclometasone dipropionate or equivalent

*Child 5–12 years:* up to 800 micrograms/day beclometasone dipropionate or equivalent

**EvGr** Before proceeding to **step 5**, refer patients with inadequately controlled asthma to specialist care. **⚡**

##### Step 5—Continuous or frequent use of oral corticosteroids

- EvGr** Add a regular oral corticosteroid (prednisolone p. 622, as single daily dose) at lowest dose to provide adequate control; continue high-dose inhaled corticosteroid (in exceptional cases, this may exceed licensed doses) **⚡**

#### Child under 5 years

##### Step 1—Mild intermittent asthma

- EvGr** Inhaled short-acting beta<sub>2</sub> agonist (such as salbutamol or terbutaline sulfate) as required

Children identified to be using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

Move to **step 2** if the child presents with any one of the following features; is using an inhaled beta<sub>2</sub> agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week. **⚡**

##### Step 2—Regular preventer therapy

- EvGr** Consider adding regular standard-dose inhaled corticosteroid
- If the child is unable to take an inhaled corticosteroid, a leukotriene receptor antagonist (such as montelukast) is an effective first-line preventer

Start inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. **A**

**Note**, inhaled standard-dose corticosteroid

*Child under 5 years:* 200–400 micrograms/day

beclomethasone dipropionate or equivalent

**EvGr** Beclomethasone dipropionate and budesonide are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 248 provides equal activity to beclomethasone dipropionate p. 244 and budesonide p. 246 at half the dosage.

Administration of high doses of inhaled corticosteroids in children may be associated with systemic side-effects, including growth failure, reduced bone mineral density and adrenal suppression.

If asthma is not adequately controlled, move to **step 3**. **A**

### Step 3—Initial add-on therapy

- EvGr** In children 2–5 years, add a leukotriene receptor antagonist if not added during step 2. If a leukotriene receptor antagonist was added at step 2, reconsider addition of standard-dose inhaled corticosteroid
- In children under 2 years, consider proceeding to **step 4**. **A**

### Step 4—Persistent poor control

- EvGr** Refer child to respiratory paediatrician. **A**

#### Stepping down

**EvGr** Once asthma is controlled, it is recommended to step down therapy and continue to regularly review the patient. When deciding which drug to step down first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient's preference, should be considered.

Patient should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates. **A**

## Management of acute asthma

### Adults

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

#### Moderate acute asthma

- Increasing symptoms
- Peak flow > 50–75% best or predicted
- No features of acute severe asthma

#### Severe acute asthma

Any one of the following:

- Peak flow 33–50% best or predicted
- Respiratory rate  $\geq$  25/min
- Heart rate  $\geq$  110/min
- Inability to complete sentences in one breath

#### Life-threatening acute asthma

Any one of the following, in a patient with severe asthma:

- Peak flow < 33% best or predicted
- Arterial oxygen saturation (SpO<sub>2</sub>) < 92%
- Partial arterial pressure of oxygen (PaO<sub>2</sub>) < 8 kPa
- Normal partial arterial pressure of carbon dioxide (PaCO<sub>2</sub>) (4.6–6.0 kPa)
- Silent chest
- Cyanosis
- Poor respiratory effort
- Arrhythmia
- Exhaustion
- Altered conscious level
- Hypotension

#### Near-fatal acute asthma

- Raised PaCO<sub>2</sub>, requiring mechanical ventilation with raised inflation pressures, or both

**EvGr** Patients with moderate asthma should be treated at home or in primary care according to response to treatment, while patients with severe or life-threatening acute asthma should start treatment as soon as possible and be admitted to hospital immediately following initial assessment.

Supplementary oxygen should be given to all hypoxaemic patients with acute severe asthma to maintain a SpO<sub>2</sub> level between 94–98%.

First-line treatment for acute asthma is a high-dose inhaled short-acting beta<sub>2</sub> agonist (salbutamol p. 239 or terbutaline sulfate p. 241) given as soon as possible. A pressurised metered dose inhaler with spacer device is preferred in patients with non-life-threatening acute asthma. Whereas, in patients with life-threatening acute asthma, a beta<sub>2</sub> agonist administered by an oxygen-driven nebuliser is recommended. If the response to an initial dose of short-acting beta<sub>2</sub> agonist is poor, consider continuous nebulisation with an appropriate nebuliser. Intravenous beta<sub>2</sub> agonists are reserved for those patients in whom inhaled therapy cannot be used reliably.

In all cases of acute asthma, patients should be prescribed an adequate dose of oral prednisolone p. 622 once daily for at least 5 days or until recovery. Parenteral hydrocortisone p. 620 or intramuscular methylprednisolone p. 621 are alternatives in patients who are unable to take oral prednisolone.

Nebulised ipratropium bromide p. 234 may be combined with a nebulised beta<sub>2</sub> agonist in patients with acute severe or life-threatening asthma or in those with a poor initial response to beta<sub>2</sub> agonist therapy to provide greater bronchodilation.

There is some evidence that magnesium sulfate p. 924 has bronchodilator effects. A single intravenous dose of magnesium sulfate may be considered in patients with severe acute asthma (peak flow < 50% best or predicted) who have not had a good initial response to inhaled bronchodilator therapy [unlicensed use]. In an acute asthma attack, intravenous aminophylline p. 255 is not likely to produce any additional bronchodilation compared to standard therapy with inhaled bronchodilators and corticosteroids. However, in some patients with near-fatal or life-threatening acute asthma with a poor response to initial therapy, intravenous aminophylline may provide some benefit. Magnesium sulfate by intravenous infusion or aminophylline should only be used after consultation with, or on the recommendation of, senior medical staff. **A**

### Child over 2 years

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

#### Moderate acute asthma

- Able to talk in sentences
- Arterial oxygen saturation (SpO<sub>2</sub>)  $\geq$  92%
- Peak flow  $\geq$  50% best or predicted
- Heart rate  $\leq$  140/minute in children aged 2–5 years; heart rate  $\leq$  125/minute in children over 5 years
- Respiratory rate  $\leq$  40/minute in children aged 2–5 years; respiratory rate  $\leq$  30/minute in children over 5 years

#### Severe acute asthma

- Can't complete sentences in one breath or too breathless to talk or feed
- SpO<sub>2</sub> < 92%
- Peak flow 33–50% best or predicted
- Heart rate > 140/minute in children aged 2–5 years; heart rate > 125/minute in children aged over 5 years
- Respiratory rate > 40/minute in children aged 2–5 years; respiratory rate > 30/minute in children aged over 5 years

**Life-threatening acute asthma**

Any one of the following in a child with severe asthma:

- SpO<sub>2</sub> < 92%
- Peak flow < 33% best or predicted
- Silent chest
- Cyanosis
- Poor respiratory effort
- Hypotension
- Exhaustion
- Confusion

**[EvGr]** Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or SpO<sub>2</sub> < 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta<sub>2</sub> agonist (salbutamol or terbutaline sulfate) given as soon as possible, ideally via a metered dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently.

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone. Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone should be reserved for severely affected children who are unable to retain oral medication.

Nebulised ipratropium bromide can be combined with beta<sub>2</sub> agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to beta<sub>2</sub> agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate p. 924 to nebulised salbutamol p. 239 and ipratropium bromide p. 234 in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe asthma despite frequent nebulised beta<sub>2</sub> agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in children with unreliable inhalation or severe refractory asthma. Aminophylline p. 255 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate has been used for acute asthma (unlicensed use) although its place in management is not yet established. **[A]**

**Child under 2 years**

**[EvGr]** Inhaled short-acting beta<sub>2</sub> agonists are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device. In a hospital setting, consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks. For more severe symptoms, inhaled ipratropium bromide in combination with an inhaled beta<sub>2</sub> agonist is also an option. **[A]**

**Follow up in all cases**

**[EvGr]** Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be

checked and regular treatment should be reviewed. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the patient's GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Patients who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission. **[A]**

**Exercise-induced asthma**

**[EvGr]** For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including inhaled corticosteroids should therefore be reviewed. If exercise is a specific problem in patients already taking inhaled corticosteroids who are otherwise well controlled, consider adding either a leukotriene receptor antagonist, a long-acting beta<sub>2</sub> agonist, an oral beta<sub>2</sub> agonist, sodium cromoglicate p. 253 or nedocromil sodium p. 253, or theophylline p. 256. An inhaled short-acting beta<sub>2</sub> agonists used immediately before exercise is the drug of choice. **[A]**

**Pregnancy and breast-feeding**

**[EvGr]** Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Short-acting beta<sub>2</sub> agonists, long-acting beta<sub>2</sub> agonists, oral and inhaled corticosteroids, sodium cromoglicate, nedocromil sodium, and oral and intravenous theophyllines can be used as normal during pregnancy. There is limited information on use of leukotriene receptor antagonists during pregnancy, however they may be used if potential benefit outweighs risk. Drugs for asthma, including corticosteroid tablets, can be used as normal and in-line with manufacturers' recommendations in breast-feeding.

Severe acute attacks of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta<sub>2</sub> agonist and oral or parenteral administration of a corticosteroid; prednisolone p. 622 is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia. **[A]**

**Bronchodilators****Adrenoceptor agonists (sympathomimetics)**

Selective beta<sub>2</sub> agonists produce bronchodilation. A short-acting beta<sub>2</sub> agonist is used for immediate relief of asthma symptoms while some long-acting beta<sub>2</sub> agonists are added

to an inhaled corticosteroid in patients requiring prophylactic treatment.

The selective beta<sub>2</sub> agonists (selective beta<sub>2</sub>-adrenoceptor agonists, selective beta<sub>2</sub> stimulants) such as salbutamol p. 239 or terbutaline sulfate p. 241 are the safest and most effective short-acting beta<sub>2</sub> agonists for asthma. Less selective beta<sub>2</sub> agonists such as ephedrine hydrochloride p. 254 is less suitable and less safe for use as a bronchodilator than the selective beta<sub>2</sub> agonists, because it is more likely to cause arrhythmias and other side-effects; it should be avoided whenever possible.

Adrenaline/epinephrine p. 211 (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, in cardiopulmonary resuscitation, and in the management of severe croup.

#### Short-acting beta<sub>2</sub> agonists

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta<sub>2</sub> agonist such as salbutamol or terbutaline sulfate. If beta<sub>2</sub> agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach.

A short-acting beta<sub>2</sub> agonist inhaled immediately before exertion reduces *exercise-induced asthma*; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

#### Long-acting beta<sub>2</sub> agonists

Formoterol fumarate p. 237 (eformoterol) and salmeterol p. 238 are longer-acting beta<sub>2</sub> agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma.

Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline sulfate. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Combination inhalers that contain a long-acting beta<sub>2</sub> agonist and a corticosteroid ensure that long-acting beta<sub>2</sub> agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.

Indacaterol p. 238 and olodaterol p. 238 are long-acting beta<sub>2</sub> agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm.

Vilanterol is a long-acting beta<sub>2</sub> agonist available only in a combination inhaler with fluticasone furoate or with umecclidinium p. 235.

#### Oral

Oral preparations of beta<sub>2</sub> agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta<sub>2</sub> agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol hydrochloride p. 236, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta<sub>2</sub> agonists are usually preferred.

#### Parenteral

Salbutamol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta<sub>2</sub> agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to

withdraw such treatment once started. In adults, beta<sub>2</sub> agonists may also be given by intramuscular injection.

#### Children

Selective beta<sub>2</sub> agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A beta<sub>2</sub> agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta<sub>2</sub> agonist may be used where appropriate. In severe attacks nebulisation using a selective beta<sub>2</sub> agonist or ipratropium bromide p. 234 is advisable.

#### Antimuscarinic bronchodilators

Ipratropium bromide can provide short-term relief in chronic asthma, but short-acting beta<sub>2</sub> agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy.

The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acclidinium bromide p. 233, glycopyrronium bromide p. 233, tiotropium p. 235, and umecclidinium are licensed for the maintenance treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm. Tiotropium (via *Respimat*® device) is also licensed as an adjunct to inhaled corticosteroids and long-acting beta<sub>2</sub> agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year.

#### Theophylline

Theophylline p. 256 is a xanthine used as a bronchodilator in *asthma* and stable *chronic obstructive pulmonary disease*; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta<sub>2</sub> agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 255, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

#### Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta<sub>2</sub> agonist or ipratropium bromide, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

## Chronic obstructive pulmonary disease

### Management

Smoking cessation reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal polysaccharide

conjugate vaccine (adsorbed) p. 1162 and influenza vaccine p. 1167).

A trial of a high-dose inhaled corticosteroid *or* an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled **short-acting beta<sub>2</sub> agonist** or a **short-acting antimuscarinic bronchodilator** used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV<sub>1</sub>), is 50% of predicted or more, *either* a long-acting antimuscarinic bronchodilator *or* a long-acting beta<sub>2</sub> agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting beta<sub>2</sub> agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting beta<sub>2</sub> agonist.

If FEV<sub>1</sub> is less than 50% of predicted, *either* a long-acting antimuscarinic bronchodilator *or* a long-acting beta<sub>2</sub> agonist with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta<sub>2</sub> agonist and a corticosteroid in a combination inhaler *plus* a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting beta<sub>2</sub> agonist, (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, below).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 255 or theophylline p. 256 can be used.

Indacaterol p. 238 is a long-acting beta<sub>2</sub> agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast p. 254 is licensed as an adjunct to existing bronchodilator treatment.

A **mucolytic** drug may be considered for a patient with a chronic productive cough.

Long-term **oxygen** therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of **oral corticosteroid**, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. **Antibacterial** treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an *oxygen alert card* endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

### Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)

Oxygen alert card	
Name: _____	
I am at risk of type II respiratory failure with a raised CO <sub>2</sub> level.	
Please use my ____% Venturi mask to achieve an oxygen saturation of ____% to ____% during exacerbations.	
Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.	

Oxygen alert card is available at [www.brit-thoracic.org.uk](http://www.brit-thoracic.org.uk).

## Croup

### Management

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 618) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 622 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 246 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) p. 211 should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

## Oxygen

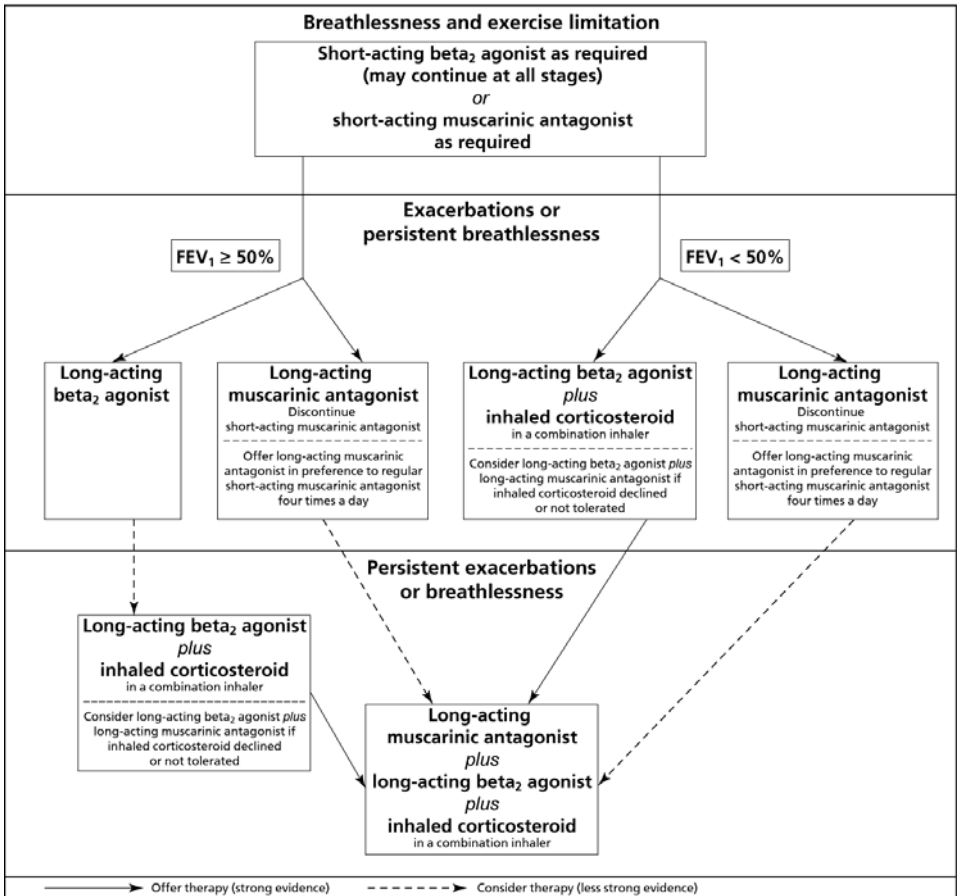

### Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (P<sub>a</sub>CO<sub>2</sub>), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

*High concentration oxygen therapy* is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (P<sub>a</sub>O<sub>2</sub>) is usually associated with low or

## Use of inhaled therapies in chronic obstructive pulmonary disease

Advice on the use of inhaled therapies in chronic obstructive pulmonary disease is based on the recommendations of the National Institute for Health and Care Excellence (2010). Management of chronic obstructive pulmonary disease in adults in primary and secondary care. London: NICE. Available from [www.nice.org.uk/CG101](http://www.nice.org.uk/CG101) Reproduced with permission

normal arterial carbon dioxide ( $P_a\text{CO}_2$ ), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ( $P_a\text{CO}_2$ ) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ( $P_a\text{CO}_2$ ) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an *oxygen alert card*.

#### Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

#### Air travel

Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient's requirement should be discussed with the airline before travel.

### Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with  $P_aO_2 < 7.3$  kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with  $P_aO_2 7.3-8$  kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with  $P_aO_2 < 7.3$  kPa or persistent disabling breathlessness;
- interstitial lung disease with  $P_aO_2 < 8$  kPa and in patients with  $P_aO_2 > 8$  kPa with disabling dyspnoea;
- cystic fibrosis when  $P_aO_2 < 7.3$  kPa or if  $P_aO_2 7.3-8$  kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when  $P_aO_2 < 8$  kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime  $P_aO_2 < 7.3$  kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

### Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

### Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

### Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with 'medium' (2 litres/minute) and 'high' (4 litres/minute) settings. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

**Oxygen concentrators** are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

### Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient's details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London, East Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In **Scotland** refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at: [www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services.aspx](http://www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services.aspx).

In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

## ANTIMUSCARINICS

## Antimuscarinics (inhaled)

09-Feb-2016

- **CAUTIONS** Bladder outflow obstruction · paradoxical bronchospasm · prostatic hyperplasia · susceptibility to angle-closure glaucoma
- **INTERACTIONS** See Appendix 1 (antimuscarinics). However, note that interactions do not *generally* apply to antimuscarinics used by inhalation.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation · cough · diarrhoea · dry mouth · gastro-intestinal motility disorder · headache · sinusitis
  - ▶ **Uncommon** Angle-closure glaucoma · atrial fibrillation · blurred vision · dizziness · gastro-oesophageal reflux disease (in adults) · mydriasis · nasopharyngitis · nausea · palpitation · paradoxical bronchospasm · pharyngitis · rash · tachycardia · throat irritation · urinary retention
  - ▶ **Rare** Dental caries

## Acidinium bromide

19-Feb-2016

## ● INDICATIONS AND DOSE

**Maintenance treatment of chronic obstructive pulmonary disease**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 375 micrograms twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Each 375 microgram inhalation of acidinium bromide delivers 322 micrograms of acidinium.

- **CAUTIONS** Arrhythmia (when newly diagnosed within last 3 months) · heart failure (hospitalisation with moderate or severe heart failure within last 12 months) · myocardial infarction within last 6 months · unstable angina
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Dysphonia · stomatitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises only use if potential benefits outweigh risks.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- ▶ **Acidinium bromide (non-proprietary)** ▼  
Acidinium bromide 375 microgram per 1 dose Acidinium bromide 375micrograms/dose dry powder inhaler | 60 dose [PoM] no price available DT price = £28.60
- ▶ **Eklira** (AstraZeneca UK Ltd) ▼  
Acidinium bromide 375 microgram per 1 dose Eklira 322micrograms/dose Genuair | 60 dose [PoM] £28.60 DT price = £28.60

## Acidinium bromide with formoterol

19-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, acidinium bromide above, formoterol fumarate p. 237.

## ● INDICATIONS AND DOSE

**Maintenance treatment of chronic obstructive pulmonary disease**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 inhalation twice daily

- **CAUTIONS** Convulsive disorders · phaeochromocytoma
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- ▶ **Acidinium bromide with formoterol (non-proprietary)** ▼  
Formoterol fumarate dihydrate 11.8 microgram per 1 dose, Acidinium bromide 396 microgram per 1 dose Acidinium bromide 396micrograms/dose / Formoterol 11.8micrograms/dose dry powder inhaler | 60 dose [PoM] no price available DT price = £32.50
- ▶ **Duaklir** (AstraZeneca UK Ltd) ▼  
Formoterol fumarate dihydrate 11.8 microgram per 1 dose, Acidinium bromide 396 microgram per 1 dose Duaklir 340micrograms/dose / 12micrograms/dose Genuair | 60 dose [PoM] £32.50 DT price = £32.50

## Glycopyrronium bromide

17-Oct-2016

## (Glycopyrrolate)

## ● INDICATIONS AND DOSE

**Maintenance treatment of chronic obstructive pulmonary disease**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 50 micrograms once daily

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For inhalation of powder, each 50 microgram capsule of glycopyrronium delivers 44 micrograms of glycopyrronium.

- **CAUTIONS** Arrhythmia (excluding chronic stable atrial fibrillation) · history of myocardial infarction · history of QT-interval prolongation · left ventricular failure · unstable ischaemic heart disease
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Insomnia
  - ▶ **Uncommon** Epistaxis · hyperglycaemia · hypoaesthesia · malaise · rhinitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer glycopyrronium for inhalation.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

F 233

## Ipratropium bromide

24-Feb-2016

### ● INDICATIONS AND DOSE

#### Reversible airways obstruction

- ▶ BY INHALATION OF AEROSOL
- ▶ Child 1 month–5 years: 20 micrograms 3 times a day
- ▶ Child 6–11 years: 20–40 micrograms 3 times a day
- ▶ Child 12–17 years: 20–40 micrograms 3–4 times a day

#### Reversible airways obstruction, particularly in chronic obstructive pulmonary disease

- ▶ BY INHALATION OF AEROSOL
- ▶ Adult: 20–40 micrograms 3–4 times a day
- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 250–500 micrograms 3–4 times a day

#### Acute bronchospasm

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–5 years: 125–250 micrograms as required; maximum 1 mg per day
- ▶ Child 6–11 years: 250 micrograms as required; maximum 1 mg per day
- ▶ Child 12–17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day
- ▶ Adult: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

#### Severe or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
- ▶ Child 12–17 years: 500 micrograms every 4–6 hours as required
- ▶ Adult: 500 micrograms every 4–6 hours as required

### PHARMACOKINETICS

The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

- **UNLICENSED USE** [EvGr](#) The dose of ipratropium for severe or life-threatening acute asthma is unlicensed. [⚠](#)
- **CAUTIONS** Cystic fibrosis
- **CAUTIONS, FURTHER INFORMATION**
- ▶ **Glaucoma** *Acute angle-closure glaucoma* has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta<sub>2</sub> agonists); care needed to protect the patient's eyes from nebulised drug or from drug powder.
- **SIDE-EFFECTS**
- ▶ **Uncommon** Laryngospasm · pharyngeal oedema · stomatitis · vomiting
- ▶ **Rare** Ocular accommodation disorder
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.
- **DIRECTIONS FOR ADMINISTRATION** If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Pressurised inhalation

- ▶ **Ipratropium bromide (Non-proprietary)**  
Ipratropium bromide 20 microgram per 1 dose Ipratropium bromide 20micrograms/dose inhaler CFC free | 200 dose [PoM](#) no price available DT price = £5.56

## Tiotropium

24-Feb-2016

F 233

#### ● INDICATIONS AND DOSE

##### **Maintenance treatment of chronic obstructive pulmonary disease**

###### ▶ BY INHALATION OF POWDER

- ▶ Adult: 18 micrograms once daily

##### **SPIRIVA RESPIMAT®**

##### **Maintenance treatment of chronic obstructive pulmonary disease | Adjunct to inhaled corticosteroids and long-acting beta<sub>2</sub> agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year**

###### ▶ BY INHALATION OF AEROSOL

- ▶ Adult: 5 micrograms once daily

- **CAUTIONS** Arrhythmia (unstable, life-threatening or requiring intervention in the previous 12 months) · heart failure (hospitalisation for moderate to severe heart failure in the previous 12 months) · myocardial infarction in the previous 6 months

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Epistaxis · oropharyngeal candidiasis · taste disturbance
- ▶ **Uncommon** Dysphonia
- ▶ **Rare** Gingivitis · glossitis · insomnia · stomatitis
- ▶ **Frequency not known** Dehydration · joint swelling

- **PREGNANCY** Manufacturer advises avoid—limited data available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Plasma-tiotropium concentration raised. Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

#### ● PRESCRIBING AND DISPENSING INFORMATION

**SPIRIVA RESPIMAT®** Use *Spiriva Respimat®* only when patient unable to use *Spiriva Handihaler®* device.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique and reminded that the powder inhalation capsules are not for oral administration.

## Tiotropium with olodaterol

15-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, tiotropium above, olodaterol p. 238.

#### ● INDICATIONS AND DOSE

##### **Maintenance treatment of chronic obstructive pulmonary disease**

###### ▶ BY INHALATION OF AEROSOL

- ▶ Adult: 2 puffs once daily

#### ● SIDE-EFFECTS

- ▶ **Rare** Laryngitis
- ▶ **Frequency not known** Skin ulcer

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Pressurised inhalation**

###### ▶ **Spiolto Respimat** (Boehringer Ingelheim Ltd) ▼

**Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per 1 dose, Tiotropium (as Tiotropium bromide) 2.5 microgram per 1 dose** Spiolto Respimat 2.5micrograms/dose / 2.5micrograms/dose solution for inhalation cartridge with device | 60 dose [PoM](#) £32.50 DT price = £32.50

## Tiotropium

19-Feb-2016

F 233

## Umeclidinium

#### ● INDICATIONS AND DOSE

##### **Maintenance treatment of chronic obstructive pulmonary disease**

###### ▶ BY INHALATION OF POWDER

- ▶ Adult: 55 micrograms once daily

##### **DOSE EQUIVALENCE AND CONVERSION**

- ▶ Each 65 microgram inhalation of umeclidinium bromide delivers 55 micrograms of umeclidinium.

- **CAUTIONS** Cardiac disorders (particularly cardiac rhythm disorders)

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises to use with caution in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Inhalation powder

- ▶ **Increase Eliпта** (GlaxoSmithKline UK Ltd) ▼

Umeclidinium bromide 65 microgram per 1 dose Increase Eliпта 55micrograms/dose dry powder inhaler | 30 dose [PoM] £27.50 DT price = £27.50

## Umeclidinium with vilanterol

19-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, umeclidinium p. 235.

#### ● INDICATIONS AND DOSE

#### Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 inhalation once daily

- **CONTRA-INDICATIONS** Severe pre-eclampsia
- **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

#### CAUTIONS, FURTHER INFORMATION

- ▶ Hypokalaemia Potentially serious hypokalaemia may result from beta<sub>2</sub> agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

- **INTERACTIONS** → Appendix 1 (antimuscarinics, sympathomimetics beta<sub>2</sub>).

- **SIDE-EFFECTS** Angioedema · arrhythmias · behavioural disturbances · collapse · fine tremor (particularly in the hands) · hyperglycaemia · hypersensitivity reactions · hypokalaemia (with high doses) · hypotension · ketoacidosis · muscle cramps · myocardial ischaemia · nervous tension · peripheral vasodilation · sleep disturbances · urticaria

#### ● MONITORING REQUIREMENTS

- ▶ In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- ▶ In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta<sub>2</sub> agonist given intravenously).

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Inhalation powder

- ▶ **Umeclidinium with vilanterol (non-proprietary)** ▼

Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose Umeclidinium bromide 65micrograms/dose / Vilanterol 22micrograms/dose dry powder inhaler | 30 dose [PoM] no price available DT price = £32.50

- ▶ **Anoro Eliпта** (GlaxoSmithKline UK Ltd) ▼

Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose Anoro Eliпта 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose [PoM] £32.50 DT price = £32.50

## BETA<sub>2</sub>-ADRENOCEPTOR AGONISTS, SELECTIVE

### Beta<sub>2</sub>-adrenoceptor agonists, selective

12-Feb-2016

- **CONTRA-INDICATIONS** Severe pre-eclampsia
- **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use) · high doses of beta<sub>2</sub> agonists can be dangerous in some children (in children) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

#### CAUTIONS, FURTHER INFORMATION

- ▶ Hypokalaemia Potentially serious hypokalaemia may result from beta<sub>2</sub> agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

- **INTERACTIONS** → Appendix 1 (sympathomimetics, beta<sub>2</sub>). Hypokalaemia may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics.

- **SIDE-EFFECTS** Angioedema · arrhythmias · behavioural disturbances · collapse · fine tremor (particularly in the hands) · headache · hyperglycaemia (especially when given intravenously) · hypersensitivity reactions · hypokalaemia (with high doses) · hypotension · ketoacidosis (especially when given intravenously) · muscle cramps · myocardial ischaemia · nervous tension · palpitation · paradoxical bronchospasm (occasionally severe) · peripheral vasodilation · rash · sleep disturbances · tachycardia · urticaria

- **PREGNANCY** Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

#### ● MONITORING REQUIREMENTS

- ▶ In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- ▶ In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta<sub>2</sub> agonist given intravenously).

#### ● PATIENT AND CARER ADVICE

- ▶ When used by inhalation **The dose**, the frequency, and the maximum number of inhalations in 24 hours of the beta<sub>2</sub> agonist should be **stated explicitly** to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of beta<sub>2</sub> agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

## BETA<sub>2</sub>-ADRENOCEPTOR AGONISTS, SELECTIVE > LONG-ACTING

[↑ above](#)

### Bambuterol hydrochloride

- **DRUG ACTION** Bambuterol is a pro-drug of terbutaline.

#### ● INDICATIONS AND DOSE

**Asthma (patients who have previously tolerated beta<sub>2</sub>-agonists) | Other conditions associated with reversible airways obstruction (patients who have previously tolerated beta<sub>2</sub>-agonists)**

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily, dose to be taken at bedtime

**Asthma (patients who have not previously tolerated beta<sub>2</sub>-agonists) | Other conditions associated with reversible airways obstruction (patients who have not previously tolerated beta<sub>2</sub>-agonists)**

► BY MOUTH

- Adult: Initially 10 mg once daily for 1–2 weeks, then increased if necessary to 20 mg once daily, dose to be taken at bedtime

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Bambec** (AstraZeneca UK Ltd)

**Bambuterol hydrochloride 10 mg** Bambec 10mg tablets | 28 tablet (POM) £14.46 DT price = £14.46

**Bambuterol hydrochloride 20 mg** Bambec 20mg tablets | 28 tablet (POM) £15.77 DT price = £15.77

236

## Formoterol fumarate

(Eformoterol fumarate)

● **INDICATIONS AND DOSE**

**Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid**

► BY INHALATION OF POWDER

- Child 6–11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

► BY INHALATION OF AEROSOL

- Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

**Chronic obstructive pulmonary disease**

► BY INHALATION OF POWDER

- Adult: 12 micrograms twice daily

► BY INHALATION OF AEROSOL

- Adult: 12 micrograms twice daily (max. per dose 24 micrograms), for symptom relief additional doses may be taken to maximum daily dose; maximum 48 micrograms per day

**OXIS®**

**Chronic asthma**

► BY INHALATION OF POWDER

- Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
- Adult: 6–12 micrograms 1–2 times a day, increased if necessary up to 24 micrograms twice daily (max. per dose 36 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 72 micrograms per day

**Relief of bronchospasm**

► BY INHALATION OF POWDER

- Child 6–17 years: 6–12 micrograms
- Adult: 6–12 micrograms

**Prophylaxis of exercise-induced bronchospasm**

► BY INHALATION OF POWDER

- Child 6–17 years: 6–12 micrograms, dose to be taken before exercise
- Adult: 12 micrograms, dose to be taken before exercise

**Chronic obstructive pulmonary disease**

► BY INHALATION OF POWDER

- Adult: 12 micrograms 1–2 times a day (max. per dose 24 micrograms), for symptom relief additional doses up to maximum daily dose can be taken; maximum 48 micrograms per day

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta<sub>2</sub> agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

● **SIDE-EFFECTS**

- **Very rare** QT-interval prolongation
- **Frequency not known** Dizziness · nausea · pruritus · taste disturbances
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **PATIENT AND CARER ADVICE** Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be

obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta<sub>2</sub> agonist. Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Pressurised inhalation

##### ► **Atimos Modulite** (Chiesi Ltd)

Formoterol fumarate dihydrate 12 microgram per 1 dose Atimos Modulite 12micrograms/dose inhaler | 100 dose [PoM] £30.06 DT price = £30.06

#### Inhalation powder

##### ► **Easyhaler (formoterol)** (Orion Pharma (UK) Ltd)

Formoterol fumarate dihydrate 12 microgram per 1 dose Formoterol Easyhaler 12micrograms/dose dry powder inhaler | 120 dose [PoM] £23.75 DT price = £23.75

##### ► **Foradil** (Novartis Pharmaceuticals UK Ltd)

Formoterol fumarate dihydrate 12 microgram Foradil 12microgram inhalation powder capsules with device | 60 capsule [PoM] £28.06 DT price = £28.06

##### ► **Oxis Turbohaler** (AstraZeneca UK Ltd)

Formoterol fumarate dihydrate 6 microgram per 1 dose Oxis 6 Turbohaler | 60 dose [PoM] £24.80 DT price = £24.80

Formoterol fumarate dihydrate 12 microgram per 1 dose Oxis 12 Turbohaler | 60 dose [PoM] £24.80 DT price = £24.80

Combinations available: **Acclidinium bromide with formoterol**, p. 233 · **Beclometasone with formoterol**, p. 245 · **Budesonide with formoterol**, p. 247 · **Fluticasone with formoterol**, p. 248

## Indacaterol

### • INDICATIONS AND DOSE

#### Maintenance treatment of chronic obstructive pulmonary disease

- BY INHALATION OF POWDER
- Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

### • CAUTIONS

Convulsive disorders

### • SIDE-EFFECTS

- Common or very common Cough · dizziness · nasopharyngitis · oropharyngeal pain · peripheral oedema · rhinorrhoea · sinusitis

- Uncommon Atrial fibrillation · chest pain · paraesthesia · pruritus

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer indacaterol inhalation powder.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Inhalation powder

##### ► **Onbrez Breezhaler** (Novartis Pharmaceuticals UK Ltd)

Indacaterol (as indacaterol maleate) 150 microgram Onbrez Breezhaler 150microgram inhalation powder capsules with device | 30 capsule [PoM] £32.19 DT price = £32.19

Indacaterol (as indacaterol maleate) 300 microgram Onbrez Breezhaler 300microgram inhalation powder capsules with device | 30 capsule [PoM] £32.19 DT price = £32.19

Combinations available: **Glycopyrronium with indacaterol**, p. 234

## Olodaterol

### • INDICATIONS AND DOSE

#### Maintenance treatment of chronic obstructive pulmonary disease

- BY INHALATION
- Adult: 5 micrograms once daily

#### DOSE EQUIVALENCE AND CONVERSION

- 2 puffs is equivalent to 5 micrograms.

- **CAUTIONS** Aneurysm · convulsive disorders

### • SIDE-EFFECTS

- Uncommon Dizziness · nasopharyngitis
- Rare Arthralgia · hypertension
- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Use with caution in severe hepatic impairment—no information available.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer olodaterol solution for inhalation.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Pressurised inhalation

##### ► **Striverdi Respimat** (Boehringer Ingelheim Ltd) ▼

Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per 1 dose Striverdi Respimat 2.5micrograms/dose solution for inhalation cartridge with device | 60 dose [PoM] £26.35 DT price = £26.35

Combinations available: **Tiotropium with olodaterol**, p. 235

## Salmeterol

### • INDICATIONS AND DOSE

**Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy** | **Nocturnal asthma in patients requiring long-term regular bronchodilator therapy** | **Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy** | **Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)**

- BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
- Child 5-11 years: 50 micrograms twice daily
- Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
- Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

#### Chronic obstructive pulmonary disease

- BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
- Adult: 50 micrograms twice daily

#### PHARMACOKINETICS

At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

- **UNLICENSED USE** *Neovent*® not licensed for use in children under 12 years.

### IMPORTANT SAFETY INFORMATION

#### CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta<sub>2</sub> agonist (salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

- **SIDE-EFFECTS** Arthralgia · dizziness · nausea
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **PATIENT AND CARER ADVICE** Advise patients that salmeterol should **not** be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta<sub>2</sub> agonist. Medicines for Children leaflet: Salmeterol inhaler for asthma prevention (prophylaxis) [www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention](http://www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention)

#### ● MEDICINAL FORMS

## BETA<sub>2</sub>-ADRENOCEPTOR AGONISTS, SELECTIVE > SHORT-ACTING

F 236

### Salbutamol

(Albuterol)

#### ● INDICATIONS AND DOSE

##### Asthma | Other conditions associated with reversible airways obstruction

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Adult: 4 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
  - ▶ Elderly: Initially 2 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Adult: 500 micrograms every 4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
  - ▶ Adult: 250 micrograms, repeated if necessary, injection to be diluted to a concentration of 50 micrograms/mL, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably
- ▶ BY INTRAVENOUS INFUSION
  - ▶ Adult: Initially 5 micrograms/minute, adjusted according to response and heart rate, usual dose 3–20 micrograms/minute, higher doses may be required, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably
- ▶ BY INHALATION OF AEROSOL
  - ▶ Adult: 100–200 micrograms, up to 4 times a day for persistent symptoms
- ▶ BY INHALATION OF NEBULISED SOLUTION
  - ▶ Adult: 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases

##### Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF AEROSOL
  - ▶ Adult: 200 micrograms

##### Acute asthma

- ▶ BY INTRAVENOUS INJECTION
  - ▶ Child 1–23 months: 5 micrograms/kg for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - ▶ Child 2–17 years: 15 micrograms/kg (max. per dose 250 micrograms) for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

##### Moderate, severe, or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION
  - ▶ Child 1 month–4 years: 2.5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - ▶ Child 5–11 years: 2.5–5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - ▶ Child 12–17 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - ▶ Adult: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

continued →

**Moderate and severe acute asthma**

- ▶ BY INHALATION OF AEROSOL
- ▶ Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms
- ▶ Adult: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer, each puff is equivalent to 100 micrograms

**Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prophylaxis of allergen- or exercise-induced bronchospasm**

- ▶ BY INHALATION OF AEROSOL
- ▶ Child: 100–200 micrograms, up to 4 times a day for persistent symptoms
- ▶ BY MOUTH USING IMMEDIATE RELEASE MEDICINE
- ▶ Child 1 month–1 year: 100 micrograms/kg 3–4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
- ▶ Child 2–5 years: 1–2 mg 3–4 times a day, inhalation route preferred over oral route
- ▶ Child 6–11 years: 2 mg 3–4 times a day, inhalation route preferred over oral route
- ▶ Child 12–17 years: 2–4 mg 3–4 times a day, inhalation route preferred over oral route

**Chronic asthma**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 3–11 years: 4 mg twice daily
- ▶ Child 12–17 years: 8 mg twice daily
- ▶ Adult: 8 mg twice daily

**Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

**ASMASAL CLICKHALER®****Acute bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1–2 puffs, up to 4 times daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1–2 puffs

**EASYHALER® SALBUTAMOL****Acute bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

**Prophylaxis of allergen- or exercise-induced bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

**PULVINAL® SALBUTAMOL****Acute bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Child 5–17 years: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms
- ▶ Adult: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Child 5–17 years: 200 micrograms
- ▶ Adult: 200 micrograms

**SALBULIN NOVOLIZER®****Acute bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

**VENTOLIN ACCUHALER®****Acute bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

- **UNLICENSED USE** Syrup and tablets not licensed for use in children under 2 years. Modified-release tablets not licensed for use in children under 3 years. Injection and solution for intravenous infusion not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS**
  - ▶ When used for uncomplicated premature labour under specialist supervision Abruption placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage
- **CAUTIONS**
  - ▶ With intravenous use Mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)
- **SIDE-EFFECTS**
  - GENERAL SIDE-EFFECTS** Lactic acidosis (with high doses) · nausea
  - SPECIFIC SIDE-EFFECTS**
    - ▶ When used for uncomplicated premature labour Bronchospasm · muscle tension · pulmonary oedema · vomiting
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS**
  - ▶ In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in children Dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections.
  - ▶ When used by inhalation For nebulisation, dilute nebuliser solution with a suitable volume of sterile

Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

- With intravenous use in adults For *bronchodilation by continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%. For *premature labour by continuous intravenous infusion*, dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze [www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze](http://www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze)

- When used by inhalation For *inhalation by aerosol or dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

###### ▶ Salbutamol (Non-proprietary)

## Terbutaline sulfate

#### ● INDICATIONS AND DOSE

**Asthma** | Other conditions associated with reversible airways obstruction

##### ▶ BY MOUTH

- Adult: Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth

##### ▶ BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 250–500 micrograms up to 4 times a day, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

##### ▶ BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: 90–300 micrograms/hour for 8–10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous

continued →

beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 500 micrograms up to 4 times a day, for persistent symptoms
- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 5–10 mg 2–4 times a day, additional doses may be necessary in severe acute asthma

#### Acute asthma

- ▶ BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ Child 15–17 years: 250–500 micrograms up to 4 times a day, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta<sub>2</sub> agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

#### Moderate, severe, or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–4 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Adult: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

#### Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prevention of exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only
- ▶ BY MOUTH
- ▶ Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
- ▶ Child 7–14 years: 2.5 mg 2–3 times a day, administration by mouth is not recommended
- ▶ Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

#### Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should **seldom** be given—20 micrograms/minute should **not** be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

#### PHARMACOKINETICS

At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

- **UNLICENSED USE** Injection not licensed for use in children under 2 years.

#### CONTRA-INDICATIONS

- ▶ When used for uncomplicated premature labour · Abruptio placentae · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

- **CAUTIONS** Mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

#### SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

Nausea

- ▶ When used for uncomplicated premature labour · Muscle tension · pulmonary oedema · vomiting
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.

- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.

#### MONITORING REQUIREMENTS

- ▶ In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).

#### DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
- ▶ When used by inhalation For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.
- ▶ With intravenous use in adults For *bronchodilation by continuous intravenous infusion*, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For *premature labour by continuous intravenous infusion*, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

#### PATIENT AND CARER ADVICE

- ▶ When used by inhalation For *inhalation by dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Tablet**

- **Bricanyl** (AstraZeneca UK Ltd)  
Terbutaline sulfate 5 mg Bricanyl 5mg tablets | 100 tablet [PoM]  
£4.91 DT price = £4.91

**Solution for injection**

- **Bricanyl** (AstraZeneca UK Ltd)  
Terbutaline sulfate 500 microgram per 1 ml Bricanyl 2.5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £16.74  
Bricanyl 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £2.16

**Inhalation powder**

- **Bricanyl Turbohaler** (AstraZeneca UK Ltd)  
Terbutaline sulfate 500 microgram per 1 dose Bricanyl 500micrograms/dose Turbohaler | 100 dose [PoM] £6.92 DT price = £6.92

**Nebuliser liquid**

- **Terbutaline sulfate (Non-proprietary)**  
Terbutaline sulfate 2.5 mg per 1 ml Terbutaline 5mg/2ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £4.04 DT price = £4.04
- **Bricanyl Respules** (AstraZeneca UK Ltd)  
Terbutaline sulfate 2.5 mg per 1 ml Bricanyl 5mg/2ml Respules | 20 unit dose [PoM] £5.82 DT price = £4.04

**CORTICOSTEROIDS****Airways disease, use of corticosteroids****Asthma****Inhaled corticosteroids**

An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

Corticosteroids are effective in *asthma*; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta<sub>2</sub> agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the patient has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid. *Regular use* of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate p. 244, budesonide p. 246, fluticasone p. 248, and mometasone furoate p. 250 appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta<sub>2</sub> agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta<sub>2</sub> agonist for the prophylaxis of asthma, but who are poorly controlled, *Symbicort*® or *DuoResp Spiromax*® (both containing budesonide with formoterol p. 247) can be used as relievers (instead of a short-acting beta<sub>2</sub> agonist), in addition to their regular use for the prophylaxis of asthma. *Symbicort*® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily, but who are poorly controlled (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy. Patients using budesonide with formoterol as a reliever once a day or more should have their

treatment reviewed regularly. The use of *Symbicort*® for both reliever and maintenance therapy is also used by some specialists in children 12–18 years [unlicensed]. *Fostair*® can also be used in adults as a reliever (instead of a short-acting beta<sub>2</sub> agonist) in addition to its regular use for the prophylaxis of asthma. It may be particularly useful for patients with poorly controlled asthma requiring reliever therapy, or for those who have had previous exacerbations of asthma which needed medical intervention. Patients requiring frequent daily use of *Fostair*® as a reliever should have their maintenance treatment reviewed. This approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta<sub>2</sub> agonists.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta<sub>2</sub> agonist or another long-acting bronchodilator. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

**Oral corticosteroids**

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

**Parenteral corticosteroids**

Hydrocortisone injection p. 620 has a role in the emergency treatment of acute severe asthma.

**Chronic obstructive pulmonary disease****Inhaled corticosteroids**

In *chronic obstructive pulmonary disease* inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta<sub>2</sub> agonist.

**Oral corticosteroids**

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 622 should be given;

treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

## Corticosteroids (inhaled)

● **INTERACTIONS** → Appendix 1 (corticosteroids).

Interactions do not generally apply to corticosteroids used for inhalation unless specified.

### ● SIDE-EFFECTS

- ▶ **Very rare** Paradoxical bronchospasm
- ▶ **Frequency not known** Adrenal crisis (with prolonged high doses) · adrenal suppression (with prolonged high doses) · aggression (in children) · aggression (particularly in children)(in adults) · anxiety · behavioural changes (in children) · behavioural changes (particularly in children) (in adults) · bruising · candidiasis of the mouth · candidiasis of the throat · cataracts · coma (with prolonged high doses) · Cushing's syndrome (with moon face, striae and acne) · depression · dysphonia · glaucoma (with prolonged high doses) · hoarseness · hyperactivity (particularly in children) · hyperglycaemia (usually only with high doses) · irritability (in children) · irritability (particularly in children)(in adults) · lower respiratory tract infections in older patients with chronic obstructive pulmonary disease (with high doses) (in adults) · pneumonia in older patients with chronic obstructive pulmonary disease (with high doses) (in adults) · reduced growth velocity (in children) · reduced mineral bone density (with long-term treatment of high doses) · side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use · sleep disturbances · throat irritation

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Candidiasis** The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.
- ▶ **Paradoxical bronchospasm** The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta<sub>2</sub> agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS**
  - ▶ In children The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ **Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007)** NICE TA131
  - ▶ In children For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended. For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta<sub>2</sub> agonist is considered appropriate, the following apply:
    - the use of a combination inhaler within its marketing authorisation is recommended as an option;

- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.

[www.nice.org.uk/TA131](http://www.nice.org.uk/TA131)

- ▶ **Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008)** NICE TA138 For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta<sub>2</sub> agonist is considered appropriate, the following apply:

- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended.

## Beclometasone dipropionate

### (Beclomethasone dipropionate)

#### ● INDICATIONS AND DOSE

##### Prophylaxis of asthma

###### ▶ BY INHALATION OF POWDER

- ▶ Child 5-11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
- ▶ Child 12-17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
- ▶ Adult: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

##### ASMBEC CLICKHALER®

##### Prophylaxis of asthma

###### ▶ BY INHALATION OF POWDER

- ▶ Child 6-11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
- ▶ Child 12-17 years: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary
- ▶ Adult: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary

##### CLENIL MODULITE®

##### Prophylaxis of asthma

###### ▶ BY INHALATION OF AEROSOL

- ▶ Child 2-11 years: 100–200 micrograms twice daily
- ▶ Child 12-17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
- ▶ Adult: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

**QVAR® PREPARATIONS****Prophylaxis of asthma**

## ▶ BY INHALATION OF AEROSOL

- ▶ Child 12-17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
- ▶ Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

**POTENCY**

Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as *Clenil Modulite*®.

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Dose adjustments may be required for some inhaler devices, see under individual preparations.

- **UNLICENSED USE** *Easyhaler*® Beclometasone Dipropionate is not licensed for use in children under 18 years. *Clenil Modulite*® -200 and -250 are not licensed for use in children under 12 years. *Qvar*® is not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE (JULY 2008)**

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (*Qvar*® and *Clenil Modulite*®) are **not** interchangeable and should be prescribed by brand name; *Qvar*® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as *Clenil Modulite*®.

- **PRESCRIBING AND DISPENSING INFORMATION** The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name.

**CLENIL MODULITE®** *Clenil Modulite*® is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

**QVAR® PREPARATIONS** When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*® should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of *Qvar*® should be adjusted according to response.

- **PATIENT AND CARER ADVICE** Steroid card should be issued with high doses of inhaled beclometasone dipropionate. Medicines for Children leaflet: Beclometasone for asthma prevention (prophylaxis) [www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0](http://www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0)

**PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

*Clenil Modulite*® 50 micrograms/metered inhalation may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- ▶ Adult: 200/12 micrograms twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, *Fostair*® 100/6 can be prescribed for patients already using beclometasone dipropionate 250 micrograms in another CFC-free inhaler; the dose of *Fostair*® should be adjusted according to response.
- ▶ For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution, the dose should be adjusted according to response. continued →

- ▶ 1 puff is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JULY 2008)

*Fostair*® contains extra-fine particles of beclometasone dipropionate and is more potent than traditional beclometasone dipropionate CFC-free inhalers. The dose of beclometasone dipropionate in *Fostair*® should be lower than non-extra-fine formulations of beclometasone dipropionate and will need to be adjusted to the individual needs of the patient.

- **PATIENT AND CARER ADVICE** With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer beclometasone with formoterol aerosol for inhalation.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

## Budesonide with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, budesonide p. 246, formoterol fumarate p. 237.

### ● INDICATIONS AND DOSE

#### DUORESP SPIROMAX® 160MICROGRAMS/4.5MICROGRAMS

##### Asthma maintenance therapy

- BY INHALATION OF POWDER  
 ► Adult: 1–2 inhalations twice daily, increased if necessary up to 4 inhalations twice daily

##### Asthma, maintenance and reliever therapy

- BY INHALATION OF POWDER  
 ► Adult: 2 inhalations daily in 1–2 divided doses, increased if necessary to 2 inhalations twice daily. 1 inhalation (max. per dose 6 inhalations) as required, for relief of symptoms, a total daily dose of up to 12 inhalations can be used for a limited time but medical assessment is recommended if more than 8 inhalations daily are needed

##### Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- BY INHALATION OF POWDER  
 ► Adult: 2 inhalations twice daily

#### DUORESP SPIROMAX® 320MICROGRAMS/9MICROGRAMS

##### Asthma, maintenance therapy

- BY INHALATION OF POWDER  
 ► Adult: 1 inhalation twice daily Increased if necessary up to 2 inhalations twice daily

##### Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- BY INHALATION OF POWDER  
 ► Adult: 1 inhalation twice daily

#### SYMBICORT 100/6 TURBOHALER®

##### Asthma, maintenance therapy

- BY INHALATION OF POWDER  
 ► Child 6–17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained  
 ► Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

##### Asthma, maintenance and reliever therapy

- BY INHALATION OF POWDER  
 ► Adult: Maintenance 2 puffs daily in 1–2 divided doses; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required, max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

#### SYMBICORT 200/6 TURBOHALER®

##### Asthma, maintenance therapy

- BY INHALATION OF POWDER  
 ► Child 12–17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained  
 ► Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

##### Asthma, maintenance and reliever therapy

- BY INHALATION OF POWDER  
 ► Adult: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required, max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

##### Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- BY INHALATION OF POWDER  
 ► Adult: 2 puffs twice daily

#### SYMBICORT 400/12 TURBOHALER®

##### Asthma, maintenance therapy

- BY INHALATION OF POWDER  
 ► Child 12–17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained  
 ► Adult: Initially 1 puff twice daily, increased if necessary up to 2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

##### Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- BY INHALATION OF POWDER  
 ► Adult: 1 puff twice daily

- **PATIENT AND CARER ADVICE** With high doses, a steroid card should be supplied. Patients counselling is advised for budesonide with formoterol dry powder inhalation (administration).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10 (high doses)

## Fluticasone

#### ● INDICATIONS AND DOSE

##### Prophylaxis of asthma

- ▶ BY INHALATION OF POWDER

- ▶ Child 5-15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- ▶ Child 16-17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- ▶ Adult: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

- ▶ BY INHALATION OF AEROSOL

- ▶ Child 4-15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- ▶ Child 16-17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- ▶ Adult: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

- ▶ BY INHALATION OF NEBULISED SUSPENSION

- ▶ Child 4-15 years: 1 mg twice daily
- ▶ Child 16-17 years: 0.5–2 mg twice daily
- ▶ Adult: 0.5–2 mg twice daily

- **SIDE-EFFECTS** Arthralgia · dyspepsia

- **DIRECTIONS FOR ADMINISTRATION** Fluticasone nebuliser liquid may be diluted with sterile sodium chloride 0.9%. It is not suitable for use in ultrasonic nebulisers.

- **PATIENT AND CARER ADVICE** With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer all fluticasone inhalation preparations.

Medicines for Children leaflet: Fluticasone inhaler for asthma prevention (prophylaxis) [www.medicinesforchildren.org.uk/fluticasone-inhaler-for-asthma-prevention](http://www.medicinesforchildren.org.uk/fluticasone-inhaler-for-asthma-prevention)

## Fluticasone with vilanterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 248.

### ● INDICATIONS AND DOSE

#### RELVAR ELLIPTA<sup>®</sup> 184 MICROGRAMS/22 MICROGRAMS

##### Prophylaxis of asthma

- ▶ BY INHALATION OF POWDER
- ▶ Child 12-17 years: 1 inhalation once daily
- ▶ Adult: 1 inhalation once daily

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 inhalation (delivered dose) of fluticasone *furoate* 184 micrograms once daily is approximately equivalent to fluticasone *propionate* 500 micrograms twice daily.

#### RELVAR ELLIPTA<sup>®</sup> 92 MICROGRAMS/22 MICROGRAMS

##### Prophylaxis of asthma

- ▶ BY INHALATION OF POWDER
- ▶ Child 12-17 years: 1 inhalation once daily
- ▶ Adult: 1 inhalation once daily

##### Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 inhalation once daily

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 inhalation (delivered dose) of fluticasone *furoate* 92 micrograms once daily is approximately equivalent to fluticasone *propionate* 250 micrograms twice daily.

- **SIDE-EFFECTS** Abdominal pain · back pain
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Max. dose fluticasone *furoate* 92 micrograms, vilanterol 22 micrograms.

**RELVAR ELLIPTA®**

**184 MICROGRAMS/22 MICROGRAMS** Avoid in moderate to severe impairment.

- **PATIENT AND CARER ADVICE** A steroid card should be provided.

Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

- ▶ In adults The *Scottish Medicines Consortium* has advised (March 2014) that fluticasone furoate/vilanterol (*Relvar Ellipta*®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in 1 second (FEV<sub>1</sub>) less than 50% of the predicted normal value.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES****Omalizumab**● **INDICATIONS AND DOSE****Prophylaxis of severe persistent allergic asthma**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

**Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H<sub>1</sub> antihistamine treatment**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 300 mg every 4 weeks

- **CAUTIONS** Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · arthralgia · headache · injection-site reactions · pyrexia · sinusitis · upper respiratory tract infection
- ▶ **Uncommon** Bronchospasm · cough · diarrhoea · dizziness · drowsiness · dyspepsia · flushing · influenza-like illness · malaise · nausea · paraesthesia · pharyngitis · photosensitivity · postural hypotension · pruritus · rash · syncope · urticaria · weight gain
- ▶ **Rare** Angioedema · antibody formation · laryngoedema · parasitic infection
- ▶ **Frequency not known** Alopecia · arterial thromboembolic events · Churg-Strauss syndrome · joint swelling · myalgia · serum sickness (including fever and lymphadenopathy) · thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Churg-Strauss syndrome Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.
- ▶ Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.
- **PREGNANCY** Manufacturer advises avoid unless essential—crosses the placenta.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ **Omalizumab for severe persistent allergic asthma (April 2013)** NICE TA278  
Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:
  - who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), **and**
  - only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.
 Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta<sub>2</sub> agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA278](http://www.nice.org.uk/TA278)

- ▶ **Omalizumab for previously treated chronic spontaneous urticaria (June 2015)** NICE TA339  
Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:
  - the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,
  - the patient's condition has not responded to standard treatment with H<sub>1</sub>-antihistamines and leukotriene receptor antagonists,
  - omalizumab is stopped at or before the fourth dose if the condition has not responded,
  - omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
  - omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,
  - the manufacturer provides omalizumab with the discount agreed in the patient access scheme.

Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA339](http://www.nice.org.uk/TA339)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2014) that omalizumab (*Xolair*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H<sub>1</sub>-antihistamines, leukotriene receptor antagonists and H<sub>2</sub>-antihistamines, used according to current treatment guidelines.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

- ▶ **Xolair** (Novartis Pharmaceuticals UK Ltd)
  - **Omalizumab 150 mg per 1 ml** Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £256.15
  - Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £128.07

## LEUKOTRIENE RECEPTOR ANTAGONISTS

### Leukotriene receptor antagonists

The leukotriene receptor antagonists, montelukast below and zafirlukast p. 252, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

### Montelukast

#### ● INDICATIONS AND DOSE

##### Prophylaxis of asthma

- ▶ **BY MOUTH**
- ▶ Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
- ▶ Child 6–14 years: 5 mg once daily, dose to be taken in the evening
- ▶ Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- ▶ Adult: 10 mg once daily, dose to be taken in the evening

##### Symptomatic relief of seasonal allergic rhinitis in patients with asthma.

- ▶ **BY MOUTH**
- ▶ Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- ▶ Adult: 10 mg once daily, dose to be taken in the evening

- **INTERACTIONS** → Appendix 1 (leukotriene receptor antagonists).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · headache · hyperkinesia (in young children) · thirst
- ▶ **Uncommon** Abnormal dreams · aggressive behaviour · agitation · anxiety · arthralgia · bruising · depression · dizziness · drowsiness · dry mouth · dyspepsia · epistaxis · hostility · hypoesthesia · irritability · malaise · muscle cramps · myalgia · oedema · paraesthesia · psychomotor hyperactivity · restlessness · seizures · sleep disturbances · sleep-walking
- ▶ **Rare** Disturbance in attention · increased bleeding tendency · memory impairment · palpitation · tremor
- ▶ **Very rare** Churg-Strauss syndrome · disorientation · erythema multiforme · erythema nodosum · hallucinations · hepatic disorders · hepatic eosinophilic infiltration · suicidal behaviour · suicidal thoughts

#### SIDE-EFFECTS, FURTHER INFORMATION

Churg-Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- **PREGNANCY** Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include cherry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer montelukast granules. Medicines for Children leaflet: Montelukast for asthma [www.medicinesforchildren.org.uk/montelukast-for-asthma](http://www.medicinesforchildren.org.uk/montelukast-for-asthma)
- **NATIONAL FUNDING/ACCESS DECISIONS**

**SINGULAIR® GRANULES****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2007) that *Singulair®* granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; *Singulair®* granules should be initiated by a specialist in paediatric asthma.

**SINGULAIR® CHEWABLE TABLETS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2007) that *Singulair®* chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; *Singulair®* chewable tablets should be initiated by a specialist in paediatric asthma.

**Zafirlukast 20 mg** Accolate 20mg tablets | 56 tablet [PoM](#) £17.75 DT price = £17.75

**MAST-CELL STABILISERS****Cromoglicate and related therapy****Overview**

The mode of action of sodium cromoglicate p. 253 and nedocromil sodium p. 253 is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually

3 to 4 times a day initially; this may subsequently be reduced.

In general, *prophylaxis* with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5–12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate and nedocromil sodium may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.

## Nedocromil sodium

### ● INDICATIONS AND DOSE

#### Prophylaxis of asthma

##### ► BY INHALATION OF AEROSOL

- Child 5–17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily
- Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

#### DOSE EQUIVALENCE AND CONVERSION

- 2 puffs = 4 mg.

● **UNLICENSED USE** Not licensed for use in children under 6 years.

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · dyspepsia · nausea · pharyngitis · vomiting
- **Rare** Taste disturbances
- **Frequency not known** Bronchospasm · cough · headache · paradoxical bronchospasm · throat irritation

#### SIDE-EFFECTS, FURTHER INFORMATION

- Paradoxical bronchospasm If paradoxical bronchospasm occurs, a short-acting beta<sub>2</sub> agonist such as salbutamol or terbutaline should be used to control symptoms; treatment with nedocromil should be discontinued.

● **PREGNANCY** Inhaled drugs can be taken as normal during pregnancy.

● **BREAST FEEDING** Inhaled drugs can be taken as normal during breast-feeding.

● **TREATMENT CESSATION** Withdrawal should be done gradually over a period of one week—symptoms of asthma may recur.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of inhalers may include mint.

● **PATIENT AND CARER ADVICE** Regular use is necessary. Patient counselling is advised for Nedocromil aerosol for inhalation (administration).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Pressurised inhalation

## Sodium cromoglicate

### (Sodium cromoglicate)

#### ● INDICATIONS AND DOSE

##### Prophylaxis of asthma

##### ► BY INHALATION OF AEROSOL

- Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
- Adult: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

##### Food allergy (in conjunction with dietary restriction)

##### ► BY MOUTH

- Child 2–13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Child 14–17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Adult: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

#### ● CAUTIONS

- When used by inhalation Discontinue if eosinophilic pneumonia occurs

#### ● SIDE-EFFECTS

- When used by inhalation Bronchospasm · cough · eosinophilic pneumonia · headache · paradoxical bronchospasm · rhinitis · throat irritation

- With oral use Joint pain · occasional nausea · rashes

#### SIDE-EFFECTS, FURTHER INFORMATION

- When used by inhalation If paradoxical bronchospasm occurs, a short-acting beta<sub>2</sub> agonist such as salbutamol or terbutaline should be used to control symptoms; treatment with sodium cromoglicate should be discontinued.

● **PREGNANCY** Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.

● **BREAST FEEDING** Unlikely to be present in milk. Inhaled drugs can be taken as normal during breast-feeding.

#### ● TREATMENT CESSATION

- When used by inhalation Withdrawal of sodium cromoglicate should be done gradually over a period of one week—symptoms of asthma may recur.

#### ● DIRECTIONS FOR ADMINISTRATION

- With oral use Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking.

#### ● PATIENT AND CARER ADVICE

- With oral use Patient counselling is advised for sodium cromoglicate capsules (administration).
- When used by inhalation Patient counselling is advised for sodium cromoglicate pressurised inhalation (administration).

##### Severe acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

##### Chronic asthma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to

450 mg twice daily, adjusted according to plasma-theophylline concentration

##### Reversible airway obstruction

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

##### PHYLLOCONTIN CONTINUUS® FORTE

##### Reversible airways obstruction

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

##### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

##### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

##### PHARMACOKINETICS

Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

- **UNLICENSED USE** Aminophylline injection not licensed for use in children under 6 months.
- **CAUTIONS** Arrhythmias following rapid intravenous injection · cardiac arrhythmias or other cardiac disease · elderly (increased plasma-theophylline concentration) (in adults) · epilepsy · fever · hypertension · hyperthyroidism · peptic ulcer · risk of hypokalaemia
- **INTERACTIONS** → Appendix 1 (aminophylline).
- **SIDE-EFFECTS** Arrhythmias (especially if given rapidly by intravenous injection) · CNS stimulation · convulsions (especially if given rapidly by intravenous injection) · diarrhoea · gastric irritation · headache · hypotension (especially if given rapidly by intravenous injection) · insomnia · nausea · palpitation · tachycardia · vomiting
- ▶ **SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Hypokalaemia Potentially serious hypokalaemia may result from beta<sub>2</sub> agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.
- Overdose**
- Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.
- For specific details on the management of poisoning, see *Theophylline*, under Emergency treatment of poisoning p. 1209.
- **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breastfeeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **MONITORING REQUIREMENTS**
  - ▶ Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
  - ▶ Measurement of plasma-theophylline concentration may be helpful and is **essential** if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.
  - ▶ In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
  - ▶ If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
  - ▶ With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous injection*, give **very slowly** over at least 20 minutes (with close monitoring).
  - ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
  - ▶ With intravenous use in adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%.
  - ▶ With intramuscular use Aminophylline is too irritant for intramuscular use.
- **PRESCRIBING AND DISPENSING INFORMATION**

Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

**Modified release** The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

**PHYLLOCONTIN CONTINUS® FORTE** *Phyllocontin Continus®* Forte tablets are for smokers and other patients where theophylline half-life is shorter.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

#### ▶ Aminophylline (Non-proprietary)

**Aminophylline hydrate 225 mg** Aminophylline hydrate 225mg modified-release tablets | 56 tablet [P] no price available DT price = £2.40

#### ▶ Phyllocontin Continus (Napp Pharmaceuticals Ltd)

**Aminophylline hydrate 225 mg** Phyllocontin Continus 225mg tablets | 56 tablet [P] £2.40 DT price = £2.40

**Aminophylline hydrate 350 mg** Phyllocontin Forte Continus 350mg tablets | 56 tablet [P] £4.22 DT price = £4.22

### Solution for injection

#### ▶ Aminophylline (Non-proprietary)

**Aminophylline 25 mg per 1 ml** Aminophylline 250mg/10ml solution for injection ampoules | 10 ampoule [POM] £6.50 DT price = £6.50

## Theophylline

### ● INDICATIONS AND DOSE

#### NUELIN SA® 175MG TABLETS

##### Reversible airways obstruction | Severe acute asthma | Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 175–350 mg every 12 hours

##### Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Child 6–11 years: 175 mg every 12 hours

▶ Child 12–17 years: 175–350 mg every 12 hours

#### NUELIN SA® 250 TABLETS

##### Reversible airways obstruction | Severe acute asthma |

##### Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 250–500 mg every 12 hours

##### Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Child 6–11 years: 125–250 mg every 12 hours

▶ Child 12–17 years: 250–500 mg every 12 hours

#### SLO-PHYLLIN®

##### Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Child 2–5 years: 60–120 mg every 12 hours

▶ Child 6–11 years: 125–250 mg every 12 hours

▶ Child 12–17 years: 250–500 mg every 12 hours

##### Reversible airways obstruction | Severe acute asthma |

##### Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 250–500 mg every 12 hours

#### UNIPHILLIN CONTINUS®

##### Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Child 2–11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma; increased to 10–16 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

▶ Child 12–17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime

symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

#### Reversible airways obstruction | Severe acute asthma | Chronic asthma

## Nebuliser solutions

##### ● HYPERTONIC SODIUM CHLORIDE SOLUTIONS

##### ● INDICATIONS AND DOSE

###### MUCOCLEAR<sup>®</sup> 3%

**Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | Mild to moderate acute viral bronchiolitis in infants**

##### ► BY INHALATION OF NEBULISED SOLUTION

- Adult: 4 mL 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

**MucoClear 3% inhalation solution 4ml ampoules** (Pari Medical Ltd) Sodium chloride 30 mg per 1 ml | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part IXa) | 60 ampoule • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

#### ● INDICATIONS AND DOSE

##### MUCOCLEAR® 6%

**Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)**

##### ► BY INHALATION OF NEBULISED SOLUTION

- Adult: 4 mL twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

**MucoClear 6% inhalation solution 4ml ampoules** (Pari Medical Ltd) Sodium chloride 60 mg per 1 ml | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part IXa) | 60 ampoule • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

#### ● INDICATIONS AND DOSE

##### NEBUSAL®

**Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)**

##### ► BY INHALATION OF NEBULISED SOLUTION

- Adult: 4 mL up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

**Nebusal 7% inhalation solution 4ml vials** (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

## Peak flow meters

### ● LOW RANGE PEAK FLOW METERS

#### MEDI® LOW RANGE

Range 40–420 litres/minute.

Compliant to standard EN ISO 23747:2007 except for scale range.

**Medi peak flow meter low range** (Medicareplus International Ltd) | 1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £6.50

#### MINI-WRIGHT® LOW RANGE

Range 30–400 litres/minute.

Compliant to standard EN ISO 23747:2007 except for scale range.

**Mini-Wright peak flow meter low range** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.14

#### POCKETPEAK® LOW RANGE

Range 50–400 litres/minute.

Compliant to standard EN ISO 23747:2007 except for scale range.

**nSpiire Pocket Peak peak flow meter low range** (nSpiire Health Ltd) | 1 device • NHS indicative price = £6.53 • Drug Tariff (Part IXa) price = £6.50

### ● STANDARD RANGE PEAK FLOW METERS

#### AIRZONE®

Range 60–720 litres/minute.

Conforms to standard EN ISO 23747:2007.

**AirZone peak flow meter standard range** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £4.69 • Drug Tariff (Part IXa) price = £4.50

#### MEDI® STANDARD RANGE

Range 60–800 litres/minute.

Conforms to standard EN ISO 23747:2007.

**Medi peak flow meter standard range** (Medicareplus International Ltd) | 1 device • NHS indicative price = £4.50 • Drug Tariff (Part IXa) price = £4.50

#### MICROPEAK®

Range 60–900 litres/minute.

Conforms to standard EN ISO 23747:2007.

**MicroPeak peak flow meter standard range** (Micro Medical Ltd) | 1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £4.50

#### MINI-WRIGHT® STANDARD RANGE

Range 60–800 litres/minute.

Conforms to standard EN ISO 23747:2007.

**Mini-Wright peak flow meter standard range** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.08 • Drug Tariff (Part IXa) price = £4.50

#### PIKO-1®

Range 15–999 litres/minute.

Conforms to standard EN ISO 23747:2007.

**nSpiire PiKo-1 peak flow meter standard range** (nSpiire Health Ltd) | 1 device • NHS indicative price = £9.50 • Drug Tariff (Part IXa) price = £4.50

#### PINNACLE®

Range 60–900 litres/minute.

Conforms to standard EN ISO 23747:2007.

**Fyne Dynamics Pinnacle peak flow meter standard range** (Fyne Dynamics Ltd) | 1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £4.50

#### POCKETPEAK® STANDARD RANGE

Range 60–800 litres/minute.

Conforms to standard EN ISO 23747:2007.

**nSpiire Pocket Peak peak flow meter standard range** (nSpiire Health Ltd) | 1 device • NHS indicative price = £6.53 • Drug Tariff (Part IXa) price = £4.50

#### VITALOGRAPH®

Range 50–800 litres/minute.

Conforms to standard EN ISO 23747:2007.

**Vitalograph peak flow meter standard range** (Vitalograph Ltd) | 1 device • NHS indicative price = £4.83 • Drug Tariff (Part IXa) price = £4.50

## Spacers

### ● SPACERS

#### A2A SPACER®

For use with all pressurised (aerosol) inhalers.

**A2A Spacer** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £4.15 • Drug Tariff (Part IXa)

**A2A Spacer with medium mask** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £6.68 • Drug Tariff (Part IXa)

**A2A Spacer with small mask** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £6.68 • Drug Tariff (Part IXa)

#### ABLE SPACER®

Small-volume device. For use with all pressurised (aerosol) inhalers.

**Able Spacer** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £4.39 • Drug Tariff (Part IXa)

**Able Spacer with medium mask** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.16 • Drug Tariff (Part IXa)

**Able Spacer with small mask** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.16 • Drug Tariff (Part IXa)

#### AEROCHAMBER PLUS®

Medium-volume device. For use with all pressurised (aerosol) inhalers.

**AeroChamber Plus** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £4.86 • Drug Tariff (Part IXa)

**AeroChamber Plus with adult mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £8.11 • Drug Tariff (Part IXa)

**AeroChamber Plus with child mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £8.11 • Drug Tariff (Part IXa)

**AeroChamber Plus with infant mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £8.11 • Drug Tariff (Part IXa)

#### BABYHALER®

For paediatric use with *Flixotide*®, and *Ventolin*® inhalers.

### ● PRESCRIBING AND DISPENSING INFORMATION

Not available for NHS prescription.

**Babyhaler** (Allen & Hanburys Ltd) | 1 device • No NHS indicative price available • Drug Tariff (Part IXa)

#### HALERAID<sup>®</sup>

Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with *Flixotide*<sup>®</sup>, *Seretide*<sup>®</sup>, *Serevent*<sup>®</sup>, and *Ventolin*<sup>®</sup> inhalers.

### ● PRESCRIBING AND DISPENSING INFORMATION

Not available for NHS prescription.

**Haleraid-120** (Allen & Hanburys Ltd) | 1 device • No NHS indicative price available • Drug Tariff (Part IXa)

**Haleraid-200** (Allen & Hanburys Ltd) | 1 device • No NHS indicative price available • Drug Tariff (Part IXa)

#### OPTICHAMBER<sup>®</sup>

For use with all pressurised (aerosol) inhalers.

**OptiChamber** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £4.28 • Drug Tariff (Part IXa)

#### OPTICHAMBER<sup>®</sup> DIAMOND

For use with all pressurised (aerosol) inhalers.

**OptiChamber Diamond** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £4.49 • Drug Tariff (Part IXa)

**OptiChamber Diamond with large LiteTouch mask 5 years-adult** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

**OptiChamber Diamond with medium LiteTouch mask 1-5 years** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

**OptiChamber Diamond with small LiteTouch mask 0-18 months** (Respironics (UK) Ltd) | 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

#### POCKET CHAMBER<sup>®</sup>

Small volume device. For use with all pressurised (aerosol) inhalers.

**Pocket Chamber** (nSpiire Health Ltd) | 1 device • NHS indicative price = £4.18 • Drug Tariff (Part IXa)

**Pocket Chamber with adult mask** (nSpiire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**Pocket Chamber with child mask** (nSpiire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**Pocket Chamber with infant mask** (nSpiire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

**Pocket Chamber with teenager mask** (nSpiire Health Ltd) | 1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

#### SPACE CHAMBER PLUS<sup>®</sup>

For use with all pressurised (aerosol) inhalers.

**Space Chamber Plus** (Medical Developments International Ltd) | 1 device • NHS indicative price = £4.26 • Drug Tariff (Part IXa)

**Space Chamber Plus with large mask** (Medical Developments International Ltd) | 1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

**Space Chamber Plus with medium mask** (Medical Developments International Ltd) | 1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

**Space Chamber Plus with small mask** (Medical Developments International Ltd) | 1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

#### VOLUMATIC<sup>®</sup>

Large-volume device. For use with *Clenil Modulate*<sup>®</sup>, *Flixotide*<sup>®</sup>, *Seretide*<sup>®</sup>, *Serevent*<sup>®</sup>, and *Ventolin*<sup>®</sup> inhalers.

**Volumatic** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £3.85 • Drug Tariff (Part IXa)

**Volumatic with paediatric mask** (GlaxoSmithKline UK Ltd) | 1 device • NHS indicative price = £6.77 • Drug Tariff (Part IXa)

#### VORTEX<sup>®</sup>

Medium-volume device. For use with all pressurised (aerosol) inhalers.

**Vortex Spacer** (Pari Medical Ltd) | 1 device • NHS indicative price = £6.28 • Drug Tariff (Part IXa)

**Vortex with child mask 0-2 years** (Pari Medical Ltd) | 1 device • NHS indicative price = £7.99 • Drug Tariff (Part IXa)

**Vortex with child mask 2 years+** (Pari Medical Ltd) | 1 device • NHS indicative price = £7.99 • Drug Tariff (Part IXa)

## 2 Allergic conditions

### Antihistamines, allergen immunotherapy and allergic emergencies

#### Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 266 or promethazine hydrochloride p. 269 are used as an adjunct to adrenaline/epinephrine p. 211 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 408, cyclizine p. 401, and promethazine teoclate p. 408) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartrate p. 265 and **promethazine** may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, 'sedating' antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 261, bilastine p. 261, cetirizine hydrochloride p. 262, desloratadine p. 262 (an active metabolite of loratadine p. 264), fexofenadine hydrochloride p. 263 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 263 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine p. 265 cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

#### Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (*Grazax*<sup>®</sup>) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 250 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta<sub>2</sub> agonist. Omalizumab should be initiated by physicians in specialist centres

experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H<sub>1</sub> antihistamine treatment.

## Allergic emergencies

### Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow's milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with *additives and excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

### Treatment of anaphylaxis

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as *anaphylaxis* and *angioedema*.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by **intramuscular** injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for *immediate self-administration*); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow **oxygen** and **intravenous fluids** is also of primary importance;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection is a useful adjunctive treatment, given after adrenaline.
- Administering an intravenous corticosteroid such as hydrocortisone p. 620 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

*Continuing respiratory deterioration* requires further treatment with **bronchodilators** including inhaled or intravenous salbutamol p. 239, inhaled ipratropium bromide p. 234, intravenous aminophylline p. 255, or intravenous magnesium sulfate p. 924 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a *dilute solution by the intravenous route*.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately.

On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

### Intramuscular adrenaline (epinephrine)

The *intramuscular route* is the *first choice route* for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine p. 211 by intramuscular injection.

*Prompt injection* of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

### Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

Age	Dose	Volume of adrenaline
▶ Child 1 month–5 years	150 micrograms	0.15 mL 1 in 1000 (1 mg/mL adrenaline) <sup>1</sup>
▶ Child 6–11 years	300 micrograms	0.3 mL 1 in 1000 (1 mg/mL adrenaline)
▶ Child 12–17 years	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL adrenaline) <sup>2</sup>
▶ Adult	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL adrenaline)

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

### Intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by **slow intravenous injection** repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a **slow intravenous infusion stopping when a response has been obtained**.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for *cardiac resuscitation*.

**Angioedema**

*Angioedema* is dangerous if *laryngeal oedema* is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under **Anaphylaxis**; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

**Hereditary angioedema**

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 273, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of *hereditary angioedema*; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 273 and icatibant p. 273 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 104 and danazol p. 678 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

**ANTIHISTAMINES > NON-SEDATING****Acrivastine****● INDICATIONS AND DOSE**

**Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria**

**▶ BY MOUTH**

- ▶ Child 12–17 years: 8 mg 3 times a day
- ▶ Adult: 8 mg 3 times a day

- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe) · elderly

- **CAUTIONS** Epilepsy

- **INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**● SIDE-EFFECTS**

- ▶ **Uncommon** Antimuscarinic effects · gastro-intestinal disturbances · headache · psychomotor impairment
- ▶ **Rare** Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- ▶ **Frequency not known** Blurred vision · drowsiness · dry mouth · urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to triprolidine.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

**● PATIENT AND CARER ADVICE****Driving and skilled tasks**

- ▶ In adults Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. driving); excess alcohol should be avoided.
- ▶ In children Although drowsiness is rare, nevertheless children and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- ▶ **Benadryl Allergy Relief** (McNeil Products Ltd)

**Acrivastine 8 mg** Benadryl Allergy Relief 8mg capsules | 24 capsule  £4.95

**Bilastine****● INDICATIONS AND DOSE**

**Symptomatic relief of allergic rhinoconjunctivitis and urticaria**

**▶ BY MOUTH**

- ▶ Child 12–17 years: 20 mg once daily
- ▶ Adult: 20 mg once daily

- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)

- **CAUTIONS** Epilepsy

- **INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**● SIDE-EFFECTS**

- ▶ **Common or very common** Headache · malaise
- ▶ **Uncommon** Abdominal pain · anxiety · diarrhoea · dizziness · dyspnoea · gastritis · increased appetite · insomnia · oral herpes · prolongation of the QT interval · pyrexia · thirst · tinnitus · vertigo · weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects.

Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

- **PREGNANCY** Avoid—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Take tablet 1 hour before or 2 hours after food or fruit juice.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer bilastine tablets.

**Driving and skilled tasks**

Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines identified.

**Cetirizine hydrochloride****INDICATIONS AND DOSE**

**Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis**

**BY MOUTH**

- ▶ Child 2-5 years: 2.5 mg twice daily
- ▶ Child 6-11 years: 5 mg twice daily
- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

● **UNLICENSED USE** Not licensed for use in children under 2 years.

● **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)

● **CAUTIONS** Epilepsy

● **INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**SIDE-EFFECTS**

- ▶ **Uncommon** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
- ▶ **Rare** Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- ▶ **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as cetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

● **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**RENAL IMPAIRMENT**

- ▶ In adults Use half normal dose if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Use half normal dose and reduce dose frequency to alternate days if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m<sup>2</sup>. Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m<sup>2</sup>. Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.

- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe) · cardiac disease · hypokalaemia · susceptibility to QT-interval prolongation

- **CAUTIONS** Epilepsy

- **INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · asthenia · weight gain
- ▶ **Uncommon** Antimuscarinic effects · arthralgia · blurred vision · dry mouth · gastro-intestinal disturbances · headache · myalgia · psychomotor impairment · urinary retention
- ▶ **Rare** Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
- ▶ **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25

Mizolastine 10 mg Mizolastine 10mg modified-release tablets | 30 tablet [PoM] £6.92 DT price = £6.92

**ANTIHISTAMINES > SEDATING****Alimemazine tartrate****(Trimeprazine tartrate)**● **INDICATIONS AND DOSE****Urticaria | Pruritus**▶ **BY MOUTH**

- ▶ Child 2-4 years: 2.5 mg 3-4 times a day
- ▶ Child 5-11 years: 5 mg 3-4 times a day
- ▶ Child 12-17 years: 10 mg 2-3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- ▶ Adult: 10 mg 2-3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- ▶ Elderly: 10 mg 1-2 times a day

- **UNLICENSED USE** Not licensed for use in children under 2 years.

- **CONTRA-INDICATIONS** Children under 2 years except on specialist advice (safety of such use has not been established) · epilepsy · hepatic dysfunction · history of narrow angle glaucoma · hypothyroidism · many antihistamines should be avoided in acute porphyrias p. 930 but alimemazine is thought to be safe · myasthenia gravis · Parkinson's disease · pheochromocytoma · prostatic hypertrophy (in adults) · renal dysfunction
- **CAUTIONS** Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) · elderly · exposure to sunlight should be avoided during treatment with high doses · pyloroduodenal obstruction · urinary retention · volume depleted patients who are more susceptible to orthostatic hypotension

- **INTERACTIONS** → Appendix 1 (antihistamines).

● **SIDE-EFFECTS**

- ▶ **Rare** Anaphylaxis · angioedema · bronchospasm · hypersensitivity reactions
- ▶ **Frequency not known** Acute dystonia · agitation · agranulocytosis · akathisia · akinesia · angle-closure glaucoma · anti-muscarinic effects · arrhythmias (may be predisposed by hypokalaemia and cardiac disease) · blurred vision · contact sensitisation · convulsions · drowsiness · dry mouth · dyskinesia · gastro-intestinal disturbances · headache · hyperprolactinaemia · hypotension · insomnia · jaundice · leukopenia (on prolonged high dose) · nasal stuffiness · neuroleptic malignant syndrome · ocular changes · pallor (in children) · paradoxical excitement · parkinsonism · photosensitivity · postural hypotension (in elderly) · postural hypotension (in volume depletion) · rashes · respiratory depression · rigidity · tardive dyskinesia (usually after prolonged high doses) · tremor · urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after

a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Avoid.
- **PATIENT AND CARER ADVICE**

#### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); sedating effects enhanced by alcohol.

## Chlorphenamine maleate

### (Chlorpheniramine maleate)

#### INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions | Relief of itch associated with chickenpox

##### ▶ BY MOUTH

- ▶ Child 1-23 months: 1 mg twice daily
- ▶ Child 2-5 years: 1 mg every 4-6 hours; maximum 6 mg per day
- ▶ Child 6-11 years: 2 mg every 4-6 hours; maximum 12 mg per day
- ▶ Child 12-17 years: 4 mg every 4-6 hours; maximum 24 mg per day
- ▶ Adult: 4 mg every 4-6 hours; maximum 24 mg per day
- ▶ Elderly: 4 mg every 4-6 hours; maximum 12 mg per day

##### ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- ▶ Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
- ▶ Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
- ▶ Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day
- ▶ Adult: 10 mg, repeated if necessary; maximum 4 doses per day

#### Emergency treatment of anaphylactic reactions

##### ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- ▶ Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
- ▶ Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
- ▶ Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day
- ▶ Adult: 10 mg, repeated if necessary; maximum 4 doses per day

- **UNLICENSED USE** *Injection* not licensed for use in neonates. *Tablets* not licensed for use in children under 6 years. *Syrup* not licensed for use in children under 1 year.

#### IMPORTANT SAFETY INFORMATION

##### MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.

- **CONTRA-INDICATIONS** Many antihistamines should be avoided in acute porphyrias p. 930 but chlorphenamine is thought to be safe
- **CAUTIONS** Epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1 (antihistamines).

#### SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
- ▶ **Rare** Anaphylaxis · angioedema · angle-closure glaucoma (in adults) · arrhythmias · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · sleep disturbances · tremor
- ▶ **Frequency not known** Antimuscarinic effects · blood disorders · exfoliative dermatitis · rashes · tinnitus

##### SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use or intravenous use CNS stimulation · irritant effects · transient hypotension

##### SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

## Hydroxyzine hydrochloride

22-Feb-2016

- **DRUG ACTION** Hydroxyzine is a sedating antihistamine which exerts its actions by antagonising the effects of histamine.

#### INDICATIONS AND DOSE

##### Pruritus

###### ► BY MOUTH

- Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
  - Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
  - Child 6–17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight
  - Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day
  - Elderly: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg twice daily
- **UNLICENSED USE** *Ucerax*<sup>®</sup> preparations not licensed for use in children under 1 year.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant

bradycardia. To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
  - Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
  - Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
  - In adults, the maximum daily dose is 100 mg;
  - In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
  - In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
  - The lowest effective dose for the shortest period of time should be prescribed.
- **CONTRA-INDICATIONS** Acquired or congenital QT interval prolongation · avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe) · predisposition to QT interval prolongation
  - **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - QT interval prolongation Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.
  - **CAUTIONS** Bladder outflow obstruction · breathing problems · cardiovascular disease · children · decreased gastrointestinal motility · dementia · elderly · epilepsy · hypertension · hyperthyroidism · myasthenia gravis · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · stenosing peptic ulcer · susceptibility to angle-closure glaucoma · urinary retention
  - CAUTIONS, FURTHER INFORMATION**
  - Elderly patients are particularly susceptible to side-effects; manufacturers advise avoid or reduce dose.
  - Manufacturers have an increased susceptibility to side-effects, particularly CNS effects.
  - **INTERACTIONS** → Appendix 1 (antihistamines).
  - **SIDE-EFFECTS**
  - **Common or very common** Dry mouth · fatigue · headache
  - **Uncommon** Constipation · dizziness · insomnia · nausea
  - **Rare** Blood disorders · bronchospasm · liver dysfunction · rashes
  - **Frequency not known** Agitation · alopecia · anorexia · anxiety · blurred vision · coma · confusion · convulsions (with high doses) · depression · diarrhoea · drowsiness · dyskinesia (after stopping use) · extrapyramidal effects · flushing · hallucinations · hypotension · impotence · labyrinthitis · menstrual disturbances · myalgia · palpitation · priapism · psychomotor impairment · sleep disturbances · tachycardia · tinnitus · tremor (with high doses) · urinary retention · ventricular arrhythmias · vertigo · vomiting
  - SIDE-EFFECTS, FURTHER INFORMATION**
  - Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.
  - **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises hydroxyzine should be avoided in patients with previous hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.
  - **PREGNANCY** Manufacturers advise avoid—toxicity in *animal* studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitability, and tremor in the neonate.

- **BREAST FEEDING** Manufacturer advises avoid—expected to be present in milk but effect unknown.
- **HEPATIC IMPAIRMENT** Manufacturer advises reduce daily dose by one-third. Manufacturer advises avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Manufacturers advise reduce daily dose by half in moderate to severe renal impairment.
- **EFFECT ON LABORATORY TESTS** May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.

- ▶ Adult: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

- **UNLICENSED USE** Not licensed for use for sedation in children under 2 years.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN  
Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CONTRA-INDICATIONS** Many antihistamines should be avoided in acute porphyrias p. 930 but promethazine is thought to be safe · should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established
- **CAUTIONS** Avoid extravasation with intravenous injection · epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1 (antihistamines).
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
  - ▶ **Rare** Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor
  - ▶ **Frequency not known** Antimuscarinic effects · blurred vision · drowsiness · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · restlessness · urinary retention

#### SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Injection pain

#### SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **RENAL IMPAIRMENT** Use with caution.

#### PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

#### PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.

Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

- **LESS SUITABLE FOR PRESCRIBING** Promethazine is less suitable for prescribing for sedation.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

CAUTIONARY AND ADVISORY LABELS 2

##### ▶ Promethazine hydrochloride (Non-proprietary)

**Promethazine hydrochloride 10 mg** Promethazine hydrochloride 10mg tablets | 56 tablet [POM] £3.30 DT price = £2.96

##### ▶ Phenergan (Sanofi)

**Promethazine hydrochloride 10 mg** Phenergan 10mg tablets | 56 tablet [P] £2.96 DT price = £2.96

**Promethazine hydrochloride 25 mg** Phenergan 25mg tablets | 56 tablet [P] £4.65 DT price = £4.65

##### ▶ Somnex (Actavis UK Ltd)

**Promethazine hydrochloride 20 mg** Somnex 20mg tablets | 8 tablet [P] £1.89 | 16 tablet [P] £2.69

##### Oral solution

CAUTIONARY AND ADVISORY LABELS 2

EXCIPIENTS: May contain Sulfites

ELECTROLYTES: May contain Sodium

##### ▶ Phenergan (Sanofi)

**Promethazine hydrochloride 1 mg per 1 ml** Phenergan 5mg/5ml elixir sugar-free | 100 ml [P] £2.85 DT price = £2.85

##### Solution for injection

EXCIPIENTS: May contain Sulfites

##### ▶ Phenergan (Sanofi)

**Promethazine hydrochloride 25 mg per 1 ml** Phenergan 25mg/1ml solution for injection ampoules | 10 ampoule [POM] £6.74

## VACCINES > ALLERGEN-TYPE VACCINES

### Bee venom extract

#### INDICATIONS AND DOSE

##### Hypersensitivity to bee venom

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

##### DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
  - hypersensitivity to wasp and bee venoms.
- Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** → Appendix 1 (bee venom extracts). Contra-indicated in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction).
- **SIDE-EFFECTS**
- **SIDE-EFFECTS, FURTHER INFORMATION** Consult product literature.

- **Hypersensitivity reactions** Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have **resolved completely**.

- **• PREGNANCY** Avoid.

- **• PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

- **• NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ **Pharmalgen<sup>®</sup> for bee and wasp venom allergy (February 2012)** NICE TA246

Pharmalgen<sup>®</sup> is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with Pharmalgen<sup>®</sup> should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

[www.nice.org.uk/TA246](http://www.nice.org.uk/TA246)

- **• MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- ▶ **Bee Venom (ALK-Abello Ltd)**

**Bee venom 120 nanogram** Pharmalgen Bee Venom 120nanogram powder and solvent for solution for injection vials | 1 vial [PoM] no price available

**Bee venom 1.2 microgram** Pharmalgen Bee Venom 1.2microgram powder and solvent for solution for injection vials | 1 vial [PoM] no price available

**Bee venom 12 microgram** Pharmalgen Bee Venom 12microgram powder and solvent for solution for injection vials | 1 vial [PoM] no price available

**Bee venom 120 microgram** Pharmalgen Bee Venom maintenance set 120microgram powder and solvent for solution for injection vials | 1 vial [PoM] no price available | 4 vial [PoM] £150.00

**IMPORTANT SAFETY INFORMATION**

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
  - hypersensitivity to wasp and bee venoms.
- Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **• CONTRA-INDICATIONS** Consult product literature

- **• CAUTIONS** Consult product literature

- **• INTERACTIONS** Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).

- **• SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Consult product literature.

- ▶ **Hypersensitivity reactions** Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have **resolved completely**.
- **• PREGNANCY** Should be avoided in pregnant women—consult product literature.
- **• MONITORING REQUIREMENTS** The first dose of grass pollen extract should be (*Grazax<sup>®</sup>*) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **• DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **• PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- **• PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer oral lyophilisates.

- **• MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral lyophilisate**

- ▶ **Grazax** (ALK-Abello Ltd)

**Phleum pratense 75000 SQ-T** Grazax 75,000 SQ-T oral lyophilisates sugar-free | 30 tablet [PoM] £80.12

## 2.1 Angioedema

**Other drugs used for Angioedema** Adrenaline/epinephrine, p. 211

### DRUGS USED IN HEREDITARY ANGIOEDEMA > COMPLEMENT REGULATORY PROTEINS

#### C1-esterase inhibitor

##### ● INDICATIONS AND DOSE

###### BERINERT<sup>®</sup>

**Acute attacks of hereditary angioedema (under expert supervision)**

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 20 units/kg

**Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)**

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure

###### CINRYZE<sup>®</sup>

**Acute attacks of hereditary angioedema (under expert supervision)**

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1000 units, repeated if necessary for 1 dose, dose may be repeated if necessary

**Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)**

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure

**Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)**

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1000 units every 3–4 days, interval between doses to be adjusted according to response

- **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS** Fever · headache · thrombosis (with high doses)
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **PRESCRIBING AND DISPENSING INFORMATION** C1-esterase inhibitor is prepared from human plasma.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder and solvent for solution for injection**

ELECTROLYTES: May contain Sodium

▶ **Beriner P** (CSL Behring UK Ltd)

**C1-esterase inhibitor 500 unit** Beriner P 500unit powder and solvent for solution for injection vials | 1 vial [PoM] £467.50

**C1-esterase inhibitor 1500 unit** Beriner P 1,500unit powder and solvent for solution for injection vials | 1 vial [PoM] £1,402.50

▶ **Cinryze** (Shire Pharmaceuticals Ltd) ▼

**C1-esterase inhibitor 500 unit** Cinryze 500unit powder and solvent for solution for injection vials | 2 vial [PoM] £1,336.00

## Conestat alfa

##### ● INDICATIONS AND DOSE

**Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency**

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

▶ Adult (body-weight 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

● **CONTRA-INDICATIONS** Rabbit allergy

##### ● SIDE-EFFECTS

▶ **Common or very common** Headache

▶ **Uncommon** Abdominal discomfort · diarrhoea · nausea · paraesthesia · throat irritation · urticaria · vertigo

● **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.

● **PRE-TREATMENT SCREENING** Test for immunoglobulin E (IgE) antibodies against rabbit allergens before starting treatment.

● **MONITORING REQUIREMENTS** Repeat immunoglobulin E (IgE) antibody testing annually or after 10 treatments—consult product literature.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for injection**

▶ **Ruconest** (Swedish Orphan Biovitrum Ltd)

**Conestat alfa 2100 unit** Ruconest 2,100unit powder for solution for injection vials | 1 vial [PoM] £750.00

### DRUGS USED IN HEREDITARY ANGIOEDEMA > SELECTIVE BRADYKININ B<sub>2</sub> ANTAGONISTS

## Icatibant

##### ● INDICATIONS AND DOSE

**Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: 30 mg for 1 dose, then 30 mg after 6 hours if required, then 30 mg after 6 hours if required; maximum 3 doses per day

● **CAUTIONS** Ischaemic heart disease · stroke

● **SIDE-EFFECTS** Dizziness · erythema · headache · injection-site reactions · nausea · pruritus · pyrexia · rash

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid for 12 hours after administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

► **Firazyr** (Shire Pharmaceuticals Ltd)

**Icatibant (as icatibant acetate) 10 mg per 1 ml** Firazyr 30mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £1,395.00

## 3 Conditions affecting sputum viscosity

### Mucolytics for cystic fibrosis

**Overview**

Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Dornase alfa below is used to reduce sputum viscosity in patients with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g. cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Mannitol p. 276, administered by inhalation, improves mucus clearance and is licensed for the treatment of cystic fibrosis as an add-on therapy to standard care.

**MUCOLYTICS****Carbocisteine****INDICATIONS AND DOSE****Reduction of sputum viscosity**

► BY MOUTH

► **Adult:** Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

- **CONTRA-INDICATIONS** Active peptic ulceration
- **CAUTIONS** History of peptic ulceration (may disrupt the gastric mucosal barrier)
- **SIDE-EFFECTS**
  - **Rare** Gastro-intestinal bleeding
  - **Frequency not known** Erythema multiforme · Stevens-Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** No information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

► **Carbocisteine (Non-proprietary)**

**Carbocisteine 375 mg** Carbocisteine 375mg capsules | 120 capsule [PoM](#) £18.98 DT price = £11.21

► **Mucodyne** (Sanofi)

**Carbocisteine 375 mg** Mucodyne 375mg capsules | 120 capsule [PoM](#) £18.98 DT price = £11.21

**Oral solution**

► **Carbocisteine (Non-proprietary)**

**Carbocisteine 75 mg per 1 ml** Carbocisteine 750mg/10ml oral solution 10ml sachets sugar free sugar-free | 15 sachet [PoM](#) £3.85 DT price = £3.85

► **Mucodyne** (Sanofi)

**Carbocisteine 50 mg per 1 ml** Mucodyne 250mg/5ml syrup | 300 ml [PoM](#) £8.39 DT price = £8.39

**Erdosteine****INDICATIONS AND DOSE****Symptomatic treatment of acute exacerbations of chronic bronchitis**

► BY MOUTH

► **Adult:** 300 mg twice daily for up to 10 days

- **CAUTIONS** History of peptic ulceration (may disrupt the gastric mucosal barrier)
- **SIDE-EFFECTS**
  - **Very rare** Abdominal pain · diarrhoea · headache · nausea · rash · taste disturbance · urticaria · vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises max. 300 mg daily in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**  
The *The Scottish Medicines Consortium* (October 2007) has advised that erdosteine (*Erdotin*<sup>®</sup>) is not recommended for the symptomatic treatment of acute exacerbations of chronic bronchitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

► **Erdotin** (Galen Ltd)

**Erdosteine 300 mg** Erdotin 300mg capsules | 20 capsule [PoM](#) £4.25 DT price = £4.25

## 3.1 Cystic fibrosis

**MUCOLYTICS****Dornase alfa****(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))**

- **DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

**INDICATIONS AND DOSE****Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function**

► BY INHALATION OF NEBULISED SOLUTION

► **Adult:** 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

**DOSE EQUIVALENCE AND CONVERSION**

► Dornase alfa 1000 units is equivalent to 1 mg

### ● SIDE-EFFECTS

► **Rare** Chest pain · conjunctivitis · dyspepsia · dysphonia · dyspnoea · laryngitis · pharyngitis · pyrexia · rash · rhinitis · urticaria

● **PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.

● **DIRECTIONS FOR ADMINISTRATION** Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment.

For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Nebuliser liquid

► **Pulmozyme** (Roche Products Ltd)

**Dornase alfa 1 mg per 1 ml** Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule [PoM] £496.43 DT price = £496.43

## Ivacaftor

22-Nov-2016

### ● INDICATIONS AND DOSE

**Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)**

► BY MOUTH

► Adult: 150 mg every 12 hours

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Reduce dose to 150 mg twice a week with concomitant use of itraconazole, ketoconazole, posaconazole, voriconazole, telithromycin, and clarithromycin.

Reduce dose to 150 mg once daily with concomitant use of fluconazole and erythromycin.

● **CONTRA-INDICATIONS** Organ transplantation (no information available)

● **INTERACTIONS** → Appendix 1 (ivacaftor).  
Avoid grapefruit and Seville oranges.

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · diarrhoea · dizziness · ear discomfort · headache · nasal congestion · nasopharyngitis · oropharyngeal pain · pharyngeal erythema · pharyngeal oedema · rash · rhinitis · tinnitus · upper respiratory-tract infection

► **Uncommon** Gynaecomastia · nipple disorders · vestibular disorder

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **HEPATIC IMPAIRMENT** Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.

● **RENAL IMPAIRMENT** Caution in severe impairment.

● **PRE-TREATMENT SCREENING** If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function before treatment, every 3 months

during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of transaminase elevations).

● **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.

● **PRESCRIBING AND DISPENSING INFORMATION** Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Manufacturer advises that patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness.

Patients or carers should be given advice on how to administer ivacaftor tablets.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25

► **Kalydeco** (Vertex Pharmaceuticals (UK) Ltd) ▼

**Ivacaftor 150 mg** Kalydeco 150mg tablets | 56 tablet [PoM] £14,000.00

## Lumacaftor with ivacaftor

22-Nov-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor above.

### ● INDICATIONS AND DOSE

**Treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)**

► BY MOUTH

► Adult: 400/250 mg every 12 hours

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Reduce initial dose to 200/125 mg daily for the first week in those also taking a potent CYP3A4 inhibitor (such as clarithromycin, itraconazole, ketoconazole, posaconazole, telithromycin, and voriconazole).

#### DOSE EQUIVALENCE AND CONVERSION

► Dose expressed as x/y mg of lumacaftor/ivacaftor.

● **CAUTIONS** Forced expiratory volume in 1 second (FEV<sub>1</sub>) less than 40% of the predicted normal value—additional monitoring required at initiation of treatment · pulmonary exacerbation—no information available

● **INTERACTIONS** → Appendix 1 (ivacaftor, lumacaftor).

### ● SIDE-EFFECTS

► **Common or very common** Dyspnoea · elevated transaminases (clinically significant) · flatulence · menstrual disturbances · metrorrhagia · nausea · rhinorrhoea · vomiting

► **Uncommon** Cholestatic hepatitis · hepatic encephalopathy · hypertension

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises reduce dose to 400/250 mg in the morning and 200/125 mg in the evening (600/375 mg total daily dose) in moderate impairment; reduce dose to 200/125 mg every 12 hours (400/250 mg total daily dose) in severe impairment. Manufacturer advises use with caution in severe impairment.

● **PRE-TREATMENT SCREENING** If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del

mutation on both alleles of the CFTR gene before starting treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure periodically during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets.

#### Missed doses

Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ **Lumacaftor with ivacaftor for treating cystic fibrosis homozygous for the F508del mutation (July 2016)** NICE TA398 Lumacaftor with ivacaftor is **not** recommended, within its marketing authorisation, for treating cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene.

Patients whose treatment was started before this guidance was published may continue treatment until they (or their carers) and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA398](http://www.nice.org.uk/TA398)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2016) that lumacaftor with ivacaftor (*Orkambi*®) is **not** recommended within NHS Scotland for the treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

## Mannitol

- **INDICATIONS AND DOSE**

### Treatment of cystic fibrosis as an add-on therapy to standard care

- ▶ **BY INHALATION OF POWDER**
- ▶ **Adult:** Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

- **CONTRA-INDICATIONS** Bronchial hyperresponsiveness to inhaled mannitol · impaired lung function (forced expiratory volume in 1 second < 30% of predicted) · non-CF bronchiectasis

- **CAUTIONS** Asthma · haemoptysis

- **INTERACTIONS** → Appendix 1 (mannitol).

- **SIDE-EFFECTS**

- ▶ **Common or very common** Cough · haemoptysis · headache · pharyngolaryngeal pain · throat irritation · vomiting · wheezing
- ▶ **Uncommon** Acne · arthralgia · bronchospasm · dizziness · dysphonia · dyspnoea · ear pain · eructation · flatulence · gastro-oesophageal reflux disease · glossodynia · hyperventilation · influenza-like illness · malaise · nausea ·

oral candidiasis · pharyngitis · pruritus · pyrexia · rash · rhinorrhoea · stomatitis · transient insomnia

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid.
- **PRE-TREATMENT SCREENING** Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mannitol inhalation powder.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ **Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012)** NICE TA266

Mannitol dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:

- who cannot use dornase alfa (rDNase) because of ineligibility, intolerance or inadequate response to dornase alfa (rDNase), **and**
- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), **and**
- for whom other osmotic agents are not considered appropriate.

[www.nice.org.uk/TA266](http://www.nice.org.uk/TA266)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (November 2013) that mannitol (*Bronchitol*®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Inhalation powder

- ▶ **Mannitol (Non-proprietary)**

**Mannitol 5 mg** Osmohale 5mg inhalation powder capsules | 1 capsule [POM](#) no price available

**Mannitol 40 mg** Bronchitol 40mg inhalation powder capsules with two devices | 280 capsule [POM](#) £231.66

**Bronchitol 40mg** inhalation powder capsules with device | 10 capsule [POM](#) no price available

## 4 Cough and congestion

### Aromatic inhalations, cough preparations and systemic nasal decongestants

#### Aromatic inhalations in adults

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. Inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. Eucalyptus with menthol p. 278 inhalation is used to relieve sinusitis affecting the maxillary antrum.

#### Cough preparations in adults

##### Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

Codeine phosphate p. 421 may be effective but it is constipating and can cause dependence; **dextromethorphan** and pholcodine below have fewer side-effects.

**Sedating antihistamines** are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

##### Palliative care

Diamorphine hydrochloride p. 423 and methadone hydrochloride p. 464 have been used to control distressing cough in terminal lung cancer although morphine p. 429 is now preferred. In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone hydrochloride linctus should be avoided because it has a long duration of action and tends to accumulate.

##### Demulcent and expectorant cough preparations

**Demulcent cough preparations** contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as **simple linctus** have the advantage of being harmless and inexpensive; **paediatric simple linctus** is particularly useful in children.

**Expectorants** are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

**Compound preparations** are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

#### Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 1056 is available over the counter; it has few sympathomimetic effects.

#### Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% p. 914 given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

#### Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years.

#### MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 266, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine hydrochloride p. 179, pseudoephedrine hydrochloride, ephedrine hydrochloride p. 254, oxymetazoline, or xylometazoline hydrochloride p. 1057 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

### COUGH AND COLD PREPARATIONS > COUGH SUPPRESSANTS

#### Pholcodine

##### ● INDICATIONS AND DOSE

##### Dry cough

- ▶ BY MOUTH USING LINCTUS
- ▶ Child 6–11 years: 2–5 mg 3–4 times a day
- ▶ Child 12–17 years: 5–10 mg 3–4 times a day
- ▶ Adult: 5–10 mg 3–4 times a day

##### IMPORTANT SAFETY INFORMATION

##### MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

- **CONTRA-INDICATIONS** Bronchiectasis · bronchiolitis (in children) · chronic bronchitis · chronic obstructive pulmonary disease (in adults) · patients at risk of respiratory failure

- **CAUTIONS** Asthma · chronic cough · persistent cough · productive cough
- **INTERACTIONS** → Appendix 1 (pholcodine).
- **SIDE-EFFECTS** Confusion · constipation · dizziness · drowsiness · excitation · nausea · rash · sputum retention · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.
- **RENAL IMPAIRMENT** Use with caution in renal impairment. Avoid in severe renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Pholcodine is not generally recommended for children. Flavours of oral liquid formulations may include orange. When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral solution

###### ▶ Pholcodine (Non-proprietary)

**Pholcodine 1 mg per 1 ml** Pholcodine 5mg/5ml linctus | 200 ml [P] £1.29 DT price = £1.29 [CD5]

Pholcodine 5mg/5ml linctus sugar free sugar-free | 200 ml [P] £1.31 DT price = £1.31 [CD5] sugar-free | 2000 ml [P] £13.10 [CD5]

**Pholcodine 2 mg per 1 ml** Pholcodine 10mg/5ml linctus strong sugar free sugar-free | 2000 ml [P] £10.88 DT price = £9.88 [CD5] Pholcodine 10mg/5ml linctus strong | 200 ml [P] £1.61 [CD5]

###### ▶ Galenphol (Thornton & Ross Ltd)

**Pholcodine 400 microgram per 1 ml** Galenphol Paediatric 2mg/5ml linctus sugar-free | 2000 ml [P] £4.50 DT price = £4.50 [CD5]

**Pholcodine 1 mg per 1 ml** Galenphol 5mg/5ml linctus sugar-free | 2000 ml [P] £8.50 [CD5]

**Pholcodine 2 mg per 1 ml** Galenphol Strong 10mg/5ml linctus sugar-free | 2000 ml [P] £9.88 DT price = £9.88 [CD5]

###### ▶ Pavacol-D (Alliance Pharmaceuticals Ltd)

**Pholcodine 1 mg per 1 ml** Pavacol-D 5mg/5ml mixture sugar-free | 150 ml [P] £1.69 [CD5] sugar-free | 300 ml [P] £2.55 [CD5]

## COUGH AND COLD PREPARATIONS > OTHER

### Citric acid

(Formulated as Simple Linctus)

#### ● INDICATIONS AND DOSE

##### Cough

###### ▶ BY MOUTH

▶ Adult: 5 mL 3–4 times a day, this dose is for Simple Linctus, BP (2.5%)

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include anise.

When prepared extemporaneously, the BP states Simple Linctus, BP consists of citric acid monohydrate 2.5%, in a suitable vehicle with an anise flavour.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral solution

###### ▶ Citric acid (Non-proprietary)

**Citric acid monohydrate 25 mg per 1 ml** Simple linctus sugar free sugar-free | 200 ml [GSL] £1.21 DT price = £0.89 sugar-free | 2000 ml [GSL] £8.90

Simple linctus | 200 ml [GSL] £1.13 DT price = £1.03

**Citric acid 100 mg per 1 ml** Carbox oral solution 10ml sachets | 10 sachet [P] no price available

## MENTHOL AND DERIVATIVES

### Eucalyptus with menthol

#### ● INDICATIONS AND DOSE

##### Aromatic inhalation for relief of nasal congestion

###### ▶ BY INHALATION

▶ Adult: Add one teaspoonful to a pint of hot, **not** boiling, water and inhale the vapour

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhol levomenthol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL.

#### ● PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Inhalation vapour

###### ▶ Eucalyptus with menthol (Non-proprietary)

**Eucalyptus oil 100 microlitre per 1 ml, Menthol 20 mg per 1 ml, Magnesium carbonate light 70 mg per 1 ml** Menthol and Eucalyptus inhalation | 100 ml [GSL] £1.36 DT price = £1.36

## RESINS

### Benzoin tincture

(Friars' Balsam)

#### ● INDICATIONS AND DOSE

##### Aromatic inhalation for relief of nasal congestion

###### ▶ BY INHALATION

▶ Child: Add 5 mL to a pint of hot, **not** boiling, water and inhale the vapour; repeat after 4 hours if necessary

▶ Adult: Add 5 mL to a pint of hot, **not** boiling, water and inhale the vapour; repeat after 4 hours if necessary

- **SIDE-EFFECTS** Allergic contact dermatitis
- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended (applied as a rub or to pillows) for infants under 3 months. When prepared extemporaneously, the BP states Benzoin Tincture, Compound, BP consists of balsamic acids approx. 4.5%.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

###### CAUTIONARY AND ADVISORY LABELS 15

###### ▶ Benzoin tincture (Non-proprietary)

**Balsamic acids 16.5 mg per 1 ml** Benzoin tincture | 500 ml [GSL] £9.95 DT price = £9.95

## 5 Idiopathic pulmonary fibrosis

**Other drugs used for Idiopathic pulmonary fibrosis**  
Nintedanib, p. 879

### ANTIFIBROTICS

#### Pirfenidone

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

#### ● INDICATIONS AND DOSE

**Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)**

##### ► BY MOUTH

- **Adult:** Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily). Caution with concomitant use of drugs known to cause photosensitivity—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).

- **CONTRA-INDICATIONS** Cigarette smoking

#### ● CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

- **Photosensitivity** Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).
- **Treatment interruption** If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

- **INTERACTIONS** → Appendix 1 (pirfenidone).

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal discomfort · anorexia · arthralgia · constipation · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · erythema · flatulence · gastritis · gastro-oesophageal reflux disease · headache · hot flush · insomnia · malaise · myalgia · nausea · non-cardiac chest pain · photosensitivity reaction · pruritus · raised hepatic enzymes · rash · somnolence · upper respiratory tract infection · urinary tract infection · vomiting · weight loss
- **Rare** Raised bilirubin in combination with raised hepatic transaminases

##### SIDE-EFFECTS, FURTHER INFORMATION

Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate hepatic impairment, particularly if concomitant use of CYP1A2 inhibitors. Avoid use in severe hepatic impairment.

- **RENAL IMPAIRMENT** Avoid use if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

#### ● MONITORING REQUIREMENTS

- Monitor for weight loss.
- Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Dizziness or malaise may affect performance of skilled tasks (e.g. driving).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- **Pirfenidone for treating idiopathic pulmonary fibrosis (April 2013)** NICE TA282

Pirfenidone is recommended as an option for treating idiopathic pulmonary fibrosis only if:

- the patient has a forced vital capacity (FVC) between 50% and 80% predicted, **and**
- the manufacturer provides pirfenidone with the discount agreed in the patient access scheme. Treatment should be discontinued if there is evidence of disease progression, defined as a decline in predicted FVC of 10% or more within any 12 month period.

Patients currently receiving pirfenidone that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA282](http://www.nice.org.uk/TA282)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2013) that pirfenidone is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

**Pirfenidone 267 mg** Esbriet 267mg capsules | 63 capsule PoM  
£501.92 | 252 capsule PoM £2,007.70 | 270 capsule PoM  
£2,151.10

## 6 Respiratory depression, respiratory distress syndrome and apnoea

### Respiratory stimulants

#### Overview

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may

arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under **expert supervision** in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

## RESPIRATORY STIMULANTS

### Doxapram hydrochloride

#### ● INDICATIONS AND DOSE

##### Postoperative respiratory depression

###### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

##### Acute respiratory failure

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

- **CONTRA-INDICATIONS** Cerebral oedema · cerebrovascular accident · coronary artery disease · epilepsy and other convulsive disorders · hyperthyroidism · physical obstruction of respiratory tract · severe hypertension · status asthmaticus
- **CAUTIONS** Give with beta<sub>2</sub> agonist in bronchoconstriction · give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing) · hypertension · impaired cardiac reserve · phaeochromocytoma
- **INTERACTIONS** → Appendix 1 (doxapram).
- **SIDE-EFFECTS** Arrhythmias · bradycardia · bronchospasm · chest pain · confusion · convulsions · cough · dizziness · dyspnoea · extrasystoles · flushing · hallucination · headache · hyperactivity · hypertension · incontinence · laryngospasm · muscle spasms · nausea · perineal warmth · pyrexia · tachycardia · urinary retention · vomiting
- **PREGNANCY** No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## 1 Dementia

### Dementia

27-Sep-2016

#### Description of condition

Dementia is a progressive and largely irreversible clinical syndrome that is characterised by a widespread impairment of mental function. There are a number of conditions that cause the symptoms of dementia. Alzheimer's disease accounts for most cases; other common causes include vascular dementia (due to cerebrovascular disease) and dementia with Lewy bodies. The symptoms of dementia include cognitive dysfunction (such as problems with memory, concentration and problem-solving), non-cognitive symptoms (such as psychiatric and behavioural problems) and difficulties with activities of daily living.

#### Aims of treatment

The aims of treatment are to promote independence, maintain function and treat symptoms.

#### Non-drug treatment

**EvGr** Patients with all types of *mild-to-moderate* dementia presenting with **cognitive symptoms** should be given the opportunity to participate in a structured group cognitive stimulation programme. 

#### Drug treatment

##### Management of cognitive symptoms

**EvGr** When pharmacological treatments are used, they should be initiated and supervised by a specialist experienced in the management of dementia.  The manufacturers of donepezil hydrochloride p. 282, galantamine p. 283, rivastigmine p. 284 and memantine hydrochloride p. 285 recommend that treatment should be reassessed on a regular basis.

**EvGr** Treatment should be continued only when it is considered to be having a worthwhile effect on symptoms. 

**EvGr** Donepezil hydrochloride, galantamine and rivastigmine (acetylcholinesterase inhibitors) are recommended for the treatment of cognitive symptoms of

*mild-to-moderate* dementia due to Alzheimer's disease.

Memantine hydrochloride is a suitable alternative for patients with *moderate* Alzheimer's disease when acetylcholinesterase inhibitors are contra-indicated or are not tolerated. Memantine hydrochloride is the drug of choice for patients with *severe* Alzheimer's disease. 

**EvGr** Pharmacological treatments are **not** recommended for the treatment of cognitive symptoms in cases of vascular dementia. 

##### Management of non-cognitive symptoms

**EvGr** Patients with dementia who develop non-cognitive symptoms (such as delusions or anxiety) or 'behaviour that challenges' (such as aggression or agitation) should only be offered a pharmacological intervention if they are severely distressed or if there is an immediate risk of harm to the patient or others. Less severe non-cognitive symptoms are treated with non-pharmacological interventions, such as multisensory stimulation or aromatherapy. 

##### Antipsychotic drugs

**EvGr** Patients with *mild-to-moderate* non-cognitive symptoms due to Alzheimer's disease, vascular dementia, mixed dementias or dementia with Lewy bodies should **not** be prescribed antipsychotic drugs.

Patients with *severe* non-cognitive symptoms due to Alzheimer's disease, vascular dementia, mixed dementias or dementia with Lewy bodies which are causing significant distress can be offered treatment with an antipsychotic drug (see *Antipsychotic drugs* under Psychoses and related disorders p. 358). Careful consideration should be given to the patient's co-morbid conditions and the benefits and risks of treatment.  The MHRA has reported (2009) a clear increased risk of stroke and a small increased risk of death when antipsychotic drugs are used in elderly patients with dementia. The balance of risks and benefits should be carefully assessed, including any previous history of stroke or transient ischaemic attack and any risk factors for cerebrovascular disease including hypertension, diabetes, smoking and atrial fibrillation.

**EvGr** Treatment with antipsychotic drugs should be started with a low dose and titrated upwards, with regular review. In patients who have dementia with Lewy bodies, careful monitoring for severe untoward reactions, such as neuroleptic sensitivity reactions, is recommended. 

**Acetylcholinesterase inhibitors and memantine**

**EvGr** An acetylcholinesterase inhibitor may be used to manage non-cognitive symptoms in patients with *mild-to-moderate* dementia due to Alzheimer's disease, if a non-pharmacological approach or an antipsychotic drug is inappropriate or ineffective.

Memantine hydrochloride may be considered in patients with *severe* symptoms, if a non-pharmacological approach or an antipsychotic drug is inappropriate or ineffective. Memantine hydrochloride may also be used in patients with *moderate* symptoms in whom acetylcholinesterase inhibitors are contra-indicated.

Patients who have dementia with Lewy bodies should be offered an acetylcholinesterase inhibitor for the treatment of non-cognitive symptoms. Acetylcholinesterase inhibitors are **not** recommended in patients with vascular dementia.

**Management of violence, aggression, and extreme agitation**

**EvGr** In cases of dementia associated with *severe* behavioural disturbance that requires urgent treatment (if violence, aggression and extreme agitation threaten the safety of the patient or others), an antipsychotic drug or a benzodiazepine may be given (see *Antipsychotic drugs* under Psychoses and related disorders p. 358; see *Benzodiazepines* under Hypnotics and anxiolytics p. 447). High doses or combinations of drugs should be avoided, and the lowest effective dose should be used. Oral treatment should be offered before parenteral administration. If intramuscular administration is needed for behavioural control, lorazepam p. 317, haloperidol p. 363 or olanzapine p. 373 should be used. Diazepam and chlorpromazine hydrochloride are **not** recommended. Intravenous administration should be used only in exceptional circumstances.

**ANTICHOLINESTERASES > CENTRALLY ACTING****Donepezil hydrochloride**

26-Sep-2016

● **DRUG ACTION** Donepezil is a reversible inhibitor of acetylcholinesterase.

● **INDICATIONS AND DOSE****Mild to moderate dementia in Alzheimer's disease**▶ **BY MOUTH**

▶ **Adult:** Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime

● **CAUTIONS** Asthma · chronic obstructive pulmonary disease · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers

● **INTERACTIONS** → Appendix 1 (parasympathomimetics). Caution with concomitant antipsychotic treatment—increased risk of neuroleptic malignant syndrome.

● **SIDE-EFFECTS**

▶ **Common or very common** Abnormal dreams · aggression · agitation · anorexia · diarrhoea · dizziness · fatigue · hallucinations · headache · insomnia · muscle cramps · nausea · pruritus · rash · syncope · urinary incontinence · vomiting

▶ **Uncommon** Bradycardia · duodenal ulcers · gastric ulcers · gastro-intestinal haemorrhage · seizures

▶ **Rare** AV block · extrapyramidal symptoms · hepatitis · potential for bladder outflow obstruction · sino-atrial block

▶ **Very rare** Neuroleptic malignant syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

● **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. No information available for severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer donepezil hydrochloride orodispersible tablets.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

▶ **Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016** NICE TA217

Donepezil can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

**Donepezil hydrochloride 1 mg per 1 ml** Donepezil 1mg/ml oral solution sugar free sugar-free | 150 ml **[PoM]** £48.00 DT price = £48.00

## Galantamine

26-Sep-2016

● **DRUG ACTION** Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

### ● INDICATIONS AND DOSE

#### Mild to moderately severe dementia in Alzheimer's disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for at least 4 weeks; maintenance 8–12 mg twice daily
- ▶ BY MOUTH USING MODIFIED-RELEASE CAPSULES
- ▶ Adult: Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for at least 4 weeks; maintenance 16–24 mg daily

● **CAUTIONS** Avoid in gastro-intestinal obstruction · avoid in urinary outflow obstruction · avoid whilst recovering from bladder surgery · avoid whilst recovering from gastro-intestinal surgery · cardiac disease · chronic obstructive pulmonary disease · congestive heart failure · electrolyte disturbances · history of seizures · history of severe asthma · pulmonary infection · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers · unstable angina

● **INTERACTIONS** → Appendix 1 (parasympathomimetics).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · bradycardia · decreased appetite · depression · diarrhoea · dizziness · dyspepsia · fatigue · hallucination · headache · hypertension · malaise · muscle spasm · nausea · syncope · tremor · vomiting · weight loss
- ▶ **Uncommon** Arrhythmias · blurred vision · dehydration · first-degree AV block · flushing · hypersomnia · hypotension · muscular weakness · palpitation · paraesthesia · retching · seizures · sweating · taste disturbance · tinnitus
- ▶ **Rare** Acute generalized exanthematous pustulosis · erythema multiforme · exacerbation of Parkinson's disease · hepatitis · Stevens-Johnson syndrome

### SIDE-EFFECTS, FURTHER INFORMATION

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- ▶ **Serious skin reactions** Serious skin reactions (including Stevens-Johnson syndrome and acute generalized exanthematous pustulosis) have been reported—manufacturer advises discontinue at the first appearance of skin rash.
- **PREGNANCY** Use with caution—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** For *immediate-release* preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment. For *modified-release* preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; max. 16 mg daily; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 9 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE** Manufacturer recommends that patients are warned of the signs of serious skin reactions; they should be advised to stop taking galantamine immediately and seek medical advice if symptoms occur.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016 NICE TA217

Galantamine can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

#### ▶ Elmino (Zentiva)

**Galantamine (as Galantamine hydrobromide) 8 mg** Elmino XL 8mg capsules | 28 capsule [PoM] £51.88 DT price = £51.88  
**Galantamine (as Galantamine hydrobromide) 16 mg** Elmino XL 16mg capsules | 28 capsule [PoM] £64.90 DT price = £64.90  
**Galantamine (as Galantamine hydrobromide) 24 mg** Elmino XL 24mg capsules | 28 capsule [PoM] £79.80 DT price = £79.80

#### ▶ Galantex XL (Creo Pharma Ltd)

**Galantamine (as Galantamine hydrobromide) 8 mg** Galantex XL 8mg capsules | 28 capsule [PoM] £25.42 DT price = £51.88  
**Galantamine (as Galantamine hydrobromide) 16 mg** Galantex XL 16mg capsules | 28 capsule [PoM] £31.80 DT price = £64.90  
**Galantamine (as Galantamine hydrobromide) 24 mg** Galantex XL 24mg capsules | 28 capsule [PoM] £39.10 DT price = £79.80

#### ▶ Galsya XL (Consilient Health Ltd)

**Galantamine (as Galantamine hydrobromide) 8 mg** Galsya XL 8mg capsules | 28 capsule [PoM] £44.09 DT price = £51.88  
**Galantamine (as Galantamine hydrobromide) 16 mg** Galsya XL 16mg capsules | 28 capsule [PoM] £55.16 DT price = £64.90  
**Galantamine (as Galantamine hydrobromide) 24 mg** Galsya XL 24mg capsules | 28 capsule [PoM] £67.83 DT price = £79.80

- ▶ **Gatalin XL** (Aspire Pharma Ltd)
  - Galantamine (as Galantamine hydrobromide) 8 mg** Gatalin XL 8mg capsules | 28 capsule [PoM] £25.94 DT price = £51.88
  - Galantamine (as Galantamine hydrobromide) 16 mg** Gatalin XL 16mg capsules | 28 capsule [PoM] £32.45 DT price = £64.90
  - Galantamine (as Galantamine hydrobromide) 24 mg** Gatalin XL 24mg capsules | 28 capsule [PoM] £39.90 DT price = £79.80
- ▶ **Gazylan XL** (Teva UK Ltd)
  - Galantamine (as Galantamine hydrobromide) 8 mg** Gazylan XL 8mg capsules | 28 capsule [PoM] £25.41 DT price = £51.88
  - Galantamine (as Galantamine hydrobromide) 16 mg** Gazylan XL 16mg capsules | 28 capsule [PoM] £31.79 DT price = £64.90
  - Galantamine (as Galantamine hydrobromide) 24 mg** Gazylan XL 24mg capsules | 28 capsule [PoM] £39.09 DT price = £79.80
- ▶ **Lotprosin XL** (Actavis UK Ltd)
  - Galantamine (as Galantamine hydrobromide) 8 mg** Lotprosin XL 8mg capsules | 28 capsule [PoM] £51.88 DT price = £51.88
  - Galantamine (as Galantamine hydrobromide) 16 mg** Lotprosin XL 16mg capsules | 28 capsule [PoM] £64.90 DT price = £64.90
  - Galantamine (as Galantamine hydrobromide) 24 mg** Lotprosin XL 24mg capsules | 28 capsule [PoM] £79.80 DT price = £79.80
- ▶ **Luventa XL** (Fontus Health Ltd)
  - Galantamine (as Galantamine hydrobromide) 8 mg** Luventa XL 8mg capsules | 28 capsule [PoM] £25.42 DT price = £51.88
  - Galantamine (as Galantamine hydrobromide) 16 mg** Luventa XL 16mg capsules | 28 capsule [PoM] £31.80 DT price = £64.90
  - Galantamine (as Galantamine hydrobromide) 24 mg** Luventa XL 24mg capsules | 28 capsule [PoM] £39.10 DT price = £79.80
- ▶ **Reminyl XL** (Shire Pharmaceuticals Ltd)
  - Galantamine (as Galantamine hydrobromide) 8 mg** Reminyl XL 8mg capsules | 28 capsule [PoM] £51.88 DT price = £51.88
  - Galantamine (as Galantamine hydrobromide) 16 mg** Reminyl XL 16mg capsules | 28 capsule [PoM] £64.90 DT price = £64.90
  - Galantamine (as Galantamine hydrobromide) 24 mg** Reminyl XL 24mg capsules | 28 capsule [PoM] £79.80 DT price = £79.80

#### Oral solution

CAUTIONARY AND ADVISORY LABELS 3, 21

- ▶ **Galantamine (Non-proprietary)**
  - Galantamine (as Galantamine hydrobromide) 4 mg per 1 ml** Galantamine 20mg/5ml oral solution sugar free sugar-free | 100 ml [PoM] £437.00
- ▶ **Reminyl** (Shire Pharmaceuticals Ltd)
  - Galantamine (as Galantamine hydrobromide) 4 mg per 1 ml** Reminyl 4mg/ml oral solution sugar-free | 100 ml [PoM] £120.00

## Rivastigmine

26-Sep-2016

- **DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases.

#### ● INDICATIONS AND DOSE

##### Mild to moderate dementia in Alzheimer's disease

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

###### ▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ **Adult:** Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increase to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, retitrate from 4.6 mg/24 hours patch

##### Mild to moderate dementia in Parkinson's disease

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance;

usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

- **CAUTIONS** Bladder outflow obstruction · conduction abnormalities · duodenal ulcers · gastric ulcers · history of asthma · history of chronic obstructive pulmonary disease · history of seizures · risk of fatal overdose with patch administration errors · sick sinus syndrome · susceptibility to ulcers
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · agitation · anorexia · anxiety · bradycardia · confusion · diarrhoea · dizziness · drowsiness · dyspepsia · extrapyramidal symptoms · headache · increased salivation · insomnia · malaise · nausea · sweating · tremor · urinary incontinence · vomiting · weight loss · worsening of Parkinson's disease
  - ▶ **Uncommon** Atrial fibrillation · AV block · depression · syncope
  - ▶ **Rare** Angina · duodenal ulceration · gastric ulceration · rash · seizures
  - ▶ **Very rare** Gastro-intestinal haemorrhage · hallucinations · hypertension · pancreatitis · tachycardia
  - ▶ **Frequency not known** Aggression · dehydration · hepatitis · restlessness · sick sinus syndrome · skin hypersensitivity reactions

#### SIDE-EFFECTS, FURTHER INFORMATION

Transdermal administration less likely to cause gastro-intestinal disturbance.

Treatment should be interrupted if gastro-intestinal side-effects occur and withheld until their resolution—retitrate dose if necessary.

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- **HEPATIC IMPAIRMENT** Titrate according to individual tolerability in mild to moderate impairment. Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Titrate according to individual tolerability.
- **MONITORING REQUIREMENTS** Monitor body-weight.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With transdermal use Apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days).
- **PATIENT AND CARER ADVICE**
  - ▶ **EXELON® PATCHES** Advise patients and carers of patch administration instructions, particularly to remove the previous day's patch before applying the new patch—consult product literature.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016  
NICE TA217

Rivastigmine can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

[www.nice.org.uk/TA217](http://www.nice.org.uk/TA217)

### EXELON® PATCHES

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2007) that *Exelon*® patches should be restricted for use in patients with moderately severe Alzheimer's disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Erastig 13.3mg/24hours transdermal patches | 30 patch [PoM] £73.90 DT price = £77.97

#### ▶ Voleze (Focus Pharmaceuticals Ltd)

##### Rivastigmine 4.6 mg per 24 hour

Voleze 4.6mg/24hours transdermal patches | 30 patch [PoM] £77.97 DT price = £77.97

##### Rivastigmine 9.5 mg per 24 hour

Voleze 9.5mg/24hours transdermal patches | 30 patch [PoM] £77.97 DT price = £29.41

##### Rivastigmine 13.3 mg per 24 hour

Voleze 13.3mg/24hours transdermal patches | 30 patch [PoM] £77.97 DT price = £77.97

## DOPAMINERGIC DRUGS > NMDA RECEPTOR ANTAGONISTS

### Memantine hydrochloride

24-Nov-2016

- **DRUG ACTION** Memantine is a glutamate receptor antagonist.

#### ● INDICATIONS AND DOSE

##### Moderate to severe dementia in Alzheimer's disease

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg once daily, then increased in steps of 5 mg every week; usual maintenance 20 mg daily; maximum 20 mg per day

- **CAUTIONS** Epilepsy · history of convulsions · risk factors for epilepsy

- **INTERACTIONS** → Appendix 1 (memantine).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Balance disorders · constipation · dizziness · drowsiness · dyspnoea · headache · hypertension

- ▶ **Uncommon** Abnormal gait · confusion · fatigue · hallucinations · heart failure · thrombosis · vomiting
- ▶ **Very rare** Seizures
- ▶ **Frequency not known** Depression · hepatitis · pancreatitis · psychosis · suicidal ideation
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m<sup>2</sup>, if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 5 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION** Oral solution should be dosed onto a spoon or into a glass of water.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016  
NICE TA217

Memantine is recommended as an option for managing moderate Alzheimer's disease in patients who are unable to take acetylcholinesterase inhibitors, and for patients with severe disease; combination treatment with memantine and an acetylcholinesterase inhibitor is not recommended. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

[www.nice.org.uk/TA217](http://www.nice.org.uk/TA217)

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Memantine hydrochloride (Non-proprietary)**

**Memantine hydrochloride 10 mg** Memantine 10mg tablets | 7 tablet [PoM] £34.50 DT price = £1.36 | 56 tablet [PoM] £69.01

**Memantine hydrochloride 20 mg** Memantine 20mg tablets | 7 tablet [PoM] £69.01 DT price = £1.50

- ▶ **Ebixa** (Lundbeck Ltd)

**Memantine hydrochloride 5 mg** Ebixa 5mg tablets | 7 tablet [PoM] no price available

**Memantine hydrochloride 10 mg** Ebixa 10mg tablets | 7 tablet [PoM] no price available | 28 tablet [PoM] £34.50 DT price = £1.36

**Memantine hydrochloride 15 mg** Ebixa 15mg tablets | 7 tablet [PoM] no price available

**Memantine hydrochloride 20 mg** Ebixa 20mg tablets | 7 tablet [PoM] no price available | 28 tablet [PoM] £69.01 DT price = £1.50

Ebixa tablets treatment initiation pack | 28 tablet [PoM] £43.13

- ▶ **Maruxa** (Consilient Health Ltd)

**Memantine hydrochloride 10 mg** Marixino 10mg tablets | 28 tablet [PoM] £29.32 DT price = £1.36

**Memantine hydrochloride 20 mg** Marixino 20mg tablets | 28 tablet [PoM] £58.65 DT price = £1.50

- ▶ **Nemdatine** (Actavis UK Ltd)

**Memantine hydrochloride 5 mg** Nemdatine 5mg tablets | 7 tablet [PoM] no price available

**Memantine hydrochloride 10 mg** Nemdatine 10mg tablets | 7 tablet [PoM] no price available | 28 tablet [PoM] £34.50 DT price = £1.36 | 56 tablet [PoM] £69.01

**Memantine hydrochloride 15 mg** Nemdatine 15mg tablets | 7 tablet [PoM] no price available

**Memantine hydrochloride 20 mg** Nemdatine 20mg tablets | 7 tablet [PoM] no price available | 28 tablet [PoM] £69.01 DT price = £1.50

Nemdatine tablets treatment initiation pack | 28 tablet [PoM] £43.12

**Orodispersible tablet**

EXCIPIENTS: May contain Aspartame

- ▶ **Valios** (Dr Reddy's Laboratories (UK) Ltd)

**Memantine hydrochloride 10 mg** Valios 10mg orodispersible tablets sugar free sugar-free | 28 tablet [PoM] £32.78

**Memantine hydrochloride 20 mg** Valios 20mg orodispersible tablets sugar free sugar-free | 28 tablet [PoM] £65.56

**Oral solution**

- ▶ **Memantine hydrochloride (Non-proprietary)**

**Memantine hydrochloride 10 mg per 1 ml** Memantine 10mg/ml oral solution sugar free sugar-free | 50 ml [PoM] £61.61 DT price = £56.74 sugar-free | 100 ml [PoM] £123.23

- ▶ **Ebixa** (Lundbeck Ltd)

**Memantine hydrochloride 10 mg per 1 ml** Ebixa 5mg/0.5ml pump actuation oral solution sugar-free | 50 ml [PoM] £61.61 DT price = £56.74 sugar-free | 100 ml [PoM] £123.23

## 2 Epilepsy and other seizure disorders

### Epilepsy

#### Control of the epilepsies

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 297, perampanel p. 301, phenobarbital p. 313, and phenytoin p. 302, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

#### Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

**MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers' products for a particular drug (November 2013)**

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers' products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer's product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer's product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

**Category 1**

**Phenytoin, carbamazepine p. 291, phenobarbital, primidone p. 313.** For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer's product.

**Category 2**

**Valproate, lamotrigine, perampanel, retigabine p. 305, rufinamide p. 306, clobazam p. 314, clonazepam p. 315, oxcarbazepine p. 300, eslicarbazepine acetate p. 293, zonisamide p. 311, topiramate p. 309.** For these drugs, the need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

**Category 3**

**Levetiracetam p. 299, lacosamide p. 296, tiagabine p. 309, gabapentin p. 295, pregabalin p. 304, ethosuximide p. 294, vigabatrin p. 311.** For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer's product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors. **Interactions.**

**Antiepileptic hypersensitivity syndrome**

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (**carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin,**

**primidone, and rufinamide**); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (**eslicarbazepine, stiripentol, and zonisamide**) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

**Interactions**

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

**Withdrawal**

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

**Driving**

Patients with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards.

Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

**Pregnancy**

Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term developmental disorders. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given advice about the

need for an effective contraception method to avoid unplanned pregnancy. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 306 and valproic acid p. 331 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

#### **Epilepsy and Pregnancy Register**

All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

#### **Breast-feeding**

Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant's drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

#### **Focal seizures with or without secondary generalisation**

Carbamazepine p. 291 and lamotrigine p. 297 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 300, sodium valproate and levetiracetam p. 299 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 314, gabapentin p. 295, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 309. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 293, lacosamide p. 296, phenobarbital p. 313, phenytoin p. 302, pregabalin p. 304, tiagabine p. 309, vigabatrin p. 311 and zonisamide p. 311.

#### **Generalised seizures**

##### **Tonic-clonic seizures**

Sodium valproate is the first-line treatment for newly diagnosed generalised tonic-clonic seizures (except in female patients who are premenopausal, see *Valproate* below). Lamotrigine is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment.

Carbamazepine and oxcarbazepine may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

##### **Absence seizures**

Ethosuximide p. 294, or sodium valproate (except in female patients who are premenopausal, see *Valproate* below), are the drugs of choice in absence seizures and syndromes; lamotrigine p. 297 is a suitable alternative when ethosuximide p. 294 and sodium valproate p. 306 are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam p. 314, clonazepam p. 315, levetiracetam p. 299, topiramate p. 309 or zonisamide p. 311 may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. Carbamazepine p. 291, gabapentin p. 295, oxcarbazepine p. 300, phenytoin p. 302, pregabalin p. 304, tiagabine p. 309 and vigabatrin p. 311 are not recommended in absence seizures or syndromes.

##### **Myoclonic seizures**

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice in newly diagnosed myoclonic seizures (except in female patients who are premenopausal, see *Valproate* below); topiramate and levetiracetam are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and they may consider clobazam, clonazepam, zonisamide or piracetam p. 379. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended for the treatment of myoclonic seizures.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

#### Atonic and tonic seizures

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate is the drug of choice (except in female patients who are premenopausal, see *Valproate* below); lamotrigine can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 306 or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine or vigabatrin are not recommended in atonic and tonic seizures.

#### Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

#### Antiepileptic drugs

##### Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate p. 293 is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

##### Ethosuximide

Ethosuximide is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethosuximide is also licensed for myoclonic seizures.

##### Gabapentin and pregabalin

Gabapentin and pregabalin are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder. Gabapentin is an effective treatment for migraine prophylaxis [unlicensed].

##### Lamotrigine

Lamotrigine is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes

especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

##### Levetiracetam and brivaracetam

Levetiracetam is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 290 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

##### Phenobarbital and primidone

Phenobarbital p. 313 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 313 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

##### Phenytoin

Phenytoin is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 294, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

##### Rufinamide

Rufinamide is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

##### Topiramate

Topiramate can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Topiramate p. 309 is also licensed for prophylaxis of migraine.

##### Valproate

Sodium valproate p. 306 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Sodium valproate has widespread metabolic effects

and monitoring of liver function tests and full blood count is essential. Valproate should not be used in female children, in females of childbearing potential, and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefits and risks of valproate therapy should be carefully reconsidered at regular treatment reviews, see *Important safety information* in the sodium valproate and valproic acid p. 331 drug monographs.

Valproic acid (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

#### Zonisamide

Clobazam p. 311 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

#### Benzodiazepines

Clobazam p. 314 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 315 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

#### Other drugs

Acetazolamide p. 1037, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 379 is used as adjunctive treatment for cortical myoclonus.

### Status epilepticus

#### Convulsive status epilepticus

Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 950 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 950 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 317 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 321 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam oromucosal solution p. 318 can be given into the buccal cavity.

#### Important

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium p. 294, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 316, midazolam, or a non-barbiturate anaesthetic such as propofol p. 1175 [unlicensed indication], should be instituted with full intensive care support.

**Phenytoin sodium** can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium should be expressed in terms of phenytoin sodium.

#### Non-convulsive status epilepticus

The urgency to treat non-convulsive status epilepticus depends on the severity of the patient's condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

#### Febrile convulsions

*Brief febrile convulsions* need no specific treatment; antipyretic medication (e.g. paracetamol p. 414), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or *recurrent febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

#### Other drugs used for Epilepsy and other seizure disorders

Magnesium sulfate, p. 924

## ANTIPILEPTICS

### Brivaracetam

30-Nov-2016

#### ● INDICATIONS AND DOSE

##### Adjunctive therapy of partial-onset seizures with or without secondary generalisation

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 16-17 years: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily
- ▶ Adult: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily

- **INTERACTIONS** → Appendix 1 (brivaracetam).

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · constipation · decreased appetite · depression · dizziness · insomnia · irritability · malaise · nausea · somnolence · vertigo · vomiting
- ▶ **Uncommon** Aggression · agitation · neutropenia · psychotic disorder · suicidal ideation

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises consider a starting dose of 25 mg twice daily in chronic liver disease; max. maintenance dose 75 mg twice daily in all stages of impairment.

- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intermittent *intravenous infusion*, manufacturer advises dilute in Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's solution; give over 15 minutes.

- With oral use Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.
- PRESCRIBING AND DISPENSING INFORMATION**  
Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.
- PATIENT AND CARER ADVICE**  
**Missed doses**  
Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.  
**Driving and skilled tasks**  
Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (July 2016) that brivaracetam (*Briviact*<sup>®</sup>) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.

#### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 8, 25

## Carbamazepine

### INDICATIONS AND DOSE

#### Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
- Elderly: Reduce initial dose
- BY RECTUM
- Adult: Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible

### DOSE EQUIVALENCE AND CONVERSION

- Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

#### Trigeminal neuralgia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100 mg 1–2 times a day, some patients may require higher initial dose, increase gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

#### Prophylaxis of bipolar disorder unresponsive to lithium

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 400 mg daily in divided doses, increased until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day

#### Adjunct in acute alcohol withdrawal

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 800 mg daily in divided doses, then reduced to 200 mg daily for usual treatment duration of 7–10 days, dose to be reduced gradually over 5 days

#### Diabetic neuropathy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100 mg 1–2 times a day, increased gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

#### Focal and generalised tonic-clonic seizures

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

#### CARBAGEN<sup>®</sup> SR

#### Focal and secondary generalised tonic-clonic seizures |

##### Primary generalised tonic-clonic seizures

- BY MOUTH
- Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 1–2 divided doses, increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- Elderly: Reduce initial dose

#### Trigeminal neuralgia

- BY MOUTH
- Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increase gradually according to response; usual dose 600–800 mg daily in 1–2 divided doses, increased if necessary up to 1.6 g daily in 1–2 divided doses

#### Prophylaxis of bipolar disorder unresponsive to lithium

- BY MOUTH
- Adult: Initially 400 mg daily in 1–2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 1–2 divided doses; maximum 1.6 g per day

#### Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

- BY MOUTH
- Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in continued →

1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses

- ▶ Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

#### TEGRETOL® PROLONGED RELEASE

##### Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures

###### ▶ BY MOUTH

- ▶ Adult: Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses
- ▶ Elderly: Reduce initial dose

##### Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

###### ▶ BY MOUTH

- ▶ Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses
- ▶ Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses

##### Trigeminal neuralgia

###### ▶ BY MOUTH

- ▶ Adult: Initially 100–200 mg daily in 2 divided doses, some patients may require higher initial dose. After initial dose, increase according to response; usual dose 600–800 mg daily in 2 divided doses, increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

##### Prophylaxis of bipolar disorder unresponsive to lithium

###### ▶ BY MOUTH

- ▶ Adult: Initially 400 mg daily in 2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

- **UNLICENSED USE** Use in the treatment of alcohol withdrawal is an unlicensed indication. Use in diabetic neuropathy is an unlicensed indication.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930. AV conduction abnormalities (unless paced) · history of bone-marrow depression
- **CAUTIONS** Cardiac disease · history of haematological reactions to other drugs · may exacerbate absence and myoclonic seizures · skin reactions · susceptibility to angle-closure glaucoma

#### CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- ▶ Blood, hepatic, or skin disorders Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).
- **INTERACTIONS** → Appendix 1 (carbamazepine).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Allergic skin reactions · aplastic anaemia · ataxia · blood disorders · blurring of vision · dermatitis · dizziness · drowsiness · dry mouth · eosinophilia · fatigue · haemolytic anaemia · headache ·

hyponatraemia (leading in rare cases to water intoxication) · leucopenia · nausea · oedema · thrombocytopenia · unsteadiness · urticaria · vomiting

- ▶ **Uncommon** Constipation · diarrhoea · involuntary movements (including nystagmus) · visual disturbances
- ▶ **Rare** Abdominal pain · aggression · agitation · anorexia · cardiac conduction disorders · confusion · delayed multi-organ hypersensitivity disorder · depression · dysarthria · hallucinations · hepatitis · hypertension · hypotension · jaundice · lymph node enlargement · muscle weakness · paraesthesia · peripheral neuropathy · restlessness · systemic lupus erythematosus · vanishing bile duct syndrome
- ▶ **Very rare** Arthralgia · muscle spasm · acne · alopecia · alterations in skin pigmentation · angle-closure glaucoma · aseptic meningitis · AV block with syncope · circulatory collapse · conjunctivitis · dyspnoea · exacerbation of coronary artery disease · galactorrhoea · gynaeomastia · hearing disorders · hepatic failure · hirsutism · hypercholesterolaemia · impaired male fertility · interstitial nephritis · muscle pain · neuroleptic malignant syndrome · osteomalacia · osteoporosis · pancreatitis · photosensitivity · pneumonia · pneumonitis · psychosis · pulmonary hypersensitivity · purpura · renal failure · sexual dysfunction · Stevens-Johnson syndrome · stomatitis · sweating · taste disturbance · thromboembolism · thrombophlebitis · toxic epidermal necrolysis · urinary frequency · urinary retention
- ▶ **Frequency not known** Suicidal ideation

#### SIDE-EFFECTS, FURTHER INFORMATION

Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

#### Overdose

For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1204.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 286 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.
- **PREGNANCY** Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Amount probably too small to be harmful. Monitor infant for possible adverse reactions.
- **HEPATIC IMPAIRMENT** Metabolism impaired in advanced liver disease.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** Test for HLA-B\*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B\*1502 allele).
- **MONITORING REQUIREMENTS**
- ▶ Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
- ▶ Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).
- **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.
- **DIRECTIONS FOR ADMINISTRATION** *Tegretol® Prolonged Release* tablets can be halved but should not be chewed.

**● PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

**● PATIENT AND CARER ADVICE**

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

**Eslicarbazepine acetate****● INDICATIONS AND DOSE**

**Adjunctive treatment in adults with focal seizures with or without secondary generalisation**

**▶ BY MOUTH**

Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

- **CONTRA-INDICATIONS** Second- or third-degree AV block
- **CAUTIONS** Elderly · hyponatraemia · PR-interval prolongation
- **INTERACTIONS** → Appendix 1 (eslicarbazepine). Caution—avoid concomitant administration of drugs that prolong PR interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dizziness · drowsiness · fatigue · gastro-intestinal disturbances · headache · impaired coordination · rash · tremor · visual disturbances
  - ▶ **Uncommon** Agitation · alopecia · anaemia · appetite changes · bradycardia · chest pain · chills · confusion · convulsions · dehydration · dry mouth · dysaesthesia · dysarthria · dystonia · electrolyte imbalance · epistaxis · gingival hyperplasia · hyperactivity · hypertension · hyponatraemia · hypotension · hypothyroidism · impaired memory · insomnia · liver disorders · malaise · menstruation changes · mood changes · movement disorders · myalgia · nail disorder · nocturia · nystagmus · palpitation · parosmia · peripheral neuropathy · peripheral oedema · psychosis · stomatitis · sweating · taste disturbance · tinnitus · urinary tract infection · weight changes
  - ▶ **Very rare** Leucopenia · pancreatitis · thrombocytopenia
  - ▶ **Frequency not known** PR-interval prolongation · suicidal ideation
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 286 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>, adjusted according to response. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **PRE-TREATMENT SCREENING** Test for HLA-B\*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative— risk of Stevens-Johnson syndrome in presence of HLA-B\*1502 allele).
- **MONITORING REQUIREMENTS** Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (October 2010) that eslicarbazepine (*Zebinix*<sup>®</sup>) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 8

▶ **Zebinix** (Eisai Ltd)

▶ **Silicarbazine acetate 800 mg** Zebinix 800mg tablets | 30 tablet [PoM] £136.00

**Ethosuximide****INDICATIONS AND DOSE**

**Absence seizures | Atypical absence seizures (adjunct) | Myoclonic seizures**

▶ BY MOUTH

- ▶ Child 1 month–5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
- ▶ Child 6–17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily
- ▶ Adult: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily

● **CAUTIONS** Avoid in acute porphyrias p. 930

● **INTERACTIONS** → Appendix 1 (ethosuximide).

**SIDE-EFFECTS**

- **Common or very common** Anorexia · abdominal pain · diarrhoea · gastro-intestinal disturbances · nausea · vomiting · weight loss
- ▶ **Uncommon** Aggression · ataxia · dizziness · drowsiness · euphoria · fatigue · headache · hiccup · impaired concentration · irritability
- ▶ **Rare** Depression · dyskinesia · gingival hypertrophy · increased libido · myopia · photophobia · psychosis · rash · sleep disturbances · tongue swelling · vaginal bleeding
- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · hyperactivity · increase in seizure frequency · leucopenia · pancytopenia · Stevens-Johnson syndrome · suicidal ideation · systemic lupus erythematosus

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Blood disorders** Blood counts required if features of infection.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk. Hyperexcitability and sedation reported.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Ethosuximide for preventing seizures [www.medicinesforchildren.org.uk/ethosuximide-for-preventing-seizures](http://www.medicinesforchildren.org.uk/ethosuximide-for-preventing-seizures)

**Blood disorders** Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 8

▶ **Ethosuximide (Non-proprietary)**

**Ethosuximide 250 mg** Ethosuximide 250mg capsules | 56 capsule [PoM] £73.20 DT price = £73.20

**Oral solution**

CAUTIONARY AND ADVISORY LABELS 8

▶ **Ethosuximide (Non-proprietary)**

**Ethosuximide 50 mg per 1 ml** Ethosuximide 250mg/5ml syrup | 200 ml [PoM] £173.00 DT price = £4.22

**Fosphenytoin sodium**

● **DRUG ACTION** Fosphenytoin is a pro-drug of phenytoin.

**INDICATIONS AND DOSE****Status epilepticus**

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, dose to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

**Prophylaxis or treatment of seizures associated with neurosurgery or head injury**

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

**Temporary substitution for oral phenytoin**

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

● **UNLICENSED USE** Fosphenytoin sodium doses in BNF may differ from those in product literature.

● **CONTRA-INDICATIONS** Acute porphyrias p. 930 · second-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome · third-degree heart block

● **CAUTIONS** Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

● **INTERACTIONS** → Appendix 1 (fosphenytoin).

**SIDE-EFFECTS**

- ▶ **Common or very common** Alterations in respiratory function · arrhythmias · asthenia · cardiovascular collapse · cardiovascular depression (particularly if injection too

rapid) · chills · CNS depression (particularly if injection too rapid) · dry mouth · dysarthria · ecchymosis · euphoria · hypotension · incoordination · pruritus · respiratory arrest · taste disturbance · tinnitus · vasodilatation · visual disturbances

- ▶ **Uncommon** Decreased reflexes · hypoacusis · hyposaesthesia · increased reflexes · muscle spasm · muscle weakness · pain · stupor
- ▶ **Frequency not known** Confusion · extrapyramidal disorder · hyperglycaemia · purple glove syndrome · tonic seizures · twitching

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cardiovascular reactions** Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended:
  - monitor heart rate, blood pressure, and respiratory function for duration of infusion;
  - observe patient for at least 30 minutes after infusion;
  - if hypotension occurs, reduce infusion rate or discontinue;
  - reduce dose or infusion rate in elderly, and in renal or hepatic impairment.
- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine.
- **PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).
- **RENAL IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).
- **PRE-TREATMENT SCREENING** HLA-B\* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer recommends blood counts (but evidence of practical value uncertain).
  - ▶ With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion (Pro-Epanutin<sup>®</sup>)*, give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

ELECTROLYTES: May contain Phosphate

- ▶ **Pro-Epanutin** (Pfizer Ltd)

**Fosphenytoin sodium 75 mg per 1 ml** Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial (PoM) £400.00 (Hospital only)

## Gabapentin

### ● INDICATIONS AND DOSE

#### Adjunctive treatment of focal seizures with or without secondary generalisation

##### ▶ BY MOUTH

- ▶ Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day
- ▶ Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- ▶ Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

#### Monotherapy for focal seizures with or without secondary generalisation

##### ▶ BY MOUTH

- ▶ Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- ▶ Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

#### Peripheral neuropathic pain

##### ▶ BY MOUTH

- ▶ Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; maximum 3.6 g per day

#### Migraine prophylaxis

##### ▶ BY MOUTH

- ▶ Adult: Initially 300 mg daily, then increased to up to 2.4 g daily in divided doses, adjusted according to response

### ● UNLICENSED USE

- ▶ In children Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.

- ▶ In adults Not licensed for migraine prophylaxis.

#### IMPORTANT SAFETY INFORMATION

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

- **CAUTIONS** Diabetes mellitus · elderly · high doses of oral solution in adolescents and adults with low body-weight · history of psychotic illness · mixed seizures (including absences)
- **INTERACTIONS** → Appendix 1 (gabapentin).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abnormal reflexes · abnormal thoughts · acne · amnesia · anorexia · anxiety · arthralgia · ataxia · confusion · constipation · convulsions · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dry throat · dyspepsia · dyspnoea · emotional lability · fever · flatulence · flu syndrome · gingivitis · headache · hostility · hypertension · impotence · increased appetite · insomnia · leucopenia · malaise · movement disorders · myalgia · nausea · nervousness · nystagmus · oedema · paraesthesia · pharyngitis (in adults) · pruritus · rash · rhinitis · speech disorder · tremor · twitching · vasodilatation · vertigo · visual disturbances · vomiting · weight gain
  - ▶ **Uncommon** Palpitations
  - ▶ **Frequency not known** Acute renal failure · alopecia · blood glucose fluctuations in patients with diabetes · breast hypertrophy · gynaecomastia · hallucinations · hepatitis · hypersensitivity syndrome · incontinence · pancreatitis · Stevens-Johnson syndrome · suicidal ideation · thrombocytopenia · tinnitus
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT**
  - ▶ In adults Reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>—consult product literature.
  - ▶ In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m<sup>2</sup>; consult product literature.
- **EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Gabapentin for preventing seizures [www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures](http://www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Lacosamide

### ● INDICATIONS AND DOSE

#### Adjunctive treatment of focal seizures with or without secondary generalisation

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child 16–17 years: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)
- ▶ Adult: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)

#### Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child 16–17 years: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals
- ▶ Adult: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

- **CONTRA-INDICATIONS** Second- or third-degree AV block

- **CAUTIONS** Conduction problems · elderly (in adults) · risk of PR-interval prolongation · severe cardiac disease
- **INTERACTIONS** → Appendix 1 (lacosamide).  
Caution with concomitant use of drugs that prolong PR interval.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abnormal gait · blurred vision · cognitive disorder · constipation · depression · dizziness · drowsiness · fatigue · flatulence · headache · impaired coordination · nausea · nystagmus · pruritus · tremor · vomiting
  - ▶ **Rare** Multi-organ hypersensitivity reaction
  - ▶ **Frequency not known** Aggression · agitation · agranulocytosis · atrial fibrillation · atrial flutter · AV block · bradycardia · confusion · dry mouth · dysarthria · dyspepsia · euphoria · hypoesthesia · irritability · muscle spasm · PR-interval prolongation · psychosis · rash · suicidal ideation · tinnitus
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 286 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Titrate with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution. Titrate with caution in severe impairment, max. 250 mg daily.
  - ▶ In adults Consult product literature for loading dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Consult product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m<sup>2</sup>.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in children For *intravenous infusion*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.
  - ▶ With intravenous use in adults For *intravenous infusion* (*Vimpat*®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. May be administered undiluted.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include strawberry.
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Lacosamide for preventing seizures [www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures](http://www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures)
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (January 2009) that lacosamide (*Vimpat*®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

infusion vials | 1 vial [PoM] £29.70

## Lamotrigine

#### ● INDICATIONS AND DOSE

**Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome**

▶ BY MOUTH

- ▶ Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures with valproate |**

**Adjunctive therapy of primary and secondary**

**generalised tonic-clonic seizures with valproate |**

**Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate**

▶ BY MOUTH

- ▶ Child 2-11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 2-11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 12-17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

continued →

**Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate**

► BY MOUTH

- Child 2-11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7-14 days; maintenance 5-15 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
- Child 12-17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate**

► BY MOUTH

- Child 2-11 years: Initially 300 micrograms/kg daily in 1-2 divided doses for 14 days, then 600 micrograms/kg daily in 1-2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7-14 days; maintenance 1-10 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate**

► BY MOUTH

- Adult: Initially 25 mg once daily for 14 days, then 50 mg daily in 1-2 divided doses for further 14 days, then 100 mg daily in 1-2 divided doses for further 7 days; maintenance 200 mg daily in 1-2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

**Adjunctive therapy of bipolar disorder with valproate**

► BY MOUTH

- Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1-2 divided doses for further 7 days; maintenance 100 mg daily in 1-2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

**Adjunctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate**

► BY MOUTH

- Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Do not confuse the different combinations or indications.

- **CAUTIONS** Myoclonic seizures (may be exacerbated) · Parkinson's disease (may be exacerbated)(in adults)
- **INTERACTIONS** → Appendix 1 (lamotrigine).
- **SIDE-EFFECTS**
  - **Common or very common** Blurred vision · aggression · agitation · arthralgia · ataxia · back pain · diarrhoea · diplopia · dizziness · drowsiness · dry mouth · headache · insomnia · nausea · nystagmus · rash · tremor · vomiting
  - **Rare** Conjunctivitis
  - **Very rare** Anaemia · blood disorders · confusion · exacerbation of Parkinson's disease (in adults) · hallucination · hepatic failure · hypersensitivity syndrome · increase in seizure frequency · leucopenia · lupus erythematosus-like reactions · movement disorders · pancytopenia · thrombocytopenia · unsteadiness
  - **Frequency not known** Aseptic meningitis · suicidal ideation
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Skin reactions** Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.
  - **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 286 for more information.
  - **PREGNANCY** Doses should be adjusted on the basis of plasma-drug concentration monitoring.
  - **BREAST FEEDING** Present in milk, but limited data suggest no harmful effect on infant.
  - **HEPATIC IMPAIRMENT** Halve dose in moderate impairment. Quarter dose in severe impairment.

- **RENAL IMPAIRMENT** Consider reducing maintenance dose in significant impairment. Caution in renal failure; metabolite may accumulate.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic lamotrigine product. Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Lamotrigine for preventing seizures [www.medicinesforchildren.org.uk/lamotrigine-for-preventing-seizures](http://www.medicinesforchildren.org.uk/lamotrigine-for-preventing-seizures)  
Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.  
Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Levetiracetam

### ● INDICATIONS AND DOSE

#### Monotherapy of focal seizures with or without secondary generalisation

##### ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Child 16-17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

▶ Adult: Initially 250 mg once daily for 1-2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

#### Adjunctive therapy of focal seizures with or without secondary generalisation

##### ▶ BY MOUTH

▶ Child 1-5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks

▶ Child 6 months-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

▶ Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

▶ Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

##### ▶ BY INTRAVENOUS INFUSION

▶ Child 4-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

▶ Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

▶ Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

#### Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

##### ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Child 12-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

▶ Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

▶ Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

### ● UNLICENSED USE

▶ In adults Levetiracetam doses in BNF may differ from those in product literature.

▶ With oral use in children *Granules* not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg.

● **INTERACTIONS** → Appendix 1 (levetiracetam).

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · aggression · anorexia · anxiety · ataxia · convulsion · cough · depression · diarrhoea · dizziness · drowsiness · dyspepsia · headache · insomnia · irritability · malaise · nasopharyngitis · nausea · rash · tremor · vertigo · vomiting

► **Uncommon** Agitation · alopecia · amnesia · blurred vision · confusion · diplopia · eczema · impaired attention · leucopenia · myalgia · paraesthesia · pruritus · psychosis · suicidal ideation · thrombocytopenia · weight changes

► **Rare** Agranulocytosis · choreoathetosis · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyskinnesia · erythema multiforme · hepatic failure · hyponatraemia · neutropenia · pancreatitis · pancytopenia · Stevens-Johnson syndrome · toxic epidermal necrolysis

► **Frequency not known** Completed suicide · pancytopenia

● **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

### ● HEPATIC IMPAIRMENT

► In adults Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>.

► In children Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m<sup>2</sup>.

### ● RENAL IMPAIRMENT

► In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m<sup>2</sup> (consult product literature).

► In adults Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m<sup>2</sup>. Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

### ● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For *intravenous infusion (Keppra®)*, dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.

► With oral use For administration of *oral solution*, requisite dose may be diluted in a glass of water.

● **PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Levetiracetam for preventing seizures [www.medicinesforchildren.org.uk/levetiracetam-for-preventing-seizures](http://www.medicinesforchildren.org.uk/levetiracetam-for-preventing-seizures)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Oxcarbazepine

### ● INDICATIONS AND DOSE

**Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures**

#### ► BY MOUTH

► Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day

► Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures**

#### ► BY MOUTH

► Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response,

dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day

- ▶ **Adult:** Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

#### Treatment of primary generalised tonic-clonic seizures

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

- **UNLICENSED USE** Not licensed for the treatment of primary generalised tonic-clonic seizures.
- **CAUTIONS** Avoid in acute porphyrias p. 930 · cardiac conduction disorders · heart failure · hyponatraemia
- **INTERACTIONS** → Appendix 1 (oxcarbazepine).
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · acne · agitation · alopecia · amnesia · asthenia · ataxia · confusion · constipation · depression · diarrhoea · diplopia · dizziness · drowsiness · headache · hyponatraemia · impaired concentration · nausea · nystagmus · rash · tremor · visual disorders · vomiting
  - ▶ **Uncommon** Leucopenia · urticaria
  - ▶ **Very rare** Arrhythmias · atrioventricular block · hepatitis · multi-organ hypersensitivity disorders · pancreatitis · Stevens-Johnson syndrome · systemic lupus erythematosus · thrombocytopenia · toxic epidermal necrolysis
  - ▶ **Frequency not known** Aplastic anaemia · bone marrow depression · hypertension · hypothyroidism · neutropenia · osteoporotic bone disorders · pancytopenia · suicidal ideation
- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 286 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.
- **RENAL IMPAIRMENT**
  - ▶ In adults Halve initial dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; increase according to response at intervals of at least 1 week.
  - ▶ In children Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>, increase according to response at intervals of at least 1 week.
- **PRE-TREATMENT SCREENING** Test for HLA-B\*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B\*1502 allele).
- **MONITORING REQUIREMENTS**
  - ▶ Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
  - ▶ Monitor body-weight in patients with heart failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer's branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for

continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

#### ● PATIENT AND CARER ADVICE

Medicines for Children: Oxcarbazepine for preventing seizures [www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures](http://www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures)

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

##### ▶ Oxcarbazepine (Non-proprietary)

**Oxcarbazepine 150 mg** Oxcarbazepine 150mg tablets | 50 tablet [PoM](#) £11.14 DT price = £8.48

**Oxcarbazepine 300 mg** Oxcarbazepine 300mg tablets | 50 tablet [PoM](#) £22.61 DT price = £6.02

##### Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 8

EXCIPIENTS: May contain Propylene glycol

##### ▶ Trileptal (Novartis Pharmaceuticals UK Ltd)

**Oxcarbazepine 60 mg per 1 ml** Trileptal 60mg/ml oral suspension sugar-free | 250 mL [PoM](#) £48.96 DT price = £48.96

## Perampanel

#### ● INDICATIONS AND DOSE

##### Adjunctive treatment of focal seizures with or without secondary generalised seizures

##### ▶ BY MOUTH

- ▶ Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- ▶ Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

- **INTERACTIONS** → Appendix 1 (perampanel).
- **SIDE-EFFECTS** Aggression · anxiety · ataxia · back pain · blurred vision · changes in appetite · confusion · diplopia · dizziness · drowsiness · dysarthria · gait disturbance · irritability · malaise · nausea · suicidal behaviour · suicidal ideation · vertigo · weight increase
- **PREGNANCY** Manufacturer advises avoid. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in moderate or severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION**  
Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.  
Patients may need to be maintained on a specific manufacturer's branded or generic perampanel product.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Phenytoin

14-Dec-2016

#### ● INDICATIONS AND DOSE

**Tonic-clonic seizures | Focal seizures | Prevention and treatment of seizures during or following neurosurgery or severe head injury**

##### ► BY MOUTH

- Child 1 month-11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- Child 12-17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
- Adult: Initially 3–4 mg/kg daily, alternatively 150–300 mg once daily, alternatively 150–300 mg daily in 2 divided doses, alternatively maintenance 200–500 mg daily, to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-phenytoin concentration monitoring), exceptionally, higher doses may be used

**Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery**

##### ► INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1 month-11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily, to be given with blood pressure and ECG monitoring
- Child 12-17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day, to be given with blood pressure and ECG monitoring
- Adult: Loading dose 20 mg/kg (max. per dose 2 g), to be given at a rate not exceeding 1 mg/kg/minute (max. 50 mg per minute), to be given with blood pressure and ECG monitoring, then (by intravenous infusion or by

slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-concentration monitoring, to be given with blood pressure and ECG monitoring

#### DOSE EQUIVALENCE AND CONVERSION

- Preparations containing phenytoin sodium are **not** bioequivalent to those containing phenytoin base (such as *Epanutin Infatabs*® and *Epanutin*® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

#### ● UNLICENSED USE

- With oral use in children Licensed for use in children (age range not specified by manufacturer).
- With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

#### IMPORTANT SAFETY INFORMATION

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH AND SEVERE HARM FROM ERROR WITH INJECTABLE PHENYTOIN (NOVEMBER 2016)**

Use of injectable phenytoin is error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.

#### ● CONTRA-INDICATIONS

**GENERAL CONTRA-INDICATIONS**

Acute porphyrias p. 930

**SPECIFIC CONTRA-INDICATIONS**

- With intravenous use Second- and third-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome

#### ● CAUTIONS

**GENERAL CAUTIONS**

Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

**SPECIFIC CAUTIONS**

- With intravenous use Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Intramuscular phenytoin should not be used (absorption is slow and erratic).

- **INTERACTIONS** → Appendix 1 (phenytoin).

#### ● SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

- **Common or very common** Acne · anorexia · coarsening of facial appearance · constipation · dizziness · drowsiness · gingival hypertrophy and tenderness (maintain good oral hygiene) · headache · hirsutism · insomnia · nausea · paraesthesia · rash · transient nervousness · tremor · vomiting
- **Rare** Leucopenia · aplastic anaemia · blood disorders · dyskinesia · hepatotoxicity · lupus erythematosus · lymphadenopathy · megaloblastic anaemia · osteomalacia · peripheral neuropathy · polyarteritis nodosa · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis

- ▶ **Frequency not known** Hypersensitivity syndrome · interstitial nephritis · pneumonitis · polyarthropathy · suicidal ideation

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - ▶ With intravenous use Alterations in respiratory function · arrhythmias · cardiovascular collapse · cardiovascular depression (particularly if injection too rapid) · CNS depression (particularly if injection too rapid) · hypotension · respiratory arrest
  - ▶ **Frequency not known**
  - ▶ With intravenous use Purple glove syndrome · tonic seizures
- #### SIDE-EFFECTS, FURTHER INFORMATION
- ▶ Hepatotoxicity Discontinue immediately and do not re-administer.
  - ▶ Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.
  - ▶ Use in adolescents Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.
  - ▶ Bradycardia and hypotension
  - ▶ With intravenous use Reduce rate of administration if bradycardia or hypotension occurs.

#### Overdose

Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 286 for more information.
- **PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose to avoid toxicity.
- **PRE-TREATMENT SCREENING** HLAB\* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).
- **MONITORING REQUIREMENTS**
- ▶ In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.
- ▶ In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
- ▶ Manufacturer recommends blood counts (but evidence of practical value uncertain).
- ▶ With intravenous use Monitor ECG and blood pressure.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in children Before and after administration flush intravenous line with Sodium Chloride 0.9%. For *intravenous injection*, give into a large vein at rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). For *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding

1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation.

- ▶ With intravenous use in adults For *intravenous infusion* (Epanutin<sup>®</sup>), give intermittently in Sodium chloride 0.9%. Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation. To avoid local venous irritation each injection or infusion should be preceded and followed by an injection of sterile physiological saline through the same needle or catheter.
- **PRESCRIBING AND DISPENSING INFORMATION**
- Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.
- **PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Phenytoin for preventing seizures [www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures](http://www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures)
- Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

#### ● MEDICINAL FORMS

**Phenytoin 6 mg per 1 mL** Epanutin 30mg/5mL oral suspension | 500 mL [PoM] £4.27 DT price = £4.27

#### Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

ELECTROLYTES: May contain Sodium

##### ▶ Phenytoin (Non-proprietary)

**Phenytoin sodium 50 mg per 1 mL** Phenytoin sodium 250mg/5mL solution for injection ampoules | 5 ampoule [PoM] £15.50-£24.40 | 10 ampoule [PoM] no price available

##### ▶ Epanutin (Phenytoin sodium) (Pfizer Ltd)

**Phenytoin sodium 50 mg per 1 mL** Epanutin Ready-Mixed Parenteral 250mg/5mL solution for injection ampoules | 10 ampoule [PoM] £48.79

## Pregabalin

### ● INDICATIONS AND DOSE

#### Peripheral and central neuropathic pain

##### ► BY MOUTH

- Adult: Initially 150 mg daily in 2–3 divided doses, then increased if necessary to 300 mg daily in 2–3 divided doses, dose to be increased after 3–7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses, dose to be increased after 7 days

#### Adjunctive therapy for focal seizures with or without secondary generalisation

##### ► BY MOUTH

- Adult: Initially 25 mg twice daily, then increased in steps of 50 mg daily, dose to be increased at 7 day intervals, increased to 300 mg daily in 2–3 divided doses for 7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses

#### Generalised anxiety disorder

##### ► BY MOUTH

- Adult: Initially 150 mg daily in 2–3 divided doses, then increased in steps of 150 mg daily if required, dose to be increased at 7 day intervals, increased if necessary up to 600 mg daily in 2–3 divided doses

- **UNLICENSED USE** Pregabalin doses in BNF may differ from those in product literature.

- **CAUTIONS** Conditions that may precipitate encephalopathy · severe congestive heart failure

- **INTERACTIONS** → Appendix 1 (pregabalin).

### ● SIDE-EFFECTS

- **Common or very common** Appetite changes · blurred vision · confusion · constipation · diplopia · disturbances in muscle control and movement · dizziness · drowsiness · dry mouth · euphoria · flatulence · impaired attention · impaired memory · insomnia · irritability · malaise · oedema · paraesthesia · sexual dysfunction · speech disorder · visual disturbances · visual field defects · vomiting · weight gain

- **Uncommon** Abdominal distension · abnormal dreams · agitation · arthralgia · chills · cognitive impairment · depersonalisation · depression · dry eye · dyspnoea · dysuria · first-degree AV block · flushing · gastro-oesophageal reflux disease · hallucinations · hyperacusis · hypersalivation · hypertension · hypoglycaemia · hypotension · hypotension · lacrimation · myalgia · nasal dryness · nasopharyngitis · panic attacks · rash · stupor · sweating · syncope · tachycardia · taste disturbance · thirst · thrombocytopenia · urinary incontinence

- **Rare** Arrhythmia · ascites · bradycardia · breast discharge · breast hypertrophy · breast pain · cold extremities · cough · dysphagia · epistaxis · hyperglycaemia · hypokalaemia · leucopenia · menstrual disturbances · neutropenia · oliguria · pancreatitis · parosmia · renal failure · rhabdomyolysis · rhinitis · urticaria · weight loss

- **Frequency not known** Aggression · congestive heart failure · convulsions · diarrhoea · encephalopathy · headache · keratitis · nausea · pruritus · QT-interval prolongation · Stevens-Johnson syndrome · suicidal ideation · urinary retention

- **RENAL IMPAIRMENT** Initially 75 mg daily and maximum 300 mg daily if eGFR 30–60 mL/minute/1.73 m<sup>2</sup>. Initially 25–50 mg daily and maximum 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>. Initially 25 mg once daily and maximum 75 mg once daily if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper over at least 1 week).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2007) that pregabalin (*Lyrica*®) is not recommended for the treatment of central neuropathic pain.

The *Scottish Medicines Consortium* has advised (April 2009) that pregabalin (*Lyrica*®) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Capsule

## Retigabine

● **INDICATIONS AND DOSE**

**Adjunctive treatment of drug-resistant focal seizures with or without secondary generalisation when other appropriate drug combinations have proved inadequate or have not been tolerated**

▶ **BY MOUTH**

- ▶ **Adult:** Initially up to 300 mg daily in 3 divided doses, then increased in steps of up to 150 mg every week, adjusted according to response; maintenance 0.6–1.2 g daily
- ▶ **Elderly:** Initially 150 mg daily in 3 divided doses, then increased in steps of up to 150 mg every week, adjusted according to response; maximum 900 mg per day

- **CAUTIONS** Known QT-interval prolongation · risk of urinary retention

**CAUTIONS, FURTHER INFORMATION**

- ▶ **QT-interval prolongation** Patients with known QT-interval prolongation, or with the following risk factors for QT interval prolongation, should be carefully monitored while taking retigabine: cardiac failure, ventricular hypertrophy, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval.

- **INTERACTIONS** → Appendix 1 (retigabine).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Amnesia · anxiety · blurred vision · confusion · constipation · diplopia · discoloration of lips · discoloration of nails · discoloration of ocular tissue · discoloration of skin · dizziness · drowsiness · dry mouth · dysuria · haematuria · impaired attention · impaired coordination · impaired speech · increased appetite · malaise · myoclonus · nausea · paraesthesia · peripheral oedema · psychosis · tremor · vertigo · visual impairment · weight gain
- ▶ **Uncommon** Dyspepsia · dysphagia · hypokinesia · nephrolithiasis · rash · suicidal ideation · sweating · urinary retention

- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** Reduce dose by 50% in moderate to severe impairment; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).
- **RENAL IMPAIRMENT** Reduce dose by 50% if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).
- **MONITORING REQUIREMENTS**
  - ▶ Ophthalmological monitoring. A comprehensive ophthalmological examination (including visual acuity test, slit-lamp examination, and dilated funduscopy) should be performed at initiation of treatment and at least every 6 months thereafter during treatment. Changes in vision or retinal pigment should lead to re-assessment of the benefits and risks of continuing treatment—discontinue unless no other treatment options are available. Monitoring should be increased if treatment is continued.
  - ▶ Monitor for discoloration of ocular tissue and visual impairment.
  - ▶ Monitor for blue-grey discoloration of nails, lips and skin—continue treatment only if potential benefit outweighs risk.
- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic retigabine product.

● **NATIONAL FUNDING/ACCESS DECISIONS**

● **NICE technology appraisals (TAs)**

- ▶ **Retigabine for the adjunctive treatment of partial onset seizures in epilepsy (July 2011)** NICE TA232  
Retigabine is recommended as an option for the adjunctive treatment of partial onset seizures with or without secondary generalisation in adults aged 18 years and older with epilepsy, only when previous treatment with carbamazepine, clobazam, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, and topiramate has not provided an adequate response, or has not been tolerated.  
[www.nice.org.uk/TA232](http://www.nice.org.uk/TA232)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2011) that retigabine (*Trobal*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

## Rufinamide

### ● INDICATIONS AND DOSE

#### Adjunctive treatment of seizures in Lennox-Gastaut syndrome

##### ▶ BY MOUTH

- ▶ Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 30-49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 50-69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 30-49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 50-69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

#### Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate

##### ▶ BY MOUTH

- ▶ Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

- **INTERACTIONS** → Appendix 1 (rufinamide).
- **SIDE-EFFECTS** Abdominal pain · acne · anorexia · anxiety · back pain · blurred vision · constipation · diarrhoea · diplopia · dizziness · drowsiness · dyspepsia · epistaxis · fatigue · gait disturbances · headache · hyperactivity · hypersensitivity syndrome · impaired coordination · increase in seizure frequency · influenza-like symptoms · insomnia · nausea · nystagmus · oligomenorrhoea · rash · rhinitis · tremor · vomiting · weight loss
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 286 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution and careful dose titration in mild to moderate impairment. Avoid in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and given in half a glass of water.

### ● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic rufinamide product.

### ● PATIENT AND CARER ADVICE

Counselling on antiepileptic hypersensitivity syndrome is advised.

Medicines for Children leaflet: Rufinamide for preventing seizures [www.medicinesforchildren.org.uk/rufinamide-for-preventing-seizures](http://www.medicinesforchildren.org.uk/rufinamide-for-preventing-seizures)

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2008) that rufinamide (*Inovelon*<sup>®</sup>) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Sodium valproate

09-Jun-2016

### ● INDICATIONS AND DOSE

#### All forms of epilepsy

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month-11 years: Initially 10-15 mg/kg daily in 1-2 divided doses (max. per dose 600 mg); maintenance 25-30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- ▶ Child 12-17 years: Initially 600 mg daily in 1-2 divided doses, increased in steps of 150-300 mg every 3 days; maintenance 1-2 g daily in 2 divided doses; maximum 2.5 g per day
- ▶ Adult: Initially 600 mg daily in 1-2 divided doses, then increased in steps of 150-300 mg every 3 days; maintenance 1-2 g daily, alternatively maintenance 20-30 mg/kg daily; maximum 2.5 g per day

**Initiation of valproate treatment**

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

**Continuation of valproate treatment**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection *or* in 2–4 divided doses by intravenous infusion

**Migraine prophylaxis**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

**EPILIM CHRONOSPHERE<sup>®</sup>****All forms of epilepsy**

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**EPILIM CHRONO<sup>®</sup>****All forms of epilepsy**

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**EPISENTA<sup>®</sup> CAPSULES****All forms of epilepsy**

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**Mania**

- ▶ BY MOUTH
- ▶ Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

**EPISENTA<sup>®</sup> GRANULES****All forms of epilepsy**

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**Mania**

- ▶ BY MOUTH
- ▶ Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

**EPIVAL<sup>®</sup>****All forms of epilepsy**

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

- **UNLICENSED USE** Not licensed for migraine prophylaxis.

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE: VALPROATE AND RISK OF ABNORMAL PREGNANCY OUTCOMES**

Infants exposed to valproate in utero are at a high risk of serious developmental disorders (up to 30–40% risk) and

congenital malformations (approx. 11% risk). Valproate should not be used in female children, females of childbearing potential or during pregnancy unless alternative treatments are ineffective or not tolerated.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 • acute or suspected mitochondrial disorders (higher rate of known liver failure and liver-related deaths) • personal or family history of severe hepatic dysfunction

- **CAUTIONS** Systemic lupus erythematosus

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- ▶ Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

- **INTERACTIONS** → Appendix 1 (sodium valproate).

**● SIDE-EFFECTS**

- ▶ **Common or very common** Aggression • anaemia • confusion • convulsion • deafness • diarrhoea • extrapyramidal disorders • gastric irritation • haemorrhage • headache • hyponatraemia • memory impairment • menstrual disturbance • nausea • nystagmus • somnolence • stupor • thrombocytopenia • transient hair loss (regrowth may be curly) • tremor • weight gain
- ▶ **Uncommon** Angioedema • ataxia • coma • encephalopathy • increased alertness • lethargy • leucopenia • pancytopenia • paraesthesia • peripheral oedema • rash • reduced bone mineral density • syndrome of inappropriate secretion of antidiuretic hormone • vasculitis
- ▶ **Rare** Behavioural disturbance • blood disorders • bone marrow failure • dementia (in adults) • drowsiness • drug rash with eosinophilia and systemic symptoms (DRESS) syndrome • enuresis • Fanconi's syndrome • hallucinations • hearing loss • hyperactivity • hyperammonaemia • hypothyroidism • learning disorders • male infertility • myelodysplastic syndrome • polycystic ovaries • Stevens-Johnson syndrome • systemic lupus erythematosus • toxic epidermal necrolysis
- ▶ **Very rare** Acne • gynaecomastia • hepatic dysfunction • hirsutism • increase in bleeding time • pancreatitis
- ▶ **Frequency not known** Hypersensitivity reactions • suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
- ▶ Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.
- **CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Exclude pregnancy before treatment—effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

- **PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia) reported. Neonatal hepatotoxicity also reported.

Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.
- **RENAL IMPAIRMENT** Reduce dose.
- **MONITORING REQUIREMENTS**
  - ▶ Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
  - ▶ Monitor liver function before therapy and during first 6 months especially in patients most at risk.
  - ▶ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION**  Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. 
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Epilim*<sup>®</sup>, *Episenta*<sup>®</sup>), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute *Epilim*<sup>®</sup> with solvent provided then dilute with infusion fluid.

**EPIVAL**<sup>®</sup> Tablets may be halved but not crushed or chewed.

**EPISENTA**<sup>®</sup> CAPSULES Contents of capsule may be mixed with soft food or drink that is cold or at room temperature and swallowed immediately without chewing.

**EPIILIM**<sup>®</sup> SYRUP May be diluted, preferably in Syrup BP; use within 14 days.

**EPISENTA**<sup>®</sup> GRANULES Granules may be mixed with soft food or drink that is cold or at room temperature and swallowed immediately without chewing.

**EPIILIM CHRONOSPHERE**<sup>®</sup> Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral sodium valproate product.

**EPIILIM CHRONOSPHERE**<sup>®</sup> Prescribe dose to the nearest whole 50-mg sachet.

#### ● PATIENT AND CARER ADVICE

Risk of abnormal pregnancy outcomes A patient guide and card should be provided to all female patients.

Medicines for Children leaflet: Sodium valproate for preventing seizures [www.medicinesforchildren.org.uk/sodium-valproate-for-preventing-seizures](http://www.medicinesforchildren.org.uk/sodium-valproate-for-preventing-seizures)

**Blood or hepatic disorders** Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

**Pancreatitis** Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

**MHRA advice: Valproate and the risk of abnormal pregnancy outcomes** Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:

- the risks associated with valproate during pregnancy;
- the need to use effective contraception;
- the need for regular review of treatment;
- the need to rapidly consult if she is planning a pregnancy or becomes pregnant

**EPISENTA**<sup>®</sup> CAPSULES Patients and carers should be counselled on the administration of capsules.

**EPISENTA**<sup>®</sup> GRANULES Patients and carers should be counselled on the administration of granules.

**EPIILIM CHRONOSPHERE**<sup>®</sup> Patients and carers should be counselled on the administration of granules.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

##### Tablet

CAUTIONARY AND ADVISORY LABELS 8, 10, 21

##### ▶ **Epilim** (Sanofi) ▼

**Sodium valproate 100 mg** Epilim 100mg crushable tablets | 100 tablet  £5.60 DT price = £5.60

**Topiramate**● **INDICATIONS AND DOSE****Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation**▶ **BY MOUTH**

▶ Child 6-17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day

▶ Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

continued →

**Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome**

► BY MOUTH

- Child 2-17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day
- Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

**Migraine prophylaxis**

► BY MOUTH

- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

- **CAUTIONS** Avoid in acute porphyrias p. 930 · risk of metabolic acidosis · risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

- **INTERACTIONS** → Appendix 1 (topiramate).

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · aggression · agitation · alopecia · anaemia · anxiety · appetite changes · arthralgia · cognitive impairment · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · dyspnoea · epistaxis · gastritis · impaired attention · impaired coordination · irritability · malaise · mood changes · movement disorders · muscle spasm · muscular weakness · myalgia · nausea · nephrolithiasis · nystagmus · paraesthesia · pruritus · rash · seizures · sleep disturbance · speech disorder · taste disturbance · tinnitus · tremor · urinary disorders · visual disturbances · vomiting
- **Uncommon** Abdominal distension · altered sense of smell · blepharospasm · blood disorders · bradycardia · dry eye · flatulence · flushing · gingival bleeding · glossodynia · haematuria · halitosis · hearing loss · hypokalaemia · hypotension · increased lacrimation · influenza-like symptoms · leucopenia · metabolic acidosis · mydriasis · neutropenia · palpitation · pancreatitis · panic attack · peripheral neuropathy · photophobia · postural hypotension · psychosis · reduced sweating · salivation · sexual dysfunction · skin discoloration · suicidal ideation · thirst · thrombocytopenia · urinary calculus
- **Rare** Abnormal skin odour · calcinosis · hepatic failure · hepatitis · periorbital oedema · Raynaud's syndrome · Stevens-Johnson syndrome · unilateral blindness
- **Very rare** Angle-closure glaucoma
- **Frequency not known** Encephalopathy · hyperammonaemia · maculopathy · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Acute myopia with secondary angle-closure glaucoma Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs:
  - seek specialist ophthalmological advice;
  - use appropriate measures to reduce intra-ocular pressure;

- stop topiramate as rapidly as feasible
- **PREGNANCY** Increased risk of cleft palate if taken in the first trimester of pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

It is recommended that the fetal growth should be monitored.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—clearance may be reduced.
- **RENAL IMPAIRMENT**
  - In adults Half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m<sup>2</sup>—reduced clearance and longer time to steady-state plasma concentration.
  - In children Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m<sup>2</sup>—reduced clearance and longer time to steady-state plasma concentration. Use with caution.

● **DIRECTIONS FOR ADMINISTRATION**

**TOPAMAX® CAPSULES** Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic topiramate product.

● **PATIENT AND CARER ADVICE**

## Vigabatrin

### ● INDICATIONS AND DOSE

**Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)**

▶ BY MOUTH

- ▶ Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
- ▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
- ▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
- ▶ Adult: Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

▶ BY RECTUM

- ▶ Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
- ▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
- ▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

- **UNLICENSED USE** Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

- **CONTRA-INDICATIONS** Visual field defects

- **CAUTIONS** Elderly · history of behavioural problems · history of depression · history of psychosis

### CAUTIONS, FURTHER INFORMATION

Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

- ▶ Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

- **INTERACTIONS** → Appendix 1 (vigabatrin).

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · aggression · agitation · blurred vision · depression · diplopia · dizziness · drowsiness · excitation (in children) · fatigue · headache ·

impaired concentration · impaired memory · irritability · nausea · nervousness · nystagmus · oedema · paraesthesia · paranoia · speech disorder · tremor · visual field defects · vomiting · weight gain

- ▶ **Uncommon** Ataxia · mania · occasional increase in seizure frequency (especially if myoclonic) · psychosis · rash
- ▶ **Rare** Peripheral retinal neuropathy · retinal disorders · suicidal ideation
- ▶ **Very rare** Hepatitis · optic atrophy · optic neuritis
- ▶ **Frequency not known** Movement disorders in infantile spasms

### SIDE-EFFECTS, FURTHER INFORMATION

Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur *rarely*—reduce dose or withdraw.

- ▶ Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and **careful monitoring** for this side-effect are required.

- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

### ● RENAL IMPAIRMENT

- ▶ In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Closely monitor neurological function.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- ▶ With rectal use Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].

### ● PATIENT AND CARER ADVICE

Patients and their carers should be warned to report any new visual symptoms that develop.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

- ▶ **Sabril** (Sanofi)

**Vigabatrin 500 mg** Sabril 500mg tablets | 100 tablet (PoM) £44.41 DT price = £44.41

#### Powder

CAUTIONARY AND ADVISORY LABELS 3, 8, 13

- ▶ **Sabril** (Sanofi)

**Vigabatrin 500 mg** Sabril 500mg oral powder sachets sugar-free | 50 sachet (PoM) £24.60 DT price = £24.60

## Zonisamide

### ● INDICATIONS AND DOSE

**Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy**

▶ BY MOUTH

- ▶ Adult: Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

continued →

**Adjunctive treatment for refractory focal seizures with or without secondary generalisation**

## ▶ BY MOUTH

- ▶ Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- ▶ Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- ▶ Adult: Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300–500 mg daily in 1–2 divided doses, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

- **CAUTIONS** Elderly · low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) · metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) · risk factors for renal stone formation (particularly predisposition to nephrolithiasis)

**CAUTIONS, FURTHER INFORMATION**

Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children).

- **INTERACTIONS** → Appendix 1 (zonisamide).
  - ▶ In adults Caution with concomitant use of drugs that increase risk of hyperthermia, metabolic acidosis, or nephrolithiasis.
  - ▶ In children Caution with concomitant use of drugs that increase risk of nephrolithiasis. Contra-indicated with use of drugs that increase risk of hyperthermia or metabolic acidosis.

**● SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · agitation · alopecia · anorexia · ataxia · confusion · constipation · depression · diarrhoea · diplopia · dizziness · drowsiness · ecchymosis · fatigue · impaired attention · impaired memory · insomnia · irritability · nausea · nystagmus · paraesthesia · peripheral oedema · pruritus · psychosis · pyrexia · rash (consider withdrawal) · speech disorder · tremor · weight loss
- ▶ **Uncommon** Aggression · cholecystitis · cholelithiasis · dyspepsia · hypokalaemia · pneumonia · seizures · suicidal ideation · urinary calculus · urinary tract infection · vomiting
- ▶ **Very rare** Amnesia · aspiration · blood disorders · coma · dyspnoea · hallucinations · heat stroke · hepatitis · hydropnephrosis · impaired sweating · metabolic acidosis · myasthenic syndrome · neuroleptic malignant syndrome · pancreatitis · renal failure · renal tubular acidosis · rhabdomyolysis · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity. Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 286 for more information.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.
- **HEPATIC IMPAIRMENT** Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic zonisamide product.

**● PATIENT AND CARER ADVICE**

Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

Medicines for Children leaflet: Zonisamide for preventing seizures [www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures](http://www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures)

**● NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2014) that zonisamide (*Zonegran*<sup>®</sup>) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

## ANTI-EPILEPTICS &gt; BARBITURATES

## Phenobarbital

(Phenobarbitone)

## ● INDICATIONS AND DOSE

**All forms of epilepsy except typical absence seizures**

## ▶ BY MOUTH

- ▶ Child 1 month–11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day
- ▶ Child 12–17 years: 60–180 mg once daily
- ▶ Adult: 60–180 mg once daily, dose to be taken at night

**Status epilepticus**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections

## ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Child 1 month–11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
- ▶ Child 12–17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

- **CAUTIONS** Avoid in acute porphyrias p. 930 · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS** → Appendix 1 (phenobarbital).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Agranulocytosis · allergic skin reactions · ataxia · behavioural disturbances · cholestasis · depression · drowsiness · hallucinations · hepatitis · hyperactivity particularly in the elderly and in children · hypotension · impaired cognition · impaired memory · irritability · lethargy · megaloblastic anaemia (may be treated with folic acid) · nystagmus · osteomalacia · paradoxical excitement (in adults) · respiratory depression · thrombocytopenia
- ▶ **Very rare** Antiepileptic Hypersensitivity Syndrome · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- ▶ **Frequency not known** Hyperkinesia (in children)

**Overdose**

For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1204.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 286 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Avoid if possible; drowsiness may occur.
- **HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
  - ▶ Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre);

however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use For administration by *mouth*, tablets may be crushed.
  - ▶ With intravenous use in adults Solution for injection must be diluted before intravenous administration.
  - ▶ With intravenous use in children For *intravenous injection*, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).
- **PRESCRIBING AND DISPENSING INFORMATION** Some hospitals supply **alcohol-free** formulations of varying phenobarbital strengths. Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer's product.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Phenobarbital for preventing seizures [www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures](http://www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures)

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

F 320

**Clobazam**● **INDICATIONS AND DOSE****Adjunct in epilepsy**

## ▶ BY MOUTH

- ▶ Child 6-17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day
- ▶ Adult: 20–30 mg daily, then increased if necessary up to 60 mg daily

**Anxiety (short-term use)**

## ▶ BY MOUTH

- ▶ Adult: 20–30 mg daily in divided doses, alternatively 20–30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose
- ▶ Elderly: 10–20 mg daily

- **UNLICENSED USE** Not licensed for use in children under 6 years.

**IMPORTANT SAFETY INFORMATION**

Do **not** confuse with clonazepam.

- **CONTRA-INDICATIONS** Chronic psychosis (in adults) · hyperkinesia · not for use alone to treat anxiety associated with depression (in adults) · obsessional states · phobic states · respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence
- CAUTIONS, FURTHER INFORMATION**  
The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
  - ▶ **Uncommon** Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
  - ▶ **Rare** Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in

children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)

▶ **Frequency not known** Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · psychosis (in children) · restlessness (in children)

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **MONITORING REQUIREMENTS**

▶ In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected non-compliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic clobazam product.

- **PATIENT AND CARER ADVICE**

## Clonazepam

- **INDICATIONS AND DOSE**

**All forms of epilepsy**

- ▶ **BY MOUTH**

- ▶ Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 0.5-1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- ▶ Child 1-4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 1-3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- ▶ Child 5-11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 3-6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- ▶ Child 12-17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 4-8 mg daily, dose usually taken at night; may be given in 3-4 divided doses if necessary

**All forms of epilepsy | Myoclonus**

- ▶ **BY MOUTH**

- ▶ Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 4-8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3-4 divided doses if necessary
- ▶ Elderly: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 4-8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3-4 divided doses if necessary

**Panic disorders (with or without agoraphobia) resistant to antidepressant therapy**

- ▶ **BY MOUTH**

- ▶ Adult: 1-2 mg daily

- **UNLICENSED USE** Clonazepam doses in BNF may differ from those in product literature. Use for panic disorders (with or without agoraphobia) resistant to antidepressant therapy is an unlicensed indication.

**IMPORTANT SAFETY INFORMATION**

Do **not** confuse with clobazam.

- **CONTRA-INDICATIONS** Coma · current alcohol abuse · current drug abuse · respiratory depression
- **CAUTIONS** Acute porphyrias p. 930 · airways obstruction · brain damage · cerebellar ataxia · depression · spinal ataxia · suicidal ideation
- **CAUTIONS, FURTHER INFORMATION**  
The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Amnesia · bronchial hypersecretion in infants and small children · co-ordination disturbances · confusion · dependence · dizziness · drowsiness · fatigue · muscle hypotonia · nystagmus · poor concentration · restlessness · salivary hypersecretion in infants and small children · withdrawal symptoms (in children)
  - ▶ **Rare** Aggression · anxiety · blood disorders · dysarthria · gastro-intestinal symptoms · headache · paradoxical

effects · pruritus · respiratory depression · reversible hair loss · sexual dysfunction · skin pigmentation changes · suicidal ideation (in adults) · urinary incontinence · urticaria · visual disturbances on long-term treatment

- ▶ **Very rare** Increase in seizure frequency
- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.
  - ▶ All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.
- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. ## 2.1 Status epilepticus

**Other drugs used for Status epilepticus** Diazepam, p. 321 · Fosphenytoin sodium, p. 294 · Phenobarbital, p. 313 · Phenytoin, p. 302

### ANTIPILEPTICS > BARBITURATES

## Thiopental sodium

### (Thiopentone sodium)

#### ● INDICATIONS AND DOSE

##### Status epilepticus (only if other measures fail)

###### ▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 75–125 mg for 1 dose, to be administered as a 2.5% (25 mg/mL) solution

##### Induction of anaesthesia

###### ▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

##### Anaesthesia of short duration

###### ▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

##### Reduction of raised intracranial pressure if ventilation controlled

###### ▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1.5–3 mg/kg, repeated if necessary

#### IMPORTANT SAFETY INFORMATION

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · myotonic dystrophy
- **CAUTIONS** Acute circulatory failure (shock) · avoid intra-arterial injection · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia · reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)
- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Arrhythmias · cough · headache · hypersensitivity reactions · hypotension · laryngeal spasm · myocardial depression · rash · sneezing
- **PREGNANCY** May depress neonatal respiration when used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution—reduce dose.
- **RENAL IMPAIRMENT** Caution in severe impairment.

## ● PATIENT AND CARER ADVICE

### Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### Powder for solution for injection

#### ▶ Thiopental sodium (Non-proprietary)

**Thiopental sodium 500 mg** Thiopental 500mg powder for solution for injection vials | 25 vial [PoM] £172.50

## HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

F 320

### Lorazepam

#### ● INDICATIONS AND DOSE

##### Short-term use in anxiety

###### ▶ BY MOUTH

- ▶ Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
- ▶ Elderly: 0.5–2 mg daily in divided doses

##### Short-term use in insomnia associated with anxiety

###### ▶ BY MOUTH

- ▶ Adult: 1–2 mg daily, to be taken at bedtime

##### Acute panic attacks

###### ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

##### Conscious sedation for procedures

###### ▶ BY MOUTH

- ▶ Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

###### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

###### ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

##### Premedication

###### ▶ BY MOUTH

- ▶ Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

###### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

###### ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

##### Status epilepticus | Febrile convulsions | Convulsions caused by poisoning

###### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein
- ▶ Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

- ▶ Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

## ● UNLICENSED USE

- ▶ In children Not licensed for use in febrile convulsions. Not licensed for use in convulsions caused by poisoning.

### IMPORTANT SAFETY INFORMATION

#### ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessional states · phobic states · respiratory depression
- **CAUTIONS** Personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence · muscle weakness · organic brain changes · parenteral administration
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
  - ▶ Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Amnesia · ataxia (in children) · ataxia (especially in the elderly)(in adults) · confusion (in children) · confusion (especially in the elderly)(in adults) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
  - ▶ **Uncommon** Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
  - ▶ **Rare** Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)
  - ▶ **Frequency not known** Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential) · pain (on intravenous injection) · psychosis (in children) · restlessness (in children) · thrombophlebitis (on intravenous injection)
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
- ▶ In adults If treatment is necessary, benzodiazepines with shorter half-lives are safer.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *intravenous injection*, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.
- ▶ With intramuscular use in adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible).
- ▶ With intravenous use in adults For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 19

#### ▶ Lorazepam (Non-proprietary)

**Lorazepam 1 mg** Lorazepam 1mg tablets | 28 tablet [PoM] £6.75 DT price = £2.35 [CD4-1] | 30 tablet [PoM] no price available [CD4-1]

**Lorazepam 2.5 mg** Lorazepam 2.5mg tablets | 28 tablet [PoM] £12.50 DT price = £2.95 [CD4-1] | 30 tablet [PoM] no price available [CD4-1]

#### Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

#### ▶ Ativan (Pfizer Ltd)

**Lorazepam 4 mg per 1 ml** Ativan 4mg/1ml solution for injection ampoules | 10 ampoule [PoM] £3.54 [CD4-1]

320

## Midazolam

21-Nov-2016

### ● INDICATIONS AND DOSE

#### Status epilepticus | Febrile convulsions

##### ▶ BY BUCCAL ADMINISTRATION

- ▶ Child 1–2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- ▶ Child 3–11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- ▶ Child 1–4 years: 5 mg, then 5 mg after 10 minutes if required
- ▶ Child 5–9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- ▶ Child 10–17 years: 10 mg, then 10 mg after 10 minutes if required
- ▶ Adult: 10 mg, then 10 mg after 10 minutes if required

#### Conscious sedation for procedures

##### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 2–2.5 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg

if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course

- ▶ Elderly: Initially 0.5–1 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 0.5–1 mg if required; maximum 3.5 mg per course

#### Sedative in combined anaesthesia

##### ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour
- ▶ Elderly: Lower doses needed

#### Premedication

##### ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 70–100 micrograms/kg, to be administered 20–60 minutes before induction, for debilitated patients, use elderly dose
- ▶ Elderly: 25–50 micrograms/kg, to be administered 20–60 minutes before induction

##### ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 1–2 mg, repeated if necessary, to be administered 5–30 minutes before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 0.5 mg, repeated if necessary, initial dose to be administered 5–30 minutes before procedure, repeat dose slowly as required

#### Induction of anaesthesia (but rarely used)

##### ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose
- ▶ Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

#### Sedation of patient receiving intensive care

##### ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

#### Confusion and restlessness in palliative care (adjunct to antipsychotic)

##### ▶ BY SUBCUTANEOUS INFUSION

- ▶ Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

#### Convulsions in palliative care

##### ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION

- ▶ Adult: Initially 20–40 mg/24 hours

- **UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Oromucosal solution not licensed for use in adults over 18 years. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature.

### IMPORTANT SAFETY INFORMATION

#### ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

#### PRESCRIBING OF MIDAZOLAM IN PALLIATIVE CARE

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and

where the risk of overdosage has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **CONTRA-INDICATIONS** CNS depression · compromised airway · severe respiratory depression
- **CAUTIONS** Cardiac disease · children (particularly if cardiovascular impairment) · concentration of midazolam in children under 15 kg not to exceed 1 mg/mL · debilitated patients (reduce dose)(in children) · hypothermia · hypovolaemia (risk of severe hypotension) · neonates · risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) · vasoconstriction
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.
- **SIDE-EFFECTS** Amnesia · anaphylaxis · ataxia · blood disorders · bronchospasm · cardiac arrest · changes in libido (in adults) · confusion · convulsions (more common in neonates) · depression of consciousness · dizziness · drowsiness · dry mouth · dysarthria · euphoria · fatigue (in children) · gastro-intestinal disturbances · hallucinations · headache · heart rate changes · hiccups · hypotension · incontinence · increased appetite · injection-site reactions · involuntary movements · jaundice · laryngospasm · muscle weakness · paradoxical aggression (especially in children and elderly) · paradoxical excitement (especially in children and elderly) · respiratory arrest (particularly with high doses or on rapid injection) · respiratory depression (may be severe with sedative and peri-operative use—facilities for its treatment are essential) · respiratory depression (particularly with high doses or on rapid injection) · restlessness (with sedative and peri-operative use) (in children) · salivation changes · severe disinhibition (with sedative and peri-operative use) (in children) · skin reactions · thrombosis · urinary retention · vertigo · visual disturbances
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs.
- **Overdose** There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.
- **BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).
- **HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epilepticus and febrile convulsions: use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Hypnovel*<sup>®</sup>), give continuously in Glucose 5% or Sodium chloride 0.9%.

## ● PRESCRIBING AND DISPENSING INFORMATION

### Palliative care

For further information on the use of midazolam in palliative care, see [www.palliativedrugs.com/formulary/en/midazolam.html](http://www.palliativedrugs.com/formulary/en/midazolam.html).

## ● PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer midazolam oromucosal solution.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

## 3 Mental health disorders

### 3.1 Anxiety

**Other drugs used for Anxiety** Duloxetine, p. 345 · Escitalopram, p. 342 · Lorazepam, p. 317 · Moclobemide, p. 340 · Oxprenolol hydrochloride, p. 141 · Paroxetine, p. 344 · Pericyazine, p. 364 · Perphenazine, p. 364 · Pregabalin, p. 304 · Trazodone hydrochloride, p. 347 · Trifluoperazine, p. 366 · Venlafaxine, p. 345

#### ANTIDEPRESSANTS > SEROTONIN RECEPTOR AGONISTS

### Bupirone hydrochloride

#### ● INDICATIONS AND DOSE

##### Anxiety (short-term use)

###### ► BY MOUTH

► **Adult:** 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · epilepsy
- **CAUTIONS** Does not alleviate symptoms of benzodiazepine withdrawal

#### CAUTIONS, FURTHER INFORMATION

A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting bupirone.

- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
  - **Common or very common** Dizziness · excitement · headache · nausea · nervousness
  - **Rare** Chest pain · confusion · drowsiness · dry mouth · fatigue · palpitation · seizures · sweating · tachycardia
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate disease. Avoid in severe disease.
- **RENAL IMPAIRMENT** Reduce dose. Avoid if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**  
May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

###### ► Bupirone hydrochloride (Non-proprietary)

**Bupirone hydrochloride 5 mg** Bupirone 5mg tablets | 30 tablet [POM] £13.30 DT price = £3.38

**Bupirone hydrochloride 10 mg** Bupirone 10mg tablets | 30 tablet [POM] £15.62 DT price = £4.20

#### HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

### Benzodiazepines

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · debilitated patients (reduce dose)(in adults) ·

elderly (reduce dose) · history of alcohol dependence or abuse · history of drug dependence or abuse · myasthenia gravis · respiratory disease

#### CAUTIONS, FURTHER INFORMATION

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**

##### Overdose

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1204.

- **PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see *Drugs and driving* under Guidance on prescribing p. 1.

▮ above

### Alprazolam

#### ● INDICATIONS AND DOSE

##### Short-term use in anxiety

###### ► BY MOUTH

- **Adult:** 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose
- **Elderly:** 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence
- **SIDE-EFFECTS**
  - **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
  - **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
  - **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
  - **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.
  - **RENAL IMPAIRMENT** Start with small doses in severe impairment.
  - **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks**  
May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.
  - **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** Alprazolam tablets are not prescribable under the NHS.

## Chlordiazepoxide hydrochloride

### ● INDICATIONS AND DOSE

#### Short-term use in anxiety

##### ▶ BY MOUTH

- ▶ **Adult:** 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
- ▶ **Elderly:** 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses

#### Treatment of alcohol withdrawal in moderate dependence

##### ▶ BY MOUTH

- ▶ **Adult:** 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens

#### Treatment of alcohol withdrawal in severe dependence

##### ▶ BY MOUTH

- ▶ **Adult:** 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence
- **SIDE-EFFECTS**  
▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression  
▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances

## Diazepam

21-Nov-2016

### ● INDICATIONS AND DOSE

#### Muscle spasm of varied aetiology

##### ▶ BY MOUTH

- ▶ **Adult:** 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions

#### Acute muscle spasm

##### ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

#### Tetanus

##### ▶ BY INTRAVENOUS INJECTION

- ▶ **Child:** 100–300 micrograms/kg every 1–4 hours
- ▶ **Adult:** 100–300 micrograms/kg every 1–4 hours
- ▶ **BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE**
- ▶ **Child:** 3–10 mg/kg, adjusted according to response, to be given over 24 hours
- ▶ **Adult:** 3–10 mg/kg, adjusted according to response, to be given over 24 hours

continued →

**Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**

## ▶ BY MOUTH

- ▶ Child 1-11 months: Initially 250 micrograms/kg twice daily
- ▶ Child 1-4 years: Initially 2.5 mg twice daily
- ▶ Child 5-11 years: Initially 5 mg twice daily
- ▶ Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

**Anxiety**

## ▶ BY MOUTH

- ▶ Adult: 2 mg 3 times a day, then increased if necessary to 15-30 mg daily in divided doses, for debilitated patients, use elderly dose
- ▶ Elderly: 1 mg 3 times a day, then increased if necessary to 7.5-15 mg daily in divided doses

**Insomnia associated with anxiety**

## ▶ BY MOUTH

- ▶ Adult: 5-15 mg daily, to be taken at bedtime

**Severe acute anxiety | Control of acute panic attacks |****Acute alcohol withdrawal**

## ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 10 mg, then 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

**Acute drug-induced dystonic reactions**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 5-10 mg, then 5-10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

**Acute anxiety and agitation**

## ▶ BY RECTUM

- ▶ Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- ▶ Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

**Premedication**

## ▶ BY MOUTH

- ▶ Adult: 5-10 mg, to be given 1-2 hours before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 2.5-5 mg, to be given 1-2 hours before procedure

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 100-200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

**Sedation in dental procedures carried out in hospital**

## ▶ BY MOUTH

- ▶ Adult: Up to 20 mg, to be given 1-2 hours before procedure

**Conscious sedation for procedures, and in conjunction with local anaesthesia**

## ▶ BY MOUTH

- ▶ Adult: 5-10 mg, to be given 1-2 hours before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 2.5-5 mg, to be given 1-2 hours before procedure

**Sedative cover for minor surgical and medical procedures**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 10-20 mg, to be administered into a large vein over 2-4 minutes, immediately before procedure

**Status epilepticus | Febrile convulsions | Convulsions due to poisoning**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: 300-400 micrograms/kg, then 300-400 micrograms/kg after 10 minutes if required, to be given over 3-5 minutes.

- ▶ Child 1 month-11 years: 300-400 micrograms/kg (max. per dose 10 mg), then 300-400 micrograms/kg after 10 minutes if required, to be given over 3-5 minutes
- ▶ Child 12-17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3-5 minutes
- ▶ Adult: 10 mg, then 10 mg after 10 minutes if required, administered at a rate of 1 mL (5 mg) per minute

## ▶ BY RECTUM

- ▶ Neonate: 1.25-2.5 mg, then 1.25-2.5 mg after 10 minutes if required.

- ▶ Child 1 month-1 year: 5 mg, then 5 mg after 10 minutes if required

- ▶ Child 2-11 years: 5-10 mg, then 5-10 mg after 10 minutes if required

- ▶ Child 12-17 years: 10-20 mg, then 10-20 mg after 10 minutes if required

- ▶ Adult: 10-20 mg, then 10-20 mg after 10-15 minutes if required

- ▶ Elderly: 10 mg, then 10 mg after 10-15 minutes if required

**Life-threatening acute drug-induced dystonic reactions**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Child 1 month-11 years: 100 micrograms/kg, repeated if necessary, to be given over 3-5 minutes

- ▶ Child 12-17 years: 5-10 mg, repeated if necessary, to be given over 3-5 minutes

**Dyspnoea associated with anxiety in palliative care**

## ▶ BY MOUTH

- ▶ Adult: 5-10 mg daily

**Pain of muscle spasm in palliative care**

## ▶ BY MOUTH

- ▶ Adult: 5-10 mg daily

- **UNLICENSED USE** *Diazepam Desitin*<sup>®</sup>, *Diazepam Rectubes*<sup>®</sup>, and *Stesolid Rectal Tubes*<sup>®</sup> not licensed for use in children under 1 year.

**IMPORTANT SAFETY INFORMATION****ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessional states · phobic states · respiratory depression

● **CAUTIONS****GENERAL CAUTIONS**

Muscle weakness · organic brain changes · parenteral administration (close observation required until full recovery from sedation) · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**SPECIFIC CAUTIONS**

- ▶ With intravenous use High risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Special precautions for intravenous injection When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Amnesia · ataxia (in children) · ataxia (especially in the elderly)(in adults) · confusion (in

children) · confusion (especially in the elderly)(in adults) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression

- ▶ **Uncommon** Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)
- ▶ **Frequency not known** Delusions (in children) · excitement (in children) · hallucinations (in children) · hypotonia (when used for muscle spasm) · irritability (in children) · marked respiratory depression, particularly with high dose (facilities for its treatment are essential) · psychosis (in children) · restlessness (in children)

#### SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Pain · thrombophlebitis · venous thrombosis (in adults)
- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).
- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use Diazepam is adsorbed by plastics of infusion bags and giving sets. Emulsion formulation preferred for intravenous injection.
  - ▶ With intravenous use in children For *continuous intravenous infusion* of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For *continuous intravenous infusion* of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
  - ▶ With intravenous use in adults For *intravenous infusion* (solution) (*Diazepam*, Wockhardt), give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL. For *intravenous infusion* (emulsion) (*Diazemuls*®), give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given *via* drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.
  - ▶ With intramuscular use or intravenous use in adults Solution for injection should not be diluted, except for intravenous infusion.
  - ▶ With intramuscular use in adults Only use intramuscular route when oral and intravenous routes not possible.

#### ● PRESCRIBING AND DISPENSING INFORMATION

##### Palliative care

- ▶ In adults For further information on the use of diazepam in palliative care, see [www.palliativedrugs.com/formulary/en/diazepam.html](http://www.palliativedrugs.com/formulary/en/diazepam.html).

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.
